Cyclopaedia: or, A New Universal Dictionary of Arts and Sciences.

TOL

Tolerium, in Ancient Geography, a town of Italy, in ancient Latium, and one of those which were taken by Coriolanus, according to Plutarch and Steph. Byz.

Tolescapatam, in Geography, a town of Hindoostan, in the Carnatic; 28 miles S.E. of Tanjore.

Toletum, Toledo, in Ancient Geography, a town of Hifpania Citerior, belonging to the Carpentani, to the S.W. upon the Tagus. According to Silva and other Spanish historians, this city was founded by a considerable body of Jews, who, on their emancipation from captivity, 540 years before the vulgar era, established themselves here, and called the place Toledoth, or Toledath, that is, mother of the people. However this be, Toletum became in process of time a Roman colony. Cæfar made it a place of arms, and Augustus rendered it the principal seat of justice for the provinces of Spain in his department. Many ancient remains, such as an aqueduct, a road, &c. have been discovered at Toledo; which see.

Toletus, (Dr. Toledo,) Francis, cardinal, in Biography, was born at Corduba in 1532, and studied at Salamanca, where he took the degree of doctor in theology, and was made professor of philosophy. At the age of twenty-seven years, he entered the society of Jesuits, and in the following year he went to Rome, and read lectures on Aristotle and theology. He acquired great popularity as a preacher, insomuch that, when he was compared with other preachers, it was said “Toledo teaches, Panigarola preaches, and Lupo moves.” He was employed by several popes in various legations, and in 1593 Clement VIII. invested him with the purple, being the first Jesuit who obtained that dignity. He died at Rome in 1596, at the age of fifty-four. Toledo was one of those theologians who were employed by Sixtus V. in revising his bible. Of his various works, we shall only mention his “Sum of Caffes of Conscience, or Instructions to Priests, in eight Books,” justly chargeable with the pernicious maxims of the fee of Rome concerning the forfeiture of the allegiance of their subjects by excommunicated princes, and with the dangerous doctrines of equivocations and mental reservations. Dupin. Nouv. Dict. Hist.

Tolfa, in Geography, a town of the Popedon, in the Patrimonio, in the curious of which are mines of alum and iron, with warm baths, and quarries of alabaster and lapis lazuli, about four miles from the sea-coast; 25 miles N.W. of Rome.

Tolhar, a town of Hindoostan, in Lahore; 18 miles S. of Rotas.

Tolhuys, a town of Guelderland, on the Rhine; where the French passed that river in the year 1672, and the Hanoverians in 1758; 6 miles W.S.W. of Emmerick.

Toli, a town of European Turkey, in Macedonia; 85 miles N.W. of Saloniki.

Tolitzin, a town of Russia, in the government of Mogilev; 70 miles N. of Mogilev.

Tolkemit, a town of Prussia, in the province of Ermeland, on the Frisch Haff; 12 miles N.E. of Elbing. N. lat. 54° 18'. E. long. 19° 33'.

Toll, Telonium, a Saxon word, though derived originally from the Latin tollere, to take away, or rather the Greek τοιλος, tribute, tax. It has two acceptations, denoting, first, a liberty to buy and sell within the bounds of a manor, and, secondly, toll is also used for a tax or custom paid for passage, or for vending goods in a market, fair, or the like. This tax originated in the expense attending the construction and preservation of highways, bridges, and canals: and it is evidently just that a traveller, and especially a merchant, who derives advantage from a bridge, a canal, or a causeway,
TOL

caufeway, in his own paffage, and in more commodiously
conveying his merchandise, should contribute to the expence
of these useful eftablifhments, by a moderate contribution;
and if the state thinks proper to eempt the citizens from
paying it, it is under no obligation to gratify strangers in
this particular. But alaw fo juft in its origin, frequently
degenerates into a great abuse. There are countries where
no care is taken of the highways, and where they neverthe-
less require considerable tolls.

Some records make mention of toll thoro, or thorough toll,
which is money paid for passage in or through some high-
ways, or over ferries, bridges, &c. Toll values, for pafling or
driving cattle over a private man's ground. And toll-turn, or
turn-toll, which is paid at the return of beasts from fairs and markets, though they are not fold.

By the ancient laws, the buyers of corn and cattle in
fairs or markets were made to pay toll to the lord of the
market, in tellimony of the contract there lawfully made
in open market, because privy contracts were held un-
kwful.

Some interpret toll a liberty, as well to take as to be free
from toll; for that they who are infeoffed with toll are
confum-free.

This freedom from toll the city of Coventry boasts an
ancient charter, granted them by Leofrick, or Luriche,
earl of the Mercians, in Edward the Confessor's time, who,
at the importance of Godceva, his lady, granted this free-
dom to the city.

Toll-Bar, or Stop, on a canal, is a beam for stopping boats
at the toll-houses.

Toll-Houses, habitations confructed on the banks of a
canal or navigation for the toll-clerks.

TOLLAND, in Geography, a county of America, in
the state of Connecticut, divided into ten townships, and
containing 13,779 inhabitants.—Alfo, a town of the same
state and county; 65 miles W.S.W. of Boston, containing
1610 inhabitants. N. lat. 41° 58'. W. long. 72° 26'.

TOLLEIT, a town of Austria; 6 miles S.W. of Ef-
ferding.

TOLLEN, a lake of Anterior Pomerania, near Trepto.
TOLLENON, among the Romans, a warlike machine,
formed in this manner: one beam was fixed very deep in
the earth, and on the top of it another more than half as
long, and moveable upon a centre. On one end of this
crofs-beam was placed a covering of hurdles or planks,
within which a few soldiers were put, and, by pulling
down the other end with ropes, these were raised above the
walls of a befieged town.

Tollon was alfo an engine for raising water out of a
draw-well.

TOLLERSHAM, in Geography, a town of Austria;
4 miles N.E. of Zwettl.

TOLLES, or Toles, names given by some to the
tofts, and by others to the glandular abfeffes sometimes
affecting the limbs.

TOLLESIO, in Geography, a town of Sweden; in West
Gothland; 23 miles E.N.E. of Gothenburg.

TOLLET, THOMAS, in Biography, a composer for,
and a performer on, the common flute, when it was in its
highest favour in England. He published likewise direc-
tions for playing on the French flageollet. And, in con-
junction with John Linton, whose instrument was the flute,
one of king William and queen Mary's band, published a
work entitled "A Confort of Muftick in Three Parts."

A ground comphoty of Tollet, was much in favour dur-
ing our own time.

TOLLING a Bell. See Ring.

TOLLIUS, CORNELIUS, in Biography, a man of learn-
ing in the 17th century, was born at Utrecht, and became
secretary to Isaac Vollius, by whom he was difmiffed under
a charge of unfaithfulness. He was afterwards profeflor
of eloquence and Greek at Harderwyk, and secretary to
the curators of that university. His works were numerous:
and the time of his death is unknown.

TOLLIUS, JAMES, M.D., brother of the preceding, profef-
lor of eloquence and Greek in the university of Duiiburg, was
the author of many learned works, and made several journies
for literary purpoifes, an account of which was given in a
pofthumous work, entitled "Epiftola Itinerariz," published
with notes, by Henninvs at Amfterdam. A work of
somewhat fimilar title, viz. "Inflinigia Itinerarii Italizz,"
was published by himfelf at Utrecht in 1669, and contained
the writings of some ancient ecclesiatical authors in Greek
and Latin, with the editor's notes. He had also previously
published an edition of "Anufius, cum Notis Variorum,"
1671 of "Cicernus Oratio pro Licinio," with notes
and a commentary, 1677; and of "Longinus," Gr. and
Lat. with Baldean's French translation, and notes by him-
self and others. He had also directed his attention to al-
chemy, as appears by his "Manufactio ad Cadam che-
micum;" "Sapientia infaniens, five Promiffa chemica:" and
"Fortuita Sacra, in quibus, prater critica nonnulla,
tota fabularis Historia Graeca, Phenicia, Aegythiaca, ad
Chemiam pertinere apatur." From this work were fe-
lected comparisons between the Greek and Latin poets,
printed at Leyden under the title of "Diflertationes fe-
exae criticae de Poetis Graecis et Latinis." Tollius died in
1696.

Another brother of this family, named ALEXANDER,
prefented to the public an edition of "Appiani Alexandri
Romani Historiz," Gr. and Lat. Moreri.

TOLLUNDY, in Geography, a town of Hindoostan, in
Ouds; 18 miles N. of Bareilly.

TOLMEZO, a town of Italy, in Friuli, with a castle,
on the Tajamento. Near the town is an extensive and ce-
brated linen manufacture, which, in the year 1782, produced
40,000 pieces of printed linen for exportation; 12 miles
N.W. of Gemona. N. lat. 46° 23'. E. long. 12° 52'.

TOLMIDESSA, in Ancient Geography, a town of
Syria, in the small country called Chalidica. Ptol.

TOLMINO, in Geography, a town of Germany, and
capital of a district, in the duchy of Carniola; 9 miles
S.E. of Feldis. N. lat. 46° 12'. E. long. 13° 47'.

TOLNA,
TOLNA, a town of Hungary, on the Danube; 50 miles S. of Buda. N. lat. 46° 20'. E. long. 18° 41'.

TOLNANI, a town of Hindoostan, in the country of Baglan; 70 miles W. of Burhanpore. N. lat. 21° 15'. E. long. 75° 3'.

TOLO, a town of Spain, in Catalonia; 22 miles N. of Balaguer.—Alto, a town on the E. coast of the island of Morty. N. lat. 22° 12'. E. long. 128° 18'.

Tolo Bay, a large bay on the E. coast of the island of Celebes, very broad at its entrance, but becoming narrower toward the bottom. S. lat. 10° 30' to 3° 5'. E. long. 121° 18' to 123°.

TOLOMETO, a seaport of Africa, in the country of Tripoli, anciently called Tolemaia; 350 miles E. of Tripoli. N. lat. 32° 30'. E. long. 20° 40'.

TOLOMEI, CLAUDIO, in Biography, a patron of literature and the arts, was born at Siena, of an ancient and noble family, in 1492. Having spent many of his earlier years at the court of Rome in the service of cardinal Ippolito de' Medici, he attached himself to the duke of Parma and Piacentia. Upon his death he removed to Padua, and in 1549 was nominated to the bishopric of Cornola, an island in the Adriatic. In 1552 he became one of the six conservators of the public liberty at Siena, and joined three other citizens in an embassy to France. Having spent about two years in that country, he returned to Rome, and died there in 1555. Tolomei took pains in cultivating the Italian language, and contended that it ought to be denominated the Tuscan. With a view of reducing Italian verse to the measure and harmony of the Latin, he published, in 1539, his "Veri e Regole della Poesia Nuova;" but his scheme did not succeed. To him was ascribed the foundation of the academy "Della Virtu" at Rome, for the purpose of explaining the architectural work of Vitruvius; and for which he was eminently qualified by his classical and antiquarian learning.

TOLON, in Geography, an island in the Grecian Archipelago. N. lat. 37° 35'. E. long. 23°.

TOLONES, one of the smaller Philippine islands, near the N. coast of Samar. N. lat. 12° 50'. E. long. 124° 57'.

TOLOSA, or TOLONSETA, a town of Spain, and capital of the province of Guipuscoa, celebrated for its steel manufacture, particularly of sword-blades; 7 miles S. of St. Sebastian. N. lat. 43° 12'. W. long. 2° 7'.

Tolosa, in Ancient Geography, a town of Gaul, in the Narbonne province, and diocese of Toulouse.

TOLOTÉ, a people of Africa, in Mauritania Cafraria.

TOLOUR, in Geography, an island in the East Indian sea, of a triangular form, and about 45 miles in circumference, considered as one of the Salibaho islands. N. lat. 4° 12'. E. long. 126° 28'.

TOLOUS, in Ancient Geography, a place of Spain, between Ilerda and Pertusa. Anton. Itin.

TOLPAS, in Geography, a river of Ruffia, in the province of Ufiug, which runs into the Schugor, N. lat. 63° 50'. E. long. 58° 22'.

TOLPIS, in Botany, a word of which we can trace neither the derivation nor meaning, and which seems to have been actually invented by Adanson; nor is it the only instance of such a kind of forgery to be found in his book. We have sometimes been tempted to suppose these seemingly original names of Adanson might be reduced from some condite sources of nomenclature or literature; but the search has always proved vain. He was no scholar, nor is his new French orthography founded in any extensive knowledge, much less any refined taste, in language, but in mere affectation. Gartner cannot be excused for adopting the above name, when he had the choice of an excellent one, (see Drepania,) given by Jussieu to this same genus. Nevertheless, Tolpis is now established, and cannot without inconvenience be set aside.—Adanf. Fam. des Pl. v. 2. 112. Gartner v. 2. 371. t. 153. Wild. Sp. Pl. v. 3. 1658. Ait. Hort. Kew. v. 4. 451. Smith Prod. Fl. Græc. Sibth. v. 2. 140. Lamarck Illutr. t. 651. Bivona Monogr. delle Tolpidi. (Drepania; Juff. 169. Desfont. Atlant. v. 2. 323.)—Clafs and order, Synagenea Polygania-aequali. Nat. Ord. Compositæ. semenculi. Linn. Ciboracæae. Linn.

Gen. CH. Common Calyx ovate, of many linear, nearly equal, parallel, close scales, with a distinct series of somewhat feathered and lax, awl-shaped, incurved scales at the base. Cor. compound, imbricated, uniform; the florets numerous, equal, all perfect, each of one petal, ligulate, abscis, five-toothed. Stam. Filaments five, capillary, short; anthers united into a cylindrical tube. Pist. Germin ovate-oblong; style thread-shaped, the length of the stamens; stigma two, recurved. Peric. none, except the cloven permanent calyx, tubid at the base. Seeds solitary, small, obovate, flattened; down fetal; of that of the radius of numerous, little, membranous, equal, acute, marginal teeth, or scales; that of the disk of similar scales, accompanied by two, or ten straight, rough bristles, longer than the seed. Recept. cellular, with crenate edges to the cells. Eff. CH. Receptacle cellular. Calyx equal, with many awl-shaped scales at the base. Seed-down of the circumference toothed; that of the disk toothed, accompanied by several bristles.

The present genus agrees most with Crepis in habit. (See that article.) The seed-down affords a clear distinctive character, and the outer scales of the calyx do not assume that enlarged, dilated, tubid appearance so remarkable in Crepis.

1. T. Barbata. Purple-eyed Succory-hawkweed. Willd. n. 1. Ait. n. 1. Prodr. Fl. Græc. n. 1942. Bivona Tolp. 13. t. 3. Savi Etrufc. v. 1. 183. (Crepis barbarata; Linn. Sp. Pl. 1131. Curt. Mag. t. 35. Hieracium medio nigro boeticum magus; Herrn. Parad. 185. t. 185. H. calyce barbato; Column. Echfr. v. 2. 28. t. 27. f. 1. H. medicum nigrum, flore majore; Gen. Em. 1625.)—Leaves elliptic-lanceolate, toothed. Outer scales of the calyx falcate, dilant, longer than the inner. Bristles of the seeds two or four.—Native of sandy fields, or wafte ground, especially near the sea, in the south of France, Italy, and the Levant, flowering in May and June. This elegant hardy annual, very early of cultivation, has, for two hundred years past, been common in gardens, where it produces, from Midsummer till the autumnal frosts, abundance of flowers. The flæms are branched, erect, spreading or decumbent, rather downy, leafy, repeatedly subdivided at the top, in a corymbose, or somewhat forked manner, the flowers, which are at first terminal and solitary, being copiously overtopped by their successions. The scales of their outer calyx are partly scattered down the stalk. Corolla expanded in the early part of the day only, and in fullline, an inch, more or less, in diameter, of a delicate pale lemon-colour; a number of the central florets of a dark purplish chocolate hue, forming an almost black velvet-like spot, or eye, in the middle, which constitutes the chief beauty of the flower. The leaves are rather regularly toothed, alternate, fiddle, green, slightly roughish; the upper ones mostly entire.

"H. cichorii
TOL

OL Re, in Geography, a town of Hindoostan, in the Carnatic; 15 miles E. of Volconda.

TOLSEY, in our Old Writers, denotes the places where merchants meet in a city or town of trade.

The word is compounded of the Saxon tol, tributum, and fes, fides.

TOLSTONOSKOI, an offshoot of Russin, in the government of Tobolik, on the Enifie; 280 miles N.W.N. of Turuchank. N. lat. 70° 16'. E. long. 85° 14'.

TOLT, in Law, a writ whereby a cause depending in a court-baron is removed into the county-court. Old Nat. Br. 4. See Pone.

TOLTEN, in Geography, a river of Chili, which runs into the Pacific ocean, S. lat. 38° 50'.

TOLTERAZITLI, in Natural History, the American name of a flower, much resembling the novalculus lapisi, but variegated with red and black spots. They use the powder of this flower and crystal, calcined together, for dif- cates of the eyes.

TOLON, in Geography, a sea-port town of South America, in the province of Carthagena, with a harbour open to the Spanish Main; in the environs of which is found the celebrated balmam to which it gives name; 50 miles S.E. of Carthagena. N. lat. 9° 45'. W. long. 75° 25'.

TOLU Balsam. See Balsam.

TOLU-Tree, Balsam of, in Botany. See Toluifera.

TOLVA, in Geography, a town of Naples, in Basilica; 9 miles S.S.E. of Acerra.

TOLUCO, a town of Mexico, in the province of Mexico; 100 miles W.N.W. of Mexico.

Gen. Ch. Cal. Perianth inferior, of one leaf, bell-shaped, five-toothed, nearly equal; one angle (or tooth?) more dilated than the rest. Cor. Petals five, inserted into the receptacle; four of them equal, linear, somewhat longer than the calyx; the fifth twice as large, involute heart-shaped, its claw the length of the calyx. Stam. Filaments ten, very short; anthers longer than the calyx. Pith. Germen oblong; style scarcely any; stigma acute. Petio. and Seeds not described.

Eff. Ch. Calyx five-toothed, bell-shaped. Petals five; the lower one very large, inversely heart-shaped. Style none.

1. T. Balsamum. Balsam of Tolu. Linn. Sp. Pl. 549. Willd. n. 1. Woodv. Med. Bot. t. 193. (B. toloutanum; Dale Pharm. 304. B. toloutanum, folia certe similebus, quod candidum cit; Bauh. Pin. 401.)—Native of the province of Tolu, in South America. We have never seen any original speciem of this plant, nor any figure, except Dr. Woodville's, drawn from a dried speciem in sir Joseph Banks's collection, the authority for which is not mentioned. Miller appears to have raised plants from seeds sent by Houtouin, but they probably did not prosper long. Perhaps the speciem just mentioned was obtained from the same

when dried. The teeth, which make a part of the seed, are, though here and there present, are so small as to be easily overlooked: the bristles are numerous, feathery.

H. cichorii favi folio, denticulato, curvo, diurnae florens, inanum; Cupan. Hort. Cath. 366.)—Leaves lanceolate, strongly toothed, somewhat hairy. Outer scales of the calyx lacin, the length of the inner. Bristles of the seeds four or more.—Common in Sicily, by way-sides, on cackareous hills near Messina, and various parts of mount Etna, flowering in June and July. Bivona. Dr. Sibthorp found it in Cyprus. The root is perennial, tapering, milky. Stems one or more, erect, wand-like, somewhat angular, one and a half or two feet high, leafy, much branched and corymbose at the upper part. Leaves more tapering at the base, with longer teeth, and rather more hairy than in the first species. Flowers numerous, about half as large as the former, of a pale sulphur-colour, reddish underneath, sometimes purplish-brown in the middle. Outer scales of the calyx lacin, partly diftorted down the flalk, but none of them longer than the inner scales. Bristles on the seeds of the disk eight, ten, or more, even in a speciem fent by baron Bivona himself. Can the purple-eyed variety of this species be the Hieracium medio nigrum, flore minor, mentioned in Ger. Em. 1625, along with the preceding?

3. T. sectans. Clove-cupped Suckory-hawkweed.—Bivona Ttolp. t. 11. t. 2. (T. virgata; Savi Etruf. v. 1. 184. Crepi ambita; Balbí Crep. 4. t. 1. "Decand. Franc. 40. t. 4.")—Lower leaves lanceolate, deeply and unequally toothed; upper linear-lanceolate, entire. Outer scales of the calyx clofe, half as long as the inner. Bristles of the seeds fix or more.—Native of hills in Italy, Sicily, and the south of France, flowering in June and July. Root peren- nial, tap-shaped. Stem three or four feet high. Pubeffence of the whole plant very variable. Radical leaves numerous, spreading circularly on the ground, four inches long, taper- ing at the base; those of the stem, except a few at the bottom, slender and awl-shaped. Flowering branches rather more diltant and slender than the leaf. Calyx mealy. Corolla lemon-coloured. "Bristles of the seeds usually fix, sometimes only five, or four;" Bivona: "sometimes four;" Savi.

5. T. coronopifolia. Flethy-leaved Suckory-hawkweed. Bivona Ttolp. 17. t. 5. (Crepi coronopifolia; Desfont. Actes de la Soc. d'Hist. Nat. de Paris, v. i. 38. t. 9, excluding the cyn. of Boccone, 13. t. 7. Willd. Sp. Pl. v. 3. 1606.)—Lower leaves pinnatifid, with linear segments. Flower-flalks divericated. Outer scales of the calyx clofe, very short. Bristles of the seed ten or more.—Native of the Canary islands, from whence it was brought to Kew by Mr. Maffon, in 1777. A hardy annual plant, flowering in August and September. The stem is a yard high, round, frilatc, leafy, foomat, much branched. Leaves smoothe, rather fuculent, various in fize; their segments dominant, often subdivided. Flowers numerous, small, yellow, on flightly fealy hollow flalks. Calyx white and cottony; its outer scales awl-shaped, unequal, feathery spreading, except...
fame lourse. Authors describe the tree as lofty, with large branches, and a thick greyish bark; the leaves like those of the Carob. If so, they are pinnate, as the natural order of the genus should indicate; but of which Dr. Woodville seems not to have been aware. The flowers in his figure are racemose. All we can make out respecting the characters of this tree confirm the account of Mutis, of its close affinity to Myroxyylon, see that article, pp. 1; the long-flaked germen of the latter appearing to be the only difference which is even obliquely hinted. The generic name of Tolufera therefore, though the most ancient, should give way to Myroxyylon, as the most comprehensive.

T. cochinchinensis, Loureir. Cochinch. 262, having simple leaves, and a berry with one or two seeds, should seem, as Poiret observes, in Lamarrick’s Dict. v. 7. 696, to be very different from the original Tolufera, and more probably a Bursera.

Tolufera, in Gardening, compriees a plant of the exotic tree kind for the floe, of which the species cultivated is the balsam of Toluy tree (T. balsamum).

Method of Culture.—This tree is raised from seeds, which should be obtained from its native situation, and be sown as soon as possible afterwards in pots of light earth, plunging them in the bark-bed of the floe. When the plants have three or four inches growth, they should be potted off separately, giving them water, and replumbing them in the bed. They afterwards only require to be managed as other woody floe plants.

They afford variety in floe and hot-house collections among other potted plants. A balsam of great use in medicinal compositions is extracted and prepared from this tree.

TOLZ, in Geography, a town of Bavaria; 24 miles S. of Munich.

TOL, a river of Russia, which rises 80 miles S.E. of Kufnetz, in the government of Kolvan, and runs into the Oby, 32 miles W.W. of Tomk. N. lat. 56° 40'. E. long. 89° 14'.—Alo, a river of China, which runs into the Heng, 5 miles S. of Heng-chan.

Tom Zil, a town of the Arabian Ira, on the Tigris; 118 miles S.S.E. of Bagdad.

TOMADÆORUM Insulae, in Ancient Geography, islands situated in the Arabian gulf. Potl.

TOMAUS, a mountain of the Peloponnesus, in Messenia, near the promontory Coryphaum. Thucydidis.

TOMAHABI, in Geography, a town of Peru; 60 miles S. of Potoè.

TOMAN, or Touman, a kind of imaginary money used among the Perfians in the keeping of their books, and calculated to facilitate the reduction of money in the payment of considerable sums. The toman contains 50 abasins, 100 manoomis, 200 fardrees, 1000 dinars bifi, or 10,000 dinars simple. The toman and dinar are imaginary monies. An abasin is worth 2 manoomis, 4 fardrees, 40 kabefquis, 20 dinars bifi, or 200 dinars.

D’Herbelot derives the word from the language of the Moguls, where it signifies the number of ten thousand. Eben Arbabchah says, that the word tomian, when used to express a weight, or money, contains ten thousand silver Arab drachmas, called mihatkal; which are a third lighter than the Attic.

The Moguls, &c. frequently use toman for ten thousand men; and say, c. gr. that the city Samarcand contains seven tomans of people fit to bear arms; and that of Andeehan nine tomans.

TOMAII, in Geography, a kingdom of Africa, situated on the side of the river Gambia, W. of Kantor.

TOMANANISA, a town of Japan, in the island of Nippon; 75 miles W. of Meaco.

TOMAR, a circar of Bengal, bounded on the N. by Sillec, on the E. by Pachete, on the S.E. by Singboom, and on the W. by Napour; about 20 miles long from N. to S., and from 10 to 20 broad.—Alfo, a town of Bengal, and chief place of a circar of the same name; 145 miles W. of Calcutta. N. lat. 23° 10'. E. long. 85° 33'.

TOMAR. See Thomas.

TOMARA, in Ancient Geography, a town of India, on this site of the Ganges. Potl.

TOMARE, a mountain on the confines between Theoprotia and Chaonia, two countries of Epirus.

TOMATO, in Botany, a word whole origin we have not ascertained, is the name of the Love-apple, or Solanum Lycopersicum. See SOLANUM.

TOMB, in Geography. See TUMB. Tomi, includes both the grave or sepulchre, wherein a defunct is interred, and a monument erected to preserve his memory.

The word is formed from the Greek, tomē, to make, sepulchre; or, according to Menage, from the Latin, tumba, which signifies the fame.

Among the Romans, none but the emperors, vestals, and perfons signalized by great actions, were allowed to have tombs in the cities, the rest were all in the country, near the high roads; whence those common words, signe, &c., which are still retained in the inscriptions of our monuments, though fet up in churches, &c.

At Anchiale was anciently seen the tomb of Sardanapalus, with this inscription in verse: “Sardanapalus built Anchiale and Tarbus in one day: go well, eat, drink, and be merry; the reli is nothing.” Strab. Geo. lib. 14.

The Romans had a kind of empty tomb, called cenatephium, an honorary tomb, in which the body of the deceased was not laid. See CENOTAPH.

The occasion of this was a superstitious notion, that the souls of those who had not funeral honours, wandered a hundred years by the banks of the rivers of hell, before they were admitted to pass over. The cenotaph being made, the fame ceremonies were practifed as at real funerals.

The cenotaphia were inscribed with the words ob honore, or memoriae sacrum, whereas other tombs in which the ashes were really deposited, were inscribed D. M. S. q. d. facer ad manes. When the words taceo omne were added, it declared the ashes enclosed therein belonged to a person infamous for some crime.

Tomb-Stones, Characters on. See Character.

Tomb-Stones, Epitaphs on. See Epitaph.

TOMBA, in Geography, a river of Peru, which runs into the Pacific ocean, S. lat. 17° 50'.

TOMBAC, a name given by the French to a yellow metal, very nearly approaching to what we call Prince’s metal, and made by mixing and fusifig together a large quantity of zinc with a smaller of copper. See Gold-coloured Metal.

TOMBACONDA, in Geography, a town of the kingdom of Burfall. N. lat. 13° 56'. W. long. 14° 57'.

TOMBALY Point, a cape on the west coast of Africa. N. lat. 10° 48'. W. long. 14° 30'.

TOMBAY, a town of Pegu; 6 miles S. of Pegu.

TOMBEBBEUF, a town of France, in the department of the Lot and Garonne; 12 miles N.W. of Villeneuf d’Agen.
TOMBUL, a town of Africa, in Quoja. N. lat. 6° 50'.
TOMBIGHE, a river which rises in the north part of Georgia, enters West Florida, and joins the Mobile, N. lat. 31° 32'. W. long. 87° 50'.—Also, a town of West Florida, on a river of the same name. N. lat. 7° 45'.

TOMBUCTOO, or Tumultoo, a city of Africa, the capital of a rich and populous kingdom, said to have been built in the 13th century by Soliman, pretended to be of the royal race of Morocco. The extent of its territory is very imperfectly ascertained; but it is said to extend northward to the confines of Sahara or the Desert, comprehending a tract of country about 90 miles in breadth; its western boundary being 150 miles W. of the city, and the eastern extending to the Bahar Soudan, or Sea of Soudan, which is a lake formed by the Nil-Al Bebede or Niger, whose opposite shore is not discernible. The city is situated on a plain, surrounded by sandy eminences about twelve miles N. of the Niger, and three days' journey from the confines of Sahara. It is said to be twelve miles in circumference, but without walls. The town of Kalra, situated on the banks of the river, is its commercial depot, or port. By means of a water-carriage E. and W. of Kabra, the trade of Tombuctoo acquires great facility; and hence the various articles of European as well as Barbary manufactures brought by the akkabaahs, or caravans, from the N. of Africa, are distributed to the different empires and states of the Soudan and the South. This great mart is referred to by all nations, whether they bring the various products of their respective countries, to barter for the European and Barbary manufactures. The houses at Tombuctoo have, in general, no upper apartments; they are spacious, and of a square form, with an opening in the centre, towards which the doors open. Contiguous to the door of entrance is a building, confining of two rooms, called a duaria, in which visitors are received and entertained, so that they do not see the women, who are very handsome. The men are so excessively jealous of their wives, that when the latter visit a relative, they are much muffled up, in order to disguise their persons; their face is also covered with their garment, through which they peep in order to explore their way. The king, whose authority has been acknowledged at Tombuctoo ever since the death of Muley Ithmael, emperor of Morocco, is the sovereign of Bambarra: his name in 1800 was Woolo; he is a black, and a native of the country which he governs: his usual place of residence is Jinnies, though he has three palaces at Tombuctoo, which are said to contain an immense quantity of gold. Many of the civil appointments at Tombuctoo, since the decease of Muley Ithmael, and the consequent decline of the authority of the emperor of Morocco, have been occupied by Moors of Maroquin origin; but the military appointments, since the forementioned period, have been distributed among Negroes of Bambarra, assigned to them by the king Woolo. The inhabitants are chiefly Negroes, who resemble the Arabs in hospitality, and value themselves on their attention to strangers. The various costumes exhibited in the market-places and streets indicate the variety and extent of the commercial intercourse with the different nations of Central Africa; the individuals being each habituated in the dress of his respective country. The tolerance prevalent at Tombuctoo is worthy of notice. The divan, or l'alamoa, never interferes with the religious tenets professed by the different people who resort hither for commercial or other purposes. The police of this place is extolled: robberies and house-breaking are scarcely known: the inhabitants of the town are peaceable and orderly. The government of the city is intrusted to a divan of twelve alemmas, or men learned in the Koran, and an umpire, who retain their appointments, received from the king of Bambarra, for three years. Their power is great. The civil jurisdiction is directed by a cadi, who decides all judicial proceedings according to the spirit of the Koran: he has twelve attendants, called tabby, who attend him, and to each of these belongs a separate department of justice. It is asserted that till of late no Jews were permitted to enter the town; and it is said, moreover, that those Jews who now resort thither, are obliged to become Mahometans. The probable reason of the exclusion of the Jews is deduced from the extreme jealousy of the individuals of the Moorish factory, whose avarice induces them to prevent any person from sharing their emoluments, whenever a plausible pretext can be found.

The climate of Tombuctoo is much extolled as salubrious and invigorating; infomuch that there is no man of the age of eighteen, who has not his wives or concubines; and it is a disgrace for a man to attain the age of puberty without being married. The natives possess an elegance and finery of manners, a great flow of animal spirits, and an invincible attachment to their country. The accommodation for travellers is very simple; camels, horfes, drivers and merchants, rendezvous at a large house, with an open space in the middle, round which are rooms sufficient for containing a bed and a table. The merchants are accommodated with houfe during the period of their stay, for bartering and exchanging their commodities, which they inveil in the produce of Soudan as speedily as possible, so that they may be ready about September for the akkabaah, and proceed to Morocco, Cairo, Jida, or some other place. The manufactures of different kinds of apparel are prepared chiefly by the women in their own houses, whenever they cannot procure European cloths and linens, or when there is a great scarcity of Fez and Tablet manufactures of silk, cotton, and woollen. The soil about Tombuctoo is generally fertile, and near the river produces rice, millet, Indian corn, and other grain; wheat and barley grow in the plains, and are cultivated principally by the Arabs of the tribe of Barbeesha, who receive a tribute from the town for forbearing to plunder the caravans from the north which pass through their territory. Coffee grows wild here, as does also indigo, which latter is occasionally cultivated, and produces a very fine blue dye used in their various cotton manufactures. The husbandmen are very expert in the management of bees: honey and wax are abundant, the former being used at Tombuctoo as an article of food, and the latter for candles. The river about Kabara affords a supply of fish. The mines of gold which lie S. of the bed of the river belong to the sultan Woolo, who refides at Jinnie; but his gold is deposited in his palaces at Tombuctoo. The exact bearing and distances of places from Tombuctoo are not satisfactorily ascertained. The city probably, says Mr. Jackson, to be situated 1500 miles S.S.E. of Fez, 1150 miles about S.S.E. of Akka, Tatta, and Wedinoon; 1500 miles in nearly the same direction from Morocco; 1320 miles from Tablet; about 230 miles E. of Jinnie; and 1500 miles E. of Housa. Major Rennell, in his Geographical Elucidations annexed to the Proceedings of the Association for discovering the Interior of Africa, says that Tombuctoo is fifty days' caravan travelling from Tatta, a place situated on the confines of Morocco, Drah, and Zengaga, and on the route from Morocco and Suez to Tombuctoo. Tatta is found to be nine and a half days' journey from Morocco; and one day short of a fatation on the Wad-drah or Drah river, which fatation is four days, or sixty-fix miles lower down than Tinguleen, a place in D'Anville's and De Lisle's map of Africa.
Africa. It was also twelve days' journey from the city of
Nun, or Non, which city, by Ben Alli's account, is two
days from the sea-coast, and well known to be opposite to
a cape of the same name. These authorities, says the major,
enable us to place Tatta 170 miles S.S.E. from Mor-
rocco. Thus, 50 days from Tatta to Tombuctoo, at
13 miles each day, produce 650 miles. By Ben Alli's
report, Tombuctoo is 48 days from the capital of sultan
Fullan, lying within the district of Gallan, on the river
Senegal: 48 days, at 13 each day, produce 620 miles; and
this line of distance meets that from Tatta in lat. 19° 40',
and nearly midway between Gallan and Cafhna. In this
position it falls only 23 miles to the N.W. of D'Anville's
Tombuctoo.

The country north of Tombuctoo is inhabited by a power-
ful tribe of Arabs, called Brabeeaha, whose original stock
emigrated in the eighth century, and took possession of a
tract of country bordering on Egypt westward: they are
a turbulent, refractory, and warlike tribe, but much afraid
of fire-arms, as they have no such, being armed only with
the lance, and occasionally with knives or daggers. There
is another nation, situated many journeys south-east of
Tombuctoo, who worship the sun, and abject from ani-
mal food, subsisting on milk and vegetables. In a part of
the country between Tombuctoo and Cafhna is dis-
covered a race of people, compared by the Arabs to the
English, who speak a language different from all the others
known in Africa, and resembling the whistling of birds,
to which they compare the English language. They ride
on saddles like those used in England, and wear rowelled
spurs, which are peculiar to themselves. Their faces are covered
by turbans, and their weapons are swords, bows, arrows,
and lances. They are said to be a groveling superstitious
people; their bodies, as well as their houses, being covered
with charms or amulets. It is said that there is a water com-
unication between Tombuctoo and Cairo; but the expence
of land-carriage by camels being more moderate, the other
is not used.

Tombuctoo, has, from time immemorial, been the great
emporium of Central Africa; an extensive and profitable
trade having been carried on with the various maritime states
of North Africa, viz. Morocco, Tunis, Algiers, Tripoli,
Egypt, &c. by means of akkabaahs, or accumulated ca-
раванов, which crofs the Sahara, or Great Defert, generally
between the months of September and April: these akka-
baahs consist of several hundred loaded camels, accompa-
nied by the Arabs who let them to the merchants.
The articles transported from Fez to Tombuctoo are principally
the following; viz. various kinds of German linens, Irish
linens, muslins, cambrics, fine cloths, coral beads, amberbeads,
pearls, Bengal raw silk, balsam, coffee, fine hyfox teas,
refined sugar, and various manufactures of Fez and Tafilet,
such as shawls and fashes of silk and gold, haykus or pieces
of silk, of cotton and silk mixed, of cotton and wool: to
which may be added red woollen caps, turbans, Italian silks,
batimis, clooves, ginger, and pepper, Venetian beads,
cowries, tobacco and salt. The produce of Souadan in re-
turn for these articles, consists principally in gold-dust,
twisted gold rings of Wagana, gold rings made at Jinnie,
bars of gold, elephants' teeth, gum of Souadan, grains of
Sahara, or grains of paradise, odoriferous gums, and a
large number of flaves purchased at Tombuctoo of the
flates or slave merchants, and brought from those regions
which border on the mountains of the Moon. To these we
may add oil-rich feathers and ambergris, collected on the
confines of the Defert. The circulating medium at Tom-
buctoo is (rubber) gold-dust, which is exchanged for mer-
chandize; a plattolia being worth 20 mizans of gold, and the
value of a mizan being about 11s. sterling. Jackson's
Morocco.

To the account above given of Tombuctoo, we shall
subjoin a few extracts from the narrative of Robert Adams,
a sailor, who was wrecked on the western coast of Africa,
in the year 1810, and detained three years in slavery by the
Arabs of the Great Defert, and resided several months in
the city of Tombuctoo, 4to. London, 1816.

Tombuctoo, according to this narrative, stands on a level
plain, having a river about two hundred yards from the
town on the S.E., named La Mar Zarah, three quarters of
a mile in width, appearing to have but little current, and
that little flowing to the S.W. The city seemed to Adams
to cover as much ground as Lisbon: but the houfes were
not continuous, had a ground-floor only, were built of
sticks, clay, and grafs, and were furnished merely with the
rudelt domestic implements: the town had no exterior
walls, or fortifications; and the population, of which our
informant could not make a regular estimate, bore no
proportioning proportion to the area of the place, if compared
with European towns, as indeed we may infer from the
nature of the houfes. The river-water, although somewhat
brackifh, is constantly used for drink; and Adams does not
believe that there were any wells at Tombuctoo. The
natives have no larger boats or velifs than canoes, of about
ten feet in length, made very inartificially. Of the natural
productions, vegetable and animal, we will specify a few.
The principal fruits are cocoa-nuts, dates, figs, pine-apples,
and sweet fruit of the peach kind: the, vegetables are, carrots,
turnips, sweet potatoes, negro-beans, and small cabbages:
the grain consists chiefly of rice and guinea-corn, and the
cultivation of the land is performed solely with a kind of
hoe, the only implement of husbandry that Adams observed.
The animals are elephants, cows, goats, buffaloes, camels, dro-
madedogs, dogs, antelopes, rabbits, and a creature called
beirte, resembling a very small camel, and used only for riding.
Besides these, there is, in the vicinity of Tombuctoo, a molt
extraordinary animal named courson, somewhat resembling a
very large dog, but having an opening or hollow on its back
like a pocket, in which it carries its prey. It has short
pointed ears and a short tail. It's skin is of an uniform reddif-
h brown on its back, like a fox, but its belly is of a light-
grey colour. It will ascend trees with great agility, and
gather cocoa-nuts, which Adams supposfs to be a part of its
food. But it also devours goats and even young children,
and the negroes were greatly afraid of it. Its cry is like
that of an owl. The natives of Tombuctoo are a stout
healthy race, and are seldom sick, although they expose
themselves by lying out in the sun at mid-day, when the
heat is almost insupportable to a white man. It is the
universal practice of both sexes to grease themselves all over
with butter produced from goats' milk, which makes the
skin smooth, and gives it a shining appearance. This is
usually renewed every day: when neglected, the skin becomes
rough, greyish, and extremely ugly. They usually sleep
under cover at night; but sometimes, in the hottest weather,
they will lie exposed to the night-air with little or no cover-
ing, notwithstanding that the fog which rises from the river
defends like dew, and, in fact, at that season, supphes the
want of rain.

All the males of Tombuctoo have an incision on their
faces, from the top of the forehead down to the nofe, from
which proceed other lateral incisions over the eyes-brows,
into all of which is inferted a blue dye, produced from a
kind of ore which is found in the neighbouring mountains.
The women have also incisions on their faces, but in a dif-

f

ferent
ferent fashion; the lines being from two to five in number, cut on each cheek-bone, from the temple straight downwards: they are also stained with blue. These incisions being made on the faces of both sexes when they are about twelve months old, the dyeing material which is injected in them becomes scarcely visible as they grow up. The ornaments of the natives are similar to those which are generally found among savage tribes. It does not appear that they hold any public exercise of religion, or have any house of worship, or ever meet to pray, though some ceremony, seemingly religious, was observed at the burial of the dead; but Adams was probably not a very accurate inquirer into these matters. Park describes the natives of Soudan as paying a prayer on the appearance of the new moon; and if the religious observances of these people were so rare of occurrence, it is not surprising that they escaped the seaman's notice.

Adams says that he saw no shops at Tombuctoo. The articles bought for sale, which consisted chiefly of tobacco, tar, gunpowder, blue nankeens, blankets, earthen jars, and some filks, are obtained from the Moors, and remain in the king's house until disposed of. The only other objects of trade seemed to be slaves. Gunpowder appeared to be more valuable than gold, since a greater weight of the former was given in a barter of the two articles. The exports of this people were chiefly gold-dust, ivory, gum, cowries, offrith-feathers, and goat-ikins, the latter stained red and yellow. Slaves were procured by purchase, and also by predatory incursions into neighbouring states. The king of Tombuctoo seemed to be despotic; but the government was mildly exercised; he and his wife were old and grey-headed; blue nankeen, adorned with gold lace, formed the usual dress of both; and the queen was accustomed to sit and look at Adams and Stevens for hours together. The palace confided simply of eight or ten small rooms on a ground-floor, not even white-washed, and built of clay and grays. To the surprise of the African committee, Adams did not recollect to have heard there of the Joliba river, a subject of such interesting research: but we should consider that the same river would probably pass under different appellations in the territories of different states. The name of La Mar Zarah closely corresponds with that of the Zayr, or Congo river, presupposed by Park to be the termination of the Niger in the Atlantic ocean; but the distance from Tombuctoo to that mouth renders it highly improbable that the river should preserve its name throughout. It should be added, also, that the Tombuctoo river is supposed to fall into the Niger at twelve miles distance from that town; yet the breadth ascribed to it by Adams will not allow us to consider it as a merely submersive stream. The editor draws two simple conclusions from this information relative to Tombuctoo; the one, he says, propitious, and the other adverse to the progress of discovery and civilization. viz. the "mild and tractable manners of the Pagan Negroes of Soudan, and their friendly deportment towards strangers," on the one hand;—and on the other, the "extended and baneful range of that original feature of African society—Slavery."

TOME, a small island near the west coast of France. N. lat. $43^\circ$ 50'; W. long. $3^\circ$ 24'.

TOME, τόμη, a bound book or writing that makes a volume.

TOMEION, formed from τόμην, fēlīon, a general name used to express any sharp or cutting instrument, used either in surgery or in the mechanic arts.

TOMELLOSO, in Geography, a town of Spain, in New Castile; 58 miles S.E. of Toledo.

TOMENTOSE LEAF, among Botanists. See LEAF:

TOMENTUM, properly signifies flocks or locks of wool, but by botanists is used for that soft downy matter which grows on the leaves of some plants, hence denominated tomentose; as verbusum tomentum, cardus tomentosus, &c.

TOMENTUM CEREBRI, in Anatomy, the flocculent internal surface of the pia mater, with its waving productions belonging to the intervals of the convolutions. The vessels, which enter the cerebral substanse, give to the whole a completely villous appearance: it is felt when the vessels have been injected, and the membrane floats in water.

TOMEPENDA, in Geography, a town of South America, in the audience of Quito; 5 miles S.E. of Jaen de Bracamoros.

TOMERIT, a mountain of European Turkey, in Albania; 12 miles E. of Dulcigno.

TOMEROS, in Ancient Geography, a river of Asia, in Carmania. Arrian.

TOMERUS, a river of India, W. of the Indus and Arabus, so named by Nearcirus. It had its source towards 27° 20' of lat. traversed the country of the Orites, and discharged itself into the sea about 25° lat.

TOMÉSOBI, in Geography, a lake of Lower Canada, whence issues the branch of the river St. Francis, on the borders of Vermont.

TOMEX, in Botany, from tomentum, woolly down, alluding to the pubescence of the plant. The original Tomer of Linnaeus proving a Calliarpa, see that article, sp. 3. Thunberg transferred the name to a new Japanese genus, with which it now remains. Such adaptations of different names are not entirely to be commended, and yet we cannot but think them more allowable than the too frequent practice of Linnaeus, of applying ancient Greek or Latin ones to new genera, avowedly different from the original plants, though the latter could not be ascertained. —Thnub. Jap, 10. Nov. Gen. 65. Schreb. 315. Willd. Sp. Pl. v. 2. 839. Mart. Mill. Dict. v. 4. Juff. 440. Poiret in Lamarck Dict. v. 7. 696.—This genus is famed with Tetranthera.—see that article.

TOMI, in Ancient Geography, a town of Lower Media, towards the mouth of the Danube, near the Euxine sea. This town was considerable, and was the place of Ovid's exile. It was the metropolis of Pontic Scythia. According to this poet, in his third book of Tristes, this city was founded by a colony sent thither from Miletus. Tomi was declared the metropolis of Scythia under the emperor Theodosius, and it was the seat of the bishop of that country.

TOMIAS, τομέας, in Antiquity, an appellation given to the sacrificers offered at the ratification of solemn leagues. It was so called because they cut out the testicles of the victim, and took the oath flanking upon them.

TOMIDA, in Geography, a town of Japan, in the island of Nippon; 5 miles S.S.W. of Quano.

TOMIN, in our Old Writers, a weight of twelve grains, used by goldsmiths and jewellers.

TOMINA, in Geography, a government of Peru, in the vicerealty of Buenos Ayres, and archbishopric of La Plata, which begins about sixteen leagues south-east from the city of La Plata. The climate here is hot, and consequently its productions are such as are common to hot countries. Some parts have vineyards, and in others are made considerable quantities of sugar. It also abounds in cattle and sheep. Its extent in some parts is near forty leagues. The vicinity of some free Indians is a continual uneasiness to the towns in this jurisdiction, and even to the city.
city of Plata itself, as they have often attempted to surprize
it. Tomina, the chief town, is situated 60 miles E.N.E.
of La Plata. S. lat. 15° 10'. W. long. 65° 46'.

TOMINE, in Commerce, a weight for gold and silver
in Spain. Gold is weighed by the Castilian mark of 50
castellanos, 400 tomines, or 4800 grains. Silver is weighed
by the same mark, but it is divided into 8 ounces, 64 ochovas,
128 adarnes, 384 tomines, or 4688 grains. The Castilian
mark weighs 3557 English troy grains; hence 144 such
marks correspond nearly to 89 lbs. English troy weight; and,
and, hence 96 Castilian ounces = 89 troy ounces.

TOMINEIO, in Ornithology, a name by which some
authors have called the guaimumbi, or humming-bird, the
smallest of all birds.

The name seems derived from the Spanish tomine, a
grain weight, as if they would call it a bird of a grain
weight.

TOMINY, in Geography, a town on the east coast of
the island of Celebes, in a bay to which it gives name. S. lat.
8° 45'.

TOMINY BAY. See GUNONG-TELU.

TOMISA, in Ancient Geography, a small country of
Afia Minor, which separated Cappadocia from Mount
Taurus.—Also, a town of Afia, upon the eastern bank of
the Euphrates.

TOMISUM, or TOMISUS, a town of Afia, in Greater
Armenia, in the country named Sophene. Strabo.

TOMKIN and TOMPSON. See TAMPTON.

TOMKINS, THOMAS, in Biography, a disciple of Bird,
M. B. and gentleman of his majesty's chapel (James L.)
was an excellent musician. He published songs of three,
four, five, and six parts, without a date. But it appears
by a copy of these songs in the library of Christ-church
college, Oxon. that they were published in 1622.

There are two very curious compositions by Tomkins
in the 3d vol. of Dr. Tudway's "Collection of Cathedral
Music," in the British Museum: the one is a full anthem,
in twelve parts; and the other an anthem in canon through-
out, of four parts in one, both well worthy the discourse
of the admirable Bird. Indeed, by the compositions we have
scored, or examined in score, of Tomkins, he seems to us
to have had more force and facility than Morley. In
his songs there are melody and accent, as well as pure harmony
and ingenious contrivance.

Thomas Tomkins, the father of Bird's disciple, was
chantor of the choir at Gloucester, whose family produced
more able musicians, during the 16th and 17th centuries,
and on which other which England can boast. Thomas, the
younger, had several brothers, musicians, &c. who distin-
guished themselves both in composition and performance;
among whom was Giles Tomkins, according to Anthony
Wood, a most excellent organist of the cathedral at Sal-
lishbury; John Tomkins, organist of St. Paul's cathedral,
and afterwards gentleman of the chapel-royal; and
Nicholas Tomkins, one of the gentlemen of the privy-
chamber to Charles I. Thomas, the subject of the present
article, the disciple of Bird, and bachelor of music, was
afterwards organist of the cathedral of Worcester, gentle-
man of his majesty's chapel, and, at length, organist.
Though he contributed to the "Triumphs of Oriana" in
the reign of queen Elizabeth, he was living after the break-
ning out of the grand rebellion, about which time he pub-
lished a work in ten books, or separate parts, entitled
"Musica Deo sacra et Ecclesiae Anglicanae," consisting
of anthems, hymns, and other compositions fitted to the
church-service. The copy of these compositions, in Christ-
church college, Oxford, is dated 1664. If this was not a
second edition, it is probable that his son was either the
author, or at least the editor of the work. By a copy of
his songs, in the same collection, that have been laid above
to be of uncertain date, they appear to have been printed
in 1622.

Butler, in his "Principles of Music," published 1636,
spoking of the Lydian mood of the ancients, which he seems
to have perused himself he underwood, says, "of this mood
is that passionate lamentation of the musical kind; for
the death of his son Absalom, composed in five parts by
Mr. Thomas Tomkins, now organist of his majesty's chapel;
the melodious harmony of which, when I heard it in the
music-school (Oxon.), whether I should more admire the
sweet well-governed voices, with consonant insuffurments,
of the fingers, or the exquisite invention, wit, and art of the
composer, it was hard to determine." And he calls Mr.
Thomas and Mr. J. Tomkins aureum par Musicorum.

A set of his vocal church music, in four and five parts.
MS. is lodged in Magdalen college, and a printed copy in
Chrift-church, Oxford. The manuscript copy was pre-
fented to Magdalen college by James Clifford, who, in
1663, published a collection of the words, with the names
of the composers of such services and anthems as continued
to be sung in our cathedrals. To this book Ant. Wood
and others frequently refer in speaking of our choral
music.

Besides the compositions by Tomkins, mentioned above,
in the collection made for lord Harley, British Museum,
there are likewise sever al very learned and curious com-
positions by this author; particularly full anthems in eight,
ten, and twelve real parts, fugato. About this time there
was a rage for multiplying parts in musical compositions
all over Europe; and Herculean labours of this kind,
achieved by Tallis, Bird, Benevoli, and others, have been
already mentioned.

TOMLINSON's RUN, in Geography, a river of Vir-
inia, which runs into the Ohio, N. lat. 40° 29'. W. long.
80° 41'.

TOMMASI, GIUSEPPE-MARIA, in Biography, a learned
archbishop, was born at Alicata, in Sicily, in 1649, and at
the age of fifteen entered among the Theatines at Pa-
lermo. He finished his studies at Rome, where he de-

tved himself to ecclesiastical literature, and from the
author of his kind of life, and the frequency of his
devotional exercises, he was regarded as a model of the
religious character. In order to the more successful pro-

cution of his favourite studies, he obtained access to the
principal libraries at Rome, and in 1660 he published his
"Codices Sacramentorum nongentis annis vetustiores,"
4to. dedicated to Chriftina, queen of Sweden. This was
followed by some other works, and particularly, in 1688,
by his "Sacrorum Bibliorium Tituli, &c." 4to. in which
he directed his attention to the ancient mode of dividing
the Bible. Indefatigably employed in the kind of study to
which he was addicted, he published several works in Latin
and Italian, chiefly on subjects of religious worship. In
consequence of these labours, Clement XI. raised him to
the dignity of cardinal in 1712, against his own inclination;
but though his revenue was thus increased, he retained his
former mode of life, and devoted the residue of his income
to the benefit of the needy. He was a regular preacher, a
diligent instructor of the poor, and a zealous promoter of
a general reformation of manners in Rome. But death
prevented the full execution of his laudable purposes in
1713, in his 64th year. The sanctity of his life procured
for

Vol. XXXVI.
for him the title of "Venerable." A collection of his works was published at Rome in 7 vols. 4to. from 1747-54. Moreri.

TOMMASINI, Jacopo Filippo, a learned ecclesiastic, was born of a noble family at Padua, in 1597, and having entered into the congregation of St. George in Alga, he was made a doctor in theology, and advanced to the first offices in his order. In 1642 he was nominated by pope Urban VIII. to the see of Citta-Nuova, in Italy, where he died in 1654. His writings were numerous; but one of the most interesting was his "Petrarcha Redivivus," 4to. 1635 and 1650, and the "Life of Petrarch." His works are distinguished by the researches of the learned and industrious author into the antiquities and literature of Padua, Moreri.

TOMMOND, in Commerce, a measure for rice at Betefagui, or Betefacekee, in Arabia. It contains 40 kellas, and weighs 168lbs. avoirdupois.

TOMOY, in Geography, an island in the East Indian seas, about two miles in circumference, shaped like a horsetoe; subject to the sultan of Bachan. S. lat. 0° 15'. E. long. 127° 4'.

TOMOLI, in Commerce, a corn-measure at Naples, and other parts of Italy; a carvo contains 36 tomoli; and a tomolo of wheat weighs about 45 rotolli; 69 tomoli = 100 English bushels nearly.

TOM-OTHLE, in Geography, a town of United America, in Tenneffee; 20 miles S. of Tellico.

TOMOTIOCA, a word used by some authors to express the Caffarian faction.

TOMOU, in Modern History, the name of a head-dress which the women wear at Otaheite, consisting of human hair plaited in threads, scarcely thicker than sewing silk, some of which are above a mile in length, without a knot. Hawkesworth's Voy. vol. ii. p. 193.

TOMPEQUE, in Geography, a town of Mexico, in the province of Guatleca.

TOMPKINS, a post-township of New York, in the S.W. extremity of Delaware county, 100 miles from Albany; bounded on the N.W. by Mahoville, N.E. by Waton, S.E. by Hancock, W. by Broome county, and a small angle on the lake of Pennsylvania. The river Delaware traverses it centrally to the W. line, where it bends southward, and forms about half the western boundary. The land is broken by hills and valleys. This town was erected in 1806, from Waton, and called Pinefield till 1808, when it received its present name, in honour of governor Tompkins of this state. In 1810, the whole population was 896, with 153 families, 48 venatorial electors, 118 taxable inhabitants, and an aggregate of real and personal property, amounting to 43,405 dollars.

TOMSONSTOWN, a town of Pennsylvania; 22 miles from Lewistown.

TOM-TUN, a town of Corea, on the river Tounen; 633 miles E.N.E. of Peking. N. lat. 42° 52'. E. long. 129° 35'.

TOMS CREEK, a river of New Jersey, which runs between Dover and Shrewsbury.

TOMSEH, a town of Asiatic Turkey, in the province of Diarbeirik, on the Ephrathas; 70 miles W. of Diarbeirik.

TOM-SHOT POINT, a cape on the coast of Africa. N. lat. 4° 40'. E. long. 7° 40'.

TOMSK, a town of Russia, in the government of Tobolsk, on the Tom. The foundation of Tomsk was laid in the reign of the czar Feodor Ivanowitx, who built an oftrob on this spot; and this happened about twenty years before the building of the town of Kuznetsk. Several nations of these countries having been reduced by force of arms, and others voluntarily submitted to the Russians, the olrog was, by degrees, converted into a fort, and the fort in time increased to a town; which at present contains above 2000 houses within its circuit. The number of inhabitants is said to be about 8000. It was at first next to Tobolsk, the second principal city in Siberia, and continued so for some years. On the highest part of the town stands a small wooden castle, defended by fourteen pieces of cannon; and in it are a cathedral built of wood, the woiwode's house, the governor's chancellery, and an arsenal. Near the fort stand several private houses and a church. The lower part of the town is the most populous. This town is extremely well situated for commerce, and the inhabitants carry on a considerable trade. It lies in the road from Enfewick, and all the towns in the eastern and northern parts of Siberia; so that all caravans going to and from China pass through this town, besides a caravan or two going from the country of the Kalmucks. Here are, indeed, all kinds of tradesmen and artificers; but they are extremely indolent and shiftful; 540 miles E. of Tobolof. N. lat. 56° 30'. E. long. 85° 14'.

TOMSKIAN TARTARS, are Tartars who dwell on both sides of the river Tom, above and below the city of Tomsk. According to the census of 1760, they were only taxed at 450 miles.

TOMSOZOV, a town of Russia, in the government of Kolivan; 80 miles E.S.E. of Kolivan.

TOMU, a sea-port of Japan, on the south coast of the island of Niphon; 115 miles S.W. of Mosco.

TON, in Commerce, a weight in England containing 20 hundreds. (See Weight.)—Also, a measure of capacity. See Measure and Tun.

Ton, with regard to a ship. See Tonnage.

Ton, or Ton-chon, in Geography, a city of China, of the second rank, in Yun-nan; 1150 miles S.W. of Peking. N. lat. 26° 50'. E. long. 100° 23'.

TONABA, in Botany, Joff. Gen. 262, is merely altered from Aublet's Taonabo; see that article and Territorium. Joffe, p. 451, points out the Arbor, n. 3, or Scarlet-feed, Brownie's Jamaica, 368. 1. 20. f. 3, as of the same genus.

TONAGAYON BAY, in Geography, a bay in lake Ontario, near the e. end of Amherst island.

TONAL, a mountain of the Tyrol; 28 miles N.W. of Trent.

TONAY, a town of Japan, on the coast of Niphon; 135 miles N.W. of Jedo.

TONAWALD, a town of Bohemia, in the circle of Boleflau; 10 miles N.E. of Turnau.

TONCAT, or Tunat, or Tangut, a town of Turkestan, near the river Sirr. Before the time of Jenghis Khan, it was included with a wall, and had a castle for its defence, with a palace for the prince. It was the nursery of many learned men, and called Dar al Ilm, that is, the Palace of the Sciences, on account of its academy. It was a place so charming, that it became a saying, "that God never made a more delicious dwelling than at Toncat." Jenghis Khan held a general diet here in 1224, which was so numerous, that its plain, though twenty miles in length, was scarcely able to contain the great mass of people who were assembled on the occasion; 250 miles N.E. of Samarend. N. lat. 43° 10'. E. long. 64° 15'.

TONCHONG, a town of Thibet; 192 miles S.E. of Lassa.

TONGABY, in Ancient Geography, a town of Asia, in the interior of Media. Ptol.
TONDELO, in Geography, a river of Mexico, which runs into the bay of Campeachy.

TONDEMANAR, a town on the N. coast of Ceylon; 12 miles N. of Jaffnapatan.

TONDEN, a town of Denmark, in the duchy of Sleswick, and next to Sleswick one of the most ancient in the duchy; it is well built, though not very large, and the inhabitants carry on a considerable trade in corn, cattle, and fine lace. The old palace was formerly fortified, but is now dismantled and in ruins; 22 miles S. of Ripen. N. lat. 54° 59'. E. long. 8° 50'.

TONDERS, in Ancient Geography, a river of Asia, in the environs of Aria, between the rivers Indus and Arabis or Arbis; called Tuberon by Mela, and Torners by Arrian.

TONDIN, or Tandino, in Architecture. See TONE.

TONDINGA-MATOOR, in Geography, a town of Hindooftan, in the circle of Rajamundry; 48 miles E. of Rajamundry.

TONDIVANUM, a town of Hindooftan, in the Carnatic; 15 miles S. of Wandiwash.

TONDOLY, a town on the W. coast of the island of Ceylon. N. lat. 6° 57'. E. long. 120° 27'.

TONDORN, a town of Germany, in the territory of Erfurt; 9 miles S.E. of Erfurt.—Allo, a town of Bohemia, in the circle of Königgratz; 9 miles W. of Branau.

TONDOW, a town of Bootan; 25 miles S. of Taffalufton.

TONDRAVY, one of the Shetland islands, about six miles in circumference, near the W. coast of Shetland. N. lat. 60° 9'. W. long. 1° 30'.

TONDY, a town of Hindooftan, in Marawar, on the sea-coast; 33 miles S.S.E. of Trumian. N. lat. 9° 42'. E. long. 79° 2'.

TONE, a river of England, which rises about six miles N. from Wivelcombe, pales by Taunton, and runs into the Parret, between Langford and Bridgewater.

Tone, or Tunes, in Music, a property of found, by which it comes under the regulation of grave and acutæ; or, the degree of acuteness or found has, from the degree of swiftness of the vibrations of the parts of the sonorous body.

For the cause, measure, degree, difference, &c. of tones, see TUNE.

The variety of tones in human voices arises partly from the dimensions of the wind-pipe, which, like a flute, the longer and narrower it is, the thinner the tone it gives; but principally from the head of the larynx, or knot of the throat; the tone of the voice being more or less grave, as the rima, or cleft of it, is more or less open.

The word tone is taken in four different senses among the ancients: 1. For any found. 2. For a certain interval, as when it is said the difference between the diapason and disdiapharon is a tone. 3. For a certain locus or compass of the voice; in which sense they use the Dorian, Phrygian, Lydian tones. 4. For tenfion, as when they speak of an acute, grave, or a middle tone. Wallis's Append. Ptolem. Harm. p. 172.

The word tone has many different applications. In the first place, a tone, distinguished from a semitone, is the characteristic of the diatonic genus, which entirely consists of tones and semitones. Of the tones there are two kinds; major and minor. The tone major is in the ratio of 8 to 9, which results from the diapason between the 4th and 5th: the tone minor is in the ratio of 9 to 10, and results from the difference between the minor 3d and the 4th.

The generation of the tone major and that of the tone minor is equally found at the second 5th D, beginning from C.

C: for the quantity by which this D surpasses the octave of the first C, is precisely in the ratio of 8 to 9; and that by which this fame D is surpassed by E, major 3d to the octave C, is in the ratio of 9 to 10.

2dly. Tone is used in France for the English word pitch, or degree of elevation of the whole scale; as ton d'songe, cathedral pitch; ton de l'opéra, opera pitch, concert pitch, Roman pitch, &c. At present, concert pitch is nearly the same every where in England, except in our churches, when all our old organs are nearly half a note above concert pitch. The Roman pitch used to be very low; and in organs, a high pitch saves metal. A low pitch in an orchestra may save fiddle-strings, and give ease and courage to singers fearful of high notes.

The tone of an instrument is good, bad, even, or unequal.

The tone of a voice is sweet or harsh, of a good or bad quality.

To speak with a tone, is a canting kind of speech, more resembling bad fingering than good speaking.

Tone of colour, in painting, is a metaphorical expression taken from music; as clair obscure, light and shade, in music, is from painting.

The French desirer an intelligent well-bred person, who has kept good company, by a metaphor from the key in music: when they say that he or she has le ton de la bonne conversation.

Tone, in Physiology, a term used without any very definite meaning, generally to express the free in which the functions are healthily performed. Tonic power is another vague expression, usually applied to those motions of the animal parts which are not obvious to our senses, although sufficiently evinced by their refusals; as nutrition, secretion, the passage of fluids along excretory ducts, &c. See LIFE.

Tone, in Rhetoric, denotes a certain inflexion or modulation of the voice, sometimes called accent, which corresponds to, and expreses the sensations and emotions of the mind. The skill and success of a reader or speaker very much depend on the proper management of these tones. See GESTURE, PRONUNCIATION, AND VOICE.

Tone, Diazeutic. See DIAZEAUTIC.

TONEWANTO, in Geography, a town of New York, on a creek of the same name, which runs into the Niagara river, 15 miles E. from the falls of Niagara.

TONG, a city of China, of the second rank, in Pe-chae-li, situated on the river Pai-ho. The walls are substantially built of brick, and higher than the houses they inclose, which mostly are of wood. The city walls are washed by the river on one side, and defended by a broad wet ditch on the other. In the year 1793, there were no guns upon the ramparts, but a few swivels were placed upright near the gates. The principal streets were straight, paved with broad flag-tiles, with a raised foot-path on each side. An awning across the streets shaded them from the scorching heat of the sun's rays. Many, however, of the labouring people were naked from the waist upwards. Several extensive buildings contained grain of different kinds, of which it was said a provision for several years was always kept in store for the consumption of the capital. Most of the houses had shops or work-rooms in front; and an industry was displayed such as the neighbourhood of Peking was likely to excite. The outside of the shops was painted with a variety of lively colours, as well as gild, with rich engravings before them, and long labels, inviting customers. Among the chief articles exported to sale, were tea, filks, and porcelain, imported from the southward; and furs of different
different kinds, most of which were brought from Tartary. It was a pleasing circumstance to observe, also, among other goods, some English clothes, though, in no considerate quantities; 10 miles E. of Peking. N. lat. 40° 56'. E. long. 11^\circ 20'.—Allo, a city of China, of the second rank, in Kiang-nan, at the mouth of the Yang-tze River; 347 miles S.S.E. of Peking. N. lat. 38°. E. long. 120° 19'.

—Allo, a city of China, of the second rank, in Ho-nan; 490 miles S.S.W. of Peking. N. lat. 32° 48'. E. long. 111° 42'.—Allo, a city of China, of the second rank, in Chen-h, on the River Lo; 447 miles S.W. of Peking. N. lat. 34° 32'. E. long. 109° 30'.—Allo, a river of Benguela, which runs into the Atlantic, S. lat. 14° 25'.

TONGA ISLANDS, a cluster of islands in the South Pacific ocean, consisting of the island of Tonga, which gives name to the whole of the cluster called Hapae, and the island of Vavao. It is a part of the group to which captain Cook gave the name of Friendly islands, but he did not include in his chart Vavao or Vavau, which he did not visit; though this is the largest, and now comparatively the most important of all those belonging to the name Archipelago, which, in his time, were under the fame government, and still speak precisely the same language, and observe the same customs.

An account has been lately published from documents furnished by Mr. William Mariner, four years resident in those islands; 2 vols. 8vo. 1817. See FEEJEE, FRIENDLY HAPAE, TONGATABOO, VAVAU, &c.

TONGATABOO ISLAND, one of the Friendly islands in the South Pacific ocean, first discovered by Tafman, who called it Amsterdam; seen by captain Cook in the year 1773, and visited by him again in 1777. Tongataboo, or Tonga, is about sixty miles in circuit, somewhat oblong, though by much broader at the E. end; and its greatest length from E. to W. The south shore is straight, and consists of coral rocks, eight or ten feet high, terminating perpendicularly, except in some places, where it is interrupted by small sandy beaches; on which, at low water, a range of black rocks may be seen. The west end is not above five or six miles broad, but has a shore somewhat like that of the south side; whereas the whole north side is environed with shoals and islands, and the shore within them low and sandy. The east side or end is most probably like the south; as the shore begins to assume a rocky appearance towards the north-east point, though not above seven or eight feet high. The island may with the greatest propriety be called a low one, as the trees on the west part, where captain Cook lay at anchor, only appeared; and the only eminent part which can be seen from a ship, is the south-east point; though many gentle rising and declining grounds are observable by one who is afloat. The general appearance of the country is that of great want of fertility. At a distance the surface seems entirely clothed with trees of various sizes; some of which are very large. But above the red, the tall cocoa-palms always raised their tufted heads; and are a very considerable ornament to any country that produces them. The boogo, which is a species of fig, with narrow pointed leaves, is the largest tree of the island. The winds are, for the most part, from some point between south and east; and when moderate, are commonly attended with fine weather. The bays of the island, as far as it could be observed, is entirely a coral rock, which is the only fort that presents itself on the shore. Of cultivated fruits, the principal are plantains, of which they have fifteen different sorts or varieties; bread-fruit; two sorts of fruit found at Otaheite, and known there under the name of jambu and eceewe; the latter a kind of plum; and a vast number of thadocks, which however are found as often in a natural state as plaited.

The roots are yams, of which are two sorts; one black, and so large that it often weighs twenty or thirty pounds; the other white and long, seldom weighing a pound; a large root, called kappe; one not unlike our white potatoes, called mawhaha; the talo, or coccos of other places; and another named jejee. Besides great numbers of cocoa-nut trees, there are three other sorts of palms, two of which are very scarce. The only quadrupeds, besides hogs, are a few rats, and some dogs, which are not natives of the place, but produced from some left by captain Cook in the year 1773, and by others got from Feejee. Fowls, which are of a large breed, are domesticated here. Amongst the birds are parrots, somewhat smaller than the common grey ones, of an indifferent green on the back and wings, the tail blueish, and the rest of a footy or chocolate brown; parroquets not larger than a parrow, of a fine yellowish-green, with bright azure on the crown of the head, and the throat and belly red; besides another sort as large as a dove, with a blue crown and thighs, the throat and under part of the head crimson, as also part of the belly, and the reft a beautiful green; owls, cuckoos, king-fihers; and a bird of the thrush kind. The other hand birds are rails, fly-catchers, and three sorts of pigeons. Of water-fowl, and such as frequent the sea, are ducks, blue and white herons, tropic birds, noddy, and white terns. The only noxious or disgusting animals of the reptile or insect tribe are sea-snakes, scorpions, and centipedes. The insects amount to about fifty different sorts. The sea abounds with fish, though the variety is less than might be expected. The most common sorts are mullets, several sorts of parrot-fish, silver-fish, and alibores; some sharks, rays, pipe-fish, a sort of pike, and some curious devil-fish. The many reefs and shoals on the north side of the island, afford shelter for an endless variety of shell-fish; amongst which are many that are esteemed precious in Europe, such as the hammer-oyler, of which, however, none could be obtained entire; a large indented oyler and several others, but none of the common sort; pumosas, cones; a sort of gigantic cockle; found also in the East Indies; pearl-shell oylers, and many others. There are likewise several sorts of sea-eggs, and many fine flat-fish, besides a considerable variety of corals, amongst which are two red sorts, the one most elegantly branched, the other tubulous. And there is no less variety among the crabs and cray-fish, which are very numerous. To which may be added, several sorts of the sponge, the sea-hare, and the like. See TONGA. S. lat. 21° 56'. E. long. 185° 14'. Cook's Third Voyage, vol. i.

TONGATORE, a town of Hindooftan, in Golconda; 30 miles S.E. of Hyderabad.

TONGBLOW, a town of Burmah; 12 miles from Ravanongong.

TONGE, Nieuwe, a town of Holland, in the island of Overflakke; 3 miles S. of Sommerdyck.

TONGE, Oude, a town of Holland, in the island of Overflakke; 4 miles S.E. of Sommerdyck.

TONGELREP, a river of Brabant, which runs into the Dommel, near Eyndhoven.

TONGEREN, or TONGRES, a town of France, in the department of the Lower Meffe, late in the biciphoric of Liege. This town is ancient, and was formerly governed by dukes. The collegiate church of Tongres is very ancient; they say it was the first on this side the Alps, built by St. Materne, who was sent by St. Peter to preach the gospel in Lower Germany, and became the first bishop of Tongres; which was erected into a diocese. It has three parih churches, and several religious houses. The French, in the year 1677, committed a thousand sacrileges and informations.
lencies, without regard to age or sex, and set fire to the town-houses, the churches, several convents, and above 600 houses: and their fury was again repeated, under a pretence that the inhabitants had refused their contributions, and affrighted the troops of the allies; 9 miles N.N.W. of Peking.

TONGERLoo, a town of France, in the department of the Dyé; 9 miles N. of Aerchet.—Also, a river of France, which runs into the Meufe, 3 miles below Maesyck.

—Also, a town of France, in the department of the Lower Meufe; 4 miles N.W. of Stockem.

TONG-GIN, a city of China, of the first rank, in Kocie-choou, on the borders of Houquang. In the environs are gold and copper mines; 850 miles S.S.W. of Peking. N. lat. 27° 39'. E. long. 108° 27'.

TONGHO, a town of Birma, and capital of a province, strongly fortified. Here are manufactures of cotton cloth, and the environs produce the best beetle in the empire.

TONGKeeL, one of the Sooloo isalands. N. lat. 6° 2'. E. long. 121° 50'.

TONG-KIN-TSIN-FOU, a town of Corea; 48 miles W.S.W. of King-ki-tao.

TONG-LAI, a town of Corea; 70 miles S. of Koang-choeou.

TONG-LAN, a town of China, of the second rank, in Quang-fi; 1077 miles S.S.W. of Peking. N. lat. 24° 27'. E. long. 106° 26'.

TONGI-PATCHI, a town of Thibet; 30 miles N. of Oramtchi Hotun.

TONGOLORE, a town of Hindoostan, in the Carnatic; 10 miles S. of Ongole.

TONGOY, a river of Chili, which runs into the Pacific ocean, S. lat. 30° 10'.

TONG-PIN, a city of China, of the second rank, in Chan-tong, on the river Ta-tsin; 190 miles S. of Peking. N. lat. 36° 6'. E. long. 115° 56'.

TONGPOTRA, a town of Pegu; 50 miles S. of Lundley.

TONG-TCHANG, a city of China, of the first rank, in Chan-tong, on the grand canal; 212 miles S. of Peking. N. lat. 34° 24'. E. long. 115° 40'.

TONG-TCHOUEN, a city of China, of the second rank, in Se-tchuen; 720 miles S.W. of Peking. N. lat. 31° 6'. E. long. 114° 44'.—Also, a city of China, of the first rank, in Se-tchuen. This city is strongly fortified, and is called a military city, because the inhabitants are all foldiers; the profession defending from father to son. Besides their pay, they have the lands which surrounds the city. These troops are disbanded in time of peace, and to make them amends, they are placed in all the garrisons that are in the frontiers of the empire; 1000 miles S.W. of Peking. N. lat. 26° 20'. E. long. 103° 2'.

TONG-TCHUEN, a town of Corea; 85 miles E.N.E. of King-ki-tao.

TONG-TIN-HOU, a lake of China, in the province of Hou-ouang, more than 80 leagues in circumference.

TONG TREE, in Rural Economy, a term applied to the pole of an ox-cart, or that of a waggon, and perhaps some other sorts of carriages.

TONGUE, Lingua, in Anatomy, an oblong member, whose form and situation are sufficiently known, and whose use is to be the organ of taste, and the principal instrument of speech and deglutition. See Deglutition.

The upper side of the tongue is covered with a papillary nervous substance, over which are spread two membranes. The outer of these membranes is pretty thick, and full of papillae, of a pyramidal figure, especially towards the tip, which papillae stand pointing towards the root of the tongue in a bending posture, which makes their figure to be concavo-convex. These, apices, or papillae, are so very minute and slender in men, that they make the coat appear on the upper part villous, especially as they approach nearer to the root. The figure of the papilla, in human tongues, is not so plainly discernible to the naked eye as to need the microscope. In brutes they are generally larger, thicker, and more conspicuous; and in some almost cartilaginous, as may be felt in the tongues of cats and oxen, but more feebly in lions. On the upper side, at a little distance from the tip, this membrane becomes thin, smooth, and glibrous, and, as it were, polished by the lower parts of the mouth on which it slides.

Under this lies a thin, soft, reticulated kind of coat, punched through with innumerable holes, and always lined with a thick and white, or yellowish mucus. This membrane is so exceedingly tender, and full of mucus, that it is not to be examined by the naked eye, unless boiled; by which it grows tough, and easily separable from the external membrane, and from the nervous part of the tongue, which lies immediately under it. After boiling, it appears like a kind of gauze, between whose threads innumerable holes appear, through which the apices of the papillary body underneath it are exerted. This membrane on the upper side, next the outward, appears white, with a cast towards yellow, but is black on the side next the tongue.

Many authors do not allow this to be a membrane, and will only have it to be a mucus hardened by boiling; but since it has so much of the resemblance of a membrane, and that authors agree in allowing two membranes to the tongue, Dr. Drake does not scruple to number it among them, since there does not appear to be any other second membrane; reckoning, with Malpighi, the smooth part under the tongue a part of the outer membrane; some, however, have considered it as a continuation of a different membrane, which covers that of a papillary texture.

Immediately under this appears a nervous papillary body, spreading itself to a moderate thickenss over the whole surface of the tongue. This body, on the under side, is every where level and smooth, except in some few places, where it is connected to the subjacent mucous part from some nervous twigs which it sends into it. Malpighi distinguishes the papilla, which make the principal part hereof, into three kinds, from their different magnitudes and figures when observed with the microscope; of which three, lying on the sides and tip are very singular, resembling little round pyramids, with globes on their tips like the horns of snails. All these papillae, which are the immediate organs of tasting, send their apices, or extremities, through the mucous membrane into the pyramidal papilla of the outer membrane, which are hollow to receive them, and seem to be nothing else but a kind of caves to defend these nervous papillae from injuries, which the farts and aperities of those bodies which we might take into our mouths might do them. See Tasting.

However necessary an organ the tongue be in speech, &c. yet infallacies have occurred, in which persons, who have lost their tongues, have spoken distinctly.

Another occurs in Lambert's Memoirs, and another in the Memoirs of the Academy of Sciences.

To the infallacies briefly mentioned above, we may add the following account of a man at Montagu, in the Bas Poitou, who being seïted with the small-pox in his fifth or
or fith year, loft his whole tongue by gangrene, or putrefaction; yet, notwithstanding, performed in perfection the five actions belonging to the tongue, viz. speaking, talking, spitting, chewing, and swallowing; nature having, with infinite artifice, given a new conformation to the mouth, proper to supply the want of the lost organ. See Jac. Rollandi Agglotomographia, five Descriptionis Oris fine Lingua quod perfecte loquitur et rhinias suas Functiones naturaliter exercet; first published in French at Saumur, in 1636, translated into Latin by Car. Ruwygerus, and published in the Ephem. German. D. an. 3.

For speech, instead of the ordinary provision, the little fleshly part of the tongue remaining was inflamed in the middle towards the palate, the teeth inverted, and long inwards, the mucous buccinatores easily contracting between the dents molares. In fine, there was a disposition in all the organs to produce speech without a tongue; for the breath lifting at the oval aperture of the larynx, was farther broken, and rendered vocal by the inflation of the fleshly body, the motion of the lips, the retraction of the buccinatores, the tremulous agitation of the uvula, and the retraction of the lower jaw. Lastly, by the inversion of the teeth, the depression of the palate, the abundance of saliva, and the capacity of the mouth, the sound was still farther modified and determined, so as to render it articulate. Habit, too, and the repeated attempts to speak at an age when the parts were easily flexible, had contributed greatly to the distinctness of it.

For talking, it is evident from this, as well as other considerations, that the tongue is not the only organ of it, but that the palate is also a part of this sense. For chewing, the office of turning the meat in the mouth was here performed by the lips and cheeks, the mucous of which repelled towards the maxillares such parts as in mastication might fall from one side to the other. For the first morfel he took, he could only chew on that side into which he put it with his hand; the second he put in like manner on the other side, and thus varied and supplied each alternately. For swallowing, the gravity of the food contributed something to this, which he farther promoted by stretching out his neck, inclining his head, and drawing back the buccinatoris within his teeth; all which were seceded by the mouth and fauces being well moistened with plenty of saliva.

In effect, divers animals, as the tortoise and the crocodile, &c. swallow without any tongue; and fish, though their tongue is fixed immovable to their palate. For spitting, it was performed by the lips, aided by the internal contraction of the mouth, and the retraction of the buccinatores over the grinders.

Rolland's instance was singular at that time, but a parallel one has been since observed in a girl at Lisbon, fifteen years old; of which an account was given, in 1718, to the Royal Academy of Sciences, by M. de Juffieu. Upon inspecting the mouth of this girl, there appeared nothing in all that part ordinarily possessed by the tongue, but a little eminence in form of a papilla, between three and four lines high, in the middle of her mouth, scarcely perceivable by the eye. Upon pressing this with the finger, a kind of motion of contraction and dilatation was perceived in it, which showed, that though the tongue was wanting, the muscles of which it was formed, and which were defined to give it motion, were nevertheless there. With the help of these she spoke as distinctly and easily as if nothing had been wanting: she distinguished tasts like other people. For mastication, it was chiefly effected by the motion of the lower jaw, which she drew nearer to, or farther from, the grinders of the upper, under which the food to be chewed was. In this action she sometimes made use of her fingers, but much more in the action of swallowing, in order to protrude the masticated food towards the orifice of the cesophagus. For drinking, she performed it like other people, excepting the attention she employed to prevent the liquor going down too fast; in order to which she kept her head a little inclined forwards. Lastly, the action of spitting was supplied by the muscles of the papilla, which filled the lower part of her mouth; these rising almost to a level with the teeth of the lower jaw, and the buccinatores approaching towards both jaws, expressed the saliva, and conducted it to the sphincter of the lips, from whence the air, driven with violence from the larynx, served as a vehicle to expel it out of the mouth. Mem. de l'Acad. Scient. ann. 1718, p. 6—16. Juffieu, loc. cit. p. 7, seq.

Dr. Mortimer, from a MS. account of the life of the Rev. Mr. Henry Wharton, chaplain to archbishop Sancroft, informs us, that he was born with two tongues. Phil. Trans. vol. xiv. p. 252.

**TONGUE.**

**Injuries and Disfigure of.** Wounds of the tongue have generally been divided, by writers on Surgery, into longitudinal and transverse. The former rarely happen, and seldom demand any but ordinary treatment. The same may be said of punctured wounds of this organ; cases which are occasionally met with in practice.

The most frequent wounds of the tongue are those which are transverse. They are hardly ever produced by outward means; but usually by the teeth, when the lower jaw is forcibly and forcibly brought against the upper one, while the tongue is out of the mouth, as sometimes happens in epilepsy and falls upon the chin. In this way, transverse wounds of considerable extent frequently happen, almost separating, in some instances, the apex from the body of the tongue. In such cases, the injury may easily be converted into a fort of cleft, which may remain for ever afterwards, and more or less interfere with the functions of the organ. This disagreable consequence is more likely to happen, when no care is taken to keep the opposite sides of the wound in proper contact, and hinder them from becoming distant from each other.

Hence, certain writers on surgery have recommended all wounds of the tongue to be immediately closed with a future; and Richter, though by no means a constant advocate for this method, is candid enough to allow, that it has succeeded in the bell manner, even in cases where the tongue was bitten nearly through. Anfanggr. der Wundartz. b. iii. p. 24.

The application of a future to the tongue being attended with some pain and difficulty, a very simple bandage has been proposed for uniting transverse wounds of this part. (Pibrae, Mem. de l'Acad. de Chirurgie, tom. ix. p. 22—23.) Richter maintains, however, that the invention referred to does not answer expectation. The main portion of it is a little fort of bag, in which the fore part of the tongue is confined. Thus all motions of this organ forwards, or laterally, may be effectually prevented; but the patient is not deprived of the power of drawing it backward, that very action, which has a direct tendency to make the sides of a transverse wound separate from each other. In some cases, indeed, as Richter observes, the apparatus seems rather to do harm. Children, to whom it proves exceedingly irksome, are made reflect at it, so that they keep moving their tongue and jaw about, to the great irritation and disturbance of the wound.

Richter further objects to Pibrae's bandage, that it is decidedly unnecessary; for, such motions of the tongue, as it directly refrains, namely, those forwards or to either side,
TONGUE.

fide, may be hindered by applying a bandage to the jaw, and making the patient refrain from talking and mastication. The same author affirms, that such treatment has answered as well as could be desired, in numerous cases, some of which were large transverse wounds in reflexes and unmanageable children. During the treatment, however, the patient is to be allowed only liquid nourishment, which must be imbibed through a tube.

Perhaps, however, on the whole, the propriety of employing a future must depend entirely on considerations of the following kind. When the transverse wound is deep, and extends quite across the dorsum of the tongue; when it is situated towards the apex, and is conveniently within reach; and when the patient is uncontrollable, and cannot be made to keep the tongue and lower jaw quiet; a future may be advantageous. On the other hand, when the wound is at the back part of the tongue, (a cafe by the bye that is unfrequent,) and a future must be difficult of application; when the wound is trivial, likely to heal of itself, and there is no risk of its occasioning any material cleft in the part; and when the patient is docile, and attentive to the advice given him; the most judicious practice is to apply such a bandage as is recommended for the fractured jaw, and to forbid all motion of the tongue and lower jaw; by speaking, masticating, &c. nothing but liquid food being allowed to be drunk through a tube.

If the wound should be so deep, as almost to separate the anterior part of the tongue from the root of this organ, the remaining connection is not to be divided; but an endeavour made to bring about an union. There are numerous cafes on record, encouraging the practitioner to expect the best consequences from the attempt. Richter's Anfangsgr. der Wundartzn. b. iv. p. 26.

With regard to other circumstances, relating to wounds of the tongue, the treatment of these cafes does not differ from that of wounds in general.

Bleeding from the Tongue.—An hemorrhage from the raninal vesels sometimes follows accidental wounds, and surgical operations on the tongue. When it is an artery that bleeds, the accident may prove dangerous, and even fatal, espeially in children, who by moving the tongue and jaw about, and continually sucking, promote the hemorrhage, and render the adoption of the measure necessary for its suppression extremely difficult. As, in these cafes, a ligature, compression, and styptics, hardly admit of being applied, the bleeding cannot be stopped, without much trouble. Whether the raninal arteries can be tied in the manner suggested below, remains to be proved; but, certainly, they are rather too far out of reach to be tied in the common way. Nor can compression, as ordinarily performed, be trusted, since it operates against soft yielding parts, and not upon any fixed point. Strong styptics, even were they deemed worthy of trial, could not well be employed, since they would be apt to mix with the saliva, and be swallowed. Yet, there are some means, by which the most perilous bleedings of this fort have been stopped. Among the most celebrated of these last methods is the actual cautery, which is preferred by several of the continental surgeons, and may, perhaps, in this solitary instance, seem almost justifiable to British surgeons, averse as they properly are to this barbarous practice.

Another plan is that of directing an assistant to keep a compres on the bleeding vesels, as long as necessary, with his finger; while, with his thumb, he takes care to make counterpressure under the jaw. M. Jourdain stopped a considerable hemorrhage from the raninal vesels, by laying a piece of ice under the tongue. M. Petit was the inventor of an apparatus for stopping such bleedings, which is at once simple, ingenious, and effectual. The surgeon is to get a piece of birch, and cut it through below the place where two branches of equal fize unite. It is to be made to resemble a fort of fork, the prongs of which are to be about eight lines long, and the handle four. It is then to be covered all over with linen, and put under the tongue in such a way, that the end of the handle is to rest against the middle of the concavity of the arch of the jaw, while the prongs embrace the frenum, and compress the bleeding vesels. The middle of a roller is next to be applied to the dorsum of the tongue, as far back as possible; and the ends, after croffing each other under the chin, are to be pinned to the child's night-cap.

If a surgeon were to be averse to these plans, or find them unaually, there is yet one resource left, namely, that of cutting down to, and tying the trunk of the lingual artery, juft where it passes over the coruu of the os hyoïdes.

Hemorrhage from the raninal vesels occasionally arises quite independently of a wound. In one such example, the bleeding proceeded from a varicoles vesel under the tongue, and was effectually stopped with the cautery. See Default's Journ. de Chirurg.

Dangerous Enlargement of the Tongue from Inflammation.—Sometimes when this organ is inflamed, it swells so prodigiously, that it protrudes between the teeth, entirely fills the cavity of the mouth, and obstructions speech, deglutition, and even respiration. In such a cafe, the most prompt affittance is demanded. Ordinary evacuations of blood, and other antiphlogistic measures, here seldom bring relief with sufficient celerity. According to surgical authors, the most certain plan consists in making two longitudinal cuts along the edges of the dorsum of the tongue, from one to two inches in length. A copious bleeding generally follows, which soon brings about a diminution of the swelling. No troublesome consequences are to be apprehended from such incisions, which heal with ease, and scarcely leave any fear behind. De la Malle, Mem. de l'Acad. de Chir. tom. v.

Jourdain succeeded in affording prompt relief, by taking blood from one of the raninal veins. This method seems liable to no objection, except perhaps that of being difficult, when the tongue is enormously swelled. Traitè des Maladies de la Bouche, &c.

In one example, the disease refilled every means until a blister was applied to the throat. Richter's Anfangsgr. band. iv. p. 29.

Some inflammatians of the tongue have been observed to originate from the lodgement of foreign bodies in it, which ought to be extricated; as, for instance, a fish-bone, or a needle. (Jourdain, Traitè des Mal. de la Bouche, &c.) Other cafes have arisen from the injudicious employment of mercury, and the excitement of a fudden and inmoderate salivation. Many examples are connected with violent inflammation of the parts about the throat.

Sometimes inflammatians of the tongue terminate in suppuration. Such absceses rarely admit of being opened, and hardly allow the use of any means, except emollient gargles.

Gases have occurred, in which inflammation of the tongue has induced mortification, and the loss of the greater part of this organ. The treatment of such instances must conform to the general rules delivered in the article Gan-grene.

When, in consequence of any enlargement of the tongue, or other disease in the mouth, the necessary food and medicines are, for a considerable time, prevented from being taken, they may be injected into the stomach through an elas
elastick catheter, which is to be passed through one of the
nostrils into the oesophagus. It has been recommended
to have the outer end of the instrument to turn upward out of
the nostril, and shaped like a funnel, whereby it is suppos
ed fluids might be more conveniently introduced. (Libouton,
Journal of the Medical, tom. xxxiv.) But we do not consider
this any material improvement, since all liquids may be easily
injected with an elastick gum syringe, such as is used for in
jecting hydroceles, without having the external end of the
catheter made in the manner above suggested.

Ucers, Induration, and Tumour of the Tongue.—Ucers
on the tongue, of an exceedingly painful, obliternar, and
malignant looking nature, are sometimes produced by the
sharp or rough edge of a tooth. This mechanical kind of
cause is easily detected on examination with the finger. If
the tooth be found, the projection or roughness must be
filed off; if it be curious, the butt plan is to extract it.
When these objects are accomplished, the fore usually heals
without further trouble.

Some very obstinate ulcers, which originate on the tongue,
and are connected with disorder of the digestive organs, may
be cured by a long perfeverance in the use of the anim. tart.
exhibited alternately in small doses, and then in larger ones,
so as to excite vomiting.

Ulcers, deferring the epithets malignant and cancerous,
not unfrequently form on the tongue. Sometimes the mal-
lady, in its most incipient state, appears as a fore. Some-
times a circumcised moveable, or immovable, ferricous
swelling is fril observable, which gradually becomes pain
ful, and ulcerates. In other instances, there is, in the be
ginning, only an induration in the subftance of the tongue,
without the slightest appearance of any swelling. The
ulcers, under consideration, are always surrounded by hard
ness. They may make their first appearance either at the
edges or at the apex of the tongue. In certain cases, the
whole, or a large portion, of this organ is covered with nu
merous small ferricous tubercles, which gradually fall into
a state of ulceration. These we have seen greatly dimi
nifhed by a gentle course of mercury. All the medicines,
tried in other cases of cancer, may be exhibited in the pre
rent ones; but, on the whole, the timely employment of
the knife merits the most confidence.

However, the following kinds of cafes have yielded to
particular remedies.

A malignant exceedingly painful ulcer on the tongue,
covered with a good deal of inflammatory hardness, has
been cured by the continued internal use of opium. The
dose is to be gradually augmented; patients are flated to
have taken, at eight, eighteen grains in one day.

One species of malignant ulcer yields to the long con
tinued exhibition of tarret emetic. The doses must be in
creased, in proportion to the time which elapses from the
fril taking of the medicine.

Very malicious and unyielding ulcers on the tongue are
found to have been cured by repeatedly applying leeches to
the under surface of this organ. Med. Commen. vol. ii.

It would be inexcezible to pass over in silence such ill
conditioned ulcers of the tongue, as originate during violent
salinations. Sometimes similar ulcers, produced by the fame
cause, take place, at the same time, on the tonsils; and, in
this circumstance, inexperienced surgeons, or mistaken prac
titioners, who are blinded with the fear of syphilis, are very
apt to suppose the fores to be venereal ones. This error
leads to the frer use of mercury: the fores frequently
slough; and the patient's health becoming greatly deranged,
he is thrown into a state of great peril. In this cafe, it is
hardly necessary to observe, that the use of mercury must
be immediately omitted, and the mouth very frequently
washed with a solution of alun.

Violent inflammations, followed by ulcerations of this
fort, are particularly apt to occur, when patients catch
cold, while they are under the influence of mercury.
For the removal of a cancerous portion of the tongue, a
biilory is the best instrument; and the patient's mouth
should be kept open during the operation, by the interpo
sition of something between the teeth. The hemorrhage
is generally what is moft apprehended: but we have instances
related of large portions, and even of the anterior half of
the tongue, being amputated, and of the bleeding being
easily suppressed, either by the actual cautery, or fome of
the ordinary means for the suppression of hemorrhage. It
appears to us, that a tolerably dexterous man might tie the
mouth of an artery in this situation, with the affifance of
two pair of forceps to tighten the ligature, when the noif
has been put over the tenaculum round the bleeding point.
Certainly, cancerous ulcers of the tongue may have ad
vanced to fuch a degree, that an operation cannot be pru
dently undertaken. The bleeding would be a very fero
gious objection; the whole diftempor of the tongue itself might
not be removable; and the contaminated flate of the ad
jacent lymphatic glands below the jaw, usually existing in
this advanced flate of the malady, would, according to re
ceived opinions, render a radical cure quite impracticable.

When the disease is not in the vicinity of the apex of
the tongue, the operator may find it difficult to draw the part
sufficiently forwards, and keep it in this position. In this
circumstance, surgical authors recommend the employment
of a pair of forceps for the purpose, the blades of which are
to be covered with rag. Should this instrument be found
inadequate, they advise the surgeon to use a pair of forceps,
the blades of which terminate in two short double hooks.
As being painful, one should always avoid, if poible, the
employment of fuch an instrument.

Here, as in all other cancerous cafes, it is the duty of the
surgeon to take care that no point, duped of participating
in the disease, be left behind. Unlesfs this maxim
be attended to, the operation will mostly be followed by a
relapse.

Abroad, surgeons have sometimes effected a cure by ap
plying the cautery, notwithstanding the wound after the
operation had put on an unhealthy and fonguous appearance.
(Journ. de Méd. tom. xviii.) In this country, practi
tioners might hope for similar successes from the cautious em
ployment of cautic; for the revival of the cautery, under
any circumstances, is an idea now almost intolerable to every
Britifh practitioner.

After the excision of a difeased portion of the tongue,
local applications cannot be very well used; nor are they
in general neccessary, when the patient moves the part as
little as poible, and avoids putting stimulating food and
liquids into his mouth.

Cancerous portions of the tongue may also be extirpated,
by pafling a double ligature through this organ, and firmly
tying one part of the ligature over each side of it.

This plan must be infinitely more painful, than the re
moval of the difeased part with a knife. To the latter
method, the hemorrhage is the only objection; and, not
withstanding all that has been faid, we think no surgeon
ought to venture to cut away a difeased tongue, without
having firft made up his mind respecting what method should
be adopted for stopping the bleeding.

When much of the tongue has been loft, there certainly
is reason to expect, that its functions will afterwards be
performed in a very imperfect manner. However, there are
are on record several examples, in which the greater part of this organ was lost, and yet the patients retained the faculties of tailing, maculating, swallowing, and articulating words, with considerable perfection. See Mem. Physiolog. &c. sur la Langue par M. Louis in Mem. de l'Acad. de Chr. tom. xiv.

The removal of scirrhous and farcomatous tumours of the tongue may be most conveniently accomplished with a scalpel and a tenaculum. Encysted swellings of this organ are generally of the melanier's kind, and ought, if possible, to be dissected out, without opening the cyst at all.

Authors relate examples, in which the tongue has been of extraordinary magnitude, either in consequence of original malformation, or a peculiar sort of disease. Excepting the deformity, arising from the projection of the part out of the mouth, some of these patients experienced no particular inconvenience, as they could speak, masticate, and swallow tolerably well. Under such circumstances, the removal of the redundant portion would not be advisable; but if the disfigurement were combined with much inconvenience, the operation would be proper, especially as the cut part would be left forward in the mouth, that the bleeding vessels could be tied. First Lines of the Practice of Surgery, by S. Cooper, edit. 3.

Tongue-grafting. See Engrafting.

Tongue-tied, the popular name for a disfigurement of the tongue in children, when it is tied down too close to the bottom of the mouth, by a ligament connected all along its middle and called its frenulum, which requires to be divided to give the tongue its proper motion.

This is sometimes the case in adults, but oftener in children, who cannot then exert their tongues to suck. This is, however, by no means so common as the women usually imagine; not so much as one child in a thousand being afflicted with it; nor is the operation in cutting it of little consequence, since often bad accidents follow it, and sometimes the loss of a child's life. When the infant can put its tongue out of its mouth, the frenulum wants no incision; but when the tongue cannot be extended beyond the teeth, the operation is necessary.

To perform this, the end of the tongue should be covered with a linen rag, and held with the fingers to prevent its slipping, and the ligament of the tongue running between the upper and lower lip, and the frenulum, is then divided, to be tied by a pair of obtuse pointed scissors, till it gives room enough for sucking or speaking; but in this doing, great care must be taken not to wound the frenulum, or the proper veins and arteries of the tongue; for children have been known to perish upon the spot from cutting the proper veins. Midwives often tear this ligament with their fingers as soon as the child is born; but this is a dangerous practice. Heiffer. See Infants.

Tongue of Fish. All fish have either a perfect tongue, or the rudiments of one, in their mouth; but this organ is very different in the various species, in its figure, mobility, and other qualities and properties; as to the figure, it is in some pointed before, as in the gudgeon; others it is round in this part, as the perch and char; and in others it is somewhat bifid, as in the pike. In some it is smooth on the upper part, as in the goby, cyprinus, and Mackarel; in others it is rough and dentated in this part, as in the salmon, mullet, &c. In many fish, the tongue is immovable, adhering firmly to the bottom of the mouth, as in the perch, cyprinus, and, indeed, in the greater part of fish; in others it is loose, as in the whale.

In the cetaceous fish, the tongue being loose, as in quadrupeds, it is used by the animal in the same manner; but in other fishes it is of no use in the moving of the food about in the mouth, nor is it the genuine organ of taste, being in many a cartilaginous substance, and therefore not proper for receiving the notices of that sense. The principal use of the tongue in these fishes seems to be in its serving as an afflignant organ of swallowing, its being more elevated than the other parts of the mouth, rendering it fit for the toasting of the food down the throat. The true use of the tongue in these fish which have it dentated is, that it serves to retain the prey from running out of the mouth, and afterwards in the swallowing of it: what readers them more fit for this use, is, that they have always the prickles turning inwards. It is the opinion of Mr. Ray, that the tongues of the cartilaginous kinds have some fenome of taste, and this is more probable, than that the more hard and rigid ones should have any such fenome. Arctedi de Piscib. See Fish.

Tongue of a Mufle. What is vulgarly called the tongue in this fish from its shape, is truly an organ, by means of which it spins a sort of threads in the manner of spiders or caterpillars, to fix itself to the rocks by. See Muscle.

Tongue, in the Mange. The aid of the tongue or voice, is a sort of agreeable clackling, or a certain sound formed by the cavalier, in striking his tongue against the roof of his mouth, when he means to amuse the horse, and fustain him, and make him work well in the manage. See Aip.

Tongue, To swallow the. A horse is said to draw in, or swallow his tongue, when he turns it down his throat, which makes him wheeze as if he were short-winded. This fact is cured by giving him a bit with a liberty for the tongue.

Tongue, Serpent', in Botany. See Adder's Tongue.

Tongues, Serpent', in Natural History. See Serpent's Tongues, and Glossoptera.

Tongue, in Masting, the taper part at the lower end of a spindle, or of a spear. In Rigging, a short piece of rope spliced into the upper part of standing-backstays, &c. to the size of the top-mast heads; it is served over with spun yarn, and its use is to keep them open to the size of the mast heads.

Tongues, Confusion of. See Confusion.

Tongue, in Geography, a town of Scotland, on the north coast of the county of Sutherland, situated on a bay called the Kyle of Tongue. N. lat. 58° 27'. W. long. 4° 14'.

Tongue Island, a small island in the Mergui Archipelago. N. lat. 9° 52'.

Tonguey. See TONGUEY.

TONGUNEMW, a town of Birmah; 35 miles S. of Raynangong.

TONGURAHUA, a town of South America, in the province of Quito; 20 miles E.N.E. of Riobamba.

TONGUSY TARTARS. See Tongues.

TONGUSY, a lake of Norway, in the province of Aggerhus; 55 miles N.W. of Christiania.

TONIATO, a small island in the St. Laurence. N. lat. 44° 38'. W. long. 75° 53'.

Tonic, tonik, formed from touna, to stretch, in Medicine, is applied to a certain motion of the muscles, in which the fibres being extended, continue their extension in such manner, as that the part seems immovable, though in reality it be in motion. See Muscle.

Such is the case of a man floundering, of birds planing or swimming through the air, &c. Galen says, that the muscles act even when at rest; for after having made any contraction to fix themselves in a certain state or disposition, the preferring of that contraction is what we call the tonic motion.

Tonic, in Music. See Genus.

Tonic Accent. See Accent.

TONICAL Echo. See Echo.
TONICHI, in Geography, a town of New Mexico, in the province of Hiaqui; 25 miles N. of Riochco.

TONIKARY, an island in the East Indian ocean, near the north coast of Celebes. N. lat. 5° 31'. E. long. 99° 31'.

TONINA, in Botany, an unexplained name of Aublet's. See HYPHYDDIA.

TONIQUE, in French Music, is equal to key-note in English music, or the principal found of a composition which generates all the rest.

TONISKA, in Geography, a town of Ruffia, in the government of Irkutsk; 40 miles E.S.E. of Stretenik.

TONKER. See LASSA.

TONKER-SONG, a town of Thibet; 504 miles E. of Laffa. N. lat. 25° 57'. E. long. 90° 46'.

TONKEY, in Agriculture, a term provincially made use of to signify short-legged and deep-caracalised, as is the case in the Chinese breed of swine. It is consequently a term sometimes applied to that breed of swine. See SWINE.

TONKIN, in Geography. See TONGIN.

TONNA. See TUNNA.

TONNAGE, the weight of goods carried in a boat, also, the rates, tons, or fums per ton, per mile, or otherwise, which are payable to the proprietors of the navigation for the liberty of using the same. See TUNNAGE.

TONNAGE, Duty of. See DUTY.

TONNAGE, in Ship-building, the cubic content, or burden, of a ship in tons; which is commonly estimated by a given rule not answering the above purpose, but producing what is denominated the builder's tonnage. The real burden a ship is to carry, when brought down in the water to the load-draught of water intended in the constitution, may be nearly found by the rules given in the article Ship-building (Tonnage or Burthen). See also Burden of a Ship.

The word is derived from a ton, or weight of water equal to 2000 pounds; for it appears that, anciently, a cubic foot of water, weighing 621 pounds, was assumed as a general standard for liquids. This cubic foot, multiplied by 32, gives 2000, the original weight of a ton. Hence eight cubic feet of water made a hoghead, and four hogheads a ton, in capacity and denomination as well as weight.

TONNAGHAN, or DONAGHAN, in Geography, a river of Canada which runs into lake Superior, on the side of which is found a quantity of virgin copper.

TONNAY-BOITONNE, a town of France, in the department of the Lower Charente; 10 miles W. of Rochfort.

TONNAY-CHARENTE, a town of France, in the department of the Lower Charente; 3 miles E. of Rochfort.

TONNEAU, in Commerce, a measure of capacity in many parts of Germany, both for wine and dry commodities. The tonneau, as a measure for corn, contains 8 shecfafls, or 32 vier- tels, 100 of which tonneaus yield about 49 English quarters. A tonneau of beer contains 128 quarters, or 25 English beer gallons. At Koniglberg, a lait contains 24 tonnes, 563 new shecfafls, 60 old ditto, 240 vier- tels, or 960 metzins. A new shecfafl contains 3152 English cubic inches, and 43 shecfafls = 63 English bushels nearly, and 20 Koniglberg laits = 207 English quarters. The lait of Spanish and French salt is reckoned at 18 tonnes, or 6600 lbs.; the lait of herrings at 12 tonnes; a lait of green marbled soap at 3 tonnes, or 12 vier- tels. See TUNNA.

TONNEAU, a corn measure in some parts of France.—Also, a weight of 2000 lbs. French, by which the burden of ships is reckoned.—Also, a general term in France for a call.

TONNEINS, in Geography, a town of France, and principal place of a district, in the department of the Lot and Garonne; 132 3/4 miles S.E. of Bordeaux. N. lat. 4° 23'. E. long. 0° 24'.

TONNERRE, a town of France, and principal place of a district, in the department of the Yonne; 18 miles N.E. of Auxerre. N. lat. 47° 51'. E. long. 4° 31'.

TONNERRE, a mountain of France, which gives name to a department; 15 miles N.W. of Worms.

TONNING. See TUNNING.

TONNINGEN, in Geography, a seaport town of Denmark, in the duchy of Slefwick, situated on a peninsula, formed by the Eider. In the year 1613, the harbour was enlarged and repaired at a considerable expense; but in 1675, during the war with Sweden, the duke, purveyor to the treaty of Rendelberg, was obliged to cede this town to the king, who caused the fortifications of it to be demolished. But when the duke recovered the town in the year 1679, they were repaired, and improved with additional works; so that when king Frederick IV. besieged it, he was not able to make himself master of it. In the year 1713, the Swedes were obliged to surrender themselves prisoners of war to Denmark; and in the year 1714, the king having got possession of the town, the fortifications were demolished a second time. Tonningen has been in a defences condition ever since that time. It had once a noble castle, but that was likewise demolished by the king's orders, in the year 1734; 57 miles N.N.W. of Hamburg. N. lat. 54° 23'. E. long. 6° 48'.

TONNOGRA, one of the smaller Friendly islands; 11 miles S. of Annamooka.

TONO, a town of Chili; 70 miles S. of St. Yago de la Nouvelle Eftromadura.

TONON. See TIONON.

TONORIUM, in Ancient History. Roman orators, though not constantly accompanied by a flute, had their voices frequently regulated by an instrument which Quintilian calls a tonorium, Cicero, a sylala, and Plutarch, συλαία, or syrinx, which is the same thing; and this instrument served as a kind of pitch-pipe. Both Cicero (De Orat. lib. iii.) and Plutarch (In Vit. C. Gracch.) relate the well-known story of the voice of the furious tribune, Caio Gracchus, being brought down to its natural pitch, after he had lost it in a transport of passion, by means of a fervant placed behind him with one of these instruments. Cicero tells us that this tibiae, with his flapper, qui flectet occulta post isum, and was not seen by the people, does not confine his employment to appeasing the passion of his master; he was, upon occasion, to incite it: "Qui inlunet celeriter eum tonum, quo illum aut remit- tum exsaturat, aut contentione vocatium." It is not easy, however, to conceive of what use this expedient could be, unless rhetorical tones were regulated by those of music.

TONOS, a word used by Hippocrates, to express in general any nerve, whether arising from the brain or spinal marrow. It is also used to express a tenion in any part.

TONOSA, in Ancient Geography, a town of Asia, situated on the river Mesus, W. of Godaia.

TONOSA, or TONOS, a town of Asia, in Cappadocia, on the route from Sebaste to Coeuflon, between Sebaste and Aria- ratia. Anton. Hin.

TONOUWAH, in Geography, a kingdom of Africa, S. of the Niger, the capital of which, Affentai (the Affenté of D'Anville), situated midway between Kahanee, a dependency of the kingdom of Tonouwa, and the sea-coast; that is, about eighteen days' journey from each. It is said that there is no communication between this coast (probably the Gold Coast) and the country of Gorjah; as the king of Affentai,
Assentai, who possesses the intervening space, prohibits his inland neighbours from passing through his country. On the other hand, a gentleman (Mr. Norris) who resided many years in Whydah, says, that there are other states (that is, the Fantees, and their confederates) lying between Assentai and the sea; and that the Assentais have often attempted, but without success, to open a communication with the coast, from that part of the Niger which forms the southern limit of the great empire of Caffina. In the kingdom of Tonouwah, which is said to border on the coast of the Christians, and of which, as we have said, Assentai, or Assenté, is the capital, a succession of hills, among which are mountains of a stupendous height, diversifies, or constitutes the general face of the country. Some of the lands are cleared; but other districts are still incumbered with woods of a vast extent; and though for the most part the highlands are patured by innumerable flocks of sheep, and by herds of cows and goats, and the vales exhibit the captivating view of successive villages, encompassed with corn and rice, and fruits of various kinds, yet these are places of native fertility and eternal barrenness.

TONG, or TUNQUIN, signify ing "the Court of the East," because when this country was a province of China, it was the imperial residence; though, with regard to its position with respect to China, it should rather be called "the Court of the West," and denominated by the natives An-nam, Anam, or Ngan-nam, i.e. the repose of the fourth, is separated from Cochinchina by a small river, and may now be considered as incorporated with it by conquest. It is bounded on the E. and N. by China, on the S. by Cochinchina, on the W. by the kingdoms of Laos and Boos, the latter being unknown to geographers. Tonquin may be regarded as consisting of eleven provinces; that of the North being the largest; its boundaries being Laos on the W., China on the N. and E., and Boos on the N.W. With regard to its aspect and surface, it may be divided into two portions, the mountains and the plain. Towards China, Cochinchina, and Laos, the mountains are extensive, but neither rocky nor precipitous; and they are partly covered with forests. In this part are found mines of gold, silver, and iron, and also of copper, which is in high estimation. The lower part of Tonquin much resembles Holland, being partly land and partly water, and intersected by canals and dykes, and also by numerous rivers and lakes. The province denominated "of the West" is watered by seven great rivers, which unite about fifteen leagues above the royal city, and form a kind of sea, or large lake, which sends out various branches. The southern part of the kingdom, though in the torrid zone, is surrounded with waters covered with boats. A navigable river, called Songkoy, traverses the kingdom from N. to S., and receives various streams, which are also partly navigable; and canals which serve for the cultivation of rice are numerous. The rivers of Tonquin rise from the mountains of Yunnan, and in the rainy season, from May to September, inundate the adjacent country. The chief of these is the Holi Kian, which, after receiving the Li-fien, passes by Kecho the capital. The population of this country is said to be considerable. Although it has few towns, it has several villages which contain many inhabitants. The capital of the kingdom and royal residence is Kecho, Kecho, or Kefho (which see). The next remarkable town is Hean, containing about 2000 houses, situated on the right bank of the river, at the distance of four or five days from its entrance into the sea. Formerly the French had a factory in this place, and the trade was considerable. (See HEAN.) At the distance of five or six leagues from the mouth of the river is another town, called Domea, much less than Hean. These towns, as well as most of the villages, and some housetts belonging to persons of wealth, are surrounded with live hedges of bamboo; and to the housetts and gardens are annexed avenues of trees, which exhibit a picturesque appearance. The high roads, which are scarcely passable in the wet season, are maintained at the public expense. The rich use horset, litters carried by men. In the mountains the housetts are dispersed, and the people almost savage. The chief product of agriculture is rice, which affords two harvests annually in the low country, but in the high lands only one. The rivers and canals abound with fish of various kinds: wheat and wine are unknown: the mulberry-tree is common: flulk is in general use among the poorer people: the sugar-cane is indigenous, but the art of refining the juice is unknown. The plough used in agriculture, consists of three pieces of wood, a pole, a handle, and a third piece, almost at right angles with the last, for opening the ground, and they are simply fixed with straps of leather: this plough is drawn by oxen or buffaloes. The horset are small, but lively and robust; but they are little used, as the inhabitants prefer travelling by water. Asses and sheep are unknown: goats are few, and swine abundant. The people eat dogs, cats, and rats: poultry, ducks, and geese abound, and are found wild in the forests. The eggs of ducks are heated in ovens, and produce young, which swarm on the canals and ponds. The forests contain deer, boars, peacocks, a peculiar kind of partridge, and quails. The tigers are large and destructive; one of which is said to have entered a town, and to have destroyed eighty-five people. The wild elephants are also very dangerous: apes are found in these forests, and some of them of large size: these and the parrots are not a little destructive of the rice and fruits. The manners of the people are those civilized than those of the Chinese: they are in general of middle stature, with broad faces, not so flat as those of the Chinese: eyes and nose small, and long black hair. The men have little beard, and do not shave. Few of the people are deformed, and the women are rather handsome. The complexion of people of rank approaches that of the Portuguese and Spaniards. At the age of seventeen or eighteen they begin to blacken their teeth, regarding white teeth as the pralie of dogs: like the Chinese, the fashion of suffering their nails to grow is reserved to the Mandarins, the men of letters, and other distinguished persons. The ladies tinge their nails with red, and sometimes their hands and feet. The drefs of the men consists of a piece of silk, several yards long, wrapped about the loins, and a long robe with loose sleeves, thrown off in travelling or during labour. The women of the lower orders are modestly clothed in a long petticoat, and one or more robes like those of the men. They cover their bosoms with a piece of linen or silk in form of a heart: they use ear-rings and bracelets of gold or silver. They commonly appear with naked legs and feet, like the men: but the rich and persons of dignity wear long drawers. The most general colour of the silk and linen is white. Black is only worn by persons of distinction. The men and women fasten their hair behind in a knot: but in the presence of a superior they let it fall, in token of respect.

The people are indolent, and loaded with heavy taxes. The public services required from them occupy about six months in the year. The learned language in Tonquin is that of China, but it degenerates into a kind of dialect which cannot be understood by a Chinese, and the words are all in single syllables, and expressing different things according to the accent and mode of enunciation. The language of Tonquin, and also of Cochinchina, called...
TONQUIN.

The Anam language, says Dr. Leyden, is simple, original, and monosyllable. It has little affinity to the Mandarin or court language of China, to that of Canton, to the copious polyphonelabic and inflected Japanese, or to any other of the Indo-Chinese languages. Barrow, in his voyage to Cochinchina, seems to consider it as a derivative from the Chinese; but Dr. Leyden perceives no similarity between the Chinese and Anam, unless that they are both monosyllabic languages, and that the signification of terms is regulated, in a great measure, by their accentuation. But though the same monosyllables occur, and though they are also accentuated in a similar manner, yet even in this case, the signification of these monosyllables is for the most part totally different. In the syntax or construction of the two languages, there is also a very great difference. The Anam language has neither genders, numbers, nor cafes, moods, tenses, nor conjugations; all which are supplied by the use of particles and the juxtaposition of words, as in the other monosyllabic languages. The same word is often the signification of both a noun and a verb, and its particular use, in such a case, is to be determined by the context, and the collocation of words in the sentence. The principles of collocation in sentences are equally simple as in the other monosyllabic languages; many instances of which are specified by Dr. Leyden. The accents in the Anam tongue are of such indispensable utility, that they have been very properly termed the soul of the language, while the primary monosyllables, varied by accent, have been made to represent its body. The Anam fytle is sometimes highly bold and figurative, and attains a degree of animation which is not very common among the Indo-Chinese nations of the continent. The ancient code of Tonquin has policed great celebrity, and was highly venerated previous to the conquest of that country by the Cochinchine. It is represented by the missionary Le Roy, as composed in the most elevated style of Chinoe, and full of uncommon modes of expression. He also mentions, that it was printed with an Anam translation, composed by an ancient Tonquin Mandarin. The religion of the Anam nation is a modification of the Budd'hist system, nearly resembling that which prevails in China. Many local and peculiar superstitions, however, are blended with it, such as the worship of the dog and tiger, to the first of which human sacrifice, and to the second, human flesh is offered. Traces of this worship are found among the mountaineers on the borders of India, as well as in the proper Indo-Chinese countries. There the tiger is worshipped by the Hajin tribe, in the vicinity of the Garrows or Garades.

The Quau-to, an ancient race, as the name signifies, who inhabit Kaubang, or the mountainous range which divides the Anam countries from China, regard themselves as the original inhabitants of Tonquin and Cochinchina, and consider the Anam as a Chinese colony. The Quau-to have a peculiar language, and write with a fytle, on the leaves of a plant, termed in Anam "jiwa." The Moi and Muong are also mountainer tribes, who speak languages different from the Anam; but it is hitherto unknown, whether they are original races, or only branches of the Quau-to. Asiatic Researches, vol. x.

Marriage is contracted without priest or ceremony, the consent of the parents forming the only ceremony. The husband may repudiate or sell his wife, but the wife cannot leave her husband without his consent. The right of primogeniture predominates, and daughters derive little benefit from the estate of their father. Polygamy is common; divorces are rare: children are not exposed as in China. The inhumanity of creditors equals that of ancient Rome, and the accumulation of usury renders the state of debtors very perilous. An abominable and cruel custom prevails, which is that of putting some person to death at the beginning of a new year, and with this view they poison the fowls and fruit which are brought to market: examples of this horrid practice, which, it is thought, will secure them good fortune, are frequent, but the punishment is rare. The chief amusements are plays, dances, and cock-fighting. The general food is rice, and pufhe is also in request. The necks of a species of swallow are also held here, as well as in China, in great esteem. The chief drinks is derived from a kind of coarse tea, but arrack is also much prized.

The climate of Tonquin is not very hot. From the month of September till March, it is temperate and healthy; in January and February the weather is cold, but neither snow nor ice is seen, and hail is very rare; the temperature of the air becomes rather infahbrion in the months of April, May, and June, which is the season of fogs and heavy rains; and great heat is felt in July and August. In the flat country, and on part of the mountains, the winds regularly blow six months from the N. and fix from the S., the first beginning in November. Among the maladies of this country, the most grievous is a kind of leprosy, which destroys the extremities of the hands and feet. The funeral ceremonies resemble those of China: pieces of gold or silver, or small pearls, are put into the mouths of the dead, that they may not enter poor into another world. Their religion resembles that of the Chinese, but the fect of Foo is most regarded. Every town or village has a tutelary genius. Sometimes the supped genii are vile animals, as serpents, dogs, cats, oxen, fih; but more frequently men, who have delved well of their country. The natives are not a little addicted to magic. The sciences, like those in China, are chiefly fought in the writings of Confucius and his commentators; the principal branches being morality, mathematics, physics, and astronomy, with the history and laws of the country. Knowledge is highly esteemed: and the men of letters are regarded as the pole nobility in the kingdom. All the offices and dignities of the state are the recompense of literary merit. Printing is known here, as in China; but painting and sculpture are in a low state. The chief trade is with China, which supplies Tonquin with fine teas, porcelain, silks, and painted linens, prepared fuggars, wheat and barley, flour, kitchen utensils, iron, devices, flez and lint, wax, cotton, gals, and toys. Strangers export from Tonquin varnish, filk raw or wrought, chiefly strong fuffs; beautiful cloth resembling linen, made of the bark of trees, different works of mother of pearl, ebony, ivory, tortoise-shell, cinnamon, copper, cotton, and several other articles. Calamine is also exported from Tonquin by the Dutch and carried to Japan, where it is used in the manufacture of bruffs. The interior commerce of Tonquin is considerable, consisting chiefly of fruits of different kinds, silk and cotton cloths, with those made of the inner bark of the paper-bearing mulberry. The cinnamon, duly cultivated, would be valuable. The trees that produce the varnish distill a juice resembling turpentine, and the quantity is increased by incisions. Sugar might form a considerable article, if the people knew how to prepare it. Paper, made of the bamboo, mulberry, elm, cotton-tree, and all kinds of white and fappy woods, is a considerable article. Salt procured from the sea, is a commodity of great demand in the interior of the country. The troops of Tonquin amount to about 140,000, of which about 8000 or 10,000 are cavalry. Elephants were formerly used in war, but the introduction of fire-arms has diminished their number. Since the revolution in Cochinchina, when the Chova rendered himself independent
The arms of the Tonquinese are the ancient mulleset fired with a match, the modern firelock being unknown there, bows, sabres, pikes and half-pees, and a defensive buckler. The troops of the king’s household, which are reckoned among the best troops of the East, are clothed in blue and red. The navy, amounts to about two or three hundred galleys, navigated with oars, and fitted for the rivers of the country than for the open sea. The king of Tonquin is reckoned among the rich sovereigns of the East, as he poises valuable treasures and an ample revenue, derived from rice, a tax upon land, a capitacion tax, the sale of dignities, and the duties on merchant-vessels, amounting to about one-tenth of the merchandise. The laws of Tonquin, like those of China, are founded on the fingle principle of paternal authority and filial obedience. The magistrates are denominated Mandarins, from the Portuguese mandar, to command, by the Europeans; but in the native languages both of China and Tonquin, the appellation is “Quan.” The tenure of lands and right of inheritance are respected even by the sovereign; and the successions in land are determined by one tribunal, and that of house and peronal property by another. The judges are corrupt, and justice is sold. The military and civil offices are venal. Executions are rare, not exceeding through the whole kingdom twenty or thirty in a year. Decapitation is counted ignominious: princes and perons of rank have the privilege of strangulation. Female criminals are trampled to death by elephants. The dignity of public executioner is hereditary. Other punishments are exile, perpetual imprisonment, and peronal chastisement, sometimes with the mutilation of a finger or ear. The prisons are said to be in a shocking state. On a general view of Tonquin, the country and the desert are extremely rich, and the people are very poor. The Jesuits, soon after the commencement of the 17th century, made an attempt to introduce into this country the Christian faith; but their efforts have not been very succesful; several instances having occurred of the persecution of Christians.

In the gulf of Tonquin there is a small ile, which is said to afford the mussel animal; and in the vicinity is a pearl fishery. The chief entrance of the river, called Dondoa by the Europeans, is obstructed by a bar, and requires the guidance of a native pilot. In this gulf, as well as the adjacent Chinefe sea, the “tuftons,” or “typhons,” are tremendous. They are preceded by very fine weather; a preeing cloud appears in the N.E. black near the horizon, edged with copper-colour on the upper part, fading into a glaring white. It often exhibits a ghastly appearance when the tempest is overhead; the typhoon bursts its rage lasts many hours from the N.E. attended with dreadful claps of thunder, large and frequent flashes of lightning, and excessive hard rains; then it sinks into a dead calm, after which it begins again with redoubled rage from the S.W., and continues for an equal length of time. Abbé Richard’s compilation from the papers of the abbe St. Phalle, a missionary in Tonquin for twelve years, who died at Paris in 1766: cited by Mr. Pinkerton, in his Geography, vol. ii. For an account of the revolutions in Tonquin from the earliest period of historical account, see Grofer’s China, vol. i.

**TONQUIN Bean.** In Botany, sometimes called Congo Bean, is the seed of *Dipteryx odorata*. See that article.

**TONQUIN MEDICINE.** See HYDROPHOBIA.

**TONS de l’Eglise.** Fr.; *Tonni Ecclesiastici*. Ital.; the ecclesiastical modes or tones in canto fermo. See PLEIN-CHANT, CANTO FERMO, and Eccelesiastical Modes, Authentic and Plagal.

For the history of the establishment of the modes at Milan and at Rome, see St. Ambrose and St. Gregory.

The modes of the Roman church are eight: four authentic, and four plagal. The four authentic, or principal, are the odd numbers: 1st, 3rd, 5th, and 7th; the plagal are the even numbers: 2d, 4th, 6th, and 8th; which answer to D and A minor, and C and D major, for the authentic; and G and A minor, and F and G major, for the plagal. These are described by Dr. Pepusch, Padre Martini, and Roufeau, and all their several scales may be seen in Burney’s General History of Music, vol. ii.

We have drawn out the scales of all the eight modes or tones ascending and descending (see Plates of Music), by which it will appear from the imperfectness of these scales in most of the tones, that they are only capable of melody; and in the common service of Roman Catholic churches, when the priests perform the duty without the assistance of professed musicians, no harmony is attempted to be given to mere canto fermo. In cathedrals, the motets and parts of the masses are sung by choirmen and children, as the anthems and services are in our cathedrals.

Notwithstanding the imperfectness of the scales, and little variety of keys in the ecclesiastical chants, secular music feems for many ages to have had no other rules, but to have been strictly confined to a few keys in the diatonic genus, without the liberty of transpositions. Hence came the timorous pedantry of excluding all other keys and scales but those used in the church; which kept every kind of melody meagre and indifp, and in subjection to the rules of ecclesiastical chanting. For it appears, that the only major keys used in canto fermo are C and its two fifths F and G; and the only minor keys A, E, and D. And in four of these keys the scale is deficient, as there is no seventh or note-deficient to G, A, or D. This accounts for so small a number of the twenty-four keys which the general system and scale of modern music furnishes, having been used by the old composers; as well as for the temperament of the organs by which these modes were afterwards accompanied.

And as all music in parts feems, for many ages after the first attempts at counterpoint, to have been composed for the service of religion upon canto fermo and its principles; it likewise accounts for the long infancy and childhood of the art, till it broke loose from the trammels of the church, by which it was bound in Gothic times: and by the cultivation of the musical drama sacred and secular, the ideas of composers were enlarged, and the talents of performers improved by new exertions, which brought the art nearer perfection during the two last centuries, than it had attained in few hundred years from the time of Guido. In explicit and religious obedience to the laws of canto fermo, no accidental flat or sharp was ever to appear; all the eight tones being rigidly in the diatonic genus in the keys of C and A natural, with no other semitones than F to E, and B to C. When the scales of these tones are drawn out at full length, they seem nothing more than different species of octave.

All these scales descending, might, however, be made perfect by a single flat or sharp at the clef: as the first tone by a flat, the third by a sharp. The 2d is perfect, descending; the 4th wants a sharp or two at the clef to determine it to be in the key of E or B minor. A flat would make the 5th complete in the key of F; and a sharp the 7th in that of G.
G. The 6th is in the key of C natural, ascending complete; and with a flat to B in the key of F, descending; the 8th with one sharp would be in G, and with two sharps in D major. But these were licences which no one thought of, or at least had the courage to practise, till counterpart began to gain ground. And even then, the musica fida, or false music, as that in transposed keys was called, no one dared to write till lately. Even the orthodox and good Padre Martini, at length vanquished his fears of the impiety of using an accidental flat or sharp in the inward parts of canto fermo.

Lorenz, author of the famous Spanish treatise called "El porque de la Musica," without which Gemmellini made Dr. Worog an absolute impossibility for any one to understand counterpoint, has written the scales of the eight tones as we have done; but has not ventured to harmonize them, as accidental sharps and flats must have been expressed or understood in the additional parts.

TONSA, in Geography, a river of European Turkey, which runs into the Mariza, near Adrianople.

TONSBERG, in Geography, a footport town of Norway, in the province of Agderhus, situated on a bay of the Baltic, built upwards of 800 years since. It formerly contained nine churches, but now has only two. The inhabitants carry on a considerable trade in fish and butter. In the year 1536, it was laid in ashes by the Swedes, since which, it has greatly declined; 42 miles S. of Christiansia. N. lat. 59° 23'; E. long. 10° 12'.

TONSELLA, in Botany, a name made by Schreber, out of the Tonclea of Aublet, which is itself taken from the Caribbean appellation of the same shrub, Rosswa-tonella. Schreber perhaps meant to give the word a classical air, by approaching it to Tonfa, an oar, or Tonella, a mooring pole, or a cable, for which indeed there seems no foundation in any recorded use of the plant. Possibily he might have in view tonfella, a word applied to the box, or other trees fit for clipping. This idea is, however, no less inapplicable to our Tonella than the former.—Schreb. Gen. 34. Willd. Sp. Pl. v. 1. 194. Vahl. Enum. v. 2. 29. Mart. Mill. Dict. v. 4. (Tonclea; Aubl. Guian. v. 3. 31. Juss. 436. Lamarck Illutr. t. 26.)—Chap. and order, Triandria Monogynia. Nat. Ord. uncertain. Juss.—It seems akin to Eowynous, and therefore probably belongs to his Rhommi.

Gen. Ch. Col. Perrninth inferior, of one leaf, bell-shaped, permanent, in five deep, ovate, acute segments. Cor. Petals five, ovate, thick, permanent, longer than the calyx, inserted into the receptacle. Nectary cup-shaped, entire, surrounding the generm. Stam. Filaments three, thread-shaped, reflexed, inserted into the infide of the nectary, rather shorter than the petals; anthers roundish. Fil. Germen superior, roundish, surrounded by the nectary; ryle cylindrical, shorter than the filaments; stigma simple. Peri. Berry spherical, seated on the permanent calyx and corolla, of one cell. Seeds four.

Obf. Jussieu appears to have been undecided about the natural affinity of this genus, from having preconceived the germen to be inferior, which it surely is not.

1. T. scandens. Climbing Tonella. Willd. n. 1. Vahl. Symb. v. 2. 179? (T. scabra; Vahl. Enum. n. 1. Tontelea scandens; Aubl. Guian. 31. t. 10.)—Leaves pointed, entire. Branches round, warty.—Gathered by Aublet in the forests of Guiana, near the river of Sinemari, thirty leagues above its mouth; flowering in October.—Von Rohr is said to have found the same in the island of Trinidad. The former terms it a shrub, climbing to the tops of the loftiest trees, and covering them with its opposite, repeatedly compound branches, which at length become pendent, even to the ground. In his own specimen before us they are slender, round, covered with minute warts, bursting through the cuticle, and bear several short opposite flowers, leafy at the extremity. We find no sign of hair-leafs. The leaves are opposite, on thick, channelled, smooth stalks elliptical, entire, two or three inches long, with a short blunt point; they are smooth on both sides, coriaceous, rather shining, with one rib, and many reticulated veins. Flowers green, very small, about the ends of the branches, in partly terminal, partly axillary, small clusters, whose entire stalks are opposite.

Vahl describes the plant of Von Rohr as a tree, whose branches have a purplish roughish bark, and are hairy in their upper part. The leaves are roughish on both sides; their veins villous at the back. Flower-stalks downy. Calyx and petals hoary; the latter fringed. We have seen no specimens of this, nor indeed of the flowers of Aublet's plant, but we cannot help supposing they may be different species, though we do not feel authorized to define them as such.

2. T. africana. Toothed African Tonella. Willd. n. 3. Vahl. n. 5. "Leaves obtuse, with glandular teeth." —Native of Guinea.—Similar to T. fimbriata, but different, having smaller and obtuse leaves, furnished with very dilute glandular teeth; a larger corolla, and fimbriate anthers. Berry, according to Vahl, the size of an apricot, smooth, orange-coloured, globular with three flight angles, and from six to ten seeds.

3. T. angula. Entire-leaved African Tonella.—Leaves pointed, entire. Branches angular, smooth.—Brought from Sierra Leone, by professor Azzelius. The dried speciments are of a peculiarly fresh light green, and quite smooth. Branches with four, not very prominent, angles, slender and wavy. Leaves two and a half inches long, elliptical, with a linear blunt point, quite entire, veiny. Flowers small, green, in small, axillary, fimbriate tufts, whose common stalks, like the flower-stalks, are about a quarter of an inch long. Fruit the size of a pea, apparently a tough-coated berry.

4. T. decussata. Crofs-branched Tonella. Vahl. n. 2. ("Anthodon decussatum; Fl. Peruv. v. 1. 45. t. 74. f. 6").—"Leaves oblong-ovate, obtusely serrate, polifhcd. Panicles forked."—Native of woods upon the Andes. A shrub, with croifing greyifh copious branches; purplifh when young. Leaves pointed, smooth on both sides, on twifefted flarks. Flower-flanks oppofite, square, shorter than the leaves, compound, forked. Flowers small, yellow, Fruit unknown, but the affinity of the plant to T. fimbriata has induced Vahl to place it in the fame genus.

5. T. fimbriata. Senegal Tonella. Vahl. n. 4. (Hippocratea fimbriata; Lamarck Illutr. v. 1. 101.)—"Leaves oblong, pointed, smooth, polifhed; ferrated towards the extremity. Stalks crowded, fingle-flowered. Branches rough."—Native of Senegal.—Branches alternate, definite of hair-leafs. Leaves about an inch long, with a blunifted point, half as long as the nail, their margins obliquely serrate, and appearing under a magnifier to be bordered with a yellow thickened line. Flower-flanks capillary, about half an inch long, numerous, from a short axillary tubercle. Petals linear, smooth.

6. T. madagafcarica. Madagafcar Tonella. Vahl. n. 5. (Hippocratea madagafcarica; Lamarck Illutr. v. 1. 101.)—"Leaves lanceolate-oblong, pointed, smooth, polifhed,

7. "Leaves obvate, entire, polished. Stalks crowded, each bearing two or three flowers."—Found by Richard in Cayenne. Branches opposite, smooth. Leaves three or four inches long, sometimes oblong-ovate, very smooth, delirite of veins. Flower-flats numerous, finely half an inch long, each divided into two or three simple partial flanks, about the same length, with minute bracteas at the base of each. Petals oblong, smooth. The fruit of these three last plants has not been examined, but Vahl was induced, as in the similar case of our fourth species, to remove them hither, on account of their very close affinity to T. africana.

The author just mentioned considers this genus as very nearly related to the Linnnaean Salacia, fea that article. This opinion is extremely probable, and if it be correct, the name of Tonfella must give place to Salacia. In the habit of the plants we find no grounds for any distinction.

TONSET, in Geography, a town of Norway, in the province of Aggerhus; 145 miles N. of Christiania.

TONFILS, in Anatomy, the glandular bodies, also called from their fize and shape amygdalae, placed at the paffage from the mouth to the pharynx. See Debulution.

Tonfils, Disfagia and Extirpation of. The tonfils are exceedingly liable to inflame; and sometimes the swelling thus produced is fo great as to obstruct deglutition and reflation in a very dangerous degree. Prompt fucceur is now moft urgently required; and relief may commonly be obtained by feareifying the enlarged tonfils, and promoting the bleeding with warm gargles.

This operation may be done with an ordinary lancet, or with a broad one contained in a feath, and confructed fo that its point can only be pulled out to a certain dilation. Pharyngotomus is the name ufually given to this inftrument. Aftclefes in the tonfils are alfo to be opened, when the fwellimg caufes ferior inconvenience.

When fcarifications cannot be made, the beft means are venefection, applying leeches to the throat, exhibiting mercurial medicines, inflaing the flem of hot water, and using proper gargles.

Aftclefes of the tonfils have been observed of coniderable extent, not burfling in the mouth, as is ufual, but in the Eulachian tube, or even the matus auditorius externus, attended with caries of the madow procufes, deafnes, and fiffuza. Such cafes are frequently incurable.

The tonfils fometimes become eurpofed, without being in- flammed. This fwellimg is improperly termed feirhouze. The glands are only swollen and of moderate firmenes. A portion of a tonfil, thus enlarged, may be cut off, without the leat danger of the reft afluming a malignant nature. This pre-ternatural swelling of the tonfils is mortly owing to repeated inflammations. Sometimes there is no palpable caufe. The malady is confantly free from pain. When the tune- faetion is coniderable, it obstructs the fpeech, deglutition, and reflation.

Difcuriant and aftringent applications here prove ineftual. The tumour admits of being removed; but it is unnecessary and improper to take away the whole tonfil, as a dangerous and even fatal hæmorrhage might be the confequence. Only fo much of the fwellimg fhoul be removed, as is fufficient to afford relief. The remaining portion in general heals, without the leat difficulty; a clear proof that the difeafe is not of a malignant nor cancerous nature.

The extirpation of a part of a tonfil, thus difeafed, has been accomplished with caufics, the actual cautery, the ligature, and cutting inftruments. The firft of these plans was feecfsfully prafticed by Wifeman; but is now quite abandoned. The confecution is alfo relinquihed, as no modern furgeons employ it, except now and then, with a view of deftroying fungous excrefences, which, in a few infiances, origimate a part of the tumour has been removed by fome other operation.

A variety of inftruments has been devised for putting a ligature round difeafed tonfils.

There are very good furgeons, who flll preferenting difeafed tonfils to cutting them away, and the mode to be adopted differs according as the swelling has a narrow or broad base. The ligature ought to be made of filver wire, or catgut. When the tumour has a narrow neck, the ligature is to be doubled, and introduced through the noflril, fo that the nofe may be feen in the throat. With the aid of a pair of forceps, the nofe may then be easily placed round the neck of the tumour. The ends of the ligature are then to be brought through a double canulla, and the fetter inftrument introduced as far as the tonfil. The ligature on each fide is then to be drawn tightly, and falfened round rings at the end of the canulla. The inftrument may next be twifled, till a due degree of contrifiction is produced.

Default employed an inftrument, called a ferre-naud, for putting the nofe of the ligature over a difeafed tonfil, and producing the necelfary degree of contrifiction. The ferre- naud was nothing more than a little ring, mounted on a longitudinal, narrow piece of fteel, about five inches long, the other end of which was grooved, or rather forked. The difeafed tonfil was firft taken hold of with a double hook. With the ring, the nofe was conducted along the hook, and put over the tonfil; the ligature was then drawn out, while the ring preffed the nofe downward and backward. Thus the due contrifiction was made, and it was next maintained by twifling the ends of the ligature round the forked extremity of the inftrument, on the outifide of the mouth. Default par Bichat, to. ii. p. 233.

When the difeafed had a broad base, and was of a conical shape, fo that the ligature was apt to flip off, Cheffelden has recommended the ufe of an inftrument like a crooked needle, fet in a handle, with an eye near the point, threafted with a ligature, which is to bethrift through the bottom of the gland, and laid hold of with a hook. The needle is then to be withdrawn. The double ligature is next to be brought forwards, and one part tied above, the other below the tumour. The ligatures are now to be cut off near the knots.

We have already observed, that the removal of the whole enlarged tonfil is unnecessary, and therefore injudicious. We may now notice, that a portion of the tumour may be cut away, without any jft ground for fearing a dangerous bleeding. The application of a ligature occasionally produces a moft perilous swelling of the difeafed tonfil, attenated with fuch hazard of suffocation, as to compel the furgeon to cut and remove it. Bertrand, and many other eminent furgeons, have been in the habit of cutting away enlarged tonfils, without ever meeting with an infance of danger from the fubfuent bleeding.

Default fometimes employed a flat fléath, made of silver,
and having a notch in it for the reception of the base of the
tonsil. The latter part being thus taken hold of, a spring
was touched, when a concealed blade immediately moved
across the notch, and made the requisite division, without
any risk of injuring the adjacent parts in the mouth.

The operation may be done with a pair of scissors, con-
structed with short blades and long handles; or it may be
performed with a bistoury, which, in general, must be the
best instrument.

The haemorrhage may usually be stopped by repeatedly
washing the mouth with very cold water.

When the enlargement of the tonsil is really of a febrile
nature, a paste which is possible, though not common, an
operation, performed so as to remove only a part of the in-
durated enlargement, would not be followed by success.

Calculous concretions have been known to form in the
tonsils, occasioning troublesome coughing, fore-throats, &c.
The propriety of extracting them, when their existence is
clearly ascertained, is almost too obvious to require being
mentioned. First Lines of the Practice of Surgery, by
Samuel Cooper, edit. 3.

TONSTALL, or TUNSTALL, Cuthbert, in Biography,
a native of a gentleman of
5 good family, and born at Hatchford, in the ancient Rich-
mondshire, about the year 1474. Having studied both at
Oxford and Cambridge, he travelled for further improve-
ment, and graduated doctor of laws at Padua. Recom-
manded by his learning and character to archbishop Warham,
he became his vicar-general, and was collated to the king
of the rectory of Harrow, in Middlesex. Besides other pre-
ferments, he was appointed, in 1516, to the office of master
of the rolls, and in this year accompanied Sir Thomas More
as ambassador to Charles V. at Brussels, where he formed an
intimacy with Erasmus. After obtaining other preferments,
and accomplishing another embassy to the emperor, he was
promoted, in 1522, to the see of London, and in 1523, to the
office of keeper of the privy seal. He was afterwards em-
ployed in several missions of importance on civil affairs; and
whilst he was at Antwerp, he manifested his religious zeal by
buying all the unfold copies of Tyndale's translation of the
Bible, in order to burn them at St. Paul's Cross. His zeal
was similarly engaged in urging Erasmus to write against
Luther, and in instigating prosecutions against hereby.
In 1530, Tonstall was promoted, in recompence of his services,
to the see of Durham. Fluctuating in his disposition and
politics, he first favoured and afterwards disapproved the
divorce of Catharine of Arragon: he also defended Henry's
assumed title of supreme head of the church, after having at
first protested against it; and though he was not indifferent
to the usurpations of the papal see, he was firmly attached
to the doctrines of the church of Rome. Repenting, as we
hope, of having burnt the Bible, he joined with Heath,
bishop of Rochester, in revising an English translation of it
in 1541. Under Edward VI. he conformed to all the ordin-
ces relating to religion, whilst in parliament he protested
against every change. At length his rich episcopal pre-
fenteation, which those who sought preferment could not re-
fil, and therefore Tonstall was charged with
mispription of treason, and a bill of attainder was brought into
the house of lords, which, though opposed by Cranmer, passed
hotly, but was stopped in the commons, the evidence being
thought insufficient. His enemies, however, determined to
displace him, and a commissioon was appointed to examin-
him with regard to all conspiracies, &c.; and having been
found guilty, he was deprived, and committed to the Tower,
where he remained a prisoner to the end of this reign. The
see of Durham was converted into a county palatine, and
granted to the duke of Northumberland. On the succession
of Mary, he was restored to his see; and his temper being
mild, he neither avenged himself on his enemies, nor were
any persons brought to the stake in his diocese during this
favourable reign. His whole conduct seems indeed to indi-
cate a favourable change in his temper, for he discouraged
persecution, and afforded an asylum to his nephew, Bernard
Gilpin. (See his article.) When Elizabeth succeeded to the
crown, hopes were entertained that his moderate principles
would have led him to acquiesce in the reformation, but he
preferred the surrender of his bishopric to compliances
against which his conscience revolted. Refusing to take the
oath of supremacy, he was deprived, and being committed to
the custody of Parker, archbishop of Canterbury, he was
attracted with kindness, and by the prelate's reasoning in-
duced to abandon some of the greater errors of popery.
He died in 1559, at the advanced age of eighty-five, and
was interred, at the archbishop's expense, in the church of
Lambeth. As to his general character, he was munificent
and attentive to his episcopal duties; and in his private life,
exemplary and amiable. He was author of several works,
among which was a treatise on arithmetic. Some of his
letters are preserved in Erasmus's collection. Biog. Brit.

TONSURE, from tondre, to shave, the art or
act of cutting the hair, and shaving the head. See HAIR.

The tonsure was anciently a mark of infamy in France;
infomuch that, when they would render any prince incapable
of succeeding to the crown, they cut off his hair and shaved
him. See BEARD.

TONSURE, in the Roman church, is used for the entrance
or admission into holy orders.

In propriety, tonsure is the first ceremony used for de-
voting a person to God and the church, by presenting him
to the bishop, who gives him the first degree of the clericate,
by cutting off part of his hair, with certain prayers and
benefactions.

Some hold the tonsure a particular order; others, as Loy-
feau, only the mark and form of ecclesiastical orders in
general.

The tonsure suffices to make a clerk; the rest is only
to qualify him for the holding of benefices. A person is
capable of the tonsure at seven years of age; thence be
neehe of simple tonsure is such an one as may be enjoyed
by a child of seven years old. The tonsure is the basis of all
the other orders.

TONSURE is also used for the crown, which priests, &c.
wear, as the mark of their order, and of the rank they hold
in the church. See CROWN.

The barbers have the measure and dimensions of the dif-
ferent kinds of tonsure, or clerical crowns, to be practised
according to the different degrees and orders. A clerk's
tonsure, a subdeacon's tonsure, a deacon's tonsure, a priest's
tonsure, are each successively bigger than the other.

TONTANEA, in Botany, a word left unexplained by
Aublet, but evidently of barbarous origin.—Aubl. Guian.
158. t. 42. Pull. 190. Lamarck Illust. t. 64. (Bel-
lardia; Schreb. Gen. 790? Willd. Sp. Pl. v. 2. 626.)
Clafs and order, Tetrandra Monogynia. Nat. Ord.
Radiaceae, Joff. Gen. Ch. Cal. Perianth superior, of one leaf, in four
deep, ovate, acute, equal, spreading segments. Cor. of one
petal, funnel-shaped; tube thrice as long as the calyx;
limb in four deep, ovate, acute, equal, spreading segments.
Stam. Filaments four, thread-shaped, inserted into the throat
of the corolla, between the segments, and about equal
to them in length; anthers roundish, of two cells. Fils. Ger-
men roundish, inferior, crowned with an annular disk; style
rather
rather longer than the corolla, thread-shaped, divided half way down; filaments dense, obtuse. *Peric. *Berry ovate, crowned with the withered calyx, of two cells, easily separable. *Seeds* numerous, convex on one side, concave on the other, winged, inserted into the tranverse partition.

Eff. *Chi.* Corolla of one petal, funnel-shaped, four-cleft, acute. Berry of two cells, with many winged seeds.

T. guianensis. Aubl. t. 42. — Native of moist woods in Guiana and Cayenne, flowering, and bearing ripe fruit, nearly all the year. A trailing herbaceous perennial plant, creeping by means of fibrous radicles; the *stem* and *branches* round, slightly downy. *Leaves* opposite, stalked, ovate, fleecy, entire, hairy, an inch and half long, with a pair of intraxialaceous *filaments.* Flowers white or blueish, three or four together, in little, axillary, stalked, solitary heads. *Berry* blue, with a vinifid juice. Schreber's *Bellardia* was named in honour of Dr. Charles Louis Bellardi, the co-adjuitor of Allioni, and still living at Turin. His *Appendix ad Floram Pedemontanam,* and his *Offenbarungen Botanizbi,* prove him an able and observing botanist. *Bellardia* ought to have been noticed by one of our predecessors in that proper place. We could adopt it here, in the place of the above doubtful name, *Tontangil,* were there not much doubt of the identity of the plants. Schreber describes his as having linear unequal segments to the calyx, a hairy or villous obtuse corolla, very short, *flament* linear anthers, and a nearly globose *capsule,* not a berry. Neither does he notice a wing to the *seeds,* which he describes as acutely angular, and dotted. Had he not cited Aublet, no one would have supposed their genera to belong to each other; nor does Schreber himself decidedly affect it. Of his *Bellardia* nothing is known, except from his own generic character, because he never published a *Species Plantarum,* to clear up the obscurities attendant on his new genera.

**TONTAPILLY,** in *Geography,* a town of Hindoostan, in the circuit of Rajamundry; 30 miles N.E. of Rajamundry.

**TONTECO,** a town of Africa, in Bambouk; 10 miles N. of Combrigoudou.

**TONTELEA,** in *Botany,* Aubl. Guian. t. 10. See *Tonsella.*

**TONTI,** or *Tonki,* in *Geography,* a river of Canada, which runs into lake Erie, nor far from the Orwell.

**TONTINE,** a loan raised on life-annuities, with the benefit of survivorship. Thus, an annuity after a certain rate of interest is granted to a number of subscribers, who are divided into classes according to their ages; and annually the whole fund of each class is shared among its survivors, till at last it falls to one, and on his death it reverts to the power that first established the tontine. The term is derived from the name of the inventor.

**TONTING,** in *Geography.* See *Tong-tin-hoi.*

**TONTON,** an African drum, which Pere Labat, in his voyage to Guinea, tom. ii. numbers among the musical instruments of the Negroes, and which is never used but upon the approach of an enemy, or on extraordinary occasions. It seems to surpass in force the Stentorphone tube of Alexander the Great; as it is said that it can be heard at the distance of fix or seven miles!

**TONTORAL,** *Cape,* in *Geography,* a cape on the coast of Chili. S. lat. 27° 30'.

**TONTONVLORE,** a town of Hindoostan, in the circuit of Complipilly; 25 miles W.N.W. of Mafulpitam.

**TONTOR,** a cape of Scotland, on the N.W. of the island of Ilay. N. lat. 5° 41'. W. long. 6° 27'.

**TONYES,** a town of Mexico, in the province of Culiacan; 60 miles N.E. of St. Miguel.

**TONYNS**'s **ISLANDS,** a cluster of small islands in the East Indian sea, near the S.W. coast of the island of Celebes. S. lat. 5° 31'. E. long. 119°.

**TONZI,** in *Ancient Geography,* a town of Thrace, on the coast of the Euaxine sea, between Apollon and Perонтicum. Ptol.

**TONZOS,** or *Tonzus,* a town in the interior of Thrace. Ptol.

**TOOBIGAN,** in *Geography,* a small island in the Sooloo Archipelago. N. lat. 6° 14'. E. long. 120° 4'.

**TOOBOUAI** **ISLAND,** one of the Society islands, in the South Pacific ocean. Its greatest extent, in any direction, exclusive of the reef, is not above five or six miles. Small as the island is, there are hills in it of a considerable elevation. At the foot of the hills is a narrow border of flat land, running quite round it, edged with a white sand beach. The hills are covered with graps, or some other herbage, except a few rocky cliffs at one part, with patches of trees interperfed to their summits; but the plantations are more numerous in some of the valleys, and the flat border is quite covered with high strong trees, whose different kinds could not be distinguished, except some coco palms, and a few of the eka. According to the information of some men whom captain Cook saw in the canoes, their island is stocked with hogs and fowls, and produces the several fruits and roots that are found at the other islands in this part of the Pacific ocean. This island is populous, and the inhabitants are more sedate than the natives of the Society islands, as well as less hospitable. Fletcher Christian, with his companions, mutineer of the Bounty, attempted to form a settlement here in the year 1789. They had a dispute with the islanders, and a secerve engagement, in which one or two of the mutineree were wounded, and many of the natives were killed. Christian, after this, left the island of Tooobouai, and failed to Otahi, where some of the crew left him: nine only remaining on board, with some of the natives, men and women, with the Christian cut the cable, and put to sea, since which time he has not been heard of. The language is the same as that spoken at Otahi. S. lat. 23° 25'. E. long. 210° 37'.

**TOODAWAH,** a town of Pegu; 35 miles S. of Lundey.

**TOODIGUNTLA,** a town of Hindoostan, in Golconda; 25 miles E. of Damiopotra.

**TOODY,** a town of Hindoostan, in Canara, on the coast; 21 miles S. of Carvar.

**TOOE,** a town of Hindoostan, in Bawar; 12 miles E. of Bawar.

**TOOFOA,** one of the friendly islands, visible from Annamooka, by means of its height, and a volcano, which almost constantly emitted smoke, and sometimes threw up stones. Its shores are steep, and covered with black sand. The rocks are hollow, and in some places of a columnar form. The mountain, except in spots that appear to have been recently burned, is covered with verdure, shrubs, and trees. The coast is about five leagues in circuit. To the north-east of this island, and about two miles distant, is another of much less extent, but of thrice its height, which is called Kao; it is a mountainous rock of a conceal form. Both these were discovered by T'afman, and have been seen by every subsequent navigator of this group. Captain Cook passed between them, and had no soundings in the channel by which they were separated. Each island was underfoot to be inhabited, but no European had landed upon either, at the time when the mutiny suddenly occurred in the Bounty two days after the departure of that vejjel from Annamooka. Lieutenant Bligh was forced into a boat with eighteen of his people, when ten leagues S.W. from Toofoa: he attempted
therefore to get an immediate supply of bread-fruit and water at that island, which, as he understood, afforded those articles. The next morning, 28th of April, 1789, they landed in a cave, on the south-west coast; they climbed the heights, but obtained only some cocoa-nuts and plantains, and a few gallons of water from holes in the rocks. The weather being too boisterous to proceed, they sheltered themselves by night in an adjacent cave. On the 1st of May, several of the inhabitants brought them a small supply, and retired peaceably in the evening. The next day their number greatly increased. Some principal personages also came round the north side of the island in canoes, and among them one of the chiefs whom captain Bligh had threatened to carry from Annamooka: they offered to accompany him to Tongataboo, when the weather should become moderate; but some symptoms appearing of a design to obtain by force the articles that he could not afford to barter with them, he determined to depart that evening, as they were not inclined to retire. They had previously told him some of their weapons, and they now allowed his people to carry their property into the boat; but they would not suffer him to embark, and a contest ensued, in which most of the English were wounded by stones, and one of them was killed. The rest escaped, and bore away towards New Holland, from whence they reached the East Indies in their boat, enduring extreme hardship, but no farther loss of lives.

TOOOGAUM, a town of Hindoostan, in Baglana; 16 miles S. of Junere.

TOOK, a town of Persia, in the province of Cohelcan; 40 miles E. of Tabalkili.

TOOKE, John Horne, in Biography, the third son of a poulterer in Newport-market, was born in Newport-street, Wellminister, in June 1736, and having spent some years at Wellminister and Eton schools, was admitted into St. John's college, Cambridge, in 1755, where he took the degree of B.A. After officiating for some time as an usher in a school at Blackheath, he took deacon's orders, in compliance with the wishes of his father, and served as a curate in Kent. But the law being the object of his choice, he entered in the Inner Temple in 1756. Nevertheless, in 1760, he was ordained as a priest, and entered into the chapel of New Brentford, purchased for him by his father. But as he entered very deeply and warmly into the political disputes of the period in which he lived, he ceased officiating as a clergyman, and took an active part in the transactions of that period. When Wilkes returned from his exile to France, and became a candidate for the representation of the county of Middlesex, Horne was his zealous adherent, and was thought to have contributed to the success of his election. It is said, that it was by his instigation that Mr. Beckford, lord mayor in 1770, made a verbal reply to his majesty's anwer to a remonstrance from the city of London; and that he drew up that reply as inscribed on the pedastal of Mr. Beckford's statue in Guildhall. He is regarded also as the principal founder of the "Society for supporting the Bill of Rights," of which he was an active member; and by his exertions Eingley, a printer, who had been committed to prison by lord Mansfield for refusing to appear for the purpose of answering to interrogatories, was at length liberated. In the years 1770 and 1771, a quarrel took place between Wilkes and Horne, in the prosecution of which the latter lost popularity, without incurring any just charge against his political integrity. In 1771 he took his degree of M.A., though opposed by some members, among whom was Mr. Paley. To him it was owing, that the publication of the debates in the house of commons has been continued without interruption.

At this time he had a literary controversy with Junius, in which he was thought to have the advantage. In 1773 he threw off his clerical garb, and proposed to resume his legal studies with a view to the profession. But at this time an incident occurred, which was of material importance with respect to his future fortune. Mr. Tooke of Purley, in Surrey, had ineffectually opposed an inclosure bill, which was likely to be detrimental to his estate, and as this bill was passing rapidly through the commons, he applied to Horne for advice. After some deliberation he proposed to Mr. Tooke a remedy, which was to commence with a libel on the speaker, which he would undertake to write. Accordingly he flated the cafe, accompanying the statement with some severe reflections, and sent it to the Public Advertiser. When the paragraph was next day reported to the house and read, it occasioned great irritation, and a motion was made for calling the printer before the house. Mr. Horne, as the acknowledged writer, was called to the bar; he immediately obeyed the summons, and in a respectful manner confesed, that through hatred to oppression, and zeal to serve a friend, he had been urged beyond the bounds of discretion. After a long debate, he was removed from the bar in custody of the serjeant at arms, and upon being brought up some days after, he was, by the good offices of some friends, discharged upon paying his fees. His purpose was answered: time was thus given for reconsidering the obnoxious bill, and the exceptional clauses were either altered or withdrawn.

Mr. Horne was an ardent opposer of the American war; and when the news of the battle of Lexington arrived, the Constitutional Society voted 1000 to the widows and children of the Americans who had fallen in it; and the resolution to this purpofe, printed in the public papers, was signed John Horne. In this resolution, the sufferers were denounced "Englishmen who, preferring death to slavery, were, for that reason only, inhumanly murdered by the king's troops at Lexington." For this paragraph he was prosecuted, and tried at Guildhall in July 1777, and pleaded his own caufe. Notwithstanding the spirit and acuteness with which he defended himself, he was sentenced to twelve months' imprisonment, and to pay a fine of 200l. He left the courts of this trial he first attended before the public as a grammatical critic; and in 1778, he printed a letter to Mr. Dunning, which discussed the force and meaning of certain conjunctions and prepositions employed in his indiciement, and which was the foundation of a larger work afterwards published. In the following year, he was dis- appointed in his expectation of being called to the bar; for though he was eminently qualified for the profession to which he aspired, he was rejected under the pretext of his being full a clergyman. This he felt as a very grievous disappointment, and with a mind not a little exasperated he devoted himself to politics. Accordingly, in 1780, he published a pamphlet, entitled "Facts," keenly reviewing Lord North's administration, and containing two chapters on Finance, supplied by Dr. Price. Soon after the termination of the American war, parliamentary reform became a popular topic; and in 1782, Horne published a letter to Mr. Dunning (lord Affurton) under the title of "A Letter on Parliamentary Reform, containing the Sketch of a Plan!" of which we shall merely say, that he disapproved of universal suffrage. Mr. Pitt was at this time a fellow advocate in the same cause. Horne now avowed himself the friend of Mr. Pitt, in opposition to Mr. Fox, whose coalition with lord North he very much disapproved. In 1786 Mr. Horne, having allu- merged the name of his friend Mr. Tooke, published his "Epica Perecenta, or Diverfions of Purley," so called from
from the country residence of his friend. Of this work, founded on his letter to Mr. Dunning, already mentioned, the most prominent subject of diffusion was the derivation of conjunctions and prepositions from verbs and nouns, whence they acquired a determinate meaning, often different from that which has been arbitrarily imposed upon them. This work attracted the notice of philologists, and gave to the author a high rank among writers on the philosophy of language. (See Grammar.) Politics, however, diverted his attention from subjects of this nature; and in 1788, he published "Two Pair of Portraits," the figures in which were the two Pitts, and the two Foxes, of the past and present generations. The first name was strongly illuminated, and the latter thrown into a dark shade. He might probably, however, at a later period, have adopted a different mode of colouring. In 1790 he opposed Mr. Fox and Lord Hood at the election of representatives in parliament for Westminster; and professing himself unconnected with party, and determined neither to open a house nor to give away a single cockade, he polled near 1700, without implication or corruption. On occasion of his defeat, he presented a petition to the house, in support of which he freely indulged himself in very bitter farcical invective. In the year 1794 he was brought to a trial, under the charge of high treason. During the progress of this trial, he maintained the most perfect composure and self-possession; and as he had little to apprehend after the previous acquittal of Hardy, the jury brought in their verdict of "not guilty," after being only eight minutes out of court. In consequence, however, of this trial, he became more cautious in his conduct, and declined the visits at Wimbledon, where he resided, of persons known to be violent in their principles and conduct. Upon the death of Mr. Tooke of Purley, he inherited, in consequence of a previous agreement, half of the property left by that gentleman to his nephew. In 1796 he offered himself again as a candidate for Westminster, and suffered a second defeat, after having polled 2819 votes. He was chargeable, however, with some inconsistency in the acceptance of a feat, in 1801, for the noted borough of Old Sarum, on the nomination of Lord Camelford. Some attempts were made to exclude him, under the plea of his being a clergyman; but a compromise being proposed by the minister, Mr. Addington, by determining the future ineligible of persons in holy orders, his defeat was a subject of conversation and lamentation. Having published by subscription a second edition in 4to. of his "Divisions of Purley," a second part in 4to. appeared in 1805, in which he chiefly adverted to etymology, and to adjectives and participles, and their formation, intermixing fatical strikures upon some literary characters of note. From this time his bodily infirmities, occasioned by a disorder to which he had been long subject, increased, though he retained his faculties in full vigour, and continued to enjoy life. His temper was little affected by mental or physical evil, and "no one more strenuously maintained," says one of his biographers, "the balance of good in human existence."—"His latter days," says the same writer, "were chequered by early circumstances, and the attention of many friends, whom he entertained with great hospitality, and amused by his conversation, which was singularly pleasant and lively. With an unsheltered brow, he could be either facetious or farcical, and his features seldom discolored what was passing within. His manners were polished, and his appearance was that of a gentleman of the old school." His life at length terminated, by tedious and continued decay, in March 1812, in the 77th year of his age. As he was never married, his property was bequeathed to his natural children. Stephens's Memoirs of John Horne Tooke. 

TOOKOOK, in Geography, a town on the W. coast of Borneo. S. lat. 2° 24'. E. long. 109° 46'.

TOOJEE, a town of Hindooftan, in Guzerat; 20 miles S. of Gogo.

TOOLEN, or Tullen, (i.e. the Isle of Seals,) a small island in the Caffian sea, near the W. coast. N. lat. 44° 14'.

TOOLAPOUR, a town of Hindooftan, in the country of Dowlatabad; 45 miles E.S.E. of Perinda. N. lat. 18° 20'. E. long. 76° 35'.

TOOLLY, a town of Hindooftan, in Goaundwa; 10 miles W. of Coomth.

TOOLMEDIN, a town of Hindooftan, in the circur of Bopal; 45 miles S.W. of Bopaltol.

TOOLS, simple and popular instruments, used in the more obvious operations, and particularly in the making of other complex instruments.

The term tool is particularly used by canal-makers, for a kind of strong curved spade or shovel employed in canal-works.

Tools are divided into edge-tools, spring-tools, pointed-tools, &c.

Mr. Parkes, in the fourth volume of his "Chemical Effays," has given a history of the origin and progressive improvement of edge-tools, and an account of the materials of which they were constructed. It appears from Goguet's "Origin of Laws," to which he refers, that as many of the ancient nations had no knowledge of iron, they used stones, flints, the horns and bones of various animals, the bones and shells of fish, reeds, and thorns for every purpose in which the moderns now use edge-tools of iron and steel. Spears and other instruments for exterminating wild beasts, and even implements of agriculture, were formerly made with gold and silver; and instead of these was afterwards substituted copper, as a metal more easily to be procured than malleable iron. The abundance of celts and other ancient instruments, found in various parts of the globe, shows that copper and brass were formerly in very general use. From the prodigious number of copper instruments of different kinds and sizes, which have been found in this country, such as axes, swords, spear-heads, arrow-heads, &c. known among antiquaries by the general name of celts, it is evident that our ancestors were well acquainted with the art of forming metallic copper in any way which they thought proper; whereas the use of metallic iron is comparatively of late introduction. At the time of the first Roman invasion, this metal was so rare, that the Britons fabricated their money with it, and even their ornamental trinkets. But the Romans having made themselves masters of the country, established imperial founderies for making iron, and constructed forges for manufacturing spears, lances, battle-axes, and implements of every kind, in different parts of the kingdom. (See Cafer, de Bell. Gall. lib. v. c. 12. Henry's Hist. of Britain, vol. ii. p. 139, 140.) At the battle of Hamilton, in 1402, the repulse of the Scots appears to have been entirely owing to the excellent temper of the arrows which were employed by the English army. Swords also were then in use, and Shielfield was, even then, famous for its cutlery. Table-knives, it is said, were first made in London in 1563, by one Thomas Matthews of Fleet-bridge. Good edge-tools cannot be made without steel; and of this there are various sorts (see Steele); such as blistered, shear, spur, far, and caid steel; besides which there is a kind of German steel, made immediately from the iron ore, by simple fusions. (See also Wootz.) The cheapest edge-
edge-tools, and other less important articles, are usually made with the first-mentioned kind, united to a large proportion of bar-iron. Clothiers' shears, firmer chisels, plane-irons, coopers' adzes, fetties, reaping-hooks, and large knives, are commonly made with shear-steel: for the method of manufacturing it, see Shears. The spur and stab steel are to be ironed for particular purposes, according to the fancy of the maker. Carpenters' steel is used for the best pen-knives, fetties, and razors; and fine saws, surgical instruments, and all edge-tools which require a fine polish, and various other implements employed in cutting iron, are all made with cast-steel. The superior beauty of instruments made with cast-steel would have occasioned a very great consumption of this article, if it had not been for the difficulty of welding, or uniting it properly with iron, and which occasioned its being used at first only for those smaller instruments, such as lancets and penknives, which are generally made entirely of steel. But since the discovery made by Mr. Thomas Frankland (for which see WELDING), cast-steel has been brought into more extensive use, and the instruments that are thus constructed, are much better than those which are made entirely of cast-steel. The circumstance of an instrument having its back made of iron, renders it not so apt to fly from the work to which the edge or steel part is applied, and eventually less liable to break.

Many articles, long after the invention of cast-steel, used to unite it to the iron by means of rivets. Hobs were still made by riveting or screwing the back, together with the eye, upon a blade made with cast-steel. We cannot minutely recite the various manipulations that are practised in the manufacture of different edge-tools. The reader will find information of a more ample kind in the work of Mr. Parkes, above cited. (See also the article CUTLERY.)

We shall, however, select the following particulars: the cooper's adze and the carpenter's axe are first formed by the white-smith, in iron, together with the eye for the helve. The instrument is then heated again, and the edge of the cutting part is fit down with a chisel, and this fit is filled with a thin piece of steel, of a corresponding size and form. The iron, that has been fit upon, is folded down upon the steel, and the whole again heated to a welding heat, when the file-dagger quickly unites the iron and the steel into one compact mass. Scythes and such other large instruments are forged at the mill, by means of a large hammer, moved by water, and the process is called "skelping." Augers, gouges, large chisels, table-knives, razors, and other instruments of a similar bulk, are forged upon a large anvil by the principal workman, aided by an assistant called the "flirker," who flircles occasionally with a file-dagger. Pen-knives, lancets, gravers, surgical instruments, and other small edge-tools, are generally forged on a small anvil firmly fixed within a large one, in order to give greater readiness. These are usually fashioned out of steel only, and forged by one workman singly and alone. Scissors are also forged by a single hand; but the anvil on which they are fashioned is of a peculiar construction, having backs or dies, and back irons of various sizes occasionally adapted to it, so as to suit the different shapes and dimensions of the separate parts of these particular instruments.

It should have been noticed, that many other tools besides the axe and adze are originally forged out of a piece of iron, with a little steel welded to it for the cutting part of the instrument.

The real Damascus sword-blades are said to be composed of slips or thin rods of iron and steel bound together with iron wire, and then firmly cemented together by welding.

It is well known that it is the circumstance of drawing down the shear-steel under the tilt-hammer that gives it the superiority over common steel. (See TILT-Hammer, and TILTING OF STEEL.) Mr. Bingley therefore suggests in his patent, that, if he could roll out his steel much thinner than it had ever been done before, he should much improve its quality: and accordingly a very thin piece of steel is let into the face of a plane-iron made of cast-iron; and, as the-steel for this particular purpose has to go through the rollers several times to make it sufficiently thin, it becomes of a peculiar texture, and the tool made with it is found to suit the joiner much better than the plane-irons hitherto in use.

In the manufacture of edge-tools, the process which immediately succeeds the forging is that of hardening. All these cutting instruments are therefore fashioned when the metal is in its original soft state; and when they have attained the intended forms, they are heated to the particular temperate suitable to the article. When they have acquired that degree of heat, they are instantly plunged into cold water, which gives them great hardnees, and renders them capable of cutting soft iron, or even steel. See TEMPERING.

Tools, DRAINING, in Agriculture, the various kinds of tools which are employed in performing this work of work, such as spades, spits, spools, draining augers, boring augers or rods, flax-knives, &c. See thea heads.

Tools, Lopping or Pruning, in Rural Economy, the various tools, such as hedge-bills, large-knives, axes, saws, chisels, &c., used in taking off the fife-shoots and branches of forest-trees. And lately an instrument uniting several of these properties has been invented, which is very convenient, and readily dispatches the boughs. It is described as below in the first volume of the "Memoirs of the Caledonian Horticultural Society," where a representation of it is also given. It is perfectly simple in its form, having merely two edged hooks, projecting from a socket-hank three inches in length, the breadth of which, where the hooks spring off, is two inches and two-tenths of an inch; the hooks themselves project from the shank three inches; between them, and on the top or upper side, is placed a strong chisel, four inches in breadth, and one inch in depth; the whole tool or instrument being about eight inches in width. The length of the wooden handle must, of course, be in proportion to the height and size of the trees to be lopped or pruned, as in different lengths, from fix to eighteen feet, which last is, it is said, as long as a man can well and properly manage them. Where trees require lopping or pruning to a greater height than the above length of shaft or handle, a ladder is to be made use of for the purpose, and one of the short-handled tools or instruments.

It is noticed, that the hook part is what is principally made use of, which cuts the branch from the upper side; the chisel is only employed when flags are left, and where branches are too strong for the hooks; in which cases, the chisel is first made to strike the branch from below; but a mallet is never used.

It is observed that fir-trees will certainly be greatly improved by lopping and pruning with this tool, both as to growth and quality of timber; but that care should be had not to over-cut or prune them. Larches will, it is said, always shew when that is the case with them, by breaking out into numerous unnatural branches; but that it may not be so soon noticed in Scotch, s juris, and other firs, which, however, have generally a fluted appearance for some years afterwards, and that it sometimes occasions their death. Four or five tiers of branches should always, it is thought, be left, particularly on young trees; and that on larches there should be still more.

Tools, ScRAPING, in Agriculture and Rural Economy, the
several sorts of tools and contrivances which are formed and made use of for cleaning and removing the mould, dirt, and other matters, that may adhere to different kinds of implements while they are in work, as those of the drill, roller, plough, and some other kinds; and to the surfaces in some other cafes, as those of wheels, roads, &c.

In the drill and the roller, the scrapers mostly consist of thin bars of iron or wood, so constructed and fixed behind, as to take off the dirty or mouldy cloppy substances as they collect upon them. In ploughs it is usually done by a small fort of paddle, with a short handle used by the ploughman.

The surfaces of wheels, in heavy carriages, are cleaned by tools of the scraping kind, properly contrived for the purpose. For tools of this sort, where the tires of the wheels, in such cafes, are made concave, it has been advised that a small item should be fixed to the body of the carriage, which may prevent a convex scraper; which, on account of the shifting of the wheel on its axis, sometimes a full inch or more at its perimeter, should be made to slide on the item, having a kind of bracket to embrace the thickens of the felly: thus the thickness of the wheel having pretended to it a convex scraper sliding on a square item; which, allowing one or two inches of play, has at its outer end a bolt-head, the two arms of which forming a bracket, will always keep the scraper opposite to the groove, or hollow in the wheel.

It is suggested that the blade of the scraper should be very shallow, as it would otherwise operate as a lever upon the bar; and either wrench it, or ultimately round off the corners, so as to allow the tool to be turned out of its proper direction, which should be at an angle of five degrees under the horizon. But it is supposed that the tool for scraping the fore-wheel of a wagon will be more difficult to fix, with proper firmeness, on account of its traversing. It might, however, it is thought, be effected by setting it on a segment attached to the body of the carriage; but the necessary length of item would prove a formidable objection in such a case. The bolt mode would, it is thought, be to fasten it to the wooden axle, so as to move always with it, and consequently preferring its relative position to the edge of the wheel.

In other cafes, other sorts of light iron plain scrapers may be fixed so as to allow them to act in removing the dirt from wheels where necessary.

In the scraping and cleaning of roads, tools of the cow-rake headed kind are used by the hand, and large machines in other shapes by horses. See Road-Scraping Machine.

Tool, Skimming, in Agriculture, that fort which is employed in taking off the surface of the land in ploughing, in order to its being deposited in the bottom of the preceding furrow, and thus making neat clean tillage-work. Tools of this kind, with sharp paring and cutting edges, are differently formed, according to the purposes to which they are to be applied; but the mode of fixing them to a fort of fore-coulter in ploughs is considered by many as a great improvement, as they are found in that way to do the work much better than if attached to the common coulter, in which manner they sometimes do not work well. See Tillage.

TOOLUC, in Geography, a town of Hindooftan, in Behar; 36 miles N.W. of Harripour.

TOOLUMBO, a town of Africa, in Bambarra. N.lat. 12°55'. W. long. 5°.

TOOM, a town of Hindooftan, which runs into the Tungbhadra; 15 miles S.E. of Samore.

TOOMANUA. See Opoum.

TOOMBEWADY, a town of Hindooftan, in the Carnatic; 8 miles S.W. of Caroor.

TOOMBUCK, a town of some note on the Persian gulf, between Congou or Kungoon, a large and populous town, and Tahir or Tahirie.

TOOMCOUR, a town of Hindooftan, in Myfro; 20 miles S. E. of Sera.

TOOMEBRIDGE, a post-town of the county of Antrim, Ireland, situated at the northern extremity of Lough Neagh, where there is a bridge over the narrow channel which separates that lake from Lough Beg. It is 97 miles N. by W. from Dublin, and 13 miles W. from Antrim.

TOOMISH, a town of Ireland, in the county of Kerry; 14 miles S. of Tralee.

TOOMRY, a town of Hindooftan, in the circur of Hindia; 24 miles N. of Hurdah.

TOOMSIR, a town of Hindooftan, in Goondwana; 38 miles N.E. of Nagpore.

TOON, a town of Persia, in the province of Cheetan; 90 miles N. of Tabakilie. N.lat. 34°32'. E.long. 53°35'.

TOONDY, a town of Bengal; 38 miles S.S.E. of Curruckdeah. N.lat. 24°58'. E.long. 86°34'.

TOONE, a river of Ireland, which runs into the Lee, 15 miles W. of Cork.

TOONG, a town of Hindooftan, in Dowlatabad; 26 miles W. of Poonah.

TOORAMBADDY, a town of Hindooftan, in Myfro; 13 miles W.N.W. of Aravacourchy.

TOORATTEO, a town on the coast of Celebes. N.lat. 5°33'. E.long. 120°4'.

TOORDA, a town of Africa, in Kaarta; 24 miles N. of Kemmoo.

TOORGOODY, a town of Hindooftan, in the Carnatic; 10 miles S.E. of Trichinopoly.

TOORSHA, a river of Bengal, which, after its confluence with the Maundy, affumes the name of Neeloomar, and flowing its course through Baharund, falls into the Berhampooter, properly (it is said) Brahma poorta, offspring of Brahma.

TOOS, a town of Persia, in Khorassan; 25 miles S. of Mefchid.

TOOSANG, a town on the west coast of Celebes. S.lat. 6°30'. E.long. 110°38'.

TOOSCHONDOLCH, an Indian village, on the west coast of North America; of importance in the fur trade. N.lat. 53°2'.

TOOSHOR, a town of Hindooftan, in Myfro; 5 miles E. of Nancul.

TOOSI, a town of Japan, on the south coast of the island of Niphon; 84 miles S.S.E. of Macao. N.lat. 34°35'. E.long. 137°35'.

TOOSIMA, one of the small Japanne islands, near the N.W. coast of Niphon. N.lat. 40°40'. E.long. 140°0'.

TOOTH, Den', in Anatomy. See Teeth.

TOOTH-ACHE. See Teeth, Difterent of.

TOOTH-DRAWING. See Teeth.

TOOTH, Wolf. See Wolves-Teeth.

TOOTH, in the Manege. It is by a horse's teeth, chiefly, that his age is known. See Teeth, in Rural Economy.

TOOTH-ACHE Tree, in Botany. See Zanthoxylum.

TOOTH-PICK. See DAUCUS.

TOOTH-WORT, a name applied to several plants, on account of a resemblance in their roots to the human teeth. This
This is very striking in \textit{Lathrea Squamaria}, whose roots are furnished with smooth white scales, very accurately imitating, except in hardnefs, the \textit{dentes ineifores}, or fore-teeth. This resemblance is perceptible also, though less exact, in the roots of the various species of \textit{Dentaria}; see that article. \textit{Opbryi Carolinianus} of Linnaeus has, for a similar reason, been sometimes called \textit{Dentaria}; which name, or \textit{Dentillaria}, has also been given by Rondeletius to the \textit{Plumbago}, because of the teeth of its corolla; a character found in many other genera. \textit{Dentella}, see that article, owes its name to the last-mentioned circumstance. It is hardly necessary to advert to the reputed qualities of the above tooth-rooted plants, which were founded on the resemblance in question. On this subject more may be said when we come to speak of the \textit{Virtues of Plants}.

\textbf{TOOTHED}, in Botany and \textit{Vegetable Physiology}, \textit{dentatus}, is properly applied to the margin of any leaf, petal, &c. when furnished with directly prominent teeth, which scarcely point either towards the base or the point of such leaf or petal, or of their segments. Yet this term is not always so strictly limited as it ought, being sometimes negligently used, when \textit{ferrate} would be more proper. \textit{Stamens} however are said to be toothed, when they have any lateral prominence, or notch whatever, as in \textit{Althaea}.

\textbf{TOOTOOCH}. See \textit{Erronian}.

\textbf{TOOTOA}. See \textit{Erronian}.

\textbf{TOP}. See \textit{Erronian}.

\textbf{TOP}, or \textit{Tope}, in \textit{Commerce}, a wine-measure at Bremen, and in other places of Germany. At Bremen, an eimer of wine contains 20 tops, 80 quarts, or 320 quarts, and is equal to 14\textsuperscript{1} English gallons.

\textbf{TOP}, in \textit{Geography}, a lake of Russia, in the government of Olonetz, about 44 miles in length, and 8 in breadth; 256 miles N.N.W. of Petrovodik. N. lat. 61\textdegree. E. long. 30\textdegree 14\textquoteleft.

\textbf{Top of a Ship}, a sort of platform, surrounding the lower mast-head, from which it projects on all sides like a scaffold. Its principal intention is to extend the topmast-sheets, so as to form a greater angle with the masts, and thereby give additional support to the latter. It is fastened by the trefoil-trees and cross-trees. The top is also convenient for containing the materials necessary for extending the small sails, and for fixing or repairing the rigging machinery. In ships of war it serves as a kind of redoubt, and is accordingly fortified for attack and defence, being furnished with fRowls, musquetry, and other fire-arms, and guarded by a thick fence of corded hammocks. It is also used as a place for looking out, either in the day or night. The frame of the top is either close-planked like a platform, or open like a grating. In all ships of war, and in the largest merchantmen, the top is fenced on the aft-side by a rail about three feet high, stretching across and supported by stanchions, between which a netting is usually constructed.

The outside of this netting is generally covered with red bays, or red painted canvas, extended from the rail down to the edge of the top, and called the \textit{top-armour}. By this name it seems to have been confedered as a sort of blind, behind which the men may conceal themselves from the aims of the enemy’s fire-arms in time of action, whilst they are charging their own muzzles, carbines, or fRowls. The dimensions of tops in the royal navy are as follow: the breadth of the top at the bottom is one-third of the length of its corresponding top-mast; the length of all tops, from the foremost to the after-edge, is equal to three-fourths of their breadth athwart; and the square hole in the middle is five inches to a foot of those dimensions. The trefoil-trees and cross-trees extend nearly to the edge of the tops.

The aft-side of the top is straight, and the fore and aft sides square from thence to the aft-side of the foremost cross-tree; from thence the fore-part breaks in with an elliptical curve. Tops in the navy are separated in the middle by a fore and aft line, which makes them much more convenient to be gotten over head.

By a late order in the navy, the under sides of tops are to be planed, and the after-part of the face and main tops is to be eighteen inches wider, and the after-part of the mizen top, one foot wider than at the chain-plate for the foremost shroud; the infide of the tops on each side by the part called \textit{rubber’s hole}, is to have a flap and hinges, so that a top-gallant yard, main, or a top-sail, may pass in and out.

Tops, to lay ropes from a fix-thread ratline to the large cables, are conical pieces of wood, with three or four grooves, or scores, from the butt to the end, for the strands to lie in, and form a triangle. If too broad at the butt, the rope will not close well, nor the strands work close as they should. A hole is made through the centre of the top, one-third the length from the butts-end, for the staff or bolt to go through, round which are put pieces of old rope, called tails, for the layers to close the rope with, and lay it hard or slack, according to the use it is for. A hole is likewise made through the middle of the top lengthways, for laying ropes with a heart. A collar is put on to afford the layer when the work is too heavy, and to enable him to hold the tails, and close the rope well.

Tops, to lay ropes of three inches and upwards, have a staff under them, with a truck-wheel at the lower end. An iron bolt goes through the centre of the top, and is lashed down to the staff, on which the tails are put and rounded over the rope, being too heavy to be laid with the collar. A frap is put round the tails, with a woolder for the layer to close the rope with.

Tops, to lay cables, have a leg to support them, with a truck-wheel at the end to run on, besides the staff which the tails go over.

Tops, for laying lines of all sizes, are of box or hard wood, tapered at the after-part, that the line may close sharp. Those for fRow lines have four grooves, and for baleines eight grooves.

\textbf{Tor and Butt}, in \textit{Ship-Building}, a method of working English plank, so as to make good conversion. As the plank runs very narrow at the top, clear of fap, this is done by disposing the top-end of every plank within six feet of the butt-end of the plank above or below it, letting every plank work as broad as it will hold clear of fap, by which method only can every other seam produce a fair edge.

\textbf{Tor-Armour}, in a Ship of War. See \textit{Tor}, supra.

\textbf{Tor-Block}. See \textit{Block}.

\textbf{Top-Brim}, a space in the middle of the foot of a top, fail, containing one-fifth of the number of its cloths. It is so called from its situation, being near the fore-part of the top when the fail is extended.

\textbf{Top-Chain}, a chain to sling the fail-yards in the time of battle, in order to prevent them from falling down, when the ropes by which they are hung happen to be shot away, or rendered incapable of service. Falconer.

\textbf{Top-Hamper}, any unecessary weight aloft, either on the top-side of a ship, or about its tops and rigging.

\textbf{Top-Leaf}, a receptacle to hold three or more lights, made of tin and glass, placed in the aft-part of the top, in any ship where an admiral or commodore leads the van of a fleet.
TOP

Top-Lining, the lining fewed on the aft-side of top-fails, to preserve the fall from the chafing of the top.

Top-Mast, the second division of a mast, or that part which stands between the lower mast and the top-gallant mast. See Mast-Making.

By a late order in the navy, the blocks at the heels of top-masts (particularly in line-of-battle ships) are to be discontinued, and the top-masts made from as small ficks as possible: the sheave-hole is to be placed nearer the heel, by which means the several quarters will be brought nearer the butt, and the sizes of the ficks for making of top-masts diminished; and as some of the rough ficks will work one way larger than the other in the upper quarters, and thereby increase the circumference of the wood, where strength is requisite, leave this additional wood, and make the mast oval: a hoop is to be placed below the sheave-hole, and above the fit-plate. The caps of top-masts, also, are to have a semi-circle cut at the after-part, with an iron clamp to fit, so as to admit of getting a top-gallant-mast up abaft the top-mast, if necessary in chase.

The heels of jib-booms are also to be left square, to serve as substitutes for mizen-top-masts occasionally: and let the hearts be prepared conformable thereto.

Top-Gallant-Masts, are two, viz. main-top-gallant-mast, and fore-top-gallant-mast, which are small round pieces of timber, let on their respective top-masts; on the top of which masts are let the flag-fails, on which the colours, as flag-pendants, &c. hang.

Top-Netting is fastened to the rail, shrouds, and top, to preserve men from falling, &c.

Top-Rope, a rope employed to screw up a top-mast, or top-gallant-mast, in order to fix it in its place, or to lower it in tempestuous weather, or when it is no longer necessary. The rope used on this occasion for the top-masts is furnished with an assemblage of pulleys at its lower end, called the top-tackle; the effort of which in erecting the top-mast is communicated from the head of the lower-mast to the foot of the top-mast; and the upper end of the latter is accordingly guided into, and conveyed up through the holes between the treffel-trees and the cap. For this purpose, the top-rope, passing through a block which is hooked on one side of the cap, and afterwards through the holes, furnished with a sheave or pulley, in the lower end of the top-mast, is again brought upwards on the other side of the mast, where it is at length fastened to an eye-bolt in the cap, which is always on the side opposite to the top-block. To the lower end of the top-rope is fixed the top-tackle, the effort of which being transmitted to the top-rope, and thence to the heel of the top-mast, necessarily lifts the latter upward, parallel to the lower-mast. When the top-mast is raised to its proper height, the lower end of it becomes firmly wedged in the square hole, between the treffel-trees. A bar of wood or iron, called the fid, is then thrust through a hole in the heel of it, across the treffel-trees, by which the whole weight of the top-mast is supported. In the same manner the top-gallant-mast is erected, and fixed at the head of the top-mast. Falconer.

Top-Sail-Lifts. See Lifts.

Top-Sails, and Top-gallant-sails, in a Ship, are those belonging to the top-masts, and top-gallant-masts. The former are extended across the top-mast by the top-fail-yard above, and by the yard attached to the lower-mast beneath; being fastened to the former by robunds, and to the latter by means of two blocks fixed on its extremities, through which the top-fail sheets are infared, passing from thence to two other blocks fixed on the inner part of the yard, close by the mast; and from these latter the sheets lead downwards to the deck, where they may be flapped or extended at pleasure. The top-gallant-fails are expanded above the top-fail-yard in the same manner. Falconer. See Sail.

Since the article Sail-making was printed, the following alterations concerning sails have been adopted in the navy: viz. top-fails are to be reduced by deducting four inches for every three feet in length of the top-mast, instead of three inches and an eighth, as at present.

Mizen-top-fails are to be hollowed in the foot a yard and a half, instead of twenty-seven inches, to prevent rubbing over the stay; and top-gallant-fails are to be hollowed two feet in the foot of the fall, for the above-mentioned purpose.

The main-top-mast-fall-fail is to have six inches gore in every cloth at the foot of the fall, and long gore at the clue.

Mizen-courses are not to be supplied to any ships under fifty guns, but two drivers in lieu.

Driver-booms, as used in 1806, are to be reduced two inches in every yard. The length of the gaff to be in proportion to the fall, and then three feet added thereto, to shew signals.

Drivers are to be cut with a deduction in length, to answer the reduction in length of the boom and gaff, as above. Drivers for line-of-battle ships, the leech to be twice the length of the luff. For frigates, the length of the leech to be once and two-thirds the depth of the luff.

Jib.—The after-leech rope is to be two inches and a half in ships of the line, and in forty-gun frigates two inches and a quarter: other ships above twenty guns two inches, and one inch and three-quarters all under.

White bolt-rope is to be used in making of falls, instead of the tarred rope at present in use.

Single clump-blocks of eight inches in size are to be tarp-bound, clue-garnet fashion for reef-tackles in the leech of falls.

Top-Side, a name given to all that part of a ship's side above the main-wales.

Top-Timbers, the timbers which form the top-side of a ship. The first general tier which reach the top of the side are called the long top-timbers, and those the drift above are called the short top-timbers.

Top-Timber Half-breadth, a section containing one-half of the ship, at the height of the top-timber line, perpendicular to the plane of elevation.

Top-Timber Line, is the curve limiting the height of the keel at the given breadth of the top-timbers.

Top-Timber Sweep, is that which forms the hollow of the top-timber. This hollow is, however, very often formed by a mould, so placed as to touch the upper-breadth sweep, and pass through the point limiting the half-breadth of the top-timber.

Top-a-Starboard, and Top the Yard-arms. See Toppings.

Top-Brakes, signifies the level of the top of a canal's bank; as B C K, Plate I. Canals, fig. 1. &c. This is generally about one foot higher than the surface of the water D K.

Top-Soiling, the art of taking off the vegetable mould or top-soil before a canal is began, to be returned again upon the bank and new-made ground by the side of it.

Top-Water is the level line of the water's surface, as D H (Plate I. Canals, figs. 14 and 15) in a canal C F G I.

Top-Drainage, in Agriculture, a term sometimes applied to the practice of removing surface-wetness from land, either before it is to be prepared for the seed, or after that
has been put into the foil. In the latter of which cases, the furrows for the water are to be stricken with the plough, so as to terminate in the drains which have been formed, and take it away. This should be done daily, as the field is gone over by the harrow. See Surface-DRAINING.

This is an useful sort of draining for ploughed lands that are inclined to be wet.

Top-DRESSING, a term applied to such forts of reduced and other manure as is laid upon the surface of land without being turned into it; and also to the practice of dressing the surface of grass-land, or that of other kinds of land and crops, with some sorts of highly reduced or powdery manure, that can be evenly spread out or sown equally over them by the hand.

In the cultivation and management of lands of these kinds, a great variety of substances is in use for this purpose, such as foot, ashes, the dung of rabbits, pigeons, and other birds, rapa-duft, gypsum, malt-duft, and several others; the nature, ufe, and benefits of which, are more particularly noticed under their different respective heads, which fee.

The advantages which the Hertfordshire farmers derive from the practice of spring or top-dressing their lands and crops, are fully fhewn in the statements that have been given in the original report of the agriculture of that district; in which it is said, the spring or top-dressings of their lands are the leading features of the farming in that county, and consist of foot, ashes, malt-duft, and oil-cake duft, or pulverized oil-cake. The foot is generally used on the wheat-crops which have had no previous manure. It is laid in keps on the crops in winter, and sown over them in the spring. But the other top-dressings are houfed, and kept dry till used in this way at the proper time. See Soor.

It has been observed in some of the early Effex agricultural reports, that the application of manure upon the surface, or what is generally called top-dressing, ought chiefly to be regulated by the following confiderations: as, first, whether the foil is of such a nature as to require any correction in its temperament, to render it more or lefs tender, open, or fiable: secondly, whether the manure profoed to be applied, is capable of operating to that end: thirdly, whether the manure is capable of affording nourifhment to vegetables, unless it is brought into clofe and immediate contact with some other power or principle containing vegetable food in the foil: and, fourthly, whether the plant profoed to be fed by fuch manure, draws its nourifhment principally from the ground, or in other ways.

It is faid, that in the affirmative of all these cases it is plain the manure should only be flightly covered or lightly ploughed under. But that when the manure is of fuch a nature as to apply but lightly to fuch confiderations; when it is capable of being diffolved on the surface, and conveyed by water downwards to the roots of the plants, or by convection into vapour, to be absorbed by their ftiems or leaves, and that the plant is equally prone to receive its nourifhment in both ways; the economy and effective operation of top-dressings are unquestionably the most highly beneficial and greatly to be preferred.

Thefe top or spring-dressings are peculiarly applicable to poor light fandy and gravelly lands, and of course to the production of the specifically heaviest corn; and they put such lands more on an equality, in point of annual value, with stronger and richer foils.

And in the Corrected Agricultural Report of the fame district, it is faid that ashes as top-dressings, though they open and loosen the foil, do not feed a crop. They are sup-posed to laf two crops, and to be of fuch benefi to wheat-
crops, that when tenants quit farms, they are allowed half the expence of alighting or top-dressing the clovers, which has been laid out, that the in-coming tenants are to fow with wheat: some few infances too are met with of following them over or on wheats. The ufal time is the middle of winter, if the feaon be mild or moif. Moaf is destroyed by fome with this fort of top-dressing on park grafs-land, who think they do little good to the foul that follows the clover on which they are fpread, otherwife than by improving the clover. They are decidedy of opinion that it is better husbandry to use foot on barley than this kind of top-dressing; as the former will do much good to the following clover, whereas the latter are of no more utility to the wheat than by increasing the quantity of the clover crop. The farmers in these cafes low from ten to fourteen facks on clover.

In other parts of the fame district, these forts of top-dressings are laid to be very beneficial; and that on being fpread out on clover, they do as much good to the following wheat, as that of a top-dressing of the foot kind or footing did. On a comparison of them, as fown in November and February on clover, over exactly the fame places of land, in the fame quantities: thofe ufed at the former period produced the best crop by about a fourth part of a load of this form of hay on the acre. Some, how-ever, in other places, do not much approve of fuch top-dressings, except on clay, to fpread the foil, as they term it: they are fuppoef to do little good on arable chalky lands.

Top-dressings compofed of the duffs of different cakes are found very ufeful, but often too expensive for the purpo-fe. Some think thofe of the linfeed-cake kind the beft dysterious they have been known for wheat in top-folding, even fo late as the month of May, with fheep fed on fuch cake in troughs. The duff of cakes of the rape kind has likewise been much employed in some places as top-dressings, even when the expence has been fo high as twenty shillings the quarter. Mills are confructed for grinding it in the above district, and large quantities are imported from Ireland, and perhaps other places. Some have ifones attached to threshing-mills for reducing it to duff as a manure, the ufe of which is greatly approved of in fome cafes. By fome it has been found that it answers the better when fpread on wheat. The quantity of this manure as a top-dressing is of from twelve to fifteen bushels on an acre, as to add to the richness of the land or foil, already in a tolerable ifte of condition. It cannot be made ufe of for any crop better than for that of wheat. By having machinery for breaking and reducing it into a duffy flate, the farmer is faid to have the advantage not only of buying it in at any time of the year when it is the moft reasonable, (for as the two feafons of using it come on, it often increases in price, and is again cheaper when they are past,) but of readily preparing it and keeping it free from any admixture of other matters. It is faid that this fubfance is not now fo good as formerly, as the manufacturers of oil from the feed of rape contrive to pref it twice at prefent, whereas they formerly never pref it more than once; and that, besides, they then only fed horeses, where they now ufe water, wind, andteam.

The two principal feafons for making ufe of these forts of duffs as top-dressings, are in the very early springing, and in the early part of the autumn, when the weather is rather moif.

Top-dressings of the malt-duft kind, which chiefly con-fift of the infant sprouts of the grain, and probably contain faccharine matter, from the powerful nature of their eflects in
The principal colour of the topaz inclines to yellow, called by professor Jameson wine-yellow. The pale wine-yellow passes from various shades of yellowish and greenish to white at the latter, but the latter colour is very rare. The topaz sometimes occurs massive and in rolled pieces, but more frequently crystallized. The crystals are seldom very large. The primitive form of the crystal, according to Hauy, is a rectangular octahedron. The common forms of the secondary crystals are varieties of the oblique four-fid ed prism, terminated by four planes. The fides of the prism are longitudinally streaked, but the terminating planes are smooth. When the edges of the crystals are truncated, the truncated planes are also smooth. The Brazilian and Siberian topazes are more deeply streaked than the Saxon. The external luster of the topaz is splendent, the internal vitreous. The longitudinal fracture is small, and imperfectly conchoidal; the crow fracture is straight, and exhibits a lamellar structure. The topaz is translucent or transparent, and refracts double: it scratches glasses, but is scratched by spinel: it is easily frangible. The specific gravity varies from 3.464 to 3.641.

The Saxon topaz becomes colourless by a gentle heat, and in this state is sometimes fold for the diamond. A strong heat deprives it of its luster and transparency. The Brazilian topaz, by exposure to a strong heat, becomes red; and in a still higher temperature, violet-blue; it is then sometimes fold for the ruby, or for pale spinel. The topaz is insensible by the blowpipe, but melts with the addition of borax. The topazes of Brazil, Siberia, and Asia Minor, become electrical by heating. The constituent parts of this gem appear to vary considerably in different specimens.

The topaz is found in various parts of Europe and Asia, and in South America. It occurs in large quantities in a rock denominated by Werner the topaz rock, which is an aggregate of massive topaz, quartz, and fchord, in which there are frequently small cavities lined with crystals of these three substances, and portions of lithomarge. This rock is situated at Schneekenstein, in Saxony.

It occurs also in veins of quartz at St. Michael's mount, in Cornwall, and with tin-ore at St. Anne's, in the same county. The topaz has recently been found, in large crystals and rolled pieces, in alluvial soil in the primitive country of the upper part of Aberdeen. Indeed it is stated, in the first volume of the Wernerian Memoirs, that a specimen of topaz, weighing one pound three ounces eight drachms troy weight, has been obtained from that part of Scotland. The largest specimen of Brazilian topaz in the museum of natural history at Paris, weighs four ounces two gros. In this museum there is also a superb Indian Bacchus engraved on topaz. Tavernier mentions a topaz, in the possession of the great Mogul, weighing one hundred and fifty-seven carats, which cost 20,300l. sterling: and Boetius de Boot, in his treatise of precious stones, affirms to have seen in the cabinet of the emperor Rudolphus, whose physitian he was, a topaz above three feet long, and six inches broad. Probably, it might be some other stone a little transparent, of a topaz colour. This gem was much prized by the ancients. Yellow-coloured rock-crystal has not been unfrequently imposed on the ignorant for topaz.

The oriental topazes, which have a deep rich orange-colour, are highly valued at present. The Brazilian topaz

Vol. XXXVI.
TOP

has not so rich and fine a colour as the former. The Saxon topaz is distinguished by its wine-yellow colour, and when cut, often exhibits a lufure equal to that of the finest oriental varieties. The mountain-green varieties of topaz, which are found in Siberia, are included under the name of aqua marine. The Brazilian ruby and sapphire include the red and blue Brazilian topaz.

The topaz may generally be distinguished from all other minerals by the rhomboidal base of its crystals, the fracture, and a crescent lamellar structure, and by the longitudinal streaks on its side planes. It is less hard and heavier than yellow sapphire, and the latter does not become electric by heating. The same characters distinguish it from sapphire; it is further distinguished from sapphire by its double refraction. Green-coloured topaz is distinguished from beryl by its greater specific gravity, that of topaz being 3.5, and of beryl only 2.7. The latter cleaves in the direction of its lateral planes, which the topaz does not.

The following minerals have been denominated topazites, when colour was considered as affording the most certain character of precious stones.

1. Yellowish-white faphirine
2. Zircon
3. Chrysolite
4. Yellowish beryl
5. Yellow rock-crystal
6. Clove-brown and brown rock-crystal

Names given to varieties of the topaz.

1. Mountain green topaz
2. Blue topaz
3. Yellow topaz
4. Wine-yellow inclining to red topaz
5. Red topaz
6. Yellowish-green topaz

See Sapphire, Ruby, and Gems.

A peculiar property of the topaz was discovered by Vanquelin, that the powder of this gem changes the syrup of violets to green if it remain in the liquor two or three hours, and this property is common to all the varieties of the topaz.

Mr. Canton, in 1760, found that the Brazilian topaz has the electrical properties of the tourmaline.

The topaz is easily counterfeited, and there are facetious ones, which, to the eye, are inferior to the natural ones.

To counterfeit the topaz in glass, see Glass resembling Topaz.

To counterfeit the oriental topaz in paste: Take crystal prepared, two ounces; ordinary gum, or red lead, seven ounces; put these into a crucible luted, and bake them twenty-four hours in a potter's kiln. If the mass is not sufficiently clear and fine, cover it up again, and give a second baking, and it will come out of a fine topaz colour. See Paste.

If we might believe the ancients, the topaz has very notable virtues; but those are now in discredit. See Gem.

TOPAZOS, or Topazus, in Ancient Geography, an island placed by Pliny in the Red Sea, 300 stadia from the continent.

TOPDALS, in Geography, a town of Norway, in the province of Christianland; 32 miles N. of Christianland.

TOPE, in Ichthyology, an English name for a species of the squalus, according to the Artediatory, the squalus galeus of Linnaeus, distinguished from the other squali by the nostrils being placed near the mouth, and by certain foramina, or apertures, near the eyes. It is the fish called by the ancients saurus, or squalus canis and curculiata. See Squalus.

TOPEL, or Tapel, in Geography, a town of Bohemia, in the circle of Pilzen; 56 miles W. of Prague. N. lat. 49° 58'. E. long. 12° 57'.—Alto, a river of Bohemia, which runs into the Egra, near Carlsbad.

TOPERHA, a small iland in a bay on the N. coast of New Guinea. S. lat. 3° 5'. E. long. 135° 35'.

TOPETINA, a town of Mexico, in the province of Mechoacan, at the mouth of a river near the Pacific ocean; 50 miles N.W. of Zacatula. N. lat. 18° 59'. W. long. 105° 44'.

TOPETRY, a town of Hindoostan, in the Carnatic; 50 miles S.E. of Tanjore.

TOPHATH, in Ancient Geography, a place in the Land of Paride, near the Dead Sea. Jofiah destroyed this place on the abolition of idolatry.

TOPHUS, a kind of node, or swelling of the perio- team. Alto, the fort of concretion found in the joints of gouty perisons.

TOPHUS, in Natural History, is a species of sand-floe, called also porus, mostly of a grey colour; but it is also found of other colours, as whith, brownish, &c. according to the foil in which it is imbedded. It much resembles the pumice in texture, being rough and brittle, and composed of a large angular grit, cemented by a very coarse terrene crystalline subsidence. It is too soft to strike fire with flint. It is common in Italy and in Germany, where it is used for building, chiefly for cellars and turning arches. Da Colta's Hiist. Foliiis, p. 136.

TOPI, in Geography, a small island in the Mediterranean, near the N. coast of the island of Elba. N. lat. 42° 51'. E. long. 11° 30'.

TOPIA, a town of Mexico, in the province of Culiaca; 80 miles N. of Culiaca. N. lat. 25° 44'. W. long. 108°.

TOPIA, the chief chain of mountains in Spanish North America, commencing in the neighbourhood of Guadalaxara, and extending north to New Mexico, a distance of 150 leagues, or, according to our maps, more than 700 British miles; while the breadth of all the ridges is, according to Alcedo, sometimes 40 leagues, or 160 miles. This chain is of such a height as to be comparable with the Andes of Peru, and abounds with precipices of the most profound and terrible aspect. It is almost universally densely clothed with large and lofty pines, and other trees which afford suffusion to birds of very variegated and beautiful appearance. On the summit the cold is intense, but the tem- perature on the fides varies according to climate and exposure. It is the source of many rivers flowing into the Atlantic and Pacific, and subject, on the melting of the snow, to very considerable inundations. During the rains, which last from June to September, the rivers become terrible in their devastations to the distance of two or three leagues, and the mosquitoes become intolerable. Among the animals in these regions, are bears, lions, and tigers, as well as squirrels of various kinds. This chain is prolific in silver, yielding about a mark for each quintal of earth. It received its name from a savage tribe, which was converted by the Jesuits in 1590; but the mines, on account of their distance from the capital, have been mostly abandoned. The ridge of Topia is also called the "Sierra Madre," or mother-chain, and embraces the singular province of Nayarit, which remained
remained Pagán till the year 1718. Towards the N. the extent of this chain has not been precisely ascertained; but the Moquis, on the W. of Santa Fé, and under the same parallel, are positively classed among its inhabitants; and it probably forms one chain with that of Nabajo, and the Sierra Azul, or Blue Ridge, of Alzete, and the lofty mountains of North-west America, sending off a branch called Gomes on the W. of New Mexico, while on the E. of that province is the inferior ridge of Namh. In the vice-
royalty, the general distance of the Tupian chain from the western shore is about 140 British miles, but in some parts not above half that space. Pinkerton.

TOPIIARIA, in Botany, a name by which some authors have called the acanthus, or bear’s-breech, a plant common in the gardens of the curious.

TOPIC, in Rhetoric, a probable argument, drawn from the several circumstances and places of a fact, &c. See ARGUMENT and LOCUS.

TOPICE, topical. Topica, expresses the art or manner of inventing and managing all kinds of probable arguments.

The word is formed from the Greek, τόπος, of τόπος, place, its subject being the places, which Aristotle calls the facts of arguments.

Aristotle has written "Topics," and Cicero a kind of comment on them, to his friend Trebatius, who, it seems, did not understand them. But the critics observe, that the "Topics" of Cicero agree fo little with those eight books of Topics which pass under the name of Aristote, that it follows necessarily, either that Cicero was much mistaken, which is not very probable; or that the books of Topics, now attributed to Aristotle, are not wholly his.

Cicero defines topics, or topics, to be the art of finding arguments, "disciplina inveniendorum argumentorum."

Rhetoric is sometimes divided into two parts; judgment, called also dialeitica; and invention, called topics.

TOPICS, formed from τόπος, place, or topical remedies, in Medicine, are commonly used for what we otherwise call external remedies, i.e. such as are applied outwardly to some particular diseased and painful part.

Such are plasters, cataplasmis, blisters, ungueants, newbs, collyriums, &c.

Topics are such medicines, as by the smallness and mobility of their particles, attended for the most part with gentle acrimony, are able to make their way into the substance of the parts to which they are applied, without eroding or winding any of the solids; and thence are juelly called penetrating topics.

It may be a question how topics in medicine act. It is commonly said, that this or that medicine penetrates the pores; but the ideas annexed to such expressions do not seem very distinct. Writers on this subject have seldom been at the pains to tell us what pores they mean. We have an essay on this subject in the Med. Eii. Edinb. vol. ii. art. 4 by Dr. Armstrong, who thinks that the effects of such medicines are not owing to the particles entering the orifices of the absorbent veins; nor to the opening of the exhalent vessels on the surface of the body by these medicines; nor will he allow the particles of penetrating topics to force their way through the costs of the vessels; but he supposes that subtle medicines are conveyed, by the exalent vessels of the skin, to those parts of the smaller arteries, where the circulation is obstructed by obstruction.

The gout is never cured by topics: they may alleviate the pain for a time; but for a cure, the source of the evil must be attacked with internals.

TOPINAM, in Geography, a town of Brazil, in the government of Para, on the river of the Amazon; 80 miles S.W. of Pauis. S. lat. 2° 43'.

TOPINAMBOS, a considerable tribe of anthropophagi in Brazil.

TOPINO, a river of Italy, which runs into the Tiber, 5 miles S. of Perugia.

TOPIRIA, in Ancient Geography, a town situated in the interior of Thrace. Pliny and Ptolemy.

TOPILTZ, in Geography, a town of Bohemia, in the circle of Leitmeritz, near which the Austrians defeated the Prussians in the year 1762; 14 miles W.N.W. of Leit-
meritz. N. lat. 50° 37'. E. long. 13° 51'.

TOPWODA, a town of Silegia, in the principality of Munsterberg; 7 miles N.W. of Munsterberg.

TOPLOCA, a town of Hungary; 14 miles S.E. of St. Crot.

TOPLOC, a town of Hungary; 20 miles S.S.W. of Podolizc.

TOPOBEA, in Botany, Aubl. Guian. 476. t. 189. Jufi. 329, is probably not generically distinct from MELAS-
TOMA; fee that article, and the natural order of MELAS-
TOMA.

TOPODURTY, in Geography, a town of Hindooftan, in Myfore; 24 miles W. of Tademer.

TOPOGRAPHY, formed from τόπος, place, and γραφή, L I delist, a description or draught of some particular place, or small tract of land; as that of a city or town, manor or tenement, field, garden, house, cell, or the like; such as surveys let out in their plots, or make draughts of, for the information and satisfaction of the proprietors.

Topography differs from chorography, as a particular from a more general.

TOPOLEVA, in Geography, a fortress of Russia, in the government of Caucasus, on the Ural; 40 miles N. of Gniev.

TOPOLITZA, a town of European Turkey, in Moldavia; 12 miles S.W. of Niemecz.

TOPOLTZAN, a town of Hungary; 52 miles N.E. of Pressburg. N. lat. 48° 34'. E. long. 18° 25'.

TOPOLITZAN, (Kis,) a town and castle of Hungary; 12 miles N.W. of Bukans.

TOPOROW, a town of Austrian Poland, in Galicia; 35 miles N.E. of Lemberg.

TOPPARPOUR, a town of Hindooftan, in Oude; 15 miles E. of Bahratsch.

TOPPING of Trees, in Rural Economy, the practice of cutting or lopping off the heads of them, especially of the different sorts of hedge-row trees, which, in this last cafe, is a disgusting and disgraceful custom, now on the decline. See POLLARD Trees.

Where, however, this fort of work is to be performed, it should, in all cafes, be executed in the autumn, or very early in the spring months.

In lopping fallen trees, the different parts should be cut out and put together into separate lots, as the large arms into one, the smaller branches into another, and the small bruth, or fraggot-wood, into a third. Thus the whole may be readily disposed of, or converted to its proper use.

Topping the Lifts, board a Ship, the fame as haling the top-fall-lifts, by slackening one of them, and pulling upon the opposite one, so as to place the yard at a greater or less obliquity with the masts. See Lifts.

Topping-Lift, a large and strong tackle, employed to suspend or top the outer end of a gall, or of the boom of a main-fail and fore-fail; such as are used in brigs, sloops, or schooners. Falconer.
TOPRAK-KALA, in Geography, a town of Turkish Armenia; 6 miles S. of Kars.

TOPRAK-KALAIH, a town of Asiatic Turkey, in the province of Diarbekir; 60 miles S. of Moful.

TOPSAIL INLET, a channel between two small islands on the coast of North Carolina. N. lat. 34° 18'. W. long. 77° 48'.

TOPSFIELD, a township of Massachusetts, in the county of Essex, containing 815 inhabitants; 24 miles N.E. of Boston.

TOPSHAM, a market-town in the hundred of Wopsford, and county of Devon, England; is situated at the confluence of the rivers Clyft and Exe, 3 miles S.E. from Exeter, and 170 miles W.S.W. from London. Leland, speaking of this town, says, "Here is the great trade and rode for shippes that with this haven, and especially for the shippes and merchant-mannes goodes of Exetermen. Men of Exeter contende to make the haven cum up to Exeter self: at this time shippes cum not further up but to Apsham." The mayor was the property of the Courtenays, earls of Exeter, one of whom procured for the town the privilege of a market, and an annual fair, which are still held; the market-day being Saturday. The town confines principally of one long street, of irregular breadth, chiefly extending north and south along the eastern bank of the Exe. Many of the houses are handsome, but the greatest number have but a mean appearance. The southern extremity, called the Strand, is the most pleasant, the river flowing within a short distance of the houses, and is chiefly inhabited by persons of fortune: the view from it is extensive and beautiful. The quay is spacious and convenient, and now belongs to the chamber of Exeter, who purchased it about the year 1778. Most of the inhabitants are employed in the shipping business; the total number, as returned under the act of the year 1811, was 2871; the number of houses was 620. The church stands near the centre of the town, on a high cliff, which affords an extensive view of a noble river, distant shipping, churches glittering through groups of trees, a fertile vale, and a fine range of mountains, rising above each other in beautiful perspective, as far as the eye can reach.

In the vicinity of Topsham is Nutwell, the seat of Lord Heathfield, nephew and successor to Sir Francis Drake. According to Ridson, the manor-house was a castle, till Lord Dintmann, about the time of Edward IV., converted it into a flatly dwelling-house. Sir Francis Drake made many alterations; and it has been nearly rebuilt by the present possessor on a more ample scale, and at a very great expense.

TOPSHAM, a township of the province of Maine, in the county of Lincoln, containing 1271 inhabitants; 156 miles N.E. of Boston.—Alfo, a town of Vermont, in the county of Orange, containing 814 inhabitants.

TOR, a sea-port of Arabia, on the coast of the Red sea, formerly a place of confluence, and strong, but at present in a ruinous state and without a garrison. Near it is a ruined castle, inhabited by the Arabs; the Greeks call this place "Raitho," which might have its name from being inhabited by some of those people called by Ptolemy "Raitheni," towards the mountains of Arabia Felix; it is inhabited by Arabs, and about twenty families of the Greek church. The monks of mount Sinai have a convent here, to which they have sometimes retired when they could not conveniently stay at mount Sinai; only one priest resides in it for the service of the church. About a league north of Tor is a well of very good water, and about it are a great number of date-trees, and several springs of salt-water, especially to the south-east, where the monks have their garden. Near it are several springs, and a bath or two, which are called the "Baths of Moles," the Greeks as well as some others are of opinion that this is Elim. The greatest curiosities of Tor are the productions of the Red sea; the shell-fish of it are different from those of the seas to the north of it; but what are most peculiar to it, are the several flate vegetables, the madrepore, a fort of coral; the fungi, or mushrooms; and the red pipe coral. In 1540, Tor was taken by the Portuguese. N. lat. 28° 10'. E. long. 33° 37'.

Ton, a town of Africa, in the country of the Foulahs. N. lat. 16° 30'.

Tor Alba, a town of the island of Sardinia; 20 miles E.N.E. of Algeri.—Alfo, a town of the island of Sardinia; 13 miles S. of Oriflaghi.

Tor di Cane, a town of Naples, in the province of Bari; 9 miles S.E. of Monopoli.

Tor Point, or Hope's Nose, a cape of England, on the coast of Devonshire, forming the north point of Torbay.

TORA, a town of Egypt, on the Nile; 8 miles S. of Cairo.—Alfo, a town of Naples; 9 miles N.N.E. of Sezza.

TORACA, or Butua, a province of Africa, in the empire of Mocaranga.

TORADOR. See Bull-Fighting.

TORAITO, in Geography, a town of Thibet; 30 miles N.E. of Tchontori.

Toral, E., a sea-port of Chili. S. lat. 27° 53'.

Toraliba, in Ancient Geography, an island of the Indian sea, near the mouth of the river Indus, and 9 miles from the island of Bybaga. Pliny.

TORAR, in Geography, a town of Hindooftan, in the circuit of Surgoonga; 30 miles E.S.E. of Surgoonga.

TORAY, a commodious bay or sea-road, five miles from Dartmouth, on the coast of Devonshire, England. It is formed by two capes, that on the east called Bob's-Nose, that on the west, Berry-Head. Its general shape is semilunar, including a circumference of about twelve miles. The winding shores on both sides are fenced with great ramparts of rock; between which, in the central part, the ground from the country, forming a gentle vale, falls easily to the water's edge. Wood grows all round the bay, even on its rocky sides, where it can get footing and shelter; but in the central part with great luxuriance. This noble bay has often afforded protection to the fleets of England, which, in their full array, ride safely within its ample bosom. The prince of Orange, afterwards king William III., landed here on the 5th of November, 1688, to effect the ever memorable revolution. Near this bay is a remarkable place called Kent's-Hole, confuting of many caverns entered by subterraneous passagés, but having only one external entrance.

Tor Abbey, the seat of George Cary, esq., is finely situated amidst some ancient and noble trees, and commands an interesting prospect of Torbay, and the rocky tors in the vicinity. The house is mostly modern; though some parts of the old abbey are still preserved. It consists of a centre and two wings; one of which is connected with a cartellated gateway, having octagonal towers and battlements. Beyond this gateway is a large barn, which formerly belonged to the Abbey. It is overgrown with a venerable mantle of ivy, and decorated with loop-holes, and numerous buttresses. The ancient religious house of this place was erected by William, lord Briwire, or Burier, in the time of king John, and endowed by him with considerable revenues, which were afterwards much augmented by his son. It was appropriated for canons of the Premonstratensian order. After the Buriers, Tor Abbey
TOR

Abbey came into the Mohun family, who were succeeded by the Ridgways, and these by the Carys, who now enjoy it. At the dissolution, the revenues amounted to £367. 11s. 11d.—Gilpin's Observations on the Western Counties, 8vo. Beauties of England and Wales, vol. iv. Devonshire, by J. Britton and E. W. Brayley, 1803.

TORAY, a bay of the North Atlantic, on the east coast of Newfoundland. N. lat. 47° 48'. W. long. 52° 20'—Alfo, a town and bay on the south coast of Nova Scotia. N. lat. 45° 8'. W. long. 61° 15'.

TORBEC, a town on the south coast of Hispaniola; 9 miles N.W. of Vache island.

TORBA, a town of France, in the department of the Maritime Alps, called by the Romans Trophea Auguli, with an ancient Gothic tower. In the environs are found many remains of monuments erected by the Romans, trophies and fragments of a flatue of Augustus; 7 miles E. of Nice.

TORBIDO, Francesco, called Il More, in Biography, was born, about the year 1500, at Verona, and perhaps rather before it, as he is said to have had, for a short time, the advantage of receiving instruction from Giorgione. He afterwards became the pupil of Libera, and his own style is a compound of those of his masters, partaking of the glow of the former, with the elaborate finish of the latter. His principal occupation was in portrait, yet he left several historical pictures of considerable merit. Amongst them are some freecoes, representing the life of the Virgin, in the cathedral at Verona; and a picture in oil of the Transfiguration, in the church of S. Maria Maggiore, at Venice. He died at the age of 81, but the exact date is unknown.

TORBIDO, in Geography, a river of Naples, which runs into the Crate, near Bisignano.

TORBISON, a town of Spain, in the province of Grenada; 14 miles N.E. of Motril.

TORBOLE, a town of the Tyrofepe, on the north-east coast of lake Garda. In 1796, this town was taken by the French; 17 miles N. of Garda.

TORBUS, See Tetrado.

TORC, a mountain of Ireland, in the county of Kerry, on the south side of Lough Lane, whence the southern part is called Lough Toire.

TORCELLO, a small island in the gulf of Venice, with a town of the same name, the see of a bishop, suffragan of Venice. The town of Torcello is in a flourishing state, which it owes to the inhabitants of Altino, who were driven out of that place by Attila, and fled hither; it has also been the see of the bishop of Altino, in consequence of the bishop Paolo having emigrated to the first-mentioned place. His successor, Mauro, or Mauritrio, obtained from pope Severino the confirmation of his new see, and built here several churches, together with the elegant nunnary S. Giovanni di Torcello. More churches were built by his successor Giuliano; and Diadato, the fourth bishop, erected finally, in the year 697, the principal church of Santa Maria; which was rebuilt from the ground, in the eleventh century, by the bishop Orlo; 5 miles N. of Venice.

TORCH, Tuma, a fort of luminary, properly a stick of fir, or other resinous and combustible matter, as pine, linden, &c. more or less thick, and long; encompassed at one end with fix wax candles, which being lighted, yield a kind of gloomy brightness.

Torches are used in some church ceremonies, particularly at the proceccions of the holy sacrament in the Romish church, and at the interments of the poorer people. Formerly they were used at the funerals of those of the first rank; but tapers and flambeaux are now introduced in their stead; and frequently also called by their name.
tip of the feathers being of that colour: the tail is long and of a reddish-orange colour, and the under-feathers of the wings are of the same hue; the females are of a less elegant colour than the males, viz., a mouse-colour, variegated with white on the back, and ash-colour on the belly; what is yellow in the male birds, is also very pale in the females: it is not uncommon in Germany, and may be taught, like the stork, to imitate the human voice. Ray.

TORDYLLUM, in Botany, Τοδάλλος of the Greeks, probably the only plant of Dioscorides, is supposed by Linnaeus to owe its name to the neat orbicular figure of its seeds, which seem as if artificially wrought, or turned. The same idea is hinted by Bodezus a Stapel, in his edition of Theophrastus, 1125: but Linnaeus appears to have been more particularly led by Ambrosius, to resolve the word into Τοδάλλος, a turning leaf, and Τόρ δάλλος, to turn. The latter seems superfluous. De Theis is dissatisfied with this etymology. We can only say, in its support, that those philologists who have not traced the word to its origin, nevertheless consider it as applying particularly to the feed of the plant.—Linn. Gen. 170. Schreb. 181. Wild. Sp. Pl. v. i. 1381. Mart. Mill. Dicht. v. 4. Sm. Fl. Brit. 194. Prodr. Fl. Græc. v. i. 180. Ait. Hort. Kew. v. 2. 124. Spreng. Prodr. Umbellif. 11. Jull. 224. Tourn. t. 170. Lamarrck Illust. t. 193. Gräfin. t. 21.—Clasf and order, Pentandria Digynia. Nat. Ord. Umbelliferae.

Gen. Ch. General Umbel of many unequal rays; partial of many unequal very short ones, flat. General Involucrum of several slender undivided leaves, mostly as long as the umbel; partial unequal, exceeding the partial umbel in length at its outside. Perianth of five teeth. Cor. Unifloral irregular, radiant; all the florets fertile; partial of the diph with five equal petals, whose inflexed points render them heart-shaped; of the radius similar, but its outermost petals are very large, and deeply divided. Stam. in all the florets, Filaments five, capillary; anthers simple, roundish. Pijl. in all the florets, Germin roundish, inferior; fyles two, small, erect; stigmas obtuse. Peric. Fruit nearly orbicular, compressed, crenate at the edge, separable into two parts. Seeds two, nearly orbicular, almost flat, with a thickened, finely crenate, margin.

Eff. Ch. Involucrum long and undivided. Corolla radiant. Flowers all perfect. Fruit nearly orbicular, compressed almost flat, with a crenate margin.

Obs. Linnaeus points out the presence of efficient flaments and stylets in all the florets as the most important difference between this genus and CAULICIDES, see that article. But the latter being ovate, fricate, and befit with rigid bristles, afford, as he afterwards justly thought, a more constant and satisfactory character.

1. T. syriacum. Syrian Hart-wort. Linn. Sp. Pl. 345. Wilds. n. 1. Ait. n. 1. Jacq. Hort. Vind. v. i. 21. t. 54. Rivin. Pentap. Irr. t. 3. (T. minor sphyriacum, fennicus limbo græcum; Linn. f. Ser. 209. Mon. feot. 9. t. 16. f. 7. Gingidium latifolium; Ger. Em. 1042.)—Partial involucrum many times longer than the nearly fidele flowers.—Native of Syria and Caria. A hardy annual in our botanic gardens, flowering in July. The whole herb is hoary with short close hairs, which render it soft to the touch. Stem twelve or eighteen inches high, angular, leafy, somewhat branched, zigzag, spreading. Leaves flaked, pinnate, of three or five broad, obtuse, rounded, notched leaves; the odd one largest, slightly three-lobed, an inch and half long. Umbels lateral and terminal, on long spreading, furrowed stalks. Flowers white, few and small; but the leaves of the partial involucrum are remarkable for being about an inch in length, obovato-lanceolate, leafy, exceeding those of the general one in size. The seeds are brittle and violet, with a crisp margin.

Native of the south of France, Italy, Sicily, and the Levant. Dr. Sibthorp found this plant in various parts of Greece and the neighbouring islands. He rejoiced in it, with great probability, to be the identical specimen of Dioscorides. As a British plant it rests on the authority of Doody, who gathered specimens from Swequet, and communicated them to Ray. The latter could not mistake the species, but he hints, in his Synopsis, ed. 2. 102, that the seeds probably escaped from some garden. This is an annual, more erect than the foregoing, but, like that, downy, not brittle. The leaves are ovate, sometimes rather oblong, sometimes roundish-heart-shaped, from three to nine; flaked and lobed in the larger more luxuriant leaves, but generally unequally crenate only: the upper ones are lanceolate or oblong. Flowers large, white or pale flesh-coloured, numerous; the two outer petals, especially of the marginal flowers, remarkably radiant, one lobe of each being disproportionate large. General and partial involucrum of narrow awl-shaped leaves, the latter smallest. Seeds smooth, with an elegant, broad, thick crenate border. This plant was formerly cultivated for the sake of its seeds, supposed to promote urine and other excretions, but now out of use. The T. apulum minimum, Columa. Ecchro. 122. t. 124. f. 1, seems to us a starved variety, different, as Jacquin well remarks, in Hort. Vind. v. 3. 2, from the following, though he errs in taking it for the true apulum, which is what he originally so called. See the next species.

3. T. apulum. Smaller Hart-wort. Linn. Sp. Pl. 345. Wilds. n. 4. Ait. n. 4. Prodr. Fl. Græc. n. 631, excluding the synonyms. Rivin. Pentap. Irr. t. 2. Jacq. Hort. Vind. v. i. 21. t. 53. Spreng. n. 3. (T. humile; Desfont. Atlant. v. i. 235. t. 58.)—Partial involucrum shorter than the flowers. Leaves laciniate; the upper ones narrow. Radiant petals solitary, of two equal lobes.—Native of cultivated fields in Italy, Barbary, and Greece. A smaller plant than the foregoing, annual like that, but with several florets, whose lower part, as well as the sheaths of each flootflocks, is faggie, with long white woolly hairs. The leaves of the lower leaves, about seven, are rounded, variously jagged and notched; those of the upper fill more various in figure, narrow, mostly wedge-shaped, often deeply, and very acute, three-lobed. Umbels of usually five rays, sometimes more, four times as long as the general involucrum. Flowers white, radiant, but not in the manner of the foregoing, they having but one greatly enlarged petal, whose two obovate lobes are nearly equal. The seeds have a broader, fricated, granulated disk, with a thick, but not fo broad, border as in T. officinale. The synonyms of Bauhun, Sefel cristatum minimum, as well as thofe of Turnefort, Ray and Morifon, cited in Sp. Pl. and Hort. Cliff., all depending on Columbus's plant mentioned under our last species, are to be transferred to that. 4. T. fëfifulum. Red Dwarf Hart-wort. Scop. Carn. v. i. 134. t. 8. Wilds. n. 6. Spreng. Prodr. 11.—General involucrum of one or two leaves. Leaves ovate, lobed and notched, nearly uniform. Radiant petals solitary, of two equal lobes. Fruit briefly.—Native of the alps of Carniola.
Carniola. This appears to be nearly related to the lait, nor can we discern why professor Sprengel marks it as a doubtfully specific. We have seen no specimens. The faithful Scopolii describes it as about a foot high, with uniform leaves, composed of two pair of obliquely ovate, or half-heart-shaped, fiddle, notched leaflets, and a terminal one, broader, deeply three-lobed. The flowers are red, or pink. Fruit oval, compressed, with a thick, finely bristly, not described as crenate, whence perhaps the doubts of professor Sprengel.

5. T. maximum. Great Hart-wort. Linn. Sp. Pl. 345. Wild. n. 5. Fl. Brit. n. 2. Engl. Bot. t. 1173. Jacq. Aufr. t. 142. Scop. Carn. v. 1. 105. Tourn. Infl. 320. (Tordylium; Rivin. Pentap. Irr. t. 1. Sefli creticum majus; Bauh. Pin. 161. Ger. Em. 1950. Cauccalis major; Chfl. Hifh. v. 2. 201. Ger. Em. 1021, bad. Herculeum Tordylium; Spreng. Prodr. 12.)—Umbels dense. Leaflets lanceolate, deeply ferrated. Stem rough with deflected bristles; umbels and fruit with erect ones.—Native of waste ground, banks and hedges, in Italy, Switzerland, Germany, and, though very rarely, England, flowering from June to August. It has long been observed under the hedge on the north side of the park, at Oxford; and was gathered by Dr. Sibthorpe, met with this plant in Greece and about Constantinople. The root is annual, tapering. Stem three or four feet high, erect, branched, leafy, furrowed, clothed all over with short, rigid, pungent bristles, which point strongly downward; while the rays of the umbels, the involucre leaves, which are all short and awl-shaped, and the germen, as well as fruit, are equally rough, with erect bristles. The lower leaves consist of about five broad, ovate leaflets, deeply and irregularly notched; the upper of about three elongated narrow ones, strongly ferrated; all rough with close-pressed rigid hairs. Flowers small, reddish, with unequal petals, but not strikingly radiant. Calyx-teeth elongated, unequal. Fruit nearly orbicular, bristly, with a thick, pale, rugose border, less crisped than in the first three species, and a slightly tumid, ribbed disk. The presence of a general as well as partial involucre, does not agree with Sprengell's character of Herbacea, nor do the seeds answer to his description of that genus.

6. T. peregrinum. Oriental Hart-wort. Linn. Mant. 55. Willd. n. 3. Ait. n. 3. (Conium dichotomum; Desfont. Atlant. v. t. 246. t. 66. Caucalis Hispanica; Camer. Hort. t. 7. t. 11. Chacryis peregrina; Spreng. Prodr. n. 11. and C. dichotoma; ibid. n. 12.)—Leaves repeatedly compound, smooth, with linear decurrent segments. Fruit elliptical, furrowed, with crisped ribs and margin.—Native of the Levant. Herb annual, smooth, with a branched spreading stem, and very finely divided, triple compound leaves. General umbels of scarcely more than three or four smooth stout rays; parial small and dense. General involucrum of one or two small, ovate, pointed, white-edged leaves; parial of several similar unequal ones. Flowers small, scarcely, if at all, radiant, white, or slightly reddish. Fruit thick, almost <a href="https://www.ea.png">fruit</a> more elliptical and acute than in the rest of the genus, having a thick, crisped edge, and three greatly elevated, less strongly corrugated, ribs at each side. The genus of this plant is certainly very ambiguous. It might perhaps be safely referred to Conium, with which its habit more agrees, especially as the fruit answers but indifferently to the idea or definition of a Tordylium.

T. latifolium, Anthriscus and nodiflorum of Linnaeus are now generally referred to Conica. Sprengel however has restored the genus Torilis of Adanson and Gartner; see that article, to which the two latter belong.

We shall have occasion to speak of the difficulties frequent in the generic distribution of this tribe, when we come to the article Umbelliferae.

TORE, Torus, in Architecture, a large round moulding, used in the bases of columns.

Daviler derives the word from the Greek, τορος, a table, to which it bears some resemblance; or from the Latin torus, a bed, as being supposed to represent the edge of a bed or quilt, swelled out with the weight of the incumbent column.

The tore is also called gross botan, and tendin. It is the significs that distinguishes the torus from the astragal.

The bases of Tuscan and Doric columns have but one tore, which is the smaller; but a smaller, or under, or bigger.

TOREE, in Geography, a cirque of Bengal, bounded to the north by Pamow, Koonda, and Ramgor; on the east by Ramgor; on the south by Chuta and Nagpour; and on the west by Palamow; about 32 miles long, and 24 broad. Toree is the capital.—Also, a town of Hindoos, and capital of a cirque of the same name, in Bengal, 210 miles W. of Calcutta. N. lat. 22° 35'. E. long. 82° 55'.

TOREK, a town of Hungary, near the Theyse; 40 miles W.S.W. of Debreczin.

TORELLI, LELIO, in Biography, a learned jurist, was born at Fano in 1489. Having studied Greek and Latin at Ferrara, he graduated at Perugia, where he studied law. The law respectable of magistracy which he occupied, was that of grand chancellor and first secretary to the dukes of Tuscany, Cosmo, and his son Francesco. He was also advanced to the rank of Florentine nobility, and the title of senator, and was consul to the academy of Florence, where he died in 1576, universally esteemed for his mental and moral qualities. He adorned himself with polite literature, in which he was a proficient, and with writing Latin and Italian poetry; but the subject of his serious study was jurisprudence. He was the author of several works on the law; but he was principally engaged in preparing a new and correct edition of the Pandects, availing himself of the Pisan or Florentine MS. This magnificent edition appeared from the Torrentian press in 1553, in three large volumes folio. His son Francesco was his associate in the labour of this work; but the son died before the father. Gen. Biog.

TORELLI, POMPONIO, a poet and man of letters, and count of Montechiarugola, was educated at Padua, where he resided eleven years. Upon his return to his native place he married, and in 1584 was sent on a mission to Spain; and having succeeded in the object of it, he afterwards employed himself chiefly in literary compositions. His works were numerous, among which we may reckon a treatise "De Debito del Cavalleria," 1566; five tragedies, viz. "La Meio- rope," "Il Tancredii," "La Galatea," "La Vittoria," and "Il Pudlori." His MSs., which were also numerous, are preserved at Reggio. He died in 1608. Thieluchi. Gen. Biog.

TORELLI, GIUSEPPE, a native of Verona, member of the Philharmonic society, and principal violin of San Petronio, at Bologna. In 1701 he was concert-master at the court of Aulphach, and his performance on the violin acquired him great reputation. He was a voluminous composer for that instrument. His productions, however, are so superannuated, as almost to cease to be music; for having little original melody, and no uncommon touch of harmony or modulation, there is nothing left to make amends for the want of novelty and elegance. This composer, besides the numerous works which he published for violins during his life,
life, of which the titles are recorded in Walther; left behind him an incited work, which was published in 1709 by his brother, Felice Torelli, after the author's decease, under the title of "Concerti grossi con una paurosa per il fantastismo utile," consisting of twelve concertos in eight parts. These concertos have been thought the bulk of his productions, and the model of grand concertos for a numerous band. Quantz, Arte di La Flute.

Torello, in Geography, a town of Naples, in Principato Ultra; 3 miles W.N.W. of Conza.—Alto, a town of Spain, in Catalonia. In the year 1664, a battle was fought near this town between the French and Spaniards, in which the former were victorious; 6 miles N. of Vique.

Torena, a town of New Navarre; 100 miles S.S.E. of Caza Grande.

Torenia, in Botany, was so called by Linnaeus, after his pupil, the Rev. Olof Torén, or Toreen, chaplain of a ship in the service of the Swedish East India Company, who studied at Upsal, in order the better to qualify himself, as a naturalist, for a voyage to China. He communicated to his great botanical preceptor many scarce plants, and addressed him a series of letters, descriptive of the voyage, in which, though various other subjects are touched upon, natural history makes a principal figure. These were published at the end of Obbeck's Voyage, (see Osbeckia) and translated with that work into English, by Dr. Forster. Soon after they were written, the author died, apparently at an early age, near Nafinge, in Sweden, Aug. 17, 1753. —Linn. Gen. 311. Schreb. 407. Willd. Sp. Pl. v. 3. 265. Mart. Mill. Diet. v. 4. Brown Prodr. Nov. Hol. v. 1. 440? Juff. 122. Lamarck. Illutr. t. 523.—Clas. and order, Didynamia Angiosperma. Nat. Ord. Peronema, Linn. Serpulibarbis, Juff.

Gen. Ch. Cal. Perianth inferior, of one leaf, tubular, angular, permanent, two-lipped; the lips toothed, unequal. Cor. of one petal, ringed, twice the length of the calyx; its upper lip nearly entire; lower three-cleft, the middle segment most prominent. Stam. Filaments four; the two uppermost simple; two lowermost longest, with a lateral branch or tooth; authors of two vertical, oblong, rather distant lobes, converging in pairs, their respective lobes closely contiguous. Pet. Germen superior, elliptic-oblong; style thread-shaped, swelling upwards; stigma of two parallel flat plates. Peric. Capsule elliptic-oblong, of two cells, and two undivided valves, with a parallel unconnected partition. Seeds numerous, roundish, attached to the partition.

Obs. We take our characters of this genus principally from the original Linnaean species, and therefore hesitate to admit, after the example of our learned friend Mr. Brown, any species with a regular five-toothed calyx, such as Capraia crassiflora, Linn. and Torena scabra of Brown. We also omit T. fassica of the last-mentioned author, and Antirrhium hexandrum of Forster, because we have not seen them. The strange name of the latter probably alludes to the lateral branches of two of the filaments, by which therefore it should seem to be a good Torena. Yet these appendages appear to be wanting in T. cordifolia of Roxburgh, if we may trust the figure, nor do we find them clearly in our T. obtusifolia. The two-lipped tubular calyx seems to us the most important mark.

1. T. ajatica. Smooth creeping Torena. Linn. Sp. Pl. 862. Willd. n. 1. Osbeck's Travels, English ed., v. 1. 337. Lamarck f. 1. (T. glabra; Osbeck It. 210. "Kaka-pu; Rheede Hort. Mal. v. 9. 103. t. 53.")—Smooth, with a creeping stem. Leaves stalked, ovate, acute, serrated.—Native of China, in watery places, flowering in September. The whole herb is smooth, except at the joints, and at the insertion of the leaves. Stem a long, branched, square, leafy, creeping by means of fibrous roots, which seem to be perennial. Leaves hardly an inch long, opposite, smooth, with shallow serrations; on stalks half about their own length. Flowers axillary, solitary, opposite; on long simple stalks, purple, large and handsome, not unlike those of Maurandia; see that article. The small teeth, or points, of the calyx are narrow, close together, and its angles are winged.

2. T. biflora. Hairy Torena. Willd. n. 2. Lamarck f. 2. Mart. Mill. Diet. n. 2.—Hairy, with an erect stem. Leaves ovate, serrated, on short stalks.—Native of China. Linnaeus thought it a variety of the first species, but it is much more hairy, with smaller flowers; the calyx fearfully winged, except at the very base. The teeth of that part appear to become more deeply separated as the calyx enlarges.

3. T. ciliaris. Fringed Torena.—Leaves ovate, acute, slightly hairy, serrated, on long stalks. Angles of the calyx broadly winged, serrated.—Native of the Nicobar Islands. Communicated by the Right Hon. Sir Joseph Banks. The stem appears to be erect. The leaves are an inch and half long, finely serrated, slightly beprinkled with hairs, oblique at the base. Foxtails nearly half the length of the leaves, channelled, hairy. Flowers opposite, about as large as the first species. Calyx remarkable for its broad wings, fringed with short upright hairs; its teeth slender and hairy.

4. T. cordifolia. Heart-leaved Torena. Roxb. Corom. v. 2. 32. t. 161. Mart. Mill. Diet. n. 3.—Nearly smooth. Stem branched, spreading. Leaves ovate-heart-shaped, serrated. Calyx without wings.—Native of the East Indies. Found by Dr. Roxburgh, in the moist pastures about Samulecoth, flowering during the cold season. The root is fibrous, simple, apparently annual. Stem erect, six inches high, square, leafy, bushy, with numerous croft branches. Leaves an inch long, paler beneath, on stalks half that length. Flowers about the tops of the branches, axillary, on long slender stalks. Calyx rather swelling, angular, but defusive of wings, two-lipped, with five small teeth. Corolla pale purple, twice the length of the calyx. Stamens, according to Roxburgh, without any lateral branch or tooth.

5. T. obtusifolia. Blunt-leaved Torena.—Leaves roundish-ovate, obtuse, stalked, wavy, somewhat toothed, smooth. Stem creeping. Lips of the calyx unequal, abrupt.—Sent from Mexico by Mutis to Linnaeus. The specimens were laid into the genus Gratola, but seem never to have been defcribed. The whole herb is smooth, branched, succulent, creeping; in habit not unlike Veronica Beccabunga, which like plant seems to grow in swampy places. Leaves ribbed, broad, an inch long. Flowers axillary, stalked, solitary, the size of T. cordifolia. Calyx angular, not winged, oblique at the mouth; its upper lip prominent, obtuse, slightly emarginate; lower much shorter, abrupt, with three small distant teeth. Corolla twice the length of the calyx, white or yellowish; internally some what hairy. The insertion of two of the flaments into the upper part of the corolla agrees with T. ajatica; we are not sure whether the other pair has any lateral teeth, but there is some appearance of such appendages, conglutinated as it were.
were with the corolla. The anthers are roundish, combined in pairs. Germin ovate, pointed. Stigma between the anthers, of two thin plates. The parts of the flower in our specimens fearefully admit of sufficient examination to determine the genus of this plant with certainty, but it appears to agree with Torenia better than with any other.

TORENTO, in Geography. See York.

TOREUMATOGRAPHY, a Greek term, signifying the knowledge, or rather defcription, of ancient sculptures, and baffo-relieves.

The invention of toreumatoigraphy is owing to Phidas, and its perfection to Polyceusus: the Italian gravers have let a great deal of light into the toreumatoigraphy.

TOREUTICUS, torqueus, formed from the Greek torqueo, lath, of torque, terebro, perforo, that part of sculpture called turning.

TORFAEU, THORMOUS, or THORMO TORVESEN, in Biography, an eminent historian, was born in a small island called Etnoe, on the southern coast of Iceland; and having laid the foundation of his education at the school of Skalholt, he spent three years, from 1654 to 1657, in the university of Copenhagen. In the spring of 1659 he was captured, in a voyage from Christianand on board a Dutch vessel, by a Swedish cruiser, and carried to Jutland. Upon his release and arrival at Copenhagen, he was appointed the king's interpreter for Icelandic antiquities. In 1662 he visited Iceland, for the purpose of collecting old MSS.; and in the accomplishment of his object, was much encouraged and assisted by the bishop of Skalholt. In 1663 he returned to Denmark with a variety of valuable materials; in 1664 he was made secretary to the district of Stavanger; and in the following year he married: but in 1667 he resigned his office, and was appointed antiquary to the king. Upon the death of his father and brother he made a voyage to Iceland, for the purpose of securing his property; and in the same year he went to Amsterdam; but on his return he was shipwrecked at Skagen, and obliged to travel to Aarhus by land. Embarking for Zealand, he encountered a storm near the island of Samoe, and landed at Senas, where he was wantonly attacked by an Icelander, and in self-defence killed his antagonist. Upon this he was arrested, tried, and condemned to suffer death. Upon an appeal first to a superior court in 1672, and afterwards to the king, it was ultimately determined that he should pay a fine of 100 dollars, and be released. The king, however, was displeased, and deprived him of his salary and office; upon which he retired to Norway, where he lived without any employment till the year 1682, when he was appointed royal historiographer and aflieor in the confilory, with a stipend of 600 dollars per annum. Thus circumscribed, he commenced his history of Norway; but in 1706 he was obliged to rest from the prosecution of it by a fever, which he had brought down to the union of Calmar, and to resign the completion of it to professor Reitzer. Having lost his wife in 1695, he married a second in 1709; and in 1719 died without issue. Torfaeus was a man of confiderable learning, and particularly conversant with ancient history and antiquities; and he was much respected by the northern sovereigns, Frederick III., Christian V., and Frederick IV. His works, actually published and left in MS., were very numerous. The collection of his MSS., relating more especially to the history of Iceland, amounts to several volumes folio, and is preferred in the king's library at Copenhagen. Gen. Biog.

In connection with Torfaeus, we shall here mention the learned and eminent Arnas Magnus, the son of an obscure country priest in the western part of Iceland, and more con-

spicious for his devotion to literary pursuits than Torfaeus. Raifed from a humble and obscure situation by extraordinary efforts of talent and industry, he attained, in 1694, at the age of 31 years, the honourable station of professor of philosophy in the university of Copenhagen; and a few years afterwards, he was invested with the offices of professor of northern antiquities and secretary of the royal archives. Inceflant in his literary labours, he composed several important works, and collected at great expense a magnificent library, serving to illustrate the literature and antiquities of the North, and more especially the literature of his native island. The greater part of this library was unhappily confumed by the fire which happened at Copenhagen in 1728; and the unfortunate Magnus was witness to the almost total destruction of the fruits of many years' labour. He died two years after this disastrous event, and bequeathed to the library of the university the remnant of his literary treasures. His friend and favourite pupil, Finnur Jenfson, was another of the eminent Icelanders, who, during the last century, have contributed to preserve unimpaired the character and respectability of their country. Created bishop of Skalholt in 1754, he retained this office during the remainder of a long life, wholly devoted to the improvement and happiness of his fellow-citizens. In his admirable work, the "Ecclesiastical History of Iceland," written in elegant Latin, and published at Copenhagen in 4 vols. 4to. he has bequeathed to his countrymen a monument of extensive erudition, genuine piety, and warm patriotic feelings, which will continue as one of the most illustrious monuments of their literature. Mackenzie's Travels in Iceland.

TORFVE, in Geography, a town of Sweden, in Weft Gothland; 75 miles N.E. of Uddevalla.

TORGA, a town of the principality of Georgia, in the province of Caket; 85 miles S.E. of Tiflis.

TORGAV, or Torgaw, a town of Saxony, in the margravate of Meiffen, on the Elbe. It was anciently the head place of a peculiar feignoiry, which passed in fief from the electors of Saxony, of the Aefcanian line. In the year 1530, the seventeen articles of the Protestant doctrine were presented at this place, to the elector John; and in 1576, the Torgau writing was made here, out of the Swabian Concordat and the Maulbrun Formula; from which writing, the year following, the Formula Concordiae was drawn up at Kloffer Bergen. In the year 1745, the Prussians passed the Elbe here; in the year 1756, they fixed their military office at this place; and in the year 1757, they broke down the bridge thrown over the Elbe. In the year 1760, the Austrians, under marshal Daun, were defeated by the Prussians, commanded by the king in person. The Austrians lost 200 officers, and 7000 men prisoners. Marshal Daun himself was wounded. The Prussians had 2500 men killed, and 4000 wounded; 28 miles E.N.E. of Leipic. N. lat. 51° 32'. E. long. 13° 31'.

TORGAU, Convocation of. See Form of Concord.

TORGEISKOI, in Geography, a town of Russia, in the government of Irtusk; 24 miles N.N.W. of Nertchinsk.

TORGE, a small island in the North sea, near the coast of Norway. N. lat. 65° 30'.

TORGELOW, a town of Anterior Pomerania, on the Ucker; 9 miles N. of Pafewalk.

TORGOCH, in Ichthyology. See Charr.

TORGOTS, in Geography, a tribe of the Mongoles, who formed themselves into a distinct horde much later than the other Kalmuck branches. Removing at first from the steppes Soongares, they marched westward till they came to the steppes on the Volga, where they finally settled, and received
received from the Russians the name of the Volgaic Kal- 
mucks. In 1616, this horde is said to have submitted to the 
Russian empire; and on crossing the Urals in 1662, their 
number amounted to 50,000 khitkies. In 1761, the 
Russian government entered into an agreement with this 
opulent and powerful horde, which restricted the authority 
of the khans to narrower bounds, and excited such discon- 
tents, that they returned in the winter of 1770 and 1771, 
to the amount of between 55,000 and 60,000 khitkies, 
over the ice of the river Urals, across the Kirghisian steppe, 
into the Soongarye. The greater part of the Soongarees 
took part in this migration; only some few anaks of the 
Torgots remained behind; but the Tartars in subjection 
to the horde refused to follow them. The fugitives were 
pursued by order of the Russian government; but most of them 
made their escape. Numbers indeed perished on their 
journey; many were taken prisoners by the Kirghises; and 
those who reached the place of their destination, put them- 
selves under the protection of the Chinese government, who 
gave them a kind reception, but afterwards, for political 
reasons, treated them with great severity. The Torgots, 
with the Khosholes and Soongarees, who flaid beyond or 
were brought back from their flight, are distributed among 
the Derbets; and wander, with their flocks and herds, in 
the flemes between the Don and Volga, from the line of 
Tseritzin as far as Caucasus, and between the Volga and 
the river Urals, from the Irghis quite to the Caspian; con- 
fsequently in the governments of Saratof and Avarakhan, 
and in the seats of the Cossacks of the Don. Tooke's Rufia, 
vol. i.

TORGOWITZA, a town of Russian Poland, in the 
palatinate of Bracal; 20 miles E. of Human.

TORGSAKER, a town of Sweden, in the province of 
Angermannland; 25 miles N. of Hernosand.

TORGHOUT, a town of France, in the department of 
the Lys; 10 miles S. of Bruges.

TORIES, or TORYs, a party or faction in England, 
opposite to the Whigs.

These two celebrated parties, which have so long divided 
our country, will make a considerable article in the English 
history, nothing inferior, in many respects, to that of the 
Guelfs and Ghibellines. The division has gone so deep, that, 
it is presumed, no Englishman, who has any concern or 
principles at all, but inclines more to one side than the other; 
for which reason, we shall borrow our account of them from 
the mouths of foreigners, who may be supposèd more 
impartial; and particularly from M. de Cize, a French officer, 
some time in the service of England, who has written the 
History of Whigism and Toryism, printed at Leipzic, 
anno 1717; and M. Rapin, whose Dissertation fur les 
Weights & les Torsys, printed at the Hague the fame year, 
is well known; and reprinted at the close of the second 

During the unhappy war which brought king Charles I. 
to the scaffold, the adherents of that king were first called 
Cavaliers, and those of the parliament Round-heads; which 
two names were afterwards changed into those of Tories and 
Whigs, on the following occasion.

A kind of robbers, or banditti, in Ireland, who kept on 
the mountains, or in the islands formed by the vast bogs of 
that country, being called Tories, a name they still bear in- 
differently with that of Rapparees; the king's enemies ac- 
cusing him of favouring the rebellion in Ireland, which 
broke out about that time, gave his partisans the name of 
Tories; and on the other hand, the Tories, to be even with 
their enemies, who were closely leagued with the Scots, 
gave them the name of Whigs, who living in the fields and 
woods, fed much on milk; whig signifying whay. But for 
a more probable etymology of whig, see Whigs.

The Cavaliers, or Tories, had then principally in view 
the political interest of the king, the crown, and the church 
of England; and the Round-heads, or Whigs, proposed 
chiefly the maintaining of the rights and interests of the 
people, and of Protestantism. Nor have the two factions 
yet lost their first views; though their first names, Cavalier 
and Round-head, be now entirely diluted.

This is the most popular account; and yet it is certain 
the names Whig and Tory were but little known till about 
the middle of the reign of king Charles II. M. de Cize 
relates, that it was in the year 1678, that the whole nation 
was first observed to be divided into Whigs and Tories; and 
that on occasion of the famous deposition of Titus Oates, 
who accused the Catholics of having conspired against the 
king and the state,—the appellation Whig was given to 
such as believed the plot real; and Tory to those who held 
it fictitious.

When we compare, says Mr. Hume (Eft. ix.), the fac- 
tions of Whig and Tory with those of Round-head and 
Cavalier, which were merely parties of principle, the most 
obvious difference that appears between them, the confusions 
in the principles of "passive obedience" and "indefeasible 
right," which were but little heard of among the Cavaliers, 
but became the Universal doctrine, and were esteemed the 
true characteristics of a Tory. If these principles were 
pulled into their most obvious consequences, they imply a 
formal renunciation of all our liberties, and an avowal of 
absolute monarchy; since nothing can be a greater absurdity 
than a limited power which must not be refitted, even when 
it exceeds its limitations. But as the most rational prin- 
ciples are often but a weak counterpoise to passion; it is no 
more than the absurd principles were found too weak for 
that effect. The Tories, as men, were enemies to op- 
pression; and also as Englishmen, says Hume, they were 
enemies to arbitrary power. Their zeal for liberty was, 
perhaps (says this partial writer), less fervent than that 
of their antagonists; but was sufficient to make them forget 
all their general principles, when they saw themselves openly 
threatened with a subversion of the ancient government.

From these sentiments arose the Revolution; an event of 
mighty consequence, and the firmest foundation of British 
liberty. The conduct of the Tories, during that event 
and after it, will afford us a true insight into the nature of 
that party. In the first place, they appear to have had the 
genuine sentiments of Britons in their affection for liberty, 
and in their determined resolution not to sacrifice it to any 
abstract principle whatsoever, or to any imaginary rights 
of princes. This part of their character might justly have 
been doubted of before the Revolution, from the obvious 
tendency of their avowed principles, and from their com- 
pliance with a court, which seemed to make little secret 
of its arbitrary desig ns. The Revolution afforded them to 
have been, in this respect, nothing but a genuine "court 
party," such as might be expected in a British govern- 
ment: that is, "lovers of liberty, but greater lovers of 
monarchy." It muñ, however, be confessed, that they 
carried their monarchical principles further, even in practice, 
but more so in theory, than was in any degree consistent 
with a limited government. Secondly, Neither their prin- 
ciples nor affections concurred, entirely or heartily, with 
the settlement made at the Revolution, or with that 
which has since taken place. This part of their character 
may seem opposite to the former; since any other settle- 
ment in those circumstances of the nation, must probably 
have been dangerous, if not fatal, to liberty. But the 
heart
heart of man, says our author, is made to reconcile contradiction; and this contradiction is not greater than between passive obedience, and the refusal employed at the Revolution. A Tory, therefore, since the Revolution, may be defined in a few words to be "a lover of monarchy, though without abandoning liberty; and a partisan of the family of Stuart," as a Whig may be defined to be "a lover of liberty, though without renouncing monarchy; and a friend to the settlement in the Protestant line."

Some, who will not venture to assert, that the real difference between Whig and Tory was lost at the Revolution, seem inclined to think, that the difference is now abolished, and that affairs are so far returned to their natural state, that there are at present no other parties among us but Court and Country; that is, men who, by interest or principle, are attached either to monarchy or liberty. The Tories have been so long obliged to talk in the republican style, that they seem to have made converts of themselves by their hypocrisy, and to have embraced the sentiments, as well as language of their adversaries. There are, however, very considerable remains of that party in England, with all their old prejudices.

The preface differs, says an anonymous writer (Edinb. Rev. N° 3 L.), between a moderate Tory and a moderate Whig, "that a Tory is more influenced by loyalty, and a Whig by the love of liberty; that a Tory considers liberty as the second interest of society, while a Whig regards it as the first." Loyalty is denominated by Mr. Hume "that noble and generous principle, inferior only in excellence to the more enlightened affection towards a legal constitution."

We should here confine ourselves to the Tories; and for what regards the Whigs, refer to that article; but since, by comparing and confronting the two parties together, both the one and the other will appear in the stronger light, it would be imprudent to separate them; so that we neither choose to say the Whigs, and refer them thither.

The factions we are speaking of, may be considered either with regard to the state, or to religion. The state Tories are either violent or moderate: the first would have the sovereign to be absolute in England, as in other countries, and his will to be a law. This party, which is not very numerous, has yet been considerable. 1. On account of its leaders, who have been lords of the first rank, and generally ministers and favourites. 2. In that, being thus in the ministry, it engaged the church Tories to maintain stiffly the doctrine of passive obedience. 3. Because they have been frequently supported by the crown.

The moderate Tories would not suffer the king to lose any of his prerogatives; but neither would they sacrifice those of the people.

The state Whigs, again, are republican or moderate: the first, according to our author, are the remains of the Long parliament, who took in hand to change the monarchy into a commonwealth: these make so tender a figure, that they only serve to strengthen the party of the other Whigs. The Tories would pernecize the world, that all the Whigs are of this kind; as the Whigs would make us believe, that all the Tories are violent.

The moderate state Whigs are much in the same sentiments as the moderate Tories; and define the government may be maintained on its ancient foundation, and that the king may be reduced to an incapacity of abusing his power, by leaving him the possession of his just rights: all the difference is, that the moderate Tories lean a little more to the side of the king, and the moderate Whigs to that of the parliament and people.

Before we consider our two parties with regard to religion, it must be observed, that the Reformation, as carried on to a greater or less length, divided the English into Episcopalian and Presbyterian or Puritans: the first contended, that the episcopal jurisdiction should be continued on the same footing, and the church in the same form, as before the Reformation: the latter maintained, that all ministers or priests had equal authority; and that the church ought to be governed by presbytery, or consistory of priests and lay elders. See Puritans.

After long disputes, the more moderate of each party relaxed a little of their stiffness; and thus formed two branches of moderate Whigs, and moderate Tories, with regard to religion; but there were others who kept to their principles with inconceivable firmness: and these constituted two branches of rigid Episcopalians and Presbyterians, comprised under the general names of Whigs and Tories; in regard, the first join the Tories, and the latter the Whigs.

The former consisted of rigid churchmen, who were again against the least change in the discipline of the church, while the more moderate among the ecclesiastical Whigs were less scrupulous and obstinate, and may be called the low or moderate churchmen. See High Church and Non-jurors.

The latter were the rigid Presbyterians, who would be contented with nothing less than the destruction of the hierarchy, while the more moderate among them would have been satisfied with much less, and put up, says Mr. Rapin, with a bare toleration.

From what has been observed, we may conclude, that as the names Tory and Whig have a regard to two different objects, they are equivocal, and of consequence ought never to be applied without expressing in which sense it is done; for the same person may be, in different respects, both Whig and Tory.

For the rest, the general motives that have formed and kept up the two parties, appear in the main to be no other than the private motives of particular persons: self-interest is the primus mobile of their actions: ever since the rise of these factions, each has struggled earnestly to get the advantage over the other; insomuch as from such superiority accrue places, and honours, and promotions, &c. which the prevailing party usually distributes among its own members, exclusive of the contrary party.

There are, however, men belonging to each of these parties, though the distinction is almost worn out, who act from conviction; some of whom are for the extension, and others for the limitation of royal prerogative, with a view to the good of the state, as their principles lead them to form different notions of the most effectual method of promoting it. The names, it is true, are almost sunk into oblivion; but the operation of the distinguishing sentiments of Whigs and Tories is discoverable in every period of the English history; and the true interest of a limited monarchy, always inseparably connected with the rights of the people, renders the distinction of importance, and should prevent its ever being disregarded.

It is with the Whigs and Tories on those points, which have discriminated the two parties, says Dr. Gregory Sharp, as it is with all other sects of men under the agitation of hope and fear, ambition and interest; they tighten or relax their principles as suits best their convenience. When the Tories have had the exerise of the powers of the prerogative, they have been eager to extend those powers.

G 2
when the edge has been turned against them, they have been as eager in the defence of popular liberty; and in like manner the Whigs, who withflood the form, have melted in the fun-fine, fo that a point of court complinance, the adminiftrations of the one have differed very little from thofe of the other. Holberg's Int. to Universal History, by Sharpe, p. 260.

As to the characters commonly attributed to the Whigs and Tories; the Tories, fays M. Rapin, appear fierce and haughty: they treat the Whigs with the greatest contempt, and even sometimes with rigour, when they have the advantage over them: they are very hot and vehement, and proceed with a rapidity, which yet is not always the effect of heat and transport, but has its foundation sometimes in good policy: they are very fubje& to change their principles, as their party prevails or is humbled.

If the rigid Presbyterians prevailed than ft of the Whig party, it would not be less hot and zealous than that of the Tories; but it is faid they have not the direction thereof; which gives room to affirm, that those at the head of the Whig party are much more moderate than the chiefs of the Tories: add, that they ufually conduct themfelves on fixed principles, proceed to their end gradually, and without violence; and their florifhes is not lefs founded on good policy, than the hiftories and precipitation of the Tories. Thus much fays our author may be faid to the advantage of the moderate Whigs, that, in the general, they maintain a good caufe, viz. the confitution of the government as by law eftablifhed.

TORIESDALE, Head, in Geography, a cape on the N. coft of Scotland. N. lat. 58° 30'. W. long. 4° 10'.

TOLLIS, in Botany, a genus of Adanfon's, whose name perhaps may have been fabricated from τουξ, to carve or embos, in allusion to the feeds, which, however, answer lefs to this idea than thofe of many neighbouring genera.

Adanfon distinguifhes this genus from Caucaulis, (fee that article,) by the want of a general involucrum, and the flendernefs of the leaves which compose the partial ones. There are principles of Arcted and Linneus, but not generally reckoned among their kind. Gætn. and more recently Sprengel, distingui#h Tolls by the diferifles of the fruit being feattured equally over its whole surface; not, as in Caucaulis, ranged along its ribs. As one of the fpecies, Antirhicus, ufuallly, if not confantly, is furnifhed with a general involucrum, and another, nodofa, is not always deftitute of one; and as the defcription of the diferifles is a very obfcrue, if not precarious, charafter; which appears by the diferagreement between Gætn. and Sprengel, concerning the fpecies supposed to compose this genus, we prefer leaving our three British ones at leaft in Caucaulis, where they are placed in the Flora Britannica.

TORM, in Geography, a town of New Mexico, in the province of Hiaqui; 35 miles S.W. of Riochicó.

TORIN Rocks, a clufter of rocks near the S.W. coft of the ifland of Mull. N. lat. 56° 16'. W. long. 6° 28'.

TORISA, a river of European Turkey, which runs into the Mariza, at Adrianople.

TORKSEY, John, in Biography, author of one of the moft impor tant tratfes in the MS. of Waltham Holy Cross, at prefent in the po{f{ion of the marquis of Lan
downe. This tract, which is the fifth in the collection, has been already defcribed. See Power, Lionel.

TORLA, in Geography, a town of Spain, in Aragon; 16 miles E. of Jaca.

TORM, Eric Olaus, in Biography, a Danoifh writer, was born in 1607, and educated in the School of Viborg. Having finifhed his education, and spent many years in the capacity of private tutor, he fett out on his travels with a view to further improvement; and visited Oxford, Leyden, and Paris; and in 1736 he was appointed professor of mathematics in the university of Copenhagen, and afterwards librarian and preacher in one of the churches. He died in 1667. He was the author of many works, chiefly mathematical and historical. Gen. Biog.

TORME, in Geography, a town of Spain, in Old Caf
tilde; 15 miles N. of Frias.

TORMENT, Cape, a cape on the coast of Canada; 24 miles below Quebec.

TORMENTILLA, in Botany, a diminutive of tormentum, a pain or gripping, supposed to have been choen to deignicate this little altrigent plant, becaufe it served to alleviate pains of the teeth, or of the bowels, tormentina. But it may lmply perhaps apply to that affringency, which, confidering the primary fenee of the above words, the name feems to indicate.—Linn. Gen. Pl. 256. Willd. Sp. Pl. v. 2. 1112. Mart. Mill. Dic. v. 4. Sm. Fl. Brit. 552. Juff. 357. ‘Tourn. t. 153. Lamarec Illustr. t. 444.—Clafs and order, Icycandra Polygnia. Nat. Ord. Senti
cina, Linn. Rafaeae, Juff.

Gen. Ch. Cal. Perianth inferior, of one leaf, flat, cut half way down into eight fegments, of which four alternate ones are smaller and more acute. Cer. Petals four, inverfely heart-shaped, flat, spreading, their claws inferted into the calyx. Stam. Filaments fifteen, awl-shaped, half the length of the petals, inferted into the calyx; anthers roundih, fimple. Pifh. Germans eight, small, collected into a little round head; fyles thread-shaped, the length of the flaminis, inferted laterally into the germenis; stigma obtufe. Peric. none. Receplate of the feeds dry, minute, covered entirely by them, and enclosed in the calyx. Seeds eight, roundih-oblong, corrugated, bluntly pointed.

Obf. Linneus remarks, that this genus differs from Potentilla, (fee that article,) in characters founded on number only, and therefore they might be united. Schreber, and recently Dr. Neftler of Straflburgh, have adopted this meafure, the latter uniting Comarum alo to Potentilla. As the numerical differences are extended throughout the parts of fructification, though fome of them are acknowledged to vary, and the two fpecies of Toremilla accord fo well in habit, we are induced to follow Linneus, Tournefort, and Juffieu, in retaining the genus; for if number were in this cafe entirely overlooked, we do not perceive how Sin
dalia could be fuppofed. (See that article, Comarum, and Rosaces.) It has been afferted, that botanifhes who retain fuch genera as this, viz. Ray, Tournefort, Linneus, and Juffieu, will not gain much fame with pofterity; but of this, we humbly presume, pofterity will be the judge.

wiry, often procumbent. Leaves ternate, lanceolate, rather hairy, deeply ferrated, with a pair of deeply cut Ripulius. Flowers bright yellow, on long, simple, foliate, lateral flasks. The late Mifs Johnes of Hafed found one plant in the romantic spot, whose flowers were double, a rare inf lance.

2. T. reptans. Trailling Tormentil. Linn. Sp. Pl. 716. Wildn. n. 2. Fl. Brit. n. 2. Engl. Bot. t. 864. (Pentaphyllum reptans alatum, folis profundius ferratis; Pl. Ox. t. 9. f. 5.)—Stem prostrate. Leaves flaked.—Native of banks and shady places, in England and Germany, but not common. We once gathered it in a lane at Brighoune, near Halifax, Yorkshire, in the middle of summer. The root, though perennial, is much smaller and slenderer than in the foregoing. Stems few, eighteen or twenty inches long, often simple, entirely prostrate, but not creeping. Whole herb finely hairy, of a light green. Radical leaves on long flanks, of five, obovate, deeply ferrated leaflets; those on the stem of three only, on shorter flanks; the floral ones sussile, narrow, and often entire. Stipules united to the base of the footflasks. Flowers twice as large as the foregoing, on very long flanks, opposite to the leaves.

Tormentilla, in the Materia Medica. The root of the common tormentil, or upright feepfoil, tormentilla erecta, is the only part that is used in medicine. It is knotty, exter- nally blackish, and internally reddish. It has a strong ftyptic taint, but imparts no peculiar pailid flavour. As a proof of its powerful astringency, it has been sbstituted for oak-bark in the tanning of skins for leather. Its active matter is therefore chiefly tannin; the infusion in boiling water being copiously precipitated by solution of ashflakes, and tinking a deep black with sulphate of iron. This root has been long held in high estimation by physicians as a very useful astringent; and having little pailin, it becomes peculiarly adapted to cafes where the heating and ftitulating medicines of this class are lefs proper, as phthisical diarrhea, diarrhoea cruenta, &c. Dr. Cullen thinks it has been justly commended for every virtue that is competent to astringents; and he adds, that he has found it, both by itself and as joined with gentian, curare intermittent fevers, when given in fubflance and in large quantities. It gives out its astringency both to water and rectified spirit, but most perfectly to the latter; the extracts, particularly the spirituous, obtained by infipification, are intensely ftyptic. The root is generally given in powder, from half a drachm to one or more for a dose; but it is more generally given in decoction; an ounce and a half of the powdered root may be boiled in three pints of water to a quart, adding, toward the end of the boiling, a drachm of cinnamon: of the strained liquor, sweetened with an ounce of any agreeable syrup, two ounces or more may be taken four or five times a day. As a local remedy, it may be used with advantage in the form of gargle and lotion in ulcerations of the tongue and mouth, against fpongy gums, and as an application to ferial ill-conditioned fores; but it is seldom used. Lewis Woodville.

Tormenting, in Agriculture, a term signifying in tillage cultivation an imperfect fort of horse-hoeing or ploughing, or what is sometimes, in some districts, termed sub-hoeing or sub-ploughing. It is occasionally too used as a term of reproach for bad tillage of any kind.

Tormentor, an implement of the tillage kind, used for breaking down and reducing the parts of fuff foils. It is a powerful tool of this sort which is much employed in Devonshire, Cornwall, and some other counties; in the first of which for the purpose of cros-cutting the barks of whole ground, left after the velling and skirting operations for beat-burning, or paring and burning the surface-turf. It is indeed useful in working lands in almost all cafes of bringing them into cultivation, and into a fine flat of mould. See Skirting, Tillage, and Velling.

This sort of implement is constructed in different modes and forms, as in a kind of long triangular shape, the beam part being lengthened out before, in which is fastened, by a fort of shank, a small wheel, which is capable of being raised or let down at pleasure, so as to regulate the depth of working of the tool. At or near the extremity of the frame behind are fixed two large wheels, so as to allow the triangular pointed shares or hoes to work in the ground. The whole is strongly framed together in three pieces; the middle or beam, and the two outside pieces. The number of shares or hoes is usually about nine. The fame tool is sometimes contrived with two wheels in the front, and with a crane neck, being the fame in all other respects. The spill of iron which paffes through the beam in the front, and supports the fore-wheel, has a number of iron rings on it, by which the depth of fliring is regulated. The length of the beam is fix feet nine inches. The breadth or width of the back-piece, where the large wheels are placed, is three feet seven inches. The large wheels are three feet in diameter. The small fore-wheel is ten inches in diameter. The fide-pieces of wood of which the frame is made, are four inches square, and the beam thereabouts. The shares or hoes, which are fixed upon shanks, with smaller parts to pafs through the frame parts and be fastened above, are fifteen inches in length.

The conduction of the tool is consequently very fimple, and easily accomplished by any common workman, fo that the farmer need never be at a loss to fo powerfique and effec- tive an implement in the cultivation of tillage land.

Tormes, in Geography, a river of Spain, which rises in Old Castile, and crossing the province of Leén, paffes by Alva de Tormes, Salamanca, &c. and enters the Duero a few leagues below Miranda de Duero.

Tormina, in Medicine, a term sometimes used to express pains in the general; but more particularly a species of pain, called tormentina ventris, or adev; in English, the gripes; which see. See also Dysentery.

Young children are very often troubled with gripes; it is upon this account that nurses, in order to prevent or re- medy them, usually mix with their spoon-meats a little branly, or some carminative feeds, as caraway-seeds, &c.

Some children breed their teeth with violent gripes, which are apt to bring on convulsions of the bowels. In adults, the dry gripes are usually cured by the exhibition of warm cathartics, such as tincture of hiera pica, eelix furatus, tincture of rhubarb, &c. with the allantion of opiates.

Tormis, Tormes, in Ancient Geography, a river of Hispania, in Lusitania, which united with the Duria. See Tormes.

Torna, in Geography, a town of Hungary, and capital of a county; 14 miles S.W. of Cacafhau.—Also, a town of Saxony; 3 miles S. of Pira.

Tornado, or Tornado, a sudden and violent gulf of wind rising suddenly from the shore, and afterwards veering round all points of the compass like a hurricane; very frequent on the coast of Guinea. These winds frequently shift suddenly from one quarter of the horizon to another, and then come again to the former point. Before a tornado comes, it calms the conflant califerly winds; and when they are past, the califerly wind gathers force again, and the weather clears up fair. See Hurricane and Whirlwind.
TORNADOTUS, or Physicus, in Ancient Geography, the name of the Geus, not Odernah, a river of Asia, on the coast of West Greenland. N. lat. 61° 30'. W. long. 47° 30'.

TORNARECCIO, in Geography, a town of Naples, in Abruzzo: 14 miles N.N.E. of Civita Borello.

TORNARSUK, an island near the west coast of West Greenland. N. lat. 61° 50'. W. long. 47° 30'.

TORNAY, a town of Sweden, in the government of Uclea; 15 miles S.S.E. of Ulea.

TORNEA, a river of Sweden, which rises from a lake in Lapland, and runs into the Gulf of Bothnia, at Tornea. Situated on a small island, formed of a river of the name at its mouth, near the Gulf of Bothnia, and said to be the oldest town in the country, and the farthest towards the north. It has three streets, running in parallel lines from north to south, which are intersected at right angles by fourteen cross-roads or lanes. Tornea, though built on an uniform plan, consists mostly of detached cottages, and contains only 600 inhabitants. The streets are very broad, and not being paved, are overgrown with grass, on which the cows regularly pasture. The inhabitants, being a mixture of Finns and Swedes, have the character of being idle, and addicted to drunkenness; yet the adjacent country, chiefly by the manufacture of the Finnish felters, is rapidly improving; and the population of the province of Lapland appears to have advanced much farther than that of any other part of Europe. In the year 1750, this, according to Baron Hermelin, was 27,000; in 1775, it had increased to 31,000; but in 1801, it amounted to 52,000. The church is built with timber, and stands at a little distance from the other buildings, but within the palisadoes which inclose the town, and is a pretty large piece of arable land. Divine service is performed here in the Swedish language, which is used by the burghers. There is another church, built with stone, on an island called Borken, which lies near the town, in which the service is performed in the Finnian language, for the benefit of the burghers' servants, and the inhabitants of the adjacent country. A very considerable trade is carried on here, not only by the Swedes and Laplanders, but by the Russians and Norwegians, who also resort to the trading and bartering places of Tornea, in order to traffic. In the year 1693, this town was honoured with the presence of King Charles XI. who, being accompanied by several persons of distinction and learning, took a view of the town, at midnight, if it may be called so, from the church tower, at Tornea. In this town, and the adjacent country from hence to Kites, observations were made in 1736 by M. Maupertuis, and some other members of the Academy of Sciences at Paris, in order to determine the measure of a degree of, and consequently the figure of the earth, and its ratification and extension by Ivanborgh in 1759. N. lat. 65° 48'. E. long. 24° 2'.

TORNEA OFVER, a town of Sweden, in West Bothnia; 3 miles N. of Tornea.

TORNESE, a cape on the coast of the Morea; 8 miles S.S.E. of Chiarenza.

TORNESOL. See Turnesol.

TORNESS, a cape on the south coast of the island of Stroma. N. lat. 58° 56'. W. long. 2° 29'.

TORNIALLI, AGOSTINO, IN Biography, a learned ecclesiastic, was born at Novara in 1543, and having entered into the society of Barnabites, he became general of the society. He undertook to write an ecclesiastical history from the beginning of the world to the time of Christ, in the form of annals, and executed the work with very laudable sagacity and correctness, furnishing the reader by his chronological and geographical observations, with a valuable commentary on the books of the Old Testament. It was first printed at Milan in 1610, and afterwards frequently reprinted. Father Negri published an enlarged edition, with valuable notes, in 1775, at Lucca, in four volumes. He declined the offer of the bishopric of Mantua, and chose to remain in the Barnabite college at Milan, where he died in 1622. Dupin.

TORNI, in Geography, a town of Germany, in the principality of Anhalt Zerbst; 3 miles W. of Zerbst.

TORNOVA, a town of Italy; 18 miles S. of Venice.

TORNO, an island in the Baltic, near the coast of Sweden. N. lat. 52° 40'. E. long. 17° 42'.—Alfo, a town of Naples, in the county of Molfi; 15 miles S.E. of Molfi. Alfo, a town of Spain, in the province of Leon, situated on the summit of a hill above the Duero, over which there is a bridge of twenty-two arches. It is the site of a bishopric, and one of the most ancient in the kingdom. Here are the remains of an ancient Moorish castle, forming a square of 143 feet, with a round tower at each angle. In the year 1476, a battle was fought here, by which Ferdinand, prince of Aragon, obtained the kingdom of Castile from Alphonso, king of Portugal: 17 miles E. of Zamora. N. lat. 41° 45'. W. long. 5° 37'.—Alfo, a town of New Mexico, in the province of Cinaloa; 50 miles N. of Cinaloa.

Toro, II, a small island in the Mediterranean, near the south coast of Sardinia. N. lat. 39°. E. long. 8° 34'.

Toro, in Ancient Geography, a town in the interior of European Sarmatia, near the river Careinates. Ptol.

TOROELA, in Geography, a town of Spain, in Aragon; 18 miles N.W. of Jaca.

TORM, a river of Russian, which runs into the Oby; 24 miles E. of Surget.

TORON, a town of European Turkey, in Macedonia, situated on the bank of the river of Zonanto and the Gulf of Caffandria; 60 miles S.E. of Saloniki. N. lat. 40°. E. long. 23° 54'.

TORONAEUS or Tornaiacus Sinar, in Ancient Geography, a small town of the Egean sea, on the coast of Macedonia, and separated from the Singitic and Thessalian gulfs by two large peninsulas. Tacitus. Pliny calls this gulf Teytbergium.

TORNONE, a town of Macedonia, upon the Toronai gulf, to which this gulf owes its name. Ptolemy places it in the Paraxis, and Thucydides fixes it in Chalcidia. About three miles from this town was a temple of Castor and Pollux.—Alfo, a town of Epirus.

TORTONTO, in Geography, a settlement of Canada, on the N.W. bank of Lake Ontario, now called York. See York.

TOROPALCA, a town of Peru; 60 miles S. of Potosi.

TOROPETZ, a town of Ruffia, in the government of Pikoiv; 156 miles S.E. of Pikoiv. N. lat. 56° 25'. E. long. 32° 24'.

TORPRESSA, a town on the island of Mull. N. lat. 56° 35'. W. long. 6° 5'.

TOROSO, a town of Transylvania, in the environs of which are mines of iron and silver; 19 miles N. of Weifenburg.

TOROSUS, in Botany, is sometimes used to express an inequality of surface, like the brawny swellings of a muscular limb; in the carapace of Pogonurus hybridus.

TORP, in Geography, a town of Sweden, in West Gothland;
Torpedo.

Land; 11 miles N. of Uddevalla.—Also, a town of Sweden, in Warmeland; 11 miles N. of Carlstadt.

Torpedo, Cramp-Fish, or Electric Ray, the rajaja tachus of Linnaeus, in Ichthyology, a sea-fish, famed, both among the ancient and modern naturalists, for a remarkable numbness with which it strikes the arm of such as touch it. See Rajaja Tachus.

This species is found in the Mediterranean, on the Atlantic coast of France, in the English seas, particularly at Torbay, near Waterford, on the coast of Ireland, and in other places. See Anfon's Voyage, p. 266.

It is generally taken with the trawl, but an imitation occurs of its taking a bait, which vindicates a fine account which Oppian has left us of this fish. It commonly lies in water about the depth of forty fathoms, in company with the congenerous rays; but its more frequent and favourite situation is the sand, in which it will bury itself by flapping its extremities, and throwing the sand in a light shower over its back. In this situation the torpedo gives its most forcible shock, which throws down the astonished passenger who inadvertently treads upon him. The food of the torpedo is fish, and they probably flupify their prey by the shock they give them; and yet the sea-urchin and common sea-crab will venture to annoy them.

This fish is so far amphibious as to live in air twenty-four hours, and but little longer in fresh water. The best method of preserving them is in well-boats kept in salt-water, and not put into much motion.

Rondelet speaks unfavourably of the torpedo as food, and tells us, that at Venice the prefect of health forbids it to be sold in the market; but in deeming it wholesome food, we have the sanction of Hippocrates and Galen, and it is sold in the markets of France. The electrical organs, indeed, which make one half of the animal, though wholesome, are an indigad meat; but its muscular part is, at least, as palatable as the flesh of the other rays; among these, the old and overgrown are always in little request.

The torpedo brings forth its young at the autumnal equinox, as affirmed by Arifotole, though questioned by Lorenzini. In one dified at La Rochelle, on the 1oth of September, were found in the matrices several of the parasites quite formed, and nine eggs in no state of forwardness; superfetation seems to be, therefore, a property of this fish; the eggs seemed to be defined for the spring brood, as they produce about the vernal as well as the autumnal equinox. There may be also another production at midsummer, but it principally takes place at the two equinoxes.

Upon touching this fish with the fingers, it frequently, though not always, happens, that the person feels an unusual painful numbness, which suddenly seizes the arm up to the elbow, and sometimes to the very shoulder and head.

The pain is of a very particular species, and is not to be described by any words; yet M.M. Lorenzini, Barelli, Redi, and Reaumur, who all felt it severelly, observe it to bear some resemblance to that painful sensation felt in the arm, upon striking the elbow violently against a hard body: though M. Reaumur affirms us, this gives but a very faint idea of it.

Its chief force is at the instant it begins; it lasts but a few moments, and then vanishes entirely. If a man do not actually touch the torpedo, how near forever he holds his hand, he feels nothing; if he touch it with a flisk, he feels a faint effect; if he touch it through the interposition of any very thin body, the numbness is felt very considerably; if the hand be prefed very strongly against it, the numbness is the less, but still strong enough to oblige a man speedily to let go.

Oppian affirms, that it will benumb the astonished fisherman, even through the whole length of line and rod. See the passage cited and translated by Pennant, Brit. Zool. vol. iii. P. 39.

So great are as the powers of this fish when in vigour, they are impaired as it declines in vigour, and totally ceases when it expires. The shocks in water are apprehended to be near a fourth of the force of those at the surface of the water, and not much more than a fourth of those entirely in air. This strange power, with which the torpedo is endowed, and which we shall presently explain, seems to have a double use; the one, when it is exerted as a means of defence against voracious fish, who are by a touch deprived of all power of feizing their prey; the other is well explained by Pliny, who tells us, that by the same powers it attains its end with respect to those fish which it wishes to ensnare; for, concealing itself in the mud, and benumbing the fish that are carelessly swimming about, it makes a ready prey of them.

M. Reaumur, having no fishes alive to examine what the torpedo would do to them, shot up a drake in water with it, and after some time it was taken out dead. See Electric Organs of Fish.

We shall now proceed to give a brief recital of the different theories that have been adopted in order to account for the extraordinary effects of the torpedo. This fish was early known to the Greeks; it is mentioned, as an esculent fish, by Hippocrates, under the name pigruns, which shews that the ancients had some knowledge of its torporous qualities. Plato also was acquainted with them, as appears by the homorons comparison of Socrates to that animal, which he puts into the mouth of Menon. Arifotole likewise treats of the benumbing or flupifying qualities of this fish, though he seems to have no idea of their being communicated by the intervention of a flisk, rope, or water.

Theophrastus, according to Athenaeus, observed that the torpedo conveyed the benumbing sensation through the fish and sread into the hands of the fishermen that held them. Diphilos, of Laodicea, takes notice that the torpedo was occasioned, not by the whole, but by certain parts of the body of this fish: and Hero of Alexandria mentions it as emitting effluvia through brails and iron, and other solid bodies.

Pliny's account, though partly true, is mingled with the marvellous and fallacious. Plutarch is more full and just; for he represents the torpedo as not only benumbing all that touch it, but flupifying a numbness through the net into the hands of the fishermens, and as even diminishing the feeling of those who poured water upon it, if it happened to be laid on the ground alive. He adds, that whilst the torpedo swims round his prey, he emits certain effluvia like darts, that first affect the water, and then the fishes in it, which are thus disabled from defending themselves or escaping.

Before the days of Galen, the torpedo was placed alive to parts affected, and particularly for the cure of an obilinate head-ache, as appears from Scribonius Largus, who lived under Claudian, and from Dicoroides, who flourished soon after. Galen conceived that the torpedo acted by a frigorous principle, for as cold occasions a numbness in an animated body, so does the shock given by that animal. Paulus of Aegina, one of the Galenic school, recommends the oil of the dead fish for tempering the hot humour of the gout, and for other ailments that required cooling applications.

Such are the unsatisfactory accounts of the philosophers and physicians of antiquity.

The Abulinnians, it is said, use torpedos for the cure of fevers,
fevers, by lying down the patient to a table, and applying the fish successively upon all his members, which puts him to cruel torment, but effectually removes his disease. Bel- lonius assures us, that our own torpedoes applied to the soles of the feet, have proved successful against fevers.

Oppian, like Diphilus, distinguishes the parts where the powers of the fish peculiarly reside; these he calls 

*αὐγοὶ* 

the flanks, from which he imagined the animal had a faculty of darting upon other fishes certain subsistences, called by a name *εἰγαλί*, the meaning of which is obscure. In the sixteenth century, some members of the Academy del Cimento availed themselves of their victory to the sea to make experiments on the torpedo. Redi began, and was afterwards assisted by Borelli, and then by the Dane, and Lorenzini, his scholar, engaged in the same pursuit, and published a curious treatise upon the subject. Redi, having endeavoured to distinguish between the real properties of the torpedo, and those erroneously ascribed to it, proceeded to the anatomy of it; and was the first who with any accuracy described those crooked subsistences lying on each side of the spine, near the head, which he considered as muscles (from thence named *musculi falcati*) that projected, according to him, certain effluvia, occasioning the sensation of numbness more or less, as the animal was excited to put these organs into action. This hypothesis of the transmision of effluvia was immediately embraced by Lorenzini, and afterwards by Claude Perrault. Borelli, not admitting the emission of benumbing particles, referred the sensation produced by this fish to a certain brisk undulation of the parts touched, which the animal could excite at will.

In 1714, M. Reaumur, being on the coast of Poitou, took an opportunity of making some experiments on the torpedo, which, with the refult, he communicated to the Royal Academy of Sciences at Paris. His hypothesis, which was generally received by the ingenious naturalists over all Europe, is not very different from that of Borelli; for instead of the undefined vibrating parts of the latter, M. Reaumur substituted muscles (the *musculi falcati* of Redi and Lorenzini) which, by the vivacity of their action, impelled upon the hand, that touched these parts, a sensation of numbness, owing to the elevation of the procretion of the nervous fluid, or a repulsion of the same. But he denied that this impression of numbness could be communicated through water, a net, or any other soft and yielding substance; nay, through a stick, except a very short one, whereas, it is certain, that the shocks of the torpedo are not less conducted through fuch media than those from a charged electrical phial.

We have been lately furnished, by the experiments and observations of John Walsh, esq. with a theory, much more plausible and just than any above recited, which considers the electric fluid as the efficient cause of the amazing qualities of the torpedo. We shall be led to a brief account of the facts on which this theory is founded by the following preliminary remarks.

Soon after the discovery of the Leyden phial, the celebrated professor Allemann applied to M. s'Graveande, governor of Efqueibo, for an account of a fish in Surinam, resembling a conger-eel, and possessing properties similar to those of the torpedo; this account was received in 1754, and published in the second volume of the Transactions of the Society at Haerlem. From this account it appears, that the shocks of the fish, which were so violent, when the fish was strong and lively, as to throw a person who touched it to the ground, were like those of the electrical fire, but unaccompanied with sparks of fire; and that the fish was a species of the gymnotus of Artedi. In the sixth volume of the same work, we have a more ample relation of the exertions of this animal by M. Vander Lott, dated from Rio Effequibo, in 1761. M. Adamfon, about the same time with the discovery of M. s'Graveande in America, met with the same or a similar fish in the river of Senegal in Africa. The earliest account we have of this kind of eel is by M. Richer, recorded by M. du Hamel, in his History of the Royal Academy of Sciences for 1777. In the island of Cayenne, says M. du Hamel, there is a fish, not unlike a conger-eel, which, touched with the finger, or even with the end of a ftick, affects the arm with a numbness, and the head with giddiness, and the eyes with a dimness of sight, which M. Richer had himself felt upon making the experiment. See Gymnotus.

We are indebted to Mr. Walsh for not only the first, but for a numerous series of experiments on the torpedo, in order to ascertain its electrical nature; together with some correct and elegant drawings of the entire animal, and of some of its principal organs that appeared upon dissection. These experiments were made in the year 1772, partly at the house of Riché, and partly at Rochelle, in the presence of the members of the Royal Academy of Sciences at that place. They were conducted in a scientific manner, and properly diversified, and the result of them satisfactorily established the torpedo in the rank of an electrician, furnished with a power over the electric matter; by means of which he can, without any foreign machinery, and almost in an instantaneous manner, collect, condense, and at his will disperse it to neighbouring bodies, through any of those substances that are known to be conductors of the electric fluid. The phenomena occasioned by the torpedo and Leyden phial, in the human frame, are precisely similar: not only the shock, but the numbing sensation sometimes given by the animal, may be exactly imitated with the phial, by means of Lane's electrometer; the regulating rod of which, to produce the latter effect, must be brought almost into contact with the prime conductor which joins the phial.

The first experiment of Mr. Walsh discovered the electric quality of the torpedo, by his conveying its effects through the same conductors with his electricity, such as metals, water, and animal fluids, and by intercepting it by the same non-conductors, as glass and sealing-wax. Besides, one of the most brilliant of his discoveries was, that this animal not only could accumulate in one part a large quantity of electric matter, but was furnished with a certain organization, disposed in the manner of the Leyden phial; thus, while one surface of the electrical part (e.g. that on the back) was charged with this matter, or in a positive state; the other surface (that on the belly) was deprived of it, or in a negative state; so that the equilibrium could be restored, by making a communication between the two surfaces by water, the fluids of the human body or metals, in the same manner as by forming a circuit between the inside and outside surfaces of the Leyden phial. A living torpedo was laid on a table, upon a wet napkin; round another table food five persons inflated; and two brafs wires, each thirteen feet long, were suspended from the ceiling by silk en trinirs. One of the wires raised by one end upon the wet napkin, the other end was immerced in a basin full of water, placed on a second table, on which stood four other basins full of water. The first person put a finger of one hand into the water in which the wire was immerced, and a finger of the other hand into the second; and so on successively, till all the five persons communicated with each other by the water in the basins. In
the last bafon one end of the second wire was dipped, and with the other end Mr. Walb touched the back of the torpedo, when the five perons felt a shock, differing in nothing from that of the Leyden experiment, except in being weaker. Mr. Walb, who was not in the circuit, was not affected. This experiment was successfully repeated several times, even with eight perons. From this experiment it is evident, that the action of the torpedo is communicated through metals and water, or, in general, through the fame media that transmit the electrical connexion. It follows, likewise, that the upper and under parts of the animal, like the upper and under surfaces of an electrified plate of glafs, are in different states; for a peron who touches only the upper or the lower part of the electric organs, will not receive the shock of the torpedo. This action evidently depends on the will of the animal, who, however, scarcely exhibits any other fenible motion or effort at the time of exerting it than a depreffion or winking of his eyes. The fame motion is observed likewise to accompany its fruitlef attempts to tranfmit a shock through non-conductors. The flock of electrical matter which the torpedo poftefles appears to be very confiderable: a torpedo, when infufcated, has given to Mr. Walb, infufcated likewise, no lefs than fifty shocks in the space of a minute and a half.

Such are the operations performed by the torpedo in air. When a large fhock, very liberal of its shocks, was held in water, with one hand on his breast and another on his back, he gave the operator shocks of the fame kind as before, but about one-fourth of the strength of those given in air. At the very inftant of raifing him out of the water, he conftantly gave a very violent shock, and another nearly as violent, when his lower surface first touched the water on dipping him into it. On briskly and alternately plunging him a foot deeper into water, and raifing him an equal height into air, besides one or two shocks which he gave during the short time he was wholly in the water, and thofe which he gave at the surface, he constantly gave at leat two when he was wholly in the air: fo that Mr. Walb efimates that he gave above one hundred shocks during the minute in which the experiment was performed. The conclusions drawn from Mr. Walb's experiments were farther confirmed by experiments made on the torpedo at Leghorn, by Dr. Ingenhouf, in 1773.

Mr. Walb obferves, that the electricity of the torpedo refides in thofe parts that are called his electric organs: the parts bordering on these acting, more or lefs, as conductors, either through their fufblance, or by their fuperficies: and of thofe, the parts which conduct the best are the two great lateral fins bounding the organs outwardly, and the space lying between the two organs inwardly. All below the double tranferve cartilages feafearily conduct at all, unlefs when the fhock is juft taken out of water and is ftil wet, the mucus, with which he is lubricated, shielding itfelf, as it dries, to be of an infufcating nature; and the organs themselves, when uncharged, appear to be not inter printed, but rather exteriorly, as Mr. Walb fuftothes, con-ductors of a fhock. We are indebted to Mr. John Hunter for an accurate anatomical defcription of the torpedo, accompanied with two excellent drawings, who has thus supplied us with a valuable addition to the anatomical examination of this animal by Redi, Steno, and Lorenzini. For his account, we refer to Electric Organs of Fish.

Although Mr. Walb's experiments leave little room to doubt, that the shock given by the torpedo is produced by the fame agent that gives the fhock in an electrical explosion, yet there are fonie circumftances which it is difficult to reconcile to the supputation that it is produced by the electric fluid. One of these difficulties is, that the fhock is able to give a fhock when he is in the water, and consequently surrounded by a medium, through which the electric fluid is known to be tranfmitted with the greatest facility. It has likewise been difficult to conceive why the shock of the torpedo, supposing it to be produced by the electric fluid, should not, like that of an electrified bar, be accompanied with the appearance of light or fharks, or should not exhibit fome figns of attraction or repulfion. But from Mr. Walb's experiments it appears, that no light could poffibly accompany the shock of the torpedo, becaufe this shock could never be made to pass through the left fenible space of air, or the smalleft interruption made by the circuit; not even through the imperceptible interval between the links of a slender brads chain, apparently in contact with each other, nor over an admirable imperceptible interval or slit formed by cutting through a fip of tin-foil paffed onfealing-wax, which constituted part of the circuit; nor are the moft delicate pith-balls, or other light bodies, in what manner forever applied, in the leat degree affected at the time of the fhock. Mr. Walb obferves, that, with refpect to the pith-balls, it is not furprising that no motion could be discovered in them, as all his experiments fully fhowed that there was no gradual accumulation of the electric fluid, as in the cafe of charged glafs; but that it was collected and condenfed in the very inftant of the explosion, by a double effe that he explains and the other differences between the phe-omena of the Leyden pial, and of the torpedo, or the abfence of light and found, in the experiments made with the latter, by the following confiderations.

In a large fhock, the number of columns above mentioned, contained in one electric organ, was found to be no lefs than eleven hundred and eighty-two. This immense collection of cylinders Mr. Walb considers as fomewhat analogous to a large number of jars in an electric battery, and as containing a very large area in confequence of the great number and extensive surface of the columns. Now it is known, from experiments made with artificial electricity, that though the electric matter violently condenfed, or expelled from a very fmall pial, his gap charged, is capable of forcing a paflage through an inch of air, and that it will afford, in a very conpicious manner, the phe-nomena of light, found, attraction, and repulfion; yet if the quantity thus condenfed be expanded and rarefied, by communicating it to, or dividing it amongst a large number of jars, whose coated surfaces confitute a space, e.g. four hundred times larger than that of the pial: this fame quantity of electric matter, thus diffufed, will now yield only the fainter, or, if they may be fo called, the negative phenomena of the torpedo. It will not now be capable of pafting over the one hundredth part of that inch of air, which, in its condenfed state, it could pafs through with ease; it will not even be able to jump over the little gap made in its track by the interruption of the tin-foil; no fparf, found, or attraction of light bodies, will now be perceived: and yet this portion of electric matter, in this diffufed state, and with its diffufability thus diminished, will, like that of the torpedo, to effed its equilibrium, run through a conpiderable circuit of different conductors, perfectly conpuous, and will communicate a fenible fhock.

The Hon. Mr. Cavendih has endeavoured to remove the difficulties above stated, firft, by fome ingenious reafonings a priori, and afterwards by others drawn from the phenomena prefented by an artificial torpedo which he con-structed, and by means of which he has imitated the effects produced by the living animal. With refpect to the difficu-

Vol. XXXVI.
The cultv of conceiving how the torpedo can give a shock in water, he observes that those electricians are mistaken, who suppose that the electric fluid will only pass along the shortest and bell conductors. When different circuits are made (e.g. by means of the body, and the human body) between the positive and negative sides of a charged jar, some parts of the electric fluid will pass along each of them; though the greater quantity will pass through those in which it meets with the least resistance. Thus, a person may receive a part of the shock given by the torpedo in water, by holding one hand on the lower surface of an electric organ, and the other on the upper, or by applying his hands to other parts of the fish, or by dipping them into the water, so that one hand is nearer to the upper surface of the electric organs than the other; yet the greater part of the shock or charge may pass at the same time in all directions over the surface of the fish, or through the substance of its body, or through the water contiguous to it. With respect to the other difficulties, he solves them by reasonings similar to those urged by Mr. Walh, and by concursing experiments. Mr. Cavendish has confirmed these reasonings by means of his artificial torpedo, which is a piece of wood A B C D E (Plate XV. Electricity, &g. 4.) of which the part A B C D E is cut into the shape of the torpedo, and 1 2 3 inches long from A to D, and 1 5 5 inches broad from B to E; the part C D E is forty inches long, and serves for a handle. M N N M is a glafs tube let into a groove cut in the wood: W W is a piece of wire passing through the glafs tube, and folded at W to a thin piece of pewter, R R, lying flat on the wood, and intended to represent the upper surface of the electric organs: on the other side of the wood there is placed such another glafs tube, with a wire passing through it, and folded to another piece of pewter like R R, intended to represent the lower surface of those organs. The whole part A B C D E is covered with a piece of sheep-skin leather. In making experiments with this apparatus, after thoroughly soaking it in water of the saltiness of the sea, made by dissolving one part of common salt in thirty of water, the end of one of the wires is fastened to the negative side of a large battery, and when it is sufficiently charged, the positive side is touched with the end of the other wire; by which means the battery will be discharged through the torpedo. In experiments with this torpedo under water, Mr. Cavendish uses a trough, A B C D E (fig. 5.), the length B C of which is nineteen inches, the depth A B fourteen inches, and the breadth thirteen inches. The battery which he used was composed of forty-five jars, of very thin glass, diffined in seven rows, and so contriv’d, that he could use any number of rows at pleasure. Mr. Cavendish was enabled, by means of this apparatus, when immersed in water, to give shocks much resembling those given by the living animal. He felt familiar concussions likewise when he dipp’d his hands in water, at the distance of two or three inches from it: and as it is affirmed, that a person accidentally treading on the living fish, when buried in the sand, is sometimes shock’d by it, he imitated this experiment with his artificial torpedo, and received shocks from it. The events indeed, in the greater part of his experiments, so numerous to be recited in this place, with this artificial fish, relative to the shock, seem to agree sufficiently with those made by Mr. walh with the living animal. The experiments which Mr. Cavendish made with this machine, relative to the circumstance of the shock of the real torpedo not being able to pass through any fenible space of air, appear likewise to correspond with Mr. Walh’s trials. A piece of sealing-wax covered with tin-foil freely conducted a shock from the artificial torpedo; but on making as small a separation as possible through the metal with a penknife, the shock would not pass. See on the subject of this article for Mr. Walh’s paper, Phil. Trans. vol. lxxii. part ii. p. 461. I. vol. liv. part ii. p. 464. For Mr. Hunter’s paper, Id. vol. lxxii. part ii. p. 481. For Dr. Ingenhouz’s, Id. vol. lxv. part i. p. 1. For Mr. Cavendish’s, Id. vol. lxxvi. part i. p. 169. See also Sir John Pringle’s Six Discourses, &c. by Dr. Kip- pis, p. 45. &c.

TORPETO, a machine so called, invented by Mr. Fulton of the United States, and designed to blow up the largest ships. It is an apparatus of which the principal piece is a copper-box, inclining a certain quantity of gunpowder, and prepared with an interior spring which sets fire to the powder, at the same time that the whole is inclosed in a covering of cork, or some other light wood, to make the torpedo float under the surface of the water. It is placed under the keel of the vessel to be destroyed, by means of a harpoon directed against the sides of the ship.

TORPEN, in Geography, a town of Transylvania; 4 miles S.S.W. of Biltriz.

TORPERLEY, a town of England, in the county of Chelfer; 10 miles S.E. of Chelfer.

TORPETCHIN, a town of Thibet; 100 miles S. of Haratoubé.

TORPHICEN, a parish in the shire of Linitlgow; Scotland, is situated four miles S. by W. from the shire-town, and extends about nine miles in length, and two and a half in breadth. Its general appearance is hilly, particularly towards the E. end, where the hill called Cair Naple is situado, which is elevated 1498 feet above the level of the sea. The greater part of the parish is inclosed; and where the land is unfit for cultivation, considerabe plantations have been made. Coal is abundant; and here are large quarries of excellent freestone; several seams of ironstone, rich in metal; and a strong chalybate spring.

In the year 1811, the population was returned as 1131, occupying 236 houfes. The hosital or preceptory of Torphichen, long the principal residence of the knights of St. John of Jerusalem, was founded, in 1220, by king David I. The croft and a square tower still remain, and are fine specimens of the elegance and beauty of the architecture. There are two wings, one on the S. and the other on the N. side; and evident marks of other two on the E. and W. This preceptory had the privilege of sanctuary, which is supposed to have extended a mile in every direction; there is a flone in the church-yard as a centre, and four others at the distance of a mile, E., W., N., and S., with St. John’s cros upon them, which stand about two feet above the surface. At the Reformation, the vall eflates of that opulent order were converted into a temporal lordship, in favour of Sir James Sandlands, lord St. John of Jerusalem; in which noble family the title of lord Torpichen still remains. Near Loch-Coat, in this parish, are the ruins of a castle, which still display baronial gloom and grandeur. About a mile to the E. of the village, is an altar of four great unpolished whin-flones, which is said to have been a druidical place of worship; and about a mile to the N.W., is Boudane Hill, upon which are evident marks of a military station.—Beauty of Scotland, vol. iii. Linitlgow. Carlile’s Topographical Dictionary of Scotland.

TORPON, a town of Little Bucharia; 20 miles S.W. of Acau.

TORQUATA, in Zoolwgy, a name given by many authors to the common or water-fish, from the remarkable ring it has about its neck. See Natrix.

TORQUE, in Heraldry, a round roll of cloth twisted
and stuffed: such is the bandage frequently seen in armories about the heads of Moors, favages, &c.

It is always of the two principal colours of the coat. The torque is the least honourable of all the enrichments worn on the helmet by way of creft.

TORQUEMADA, John de, in Biography, a cardinal, was born at the place in Spain whence he took his name in 1538, and entered at the age of 15 into the Dominican order at Valladolid. He distinguished himself at home, in the university of Paris, and in various other places, and at length was promoted to the cardinalate, under the title of St. Sixtus, in 1439. After having been successively translated from one bishopric to another, he died in 1468, at the age of 80 years. He published a great number of works on theology, and in defence of the papal authority. Among other preferments which he enjoyed, he was confessor to Isabella of Castile from her infancy; and such was the temperate zeal that actuated him, he extorted from her a promise, that if she ever came to a throne, she would make the chastisement and destruction of heretics her principal object.

Another person of the same name was provincial in New Spain, and published a Spanish work under the title of “Monarchia Indiana,” or, A History of the Wars, Discoveries, Conquests, &c. in the West Indies, in 22 books, 3 vols. fol. 1615. Dupin. Morei.

TORQUEMADA, in Geography, a town of Spain, in the province of Leon, on the Arlanza; 12 miles E. of Palencia.

TORQUILLA, in Ornithology, the name of a species of wood-pecker, more commonly known by the name of jynx, and called in English the vory-neck.

TORQUINO, in Geography, a river of Cuba, which runs into the Spanish Main, N. lat. 20°. W. long. 76° 57'.

TORR, a town of Arabia, in the province of Yemen; 32 miles E. of Lobelia.

Torrallba, a town of Spain, in New Castile; 7 miles N.E. of Ciudad Real.

Torralva, a town of Spain, in Navarre, 15 miles from Estella.

Torrano, a town of Spain, in Navarre; 15 miles W. of Pamplona.

Torre, Filippo del, in Biography, an eminent antiquary, was born at Ciudad de Friuli in 1657, and having acquired an extensive knowledge of jurisprudence, mathematics, and anatomy at the university of Padua, he sought farther improvement at Rome in 1687, and became an academician of the college of the Propaganda. He was afterwards employed as auditor to cardinal Imperiali, in his legation to Ferrara, and accompanying him on his return to Rome, he devoted his attention to the great work on the antiquities of Antium, which he published in 1700. In 1702 he was nominated by pope Clement XI. to the bishopric of Adria, and there he presided with great reputation until his death, in 1717. Among his writings we may mention as the principal, his “Monumenta Veteris Antii,” 4to.; besides which, he published several other dissertations on antiquities, natural history, &c. and left many more in MS. Gen. Biog.

Torre, John Maria de la, a celebrated Italian philosopher, was born at Rome in 1710, studied at the Clementine college, and was elected professor of mathematics and philosophy in the college of Ciudad, in the Friuli; and afterwards removed to Naples, where he taught the same sciences in the archiepiscopal seminary. In 1754 he was appointed librarian to the king of Naples, superintendent of the royal printing-house, and conservator of the museum. In the construction of microscopes he is said to have made considerable improvements. He was a member of the principal academies in Italy, and a correspondent of those of Paris and Berlin, and of the Royal Society of London. He died in March 1782. His works, besides a Treatise on Arithmetic, are, “The Science of Nature,” Naples, 1749, 2 vols. 4to.; Venice, 1750, 4to.; “Elementa Physica,” Naples, 1767, 8vo.; “History of the Phenomena of Vefuvius,” ibid. 1755, 4to.; “Microscopic Observations,” ibid. 1776.

Torre, in Geography, a town of Spain, in Catalonia; 6 miles S. of Lerida.

Torre del Acre, or Agri, a town of Naples, in Bafilicata, on the coast of the gulf of Tarento; 25 miles S.S.E. of Matera.

Torre del Anuntiata, a town of Naples, in Lavora; 9 miles S.E. of Capua.

Torre Calenza, a town of the island of Corfica; 15 miles N.E. of Ajazzos.

Torre de Candarca, a town of Naples, in Capitanata; 11 miles W.S.W. of Manfredonia.

Torre Capigliola, a town of the island of Corfica; 10 miles N. of Ajazzos.

Torre del Capo di Roffio, a town of Naples, in Calabria; 18 miles N.E. of Cainso.

Torre Carabula, a town of the island of Corfica; 10 miles W.S.W. of Vico.

Torre di Cedagna, a town of Spain, in Catalonia; 9 miles N. of Puycerda.

Torre di Francolifi, a town of Naples, in Lavora; 8 miles N.W. of Capua.

Torre di Galeria, a town of the island of Corfica; 15 miles S. of Calvi.

Torre la Contarella, a town of Naples, in Capitanata; 2 miles S. of Vielet.

Torre Girolata, a town of the island of Corfica; 20 miles S. of Calvi.

Torre del Greco, a town of Naples, in Lavora. This town was destroyed by an eruption of Vefuvius; yet the inhabitants, after the eruption, returned and rebuilt the town on the same spot; 5 miles S.E. of Capua.

Torre Maggiore, a town of Naples, in Capitanata; 5 miles S.W. of St. Serviero.

Torre di Mare, a town of Naples, in Bafilicata; 20 miles S.E. of Matera.

Torre di Mesza, a town of Italy, in the department of the Mincio; 16 miles E.S.E. of Mantua.

Torre Molina, a town of Spain, in Grenada; 12 miles from Antequera.

Torre de Moncorvo, a town of Portugal, in the province of Tras os Montes, surrounded with a wall, and defended by a bastion and a castle. The number of inhabitants is about 1300; 42 miles S.S.W. of Braganca. N. lat. 41°. W. long. 6° 44'.

Torre di Neapoli, a town of the island of Sardinia; 5 miles N. of Orifatana.

Torre di Negarco, a town of Italy, in the department of the Mincio; 14 miles E. of Mantua.

Torre d'Orho, a town of Italy, in the department of the Mincio, near its union with the Po; 14 miles S.S.W. of Mantua.

Torre del Penza, a town of Naples, in Abruzzo; a promontory, near the Adriatic; 15 miles E. of Lanciano.

Torre Reffo, a town of Naples, in the province of Otranto; 10 miles N. of Tarento.
Torre de St. Basilia, a town of Naples, in Baflicitca, on the coast of the gulf of Tarento; 8 miles S.E. of Turin.
Torre St. Saffiano, a town of Naples, in the province of Otranto; 7 miles S.E. of Orria.
Torre de las Salinas, a town of Spain, in Valencia, near the coast of the Mediterranean, which carries on a great trade in salt, with which it is furnished by a small lake, formed by saline springs; and though the water be apparently weakened by rain, yet is salt made of it by the exhalations of the sun. The usual quantity thus produced, one year with another, is about 900,000 fanegas, each fanega being 150lbs. weight; but when heavy rains are accompanied by excessive heat, it comes little short of 1,500,000.
This is the most considerable salt-work in all Spain; 20 miles S.E. of Orihuela.
Torre de Sanguinanaza, a town of the island of Candia; 9 miles E. of Retiro.
Torre della Saffia, a town of Naples, in Capitanata; 3 miles N.E. of Salpe.
Torre Sicara, a town of the Popedom, in the marquisate of Ancona, on the Tronto, opposite Acoli.
Torre Tavignano, a town of the island of Corsica; 28 miles S.E. of Corte.
Torre di Vacarella, a town of Naples, in Capitanata; 10 miles N.E. of Troja.
Torre di Varano, a town of Naples, in Capitanata; 20 miles W. of Viele.
Torre la Vega, a town of Spain, in the province of Bifeay; 11 miles S.W. of Santander.
TORRECILLA, a town of Spain, in Old Castile; 11 miles S.E. of Najera.
TORRECILLAS, a town of Spain, in Estremadura; 6 miles E.N.E. of Truxillo.
TORRECUSO, a town of Naples; 5 miles W. of Benevento.
TORREDAL, a river of Norway, which runs into the sea near Christianfand.
TORREFACTION, formed of torrefacere, to roast, in Metallurgy. See Roasting.
Torrefaction, in Pharmacy, a kind of roasting, or asfation, in which a drug is laid to dry on a metallic plate placed over or before coals, till it become friable to the fingers.
Torrefaction is particularly used, when, after reducing some drug, as rhubarb, or myrobalan, into powder, it is laid on an iron or silver plate, and that placed over a moderate fire till the powder begins to assume a darkish hue; which is a mark, that those remedies have lost their purgative virtue, and have acquired a more astringent one.
Formerly they used to torrefy opium, to get out some malignant parts fancied to be in it, before they dared use it in medicine; but the effect was, that its volatile spirits and sulphur, in which its greatest virtue consists, were hereby evaporated.
TORRETFIED EARTH, in Agriculture, that which has undergone the action of fire, or been burnt. It has been observed by the writer of a paper on peat in the third volume of the "Transactions of the Highland Society of Scotland," that the uncommon fertility of torrefied earth can scarcely have escaped the notice of any one; but that it is difficult to account for the cause. It is suggested that torrefaction, by destroying the cohesive power of clay, may in that way render a soil containing torrefied earth more permeable to the roots of plants. But brick-dust, or burnt clayey matters, even when burned on the surface of grass-ground, confuses the moffes, or plants of that kind, and produces a deep verdure and lively vegetation of sweet herbage. It is stated by the author of the "Elements of Agricultural Chemistry," that when clay or tenacious earths are burnt, their power of absorbing moisture is lessened, and they are brought nearer to a state analogous to that of sands. That in the manufacture of bricks, this general principle is well illustrated: as, if a piece of dry brick-earth be applied to the tongue, it will adhere to it very strongly, in confluence of its power to absorb water; but that after it has been burnt, there will be scarcely a sensible adhesion. The process of torrefaction or burning may, therefore, render an earth less compact, less tenacious and retentive of moisture; and, when properly applied, may convert a matter that was stiff, damp, and, in consequence, cold, into one that is powdery, dry, and warm; and much more proper as a bed for vegetable life.
Dr. Darwin, in his "Phytologia," has supposed that clay, during torrefaction, may absorb some nutritive principles from the atmosphere that may afterwards be supplied to plants; but the earths are pure metallic oxys, saturated with oxygen; and the tendency of torrefaction, or burning, is to expel any other volatile principles that they may contain in combination. If the oxys of iron in earths be not saturated with oxygen, torrefaction tends to produce its further union with this principle; and hence in burning, the colour of clays changes to red. The oxys of iron which contains its full proportion of oxygen, has less attraction for acids than the other oxys, and is consequently less likely to be dissolved by any fluid acids in the earthy parts of land; and it appears in this state to act in the same manner as the earths. And though it has been suggested, that the oxys of iron, when combined with carbonic acid, is poisonous to plants; and that one use of torrefaction is to expel the carbonic acid from it; yet the carbonate of iron is not soluble in water, and is a very inert substance; besides, a luxuriant crop of cereals has been raised by the writer in a soil composed of one-fifth carbonate of iron, and four-fifths carbonate of lime. Carbonate of iron, too, abounds in some of the most fertile soils of this country, particularly the red hop-soil. And there is no theoretical ground, it is said, for supposing that carbonic acid, which is an essential food of plants, would, in any of its combinations, be poisonous to them; besides, it is known that lime and magnesia are both noxious to vegetation, unless combined with this principle.
The first of the above writers has likewise found, that cohesive earth which has suffered torrefaction, such, for instance, as brick-dust, is one of the most powerful agents in promoting the solubility of peat, and, consequently, not only of affilting in the cultivation of land of that sort, but in expediting the preparation of that earth as a manure. And as it has this very powerful effect in exciting the fertility of peat, kilns might, perhaps, be constructed, in which cohefive earth might be burnt either with the refuse of coal or peat-fuel. After the peat had been somewhat mellowed by the first culture as propounded, into a foil, a quantity of this brick-dust material might be spread out on the surface, after being turned up, to be harrowed in with the head. But although the torrefaction or burning of clay for this purpose should not be attainable at a moderate expense, if a sufficient quantity of earth be once mixed with the peat, it will not be difficult to reduce that earth to the state of brick-dust. As when the viviparity of peat is destroyed, and its parts separated by the intervention of earthy particles, it is very susceptible of combustion; it might be lightly turned over in the beginning of summer, and fire be communicated to it as soon as
of Mantua.—Alfo, a town of Italy, in the department of the Pararo; 8 miles W.S.W. of Modena.

TORRICEILLI, EVANGELISTA, in Biography, a very distinguished mathematician and philosopher, was born at Faenza in 1608, and at the age of eighteen he went to Rome to complete his education, and particularly to extend his acquaintance with mathematics, under the instruction of Benedetto Castelli, who was professor of mathematics in that city. After the perusal of Galileo's "Treatise on Motion," he composed a work of a similar kind, which being shown to Galileo by Castelli, excited his admiration, and induced him to invite the young author to his house. But as Galileo died three months after his arrival, he proposed to return to Rome; he was diverted, however, from his purpose, by being appointed mathematician and philosopher to the grand duke Ferdinand II., who also advanced him to the mathematical chair at Florence. In this honourable station he assiduously prosecuted his speculations and experiments, till death prematurely deprived the world of the benefit which could not fail to result from them, in the year 1647, at the age of 39 years. His "Treatise on Motion," already mentioned, was published in a "Collection of his Mathematical Works" in 1644. Of his dispute with Roberval concerning the Cycloid, we have already given a short account under that article. But Torricelli's fame is sufficiently established by his discovery of the true principle upon which the barometer is constructed. (See Torricellian.) Torricelli was no less celebrated for his mathematical knowledge, evinced by his improvement of the science of indivisibles discovered by Cavalieri, and for his acquaintance with the principles of optics, by which he was led to improve the construction of telescopes and microscopes. His discoveries, by which his name is immortalized among the promoters of useful sciences, are recorded in his "Lettere Accademiche," published at Florence in 1715, 4to., by Buonaventuri, with the life of Torricelli prefixed. The style in which he wrote in his native language was pure and elegant, and his general character was such as to command the respect and esteem of all who knew him.

TORRICEILLIAN, a term very frequent among physical writers, used in the phrase Torricellian tube, or Torricellian experiment, on account of the inventor, Torricelli, a disciple of the great Galileo.

Torricellian Tube, is a glass tube, open at one end, and hermetically sealed at the other, about three feet long, and one-tenth of an inch in diameter. See Barometer.

Torricellian Experiment, is performed by filling the Torricellian tube with mercury, by dropping the open orifice with the finger, inverting the tube, and plunging that orifice into a vessel of flagrant mercury. This done, the finger is removed, and the tube sustained perpendicular to the surface of the mercury in the vessel.

The consequence is, that part of the mercury falls out of the tube into the vessel, and there remains only enough in the tube to fill from twenty-eight to thirty-one inches of its capacity, above the surface of the flagrant mercury in the vessel.

Thofe twenty-eight, &c. inches of mercury are sustained in the tube by the preflure of the atmosphere on the surface of the flagrant mercury; and according to this atmosphere is more or less heavy, or as the winds, blowing upwards or downwards, heave up or deprefs the column, and to increase or diminish its weight and figure, more or less mercury is sustained from twenty-eight inches to thirty-one.

There is a cafe, however, firft taken notice of by Haygensi (Journal de Scavans, 1674, p. 111.) in which, if a glass tube of a small bore seventy or eighty inches in length, be well cleaned, and filled with mercury well purified of
of air, &c. in the manner described under Barometer, and
then carefully inverted into a vessel of stagnant mercury,
the mercury, instead of coming down to the height jut
mentioned, at which the preffure of the atmosphere is able
to sustain it, will continue to fill the tube, and stand at
the height of seventy-five inches: but by stricking the tube,
or gently shaking it, the mercury will descend and fettle
at its proper height, as in the common barometer. This
phenomenon is explained on the principles of the at-
traction of cohesion, which acts most powerfully in contact:
for when the tube is clean, and the mercury well purged of
air, many parts of the mercury, which, by the interpoftion
of small air-bubbles, would be kept from touching the tube,
are brought into contact with it, and those particles that are
in the middle of the column adhere to those that are next to
the fides of the tube, and thus form a compact column.
Besides, the increafe of attracting surface at the arched top
of the tube, by means of which a greater number of mer-
curial particles may come into contact with the glass than
those that recede from the contact of one to another, will
also give an advantage to the attraction of the glass, and
cause the mercury, immediately in contact with it, to adhere
to it. That the attraction of cohesion, as already explained,
is the caufe of this phenomenon is plain, because the
experiment will not succeed when the mercury is not well
purged of its air, nor even then if the bore of the tube is
large.

The Torricellian experiment makes what we now call
the barometer.

Torricellian Vacuum, is the vacuum produced by
filling a tube with mercury, and allowing it to defcend
to such a height as is counterbalanced by the preffure of
the atmosphere, as in the Torricellian experiment and barometer.
For the method of rendering this vacuum luminous by elec-
tricity, see Electrical, Exp. 15.

Torricello, in Geography, a town of the duchy
of Parma, on the Po; 12 miles N.W. of Parma.
Torrid Zone, See Zone.

Torrigia, or Torreglia, in Geography, a town of
the Ligurian republic; 15 miles N.E. of Genoa.

Torrijos, a town of Spain, in New Cafhile; 15
miles N.W. of Toledo.

Torromore Head, a cape of Scotland, on the E.
coast of the islad of Skye. N. lat. 57° 22'. W. long.
6° 2'.

Torrin-Beg, a rock on the S.W. of the islad of
Mull. N. lat. 56° 19'. W. long. 6° 20'.

Torrington, or Great Torrington, as it is
generally called, to diftinguish it from a village of the fame
name, is a market-town in the hundred of Fremington,
and county of Devon, England; 36 miles N.W. from Exeter,
and 197 miles W. by S. from London. The town is situ-
ated, partly on the fummit, and partly on the declivity of
an eminence which forms the caffen bank of the river Tor-
riddle. On the fouth fide are fome flight veftiges of an
ancient caffen, the origin of which is unknown; though,
according to Ridfon, it was the head of a notable baryon,
which continued from the Conqueft to the time of Edward I.
Its feite is now used as a bowling-green, and commands a fine
profpect. The river is here fesen to flow in a graceful cur-
rent along a narrow valley, inclofed by floping ridges,
and having a beautifully wooded back-ground. Torrington
was formerly infetted with the privilege of having reprefentatives
in parliament; but no return has been made fince the reign
of Henry VI. Its government is veited in a mayor, eight
aldermen, and feventeen burgreffes, who act under a charter
granted by queen Mary. The town confifts chiefly of one
long ftrert, "indifferently beautiful," fays Ridfon, "with
buildings very populous, and flourishing with merchants and
men of trade." The population return of the year 1811,
states the number of houses to be 414; the number of in-
habits 2151: the chief employ of the latter arises from
the woollen manufacture. A weekly market is held on Sat-
urdays; and here are four annual fairs. The parish con-
tains two churches, the moft ancient of which is furnished
with a library. In the town are fome ancient alms-houfes,
poffeffing the right of commongage on an extensive piece of
ground given by William Fitz-Robert, baron of Torring-
ton, in the reign of Richard I. Here is likewife a charity-
school for thirty-two boys. Margaret, countefs of Rich-
mond, mother of Henry VII., refided fome time in Torr-
ington, and was a confiderable benefactor to it.

At Fretel-hitoke, a village oppofite Torrington, on the
W. fide of the Torridge, are the ruins of a priory, founded
by Sir Roger Beaufhamp, in the reign of Henry III., for
fecular Augufline canons. At the difflution, the annual
revenues were valued at 127l. 2s. 4d. The feite of the priory
is now a farm-yard. The chief remains of the buildings
are the walls of two or three apartments, the weft window
of the conventual church, which still continues perfect,
and the great gate.

Near Torrington is Crofs, late the feat of H. Stevens,
eq, a handsome manfion, looking down on the romantic
feenery which encompaffes the bridge and the banks of the
Torridge.

A few miles from Crofs, southward, are the ruins of an
old manfion called Heanton, formerly a feat of the Rolles,
afterwards of lord Oford, and latterly of lord Clifton, who,
after its late demolition by fire, cut down the oaks which
were in the park, forming woods and groups of the noblest
Devonshire, by J. Britton and E.W. Brayley, 1803. Pol-
whale's Hilfory, &c. of Devonhile, folio, 1797.

Torrington, a town of the flate of Connecticut; 22
miles W.N.W. of Hartford.

Torrington Bay, or Bedford's Bay, a bay on the S.
coast of Nova Scotia; 3 miles N. of Halifax.

Torro, a river of Africa, which runs into the
Scherbro.

Torroff, a town of Bengal; 70 miles N.E. of
Dacca. N. lat. 24° 20'. E. long. 85° 18'.

Torrum, a town of Sweden, in the province of
Blekingen; 10 miles S.E. of Carlferona.

Torryburn, a feaport town of Scotland, in Fif-
eshire, on the Frith of Forth, with a good harbour,
to which belong thirteen veftels, amounting to upwards of
1000 tons.

Torsaker, a town of Sweden, in Angermanland;
27 miles N. of Hernofand—Alfo, a town of Sweden, in
the province of Gefcia; 15 miles S.W. of Gefe.

Torsang, a town of Sweden, in the province of
Dalecarlia; 10 miles S. of Falun.

Torsas, a town of Sweden, in the province of Smal-
land; 18 miles S.S.W. of Calmar—Alfo, a town of Swe-
den, in the province of Smaland; 16 miles S.W. of Wesio.

Torseera, a town of Hindooftan, in the cirec
of Sumbulpor; 16 miles S. of Sumbulpor.

Torsella, a town of Sweden, in Sudermanland,
on a river which runs into the Malar lake; 46 miles W.
of Stockholm.

Torsok, a town of Russia, on the route from
Peterburgh to Moscov, 71 verfs dillant from Vyfhi-
Voloshok, remarkable for a fpring superflitiously venerated
and attracting pilgrims from all parts. This town has no
less than 20 churches, fome of flone; and is in a thriving
condition. See Torox.

Torsiano,
causing the plates to start, so as to be easily detached from the bone. These plates vary in thickness, according to the age and size of the animal, and measure from an eighth to a quarter of an inch in thicknesses. A large turtle is said to afford about eight pounds of tortoise-shell; or, according to M. Schoepf, from five to fifteen or twenty pounds; and unless the animal itself be about the weight of 150 pounds, the shell is not worth much.

In order to bring tortoise-shell into the particular form required on the part of the artist," says Dr. Shaw, "it is steeped in boiling water, till it has acquired a proper degree of softness, and immediately afterwards committed to the pressure of a strong metallic mould of the figure required; and where it is necessary that pieces should be joined so as to compose a surface of considerable extent, the edges of the respective pieces are first scraped or thinned, and being laid over each other during their heated state, are committed to a strong press, by which means they are effectually joined or agglutinated. These are the methods also by which the various ornaments of gold, silver, &c. are occasionally fixed to the tortoise-shell, which is not capable of being melted, as vulgarly supposèd. The Greeks and Romans appear to have been peculiarly partial to this elegant ornamental article, with which tortoises were frequently covered the doors and pillars of their houses, their beds, &c. In the reign of Augustus, this species of luxury seems to have been at its height in Rome." Shaw’s General Zoology, vol. iii. pt. 1.

The Egyptians, says Mr. Bruce in his Abyssinian Travels, dealt very largely with the Romans in this elegant article of commerce. According to Pliny, the cutting of them for finering or inlaying was first practised by Carvilius Pollio; and this circumstance leads us to presume, that the Romans were not acquainted with the art of separating the laminate by fire placed in the inside of the shell, when the meat is taken out; for these scales, though they appear perfectly distinct and separate, nevertheless adhere, and more frequently break than split, where the mark of separation may be distinctly seen. Martial says, that beds were inlaid with it. Juvenal and Apuleius mention, that the Indian bed was all-over finiring with tortoise-shell on the outside, and swelling with stuffing within. The immense use made of it at Rome may be inferred from what Velleius Paterculus says, who observes, that when Alexandria was taken by Julius Cæsar, the magazines were so full of this article, that he proposed to have made it the principal ornament of his triumph, as he used ivory afterwards, when triumphing for having happily finired the African war. This finiture has been, in more modern times, a great article in the trade to China.

Tortoise-shell colour may be given to horn, by first preëssing the horn into proper plates or scales, and tempering two parts of quick-lime and one of litharge to the consistence of a soft paste with soap-lye. Let this paste be laid over all the parts of the horn, except such as are proper to be left transparent, and thus let it remain till it be thoroughly dry; when the paste being brushed off, the horn will be found partly opaque and partly transparent, like tortoise-shell. Semi-transparent parts may be added, by mixing whiting with some of the paste to weaken its effect in particular places, by which means spots of a reddish-brown will be produced, which will increase the beauty of the work as well as its resemblance of real tortoise-shell. Handmaid to the Arts, vol. i. p. 518.

Tortoise, in the Military Art. See Testudo.

Tortoise, River of, in Geography, a river of North America, in Louisiana and Florida, formed by the Mississippi.

TORTOLA.
TORTOLA, a town of Spain, in New Cañi; 5 miles N.E. of Guadalaxara.—Alfo, a town of Spain, in New Cañi; 8 miles S. of Cuenca.—Alfo, one of the Virgin islands in the West Indies, first settled by a party of Dutch Bucaneers, who built a fort for their protection; but who, in the year 1666, were driven out by another party of the same adventurers, calling themselves English, and pretending to take possession for the crown of England; and the English monarch, if he did not connive at the enterprise, made no exertion to take the benefit of it: for Tortola and its dependencies were soon afterwards annexed to the Lee ward Island government, in a compulsion granted by king Charles II. to Sir William Stapleton. The Dutch had done little towards the cultivation of the island, when they were expelled; but the chief merit of its improvements was reserved for some English settlers from the little island of Anguilla, who, about a century and a quarter ago, embarked with their families and settled in the Virgin Islands; which fee. Tortola is not more than 15 miles long and 6 miles broad. Its chief and almost only staple productions are sugar and cotton. N. lat. 18° 20'. E. long. 64° 20'.

TORTOLI, a town of the island of Sardinia, near the E. coast; 50 miles N.N.E. of Cagliari.

TORTONA, a town of France, in the department of Marengo, on the Scrinia; late the see of a bishop, suffragan of Milan, with a good citadel, situated on an eminence. This place has often been taken and retaken during the different wars in Italy. It gives name to a district called Tortone; 9 miles E. of Alexandria. N. lat. 44° 53'. E. long. 8° 52'.

TORTORELLA, a town of Naples, in Principeato Citra; 5 miles N.E. of Policargo.

TORTORICI, a town of Sicily, in the valley of Demon; 30 miles N.W. of Taormina. N. lat. 38° 9'. E. long. 142'.

TORTOSA, a town of Spain, in the province of Catalonia, situated near the Ebro, about 15 miles from its mouth; the see of a bishop, suffragan of Saragossa. It is said to have been founded 2000 years before the Christian era, but the proofs of this illustrious origin are unfortunately lost. Scipio gave it the name of "Dordofa," and made it a municipal city. Among the numerous and trifling combats between the Spanish and the Moors, there was one in which the women of Tortosa signalized themselves. They courageously mounted the ramparts of their city, and performed such prodigies of valour, that Raymond Berenger, the last count of Barcelona, in a fit of emotion, for them, in 1170, the military order of the hacha, or flambeau. They merited and obtained the same day several honourable privileges, which exist not at present; they have however preserved the right of precedence in matrimonial ceremonies, let the rank of the men be ever so distinguished. The most remarkable buildings are the cathedral and the castle; the latter of which is a mile square, and in a state of decay; and only serves as a place of residence for a governor; 81 miles S.E. of Saragossa. N. lat. 45° 47'. E. long. 9° 26'.

—Alfo, a sea-port of Syria, in the pachalic of Tripoli, anciently called "Antaradus" and "Orthofa." This town appears to have been built about the fifth or sixth century; it is situated on the sea, and may be about three-quarters of a mile in circumference. The ancient walls are of large hewn stone; without them there are other lower walls, with a fosse round them. At the N.W. corner there are great remains of the castle, and the present town is within the walls of it, which are strong, and built of large hewn stone, rufhicated. They are of a surprizing height, being at least fifty feet high, and the whole is near half a mile in circuit. Within the walls there is a church. Towards the E. cor ner of the city there is also a very beautiful large church; it is built of hewn stone inside and out, and consists of three naves; it does not seem to have been finished, and probably is a building of the sixth century; it is of the Corinthian order; and the arches, which are executed with the plain olive leaf, are built on square pillars, covered on the four sides with semi-circular pilasters. The pulpit was fixed to one of the pillars, and over it there is an inscription in the Syriac language. When Jerufalem was in the hands of the Christians, Torto was the see of a bishop, suffragan of Tyre; 35 miles N. of Tripoli. N. lat. 34° 55'. E. long. 32° 28'.—Alfo, a river of Syria, which runs into the Mediterranean, between Antioch and Tripoli.—Alfo, a cape of Spain, on the coast of Catalonia. N. lat. 40° 43'. E. long. 2° 47'.

TORTUE, a river of America, which runs into the Wabaf, N. lat. 39° 32'. W. long. 87° 55'.

TORTUES, a river of Louifiana, which runs into the Missouri, N. lat. 38° 26'. W. long. 94° 24'.

TORTUGA SALADA, an island in the Caribbean sea, about 36 miles in circumference; the east end is full of rugged and broken rocks, which stretch themselves a little way out to sea. At the east-east part is an indiffident good road for shipping, and much frequented in peaceable times by merchants, which come hither to trade. From May to August: for at the east end is a large salt-pond, within 200 paces of the sea. Near the west extremity of the island, on the south side, there is a small harbour, and some fresh water. The end of the island is full of shrubry trees; but the east end is rocky, and bare of trees, producing only coarse grass. Upon it are some goats, but not many. The turtles or tortoises come into the sandy bays to lay their eggs, and from hence the island has its name. There is no anchoring anywhere but in the road where the salt-ponds are, or in the harbour. N. lat. 11° 7'. W. long. 64° 30'.

Tortuga, an islet about six miles from the north coast of the island of Hispaniola, about 40 miles in circumference. N. lat. 20° 41'. W. long. 72° 40'.

TORTUGAS POINT, a cape of South America, on the coast of Chili, near Coquimbo.—Alfo, the south point of the port of Coquimbo, on the coast of Chili. The road or harbour is well sheltered, but will not contain above 20 or 30 vessels safely. S. lat. 20° 37'.

Tortugas Shoals, shoals and rocks in the gulf of Mexico, near the coast of East Florida. N. lat. 24° 36'. W. long. 82° 50'.

Tortugas, Dry, shoals in the Florida streams, at the entrance of the gulf of Mexico. N. lat. 24° 40'. W. long. 82° 25'.

TORTUGILLA, a small islet in the Spanish Main, near the coast of South America. N. lat. 8° 45'. W. long. 76° 20'.

TORTULA.

This is a most natural genus, the character of whole fringe cannot be mistaken. Barbula of Hedwig differs only in having round-headed male flowers, on a separate plant from the female, instead of axillary bud-like ones, on the same individual. This is a difficult and obscure distinction, without any natural difference. Of Barbula Hedwig defines twelve species, of Tortula three. Of the two genera united, nineteen are now enumerated as natives of Britain and Ireland only, exclusive of five of Hedwig's, not as yet discovered among us, so that twenty-four are known in all.

The habit of the genus here described is rather dwarf; the stems erect, sometimes short or nearly wanting; root fibrous, mostly perennial; leaves entire; fruit-flanks terminal or lateral; capule nearly erect; generally even, rarely furrowed; lid conical or awl-shaped; fringe long, brown, or deep red, elegantly twisted, its points rather loose and spreading.

The species are, in many cases, difficult to ascertain, and probably some of the smaller ones are too much multiplied. All our native ones are figured in English Botany. We shall here feele some of the principal, in order to exhibit, as in other inferences, a compendious view of the genus.

T. rigida. Rigid Screw-mofs. Fl. Brit. n. 1. Engl. Bot. t. 186. (Barbula rigida; Hedw. Crypt. v. 1. t. 65. t. 25. Bryum rigidum; Hud. 477. B. acaulon, orice tenuifolia Gerardi folio; Dill. Mucf. 388. t. 49. f. 55.)—Stem very short. Leaves spreading, rigid, involute, obtuse, ribbed. Capule cylindrical. Lid conical. Found on rocks, walls, chalky banks and cliffs, bearing capsules in the winter and early spring, not only in England, but in various parts of Europe, from Sweden to Greece. The writer of the present article first discovered and distinguished this humble moss, since the time of Dillenius, on a bank on the right hand of the road from Norwich towards Yarmouth, a little beyond Thorpe. It agrees in size with the most common of mosses, T. muralis, hereafter mentioned, but differs in the thickness and dark colour of its almost linear leaves, which have no hair at the point. The fruit-flask is solitary, red, half an inch to an inch high. Capule inclining, cylindrical, smooth, dark brown, with a slender veil and lid. Fringe brown, of thirty-two fine teeth. The foliage is incurred when dry.

41. Schrad. Spicil. 66.)—Stem much branched. Leaves all ovate, acute, keeled, with a midrib. Sheaths between the branches, imbricated. More common than the last, in England, Sweden, and Germany; bearing capsules in March. The tufts of this are much higher, the branches being more slender and more numerous. Leaves more ovate and pointed; those of the sheath more numerous, ribbed, imbricated, not rolled together, differing little from the proper foliage. Fruit-flasks tawny, or red. Capule erect, somewhat ovate, smooth, with a shorter thicker lid than that of T. convoluta, with which the present species has usually been confounded.

T. fallata. Sturdy Furrowed Screw-mofs. Fl. Brit. n. 6. Engl. Bot. t. 2384. (Bryum fallatum; Dickf. Crypt. facc. 2. 6, excluding the synonyms.)—Stem none. Leaves ovate, keeled, incurved. Capule erect, ovate, somewhat cylindrical, furrowed. Lid oblique.—Hitherto gathered only by our great English cryptogamist Mr. Dickson, about Banks, and by the sides of rivers, in Scotland. The synonyms he has applied to it are fully pointed out by Hedwig as erroneous, and belonging in fact to three different species. But Hedwig himself errs far more unaccountably, in ascerting Mr. Dickson's moss to be merely T. convoluta. The want of a stem, smaller size of the whole plant, and, above all, the strongly furrowed capule, singular perhaps in the whole genus, afford sufficient distinctions. The fringe and lid are as long as the capule; veil much longer. There appears to be no sheath to the solitary fruit-flask, whose height is half an inch.

T. rurals. Great Hairy Screw-mofs. Erhr. Crypt. n. 184. Fl. Brit. n. 7. Engl. Bot. t. 2070. (Barbula rurals; Hedw. Sp. Mucf. 121. Bryum rurale; Linne. Sp. Pl. 1581. B. rurale unguiculatum hirutum, elatus et ramosus; Dill. Mucf. 352. t. 45. t. 12.)—Stem branched. Leaves obtuse, recurved, hair-pointed; the uppermost falcate. Capule cylindrical, somewhat ovate.—Common on walls, roofs, and the trunks of trees, throughout Europe from Sweden to Greece, bearing fruit from January to April. This is much larger than any of the foregoing, the stems, mottly about two inches high, composing broad cushion-like patches, of a dirty hoary aspect in dry weather; dark green in wet; bearing abundance of upright capules, on long red flanks, in winter and spring. The leaves, recurved in every direction, are very abrupt, with a strong rib, ending in a long, roughish, wavy hair. Capule falcate, the teeth of its fringe united at the bottom into a firm, partly perforated, tube, which lacks character in this, the fulbulata, and a few other Tortula, has given occasion to Mohr to establish a genus by the name of Syntrichia; but it seems to us better avoided.

T. fulbulata. Awn-shaped Screw-mofs. Hedw. Sp. Mucf. 122. t. 27. Fl. Brit. n. 8. Engl. Bot. t. 1101. (Bryum fulbalatum; Linne. Sp. Pl. 1581. Curt. Lond. facc. 1. t. 66. B. capulis longis fulbalatis; Dill. Mucf. 350. t. 45. f. 40.)—Stem nearly simple, short. Leaves ovato-lanceolate, pointed. Capule cylindrical. Lid awl-shaped, strait.—Common in damp shady places, in the southern and middle countries of Europe; rare in Sweden, and even in Scotland. It forms dense perennial tufts, of a fine deep green, bearing capsules in March and April. The leaves are broad, nearly ovate, tipped with a point, sometimes elongated into a hair, when it becomes the T. pilosus of Schrad's Spicil. 66. The fruit-flasks are terminal, an inch or more in height, rather flat, but seldom straight. Capule alnimt erect, long and falcate, with a long taper lid and veil. Fringe united into a spiral tube for three quarters of its length.
T. murale. Wall Screw-moss. Hedw. Sp. Mucf. 123. Fl. Brit. n. 9. Engl. Bot. t. 1033. Bryum murale; Linn. Sp. Pl. 1581. B. tegulare humile, pilosum et incanum; Dill. Mucf. 355. t. 45. f. 14.—Stem mostly simple, very short. Leaves ovate, acute, hair-pointed. Capfule cylindrical, slightly elliptical. Lid conical.—This is perhaps the most universal of all mosses throughout Europe. Every wall and bank is covered with it, and the abundant capsules, produced in winter and spring, remain in a dry and empty state almost throughout the year. The roots are perennial. Stems very short, though sometimes divided, compoing broad dark-green patches, not dense elevated tufts, and rendered hoary by the terminal white hairs of the leaves. These hairs, however, vary in length, and are sometimes scarcely discernible. Fruit-flalk terminal, straight, reddish-brown, near an inch high. Old capfule a little curved when the fringe falls off. The latter is so much twisted as in most other species, the teeth, all separate and parallel, making hardly more than one turn. Lid red, not half so long as the capfule, slightly oblique. Veil as long as both together, flender, brownish.

T. cuneiformis. Wedge-shaped Screw-moss. Fl. Brit. n. 10. Engl. Bot. t. 1510. (Bryum cuneiformis; Dickf. Crypt. f. 5. 7. B. murale s.; Hudif. 477. B. humile, pilis carens, viride et pellucidum; Dill. Mucf. 356. t. 45. f. 15)—Stem very short, mostly simple. Leaves ovobariate, reticulated, pellucid, slightly pointed. Capfule cylindrical. Lid conical.—Found on banks and sandy ground, at Streatham, Surrey, and abundantly about Oxford, according to Dillenius. Mr. D. Turner gathered the specimens figured in Engl. Bot. on some old banks at Hpton, near Yarmouth. This moss is said to be biennial, bearing capsules in the early spring, and compoing broad indeterminate patches. When carefully examined, it cannot be confounded with any variety of the last. The leaves are of a brighter green, flrongly reticulated, pointef. Capfule more oval, with a longer, more awl-shaped, lid; its fringe bright red, or crimson, repeatedly and closely twisted together, which alone would distinguish this species from the preceding.

T. tortuosa. Frizzled Mountain Screw-moss. Hedw. Sp. Mucf. 124. Fl. Brit. n. 12. Engl. Bot. t. 1708. (Bryum tortuolum; Linn. Sp. Pl. 1583. Dickf. Dr. Pl. 48. B. cirrata, ferris et capulis longioribus; Dill. Mucf. 377. t. 48. f. 40)—Stem branched, level-topped. Leaves linear near to lanceolate, keeled; twisted and unrolled when dry. Capfule cylindrical, lightly ovate. Fringe lax.—Plentiful on the mountains of Wales, Scotland, and the north of England, Derbyshire, &c. as well as in Sweden, Switzerland, Germany, Italy, and, according to Dillenius, in Virginia. It bears capsules in summer, but not very conftantly. A large and handsome species, whose fronds, from two to four inches high, compose both and soft tufts, of a most beautiful green, the leaves being long and taper, frizzled when dry, especially at the rough, or minutely crenate, edges. Fruit-flalks an inch and a half or two inches high, bright crimson; pale yellow at the summit. Capfule inclining, flender, smooth, light brown, crimson at the mouth; finally erect. Lid taper, half as long as the capfule. Fringe long, crimson, gradually unrolled, and partly spreading or straight, approaching the character of a Trichostomum. See that article hereafter.

T. barbata. Bearded Lateral Screw-moss. Fl. Brit. n. 14. Engl. Bot. t. 2391. (Bryum barbatum; Curt. Lond. f. 4. t. 65. B. unguiculatum et barbatum, tenus et felletum; Dill. Mucf. 384. t. 48. f. 48.)—Stem branched from the base. Leaves elliptic-lanceolate, spreading, somewhat revolute. Fruit-flalks lateral. Capfule ovate.—Native of walls and barren heaths, in the winter and spring, said to be not unfrequent about London, particularly at Charlton, where nevertheless we have many a time sought it in vain. Mr. Hudson is reported to have confounded this species with T. cuneiformis, or perhaps nervosus, above described, though certainly none of the genus can be more essentially unlike. The fronds are level-topped, branched from the base, clothed with dark-green, single-ribbed, bearded leaves, recurved when dry; the uppermost forming a kind of star at the top of each branch. The fruit-flalks seem to spring from the base of each branch; yet the flower, to which each owes its origin, perhaps terminated the foot of the preceding feafon. Capfule small, erect, ovate, polifhed. Fringe red, not very much twisted, more than half the length of the capfule. The lid is represented by Curtis nearly as long as the capfule, awl-shaped, and oblique. The specific name was meant to conftrast this moss with the following, supposed to have no fringe; so that few names can be more exceptionable than either.

T. imberbis. Decidious Screw-moss. Fl. Brit. n. 15. Engl. Bot. t. 2392. (Bryum imberbe; Linn. Mam. 309. B. tenue, imberbe et pallidum, foliis crebrisioribus; Dill. Mucf. 382. t. 48. f. 45.)—Stem branched. Leaves awl-shaped, spreading; ovate at their base. Stalks about the upper part of the branches. Capfules cylindric, somewhat elliptical.—Found on dry banks, walls, and amongst grafts, perfecting its capsules very early in the spring. This has much the habit of the last, but its leaves are of a paler yellowish-green, more tapering and channelled, turning inward in drying. Fruit-flalks purplish, an inch high. Capfule more cylindric and longer, while the lid is shorter than in T. barbata. Fringe light brown, very soon decia- duous, whence Dillenius thought it to be wanting, and his definition led Linnaeus to apply the faulty name, which still flicks to this species.

T. ariflata. Short-pointed Screw-moss. Fl. Brit. n. 16. Engl. Bot. t. 2393. (Bryum ariflata; Dickf. Crypt. f. 4. 12. t. 11. f. 7.)—Stem branched, level-topped. Leaves oblong, obtuse, with a minute point; curved inward and twifled when dry. Capfule cylindric.—Found on walls at Croydon, Surrey, by Mr. Dickfon, who first defcribed this moss, and to whom we are indebted for the specimens. The fronds are perennial, branched and level-topped, much in the manner of the two foregoing. Leaves rather abruf, with a very small terminal point: by drying they become twifled, enfolding the branch in a spiral order, and are neither recurved nor inflexed. Fruit-flalks terminal, crimson, scarcely an inch high. Capfule cylindric, of a light flining brown, thin and semi-pellucid. Lid incurved, tapering, tawny, almost equal in length to the capfule. Fringe soon falling off.

TORTURA, or TANTUR, in Geography, a town of Palatina, on the coast of the Macedonian, called in the scripture Dor, Dora, and Nephot. Josuah took it from the Canaanities, and it fell to the tribe of Manasseh. Tryphon, tyrant of Syria, after the murder of Antiochus VI. fled to this place for shelter; but he was soon compelled to abandon it, and shortly after lost his life. In the times of Christianity it was erected into a bishopric under the archbishop of Caesarea. It is at present a village only. The environs abound in grain, cotton, and fruit: wheat in particular is abundant, and of a quality inferior to the other parts of Palatine and Syria; 15 miles S. of Acre. N. lat. 32° 35'. E. long. 34° 2'.

TOR
TORTURA, a word appropriated by many medical writers, to express only the distortions of the face, and particularly of the mouth, in convulsions.

TORTURE, a grievous pain inflicted on a criminal, or person accused, to make him confess the truth.

The forms of torture are different in different countries. In some they use water, in others iron, in some the wheel or rack, in some the boot, thumbsnails, &c. See Rack, Boot, &c.

Torture itself is from Latin 'torrare,' and means to be seized by fits of pain, to suffer inflammation.

The marquis Beccaria (chap. 16.) with exquisitely ratiocinates proposes this problem: the force of the muscles and the sensibility of the nerves of an innocent, person being given, it is required to find the degree of pain necessary to make him confess himself guilty of a crime.

TORTYRA, in Ancient Geography, the name of one of the seven towns which Cyrus gave to his favourite Pythaeus, supposed to be in the environs of Afa Minor. Athens, and

Torus, in Architecture. See Toric.

Torus, in Botany and Vegetable Physiology, a name applied by Mr. Salisbury to what is termed by Linnaeus either the receptacle of the flower, or a glandular nectary surrounding the calyx of the germb. Jullien and his followers call it 'idius hypogynus,' alluding to its form, as well as its situation. The word torus is very descriptive, as expre sing the frequent resemblance of the part in question to what usually forms an architectural column, and it is certainly preferable to the compounded appellation just mentioned. A very curious lobed and plaited torus may be seen in Cognac, but we believe it to be strictly a glandular nectary. Mr. Brown's natural order of 'Epacridae' contains some genera with five separate glanss, of a like nature, indubitably (in our opinion) nectariferous; and others with an uninterrupted annular nectariferous disk, or torus, under the germs. It does not follow, because Linnaeus has sometimes misapplied the term 'nectarium,' that there is no such thing in nature; but his opponents have wished to obscure and invalidate that term, because he has in general, with so much originality and success, employed it for the clear and concise determination of genera. This displays a want of candour, unbecoming disinterested students and admirers of Nature.

Torus, in Ancient Geography, a mountain of Sicily, between Hercules and Agrigentum.

TORUSCULA, a word used by some medical writers to express a tub.

TORY. See Toreis.

Tory Isl., in Geography, an island lying north of Bloody Ferland Point, in the county of Donegal, about 61 miles from the main land. It is said to be extremely fertile.

TORYNE, in Pharmacy, the name of a kind of fpatsila intended for strewing up the ingredients of decoctions while boiling.

TORYNETOS, a name given by some to a mixture of bread and water boiled together, whether meant as a kind of a panada, or for a poultice.

TORZA, in Geography, a town of Persia, in the province of Irak; 40 miles E. of Hamadan.

TORZOK, a town of Ruffia, in the government of Tver, on the Tvertza; 40 miles W.N.W. of Tver. N. lat. 57°. E. long. 35° 14'. See Tornhok.

TOSA, a sea-port town of Spain, in the province of Catalonia; 23 miles S.S.E. of Gerona. N. lat. 41° 43'. E. long. 2° 48'.--Alto, a river of Italy, which runs into lake Maggiore; 4 miles N.E. of Omegna.--Allo, a town of Japan, capital of a province of the island of Xicoco, on the south coast. N. lat. 33° 40'. E. long. 134° 50'.

TOSALE, in Ancient Geography, a town of India, on the other side of the Ganges, and near it, which had the title of metropolis. Ptolemy.

TOSANLI, in Geography, a river of Natolia, which waters the city of Tocat, and afterwards joins the Jekillemak. It was anciently called Lycus.

TOSCARAN, a town of Peria, in the province of Irak; 21 miles S. of Hamadan.

TOSCANELLA, a town of the Popedon, in the Patrimonio, the see of a bishop, suffragan of Viterbo; 9 miles W.S.W. of Viterbo. N. lat. 42° 24'. E. long. 11° 52'.

TOSCANELLI, Paolo, in Biography, an eminent astronomer, was born at Florence in 1397. Declining the profession of his father, who was a physician, he devoted himself to the study of geometry and astronomy, and also of the Latin and Greek languages. He was one of the curators of Niccoli's library, and conversant with the solar motions. He corrected the astronomical tables of Alphonse and the Arabians. Of his astronomical tables he left a memorial in the great dial fixed upon the metropolitan church at Florence, erected about the year 1468. He died in 1482, at the age of 85.

TOSCOLANO, in Geography, a town of Italy, in the department of the Benaco, on a small river which runs into lake Garda. Here is a manufacture of cloth, with some paper and iron-mills, 6 miles E.N.E. of Salo.

TOSENA, a town of Sweden, in Ost Gothland; 20 miles W.N.W. of Uddevalla.

TOSI, GIOSEPPE FELICE, of Bologna, in Biography, maestro di capella at Venice the latter end of the 17th century, and composer of five operas for that city between the years 1684 and 1690. (Gloria della Poetria.) Befide thefe dramas, he composed others for Bologna. His name, however,
however, will be longer remembered by the merit of his son, than by his musical productions, which have been long lost and forgotten. See the next article.

Tosi, Pier Francesco, Accademia Filasmonico di Bologna, and not only an eminent opera singer, in Soprano, during his youth, but a composer of cantatas, in which the recitatives were particularly impassioned, energetic, and impressive, and author of an excellent treatise on singing, well known in England, by the late Mr. Galliard’s admirable translation.

The author of this treatise seems to have had no partiality for rapid execution. His own favourite style of singing was the pathetic, which he describes and recommends by excellent precepts. Though this elementary treatise has been written more than fourscore years, no work of the same kind has been produced in Europe since its publication, but upon Tosi’s model, and in confirmation of his precepts.

The excellent composer of the old school, Galliard, a profound and experienced judge of every species of musical merit, not only recommended its use to the first musical professors, instrumental as well as vocal, by an admirable translation and notes in 1740, but by his examples instantly excited it into a classical work.

In 1757, Agricola, opera composer to Federico II., king of Prussia, and the best singing-master in Berlin, published a translation of it with useful and instructive notes, which made the work well-known in Germany; a knowledge which Willem of Leiprecht much increased by frequent extracts from it, in his musical journals.

And in 1774, Mancini, singing-master to the archdukes of Vienna, published a treatise on singing of great merit, founded on the work, and confirming the principles of Tosi, of whom he speaks with the highest respect in his chapter on “Intonation.” “Giovanna non poco si ogni secolare leggera ‘nel libro tanto stigmati di Pier Francesco Tosi. A carte 12, la spiegazione, che ello fa sopra il femituo maggiore, e minore, appunto per sapere la quantità degli intervalli, o su delle commie, chi le compone.” —It will be of no small service to students in singing, if they read in the work of P. F. Tosi, (p. 12. of the original,) the explanation which he gives of major and minor tones, that they may know precisely the quantity of the several intervals, or rather commas, of which they are composed.” See Mancini, for the original title and further account of his book.

Of Tosi’s life but little is known, except from Galliard’s prefatory discourse to his translation; who tells us that he was a finger of great esteem and reputation. He sung on the stage at Venice in 1707, in the opera of “Olibrio,” written by Apolito Zeni, and let by Gasparrini, where he is styled Virtuoso di S. A. Electoraleo Palatina. He spent the chief part of his time, according to Galliard, in travelling, and by that means heard the most eminent singers in Europe; whence, by the help of his refined taste, he made the observations which are contained in his book. Among many excursions, his curiosity was excited to visit England, where he resided for some time in the reigns of King James II., king William, George I., and beginning of George II. He was very much esteemed by persons of rank wherever he went; among whom, in England, was the late earl of Peterborough, whom he had often met in his travels on the continent, to whom he had dedicated his book, though it was printed at Bologna in 1723, some time after he had quitted England. The emperor Joseph I. gave him an honourable employment in some part of Italy, and the archduches, a church retirement in Flanders, where he died.

The original title of his book, which is now become scarce, is, “Opinione de’ Cantori Antichi e Moderni o Sieno Offervazioni sopra il Canto figurato.” 8vo.

The earl of Peterborough, to whom he dedicates his book, was one of the best informed judges of dramatic music and performance in his time. He married the amiable and accomplished Mrs. Annabella Robinson, after a very long courtship. (See her article.) Tosi used to meet Bononcini, and all the first opera singers of the time, at the earl’s villa, at Parson’s Green; and we remember hearing Monticelli, Reginelli, and Manzoli, speaking with great respect of the “Trattato di Tosi.”

TOSIA, in Geography, a neat town of Asia, in Notulia, built on the site of a hill, at the foot of which is a fine fertile country; 70 miles S.S.W. of Sinoh.

TOSICIA, a town of Naples, in Abruzzo Ultra; 7 miles S. of Terrano.

TOSINO, a river which crosses the marquisate of Ancona, and runs into the Adriatic, N. lat. 42° 57’. E. long. 13° 55’.

TOSMUANASSA, in Ancient Geography, a town of Asia, in Bactria. Politeny.

TOSNA, in Geography, a river of Russia, which runs into the Neva, near Pechora, in the government of Petersburg.

TOSNITZPACH, a river of Austria, which runs into the river Erlebach, 2 miles below Scheibins.

TOSOLIC, a town of Thibet; 35 miles S. of Tourfan.

TOSON-HOTOC, a town of Chinese Tartary; 88 miles S.S.W. of Haratoube.

TOSPICTES, in Ancient Geography, a country of Asia, in Greater Armenia, S. of the sources of the Euphrates and Tigris. Politeny.

TOSQUIATOSY CREEK, in Geography, one of the branches of the Allegany river.

TOS, a river of Switzerland, which runs into the Rhine, 2 miles S.E. of Egglisau, in the canton of Zurich.

TOSQUAQUA, a town of Peru, in the audience of Quiot; 110 miles W. of Quiot.

TOSSE, a town of France, in the department of the Landes; 12 miles W. of Dax.

TOSSIAT, a town of France, in the department of the Ain; 7 miles S.E. of Bourg-en-Bresse.

TOSIGNANO, a town of Italy, in the department of the Aosta; 13 miles W. of Ferrara.

TOSO, a town of Sweden, in West Gothland; 42 miles N.N.E. of Uddevalla.

TOST, or TOSCHEK, a town of Silevia, in the principality of Oppeln; 26 miles S.E. of Oppeln.

TOSTA, a river of Mexico, which runs into the Pacific ocean, N. lat. 12° 30’.

TOSTAR, or Suster. See SHUS, SHUSTER, and SUSA.

TOSTERYD, a town of Sweden, in Smaland; 22 miles S. of Jonkoping.

TOSTES, a town of France, in the department of the Lower Seine; 12 miles S.W. of Arques.

TOSTO, Cape, a cape on the N. coast of Spain. N. lat. 45° 15’. W. long. 9° 15’.

TOSUN HOTUN, a town of Thibet; 550 miles W.S.W. of Tourfan. N. lat. 41° 55’. E. long. 99° 10’.

TOT VARADIN, a town of Hungary; 24 miles S.E. of Boros Jeno.

TOTA ISLAND, or Island of Planteous, an island of the Atlantic, near the coast of Africa, at the mouth of the Scherbro.

TOTANA, a town of Spain, in the province of Murcia; 11 miles N.E. of Lorca.

TOTANO,
TOTANO, or Totanus, in Ornithology, the name of a bird common in the Italian markets, and more usually known by the name of Votia; which fee.

The totanus of Limnaeus is a species of Scolopax, (which, see,) and the crest of other authors. See Rail.

TOTANUS is allowed by Petter for the Limnae; which fee.

TOTAQUESTAC, in Ornithology, the name of a beautiful American bird, described by Niezenberg from Anto

nivus Herrera. It is said to be something smaller than a pigeon, and all over of a most beautiful green; its tail-feathers are of a very great length, and are greatly esteemed. The Indians value the bird so highly, that it is death by their laws to kill it, so that when it is caught they only fling it and let it go again. Ray.

TOTEN, in Geography, a town of Norway, in the prov

ince of Agderhus; 47 miles N. of Christiania.

TOTES, a town of France, in the department of the Lower Seine; 14 miles N. of Rouen.

TOTEZVA, a town of Hungary, on the river Bodrog; 5 miles S.W. of Patak.

TOTFAU, a town of Hungary; 1 mile N. of Sich. Alfo, a town of Hungary; 8 miles W. of Podolice.

TOTILA, in Biography, king of the Ostrogoths in Italy, was a commander of the Gothic garrison at Trevigo, and upon the deposition and murder of his uncle Ereric, was chosen to succeed him A.D. 541. After several successful contests with the Romans, and the capture of their chief cities, he advanced to Tibur, within eighteen miles of the capital. In every step of his progress his conduct was con

ciliatory; he restrained his soldiers, in the career of victory, from all acts of licentiousness; and by the exercise of humanity and liberality, he attached to his service and cause his vanquished enemies. Upon his approach to the capital, the emperor Jutlinian was alarmed, and recalling Belisarius from the Persian war, sent him, already renowned for his character and exploits, to its relief. Failing in his attempts to throw succours into the city, he withdrew, and abandoned it to the d지를 of famine; so that those inhabitants who could make their escape deserted it, and those that remained importantly solicited the governor to capitulate. At length the Roman garrison retired, and one of the gates was opened to the Gothic troops, by which Totila entered the city December 17, A.D. 546. Although the conqueror spared the lives of the inhabitants, he allowed his soldiers to pillage the city, and by so doing reduced the wealthy senators and their families to absolute beggary. Having convened those few of this rank that remained, he reprehended and threatened them; but pacified by the intercession of Pelagius, he sent a respectful message to Jutlinian, offering to live with him upon amicable terms; and yet intimating, that on the rejection of his proposal he would utterly destroy Rome, and remove the fleet of war to Illyricum. The emperor referred him for an answer to Belisarius, upon which flight he began to demolish the city. As he was proceeding in the work of destruction, Belisarius re

monstrated with him on the barbarity of his conduct, and so far succeeded as to induce Totila to desist, and to march off, with his troops and the senators, to Lucania. The remaining inhabitants were dispersed in exile, and Rome was for forty days in a state of total depopulation. Belisarius seized the opportunity of taking possession of the city, repairing the fortifications to the utmost of his power, and recalling the inhabitants. Upon receiving this intelligence, the Gothic sovereign returned, and having made many unsuccessful at

ttempts for regaining possession of the city, and pacified, in repeated assaults, the chieftains of his troops, he was under a necessity of decamping, and of marching, with degraded reputation, and a discontented army, to the siege of Portu

gia. He contrived, however, to regain the confidence of his troops, and after obtaining a reinforcement, marched again for Rome, and by the treachery of some Haurian cen

tinels, became master of the city. Experience had now taught him wisdom; and he adopted every measure which he found policy dictated for conciliating his enemies. He not only repaired the walls and edifices which he had demol

ished, but recalled the senators, and restored them to their rank, and at the same time invited the citizens to take pos

sion of their property, supplying them in the mean while with provisions. He also exhibited the Circenian games, and prefaced at them with the dignity of a Roman emperor. Totila renewed his embassy to Jutlinian, making an offer of peace and alliance; but the emperor would not admit the Gothic ambassadors to an audience. The Gothic sovereign was incensed by this treatment; and fitting out a powerful fleet, took Rhegium and Tarentum, and passed over to Sicily, which he speedily reduced and pillaged; and having made himself master of Sardina and Corsica, and ravaged the whole sea-coast of Greece, whilst his troops were be

fieguing on the coast of Sicily, he was surprised by the emperor's signal for aid, and was obliged to raise the siege, and soon after he left Sicily. Jutlinian, encouraged by these fortunate events, determined to procure Italy from the power of Totila; and having recalled Beli

sarius, devoted the command of his army to Narves, who marched directly to Rome, and meeting Totila in his pro

gress, prefented to him the emperor's message, which was merely an offer of pardon. Totila seemed to regard it as an insult, and replied, that he would conquer or die. In the furious combat between the hostile armies that ensued, the Goths were driven from the field of battle, and Totila fled with no more than five attendants. In his flight he was overtaken by Albad, a leader of the Gepidae, who pierced him through the body with a lance. His faithful companions hurried him away seven miles beyond the scene of action, and had his wound dressed; but he soon after ex

pired. A private burial terminated the glory of this conqueror of Rome, whom his eulogists have celebrated for va

lour tempered by humanity and moderation, and for a go

dernment conducted with a regard to justice, and equity.

With this battle, fought in July 552, the 11th year of To

TOTIMA, in Geography, a town of Ruflia, in the go

vernment of Vologda. In the environs are several salt-pits; 92 miles N.E. of Vologda. N. lat. 60° 10'. E. long. 42° 54'.

TOTINESS, an ancient borough and market-town in the hundred of Coleridge, and county of Devon, England; is situated on the banks of the river Dart, 22 miles S.S.W. from Exeter, and 195 miles W.S.W. from London. It ranks among the most ancient towns in the kingdom; and its credit could be given to Geoffrey of Monmouth, would assume an origin coeval with the first, for here, according to this author, Brutus first landed; and the inhabitants, to corroborate the tale, still point out a place near the spot where the castle gate floor, as the very one on which he first set his foot. It is certainly, however, of remote antiquity; for Leland mentions that the Roman fort-way, extending through Devonshire and Somersetshire, began here; and Ridlon quotes a passage from Bede, which notices the ar
rival of Ambrosius and Uther-Pendragon at Totnes, when they returned from Bretagne to oppose the tyranny of Vor

tigen. The site of the town is peculiarly fine: from the margin of the Dart it climbs the steep declivity of a hill, and stretches itself along its brow; commanding a view of the winding stream and the country in its vicinity; but sheltered by
by higher grounds on every side. The piazzas in front of the houses in some parts of the town, and the higher stories projecting over the lower, are manifest proofs of its antiquity; a claim which is strengthened by the keep of its castle, a large circular building, turretted, rising from an immense artificial mound. This castle, according to Brown Willis, was erected by Judhael de Totnais (to whom the manor was given by the Conqueror), and made the head of his barony. During his residence here, he founded a priory for Benedictines, which continued till the dissolution, when its annual revenues were estimated at £24. 10s. 2d. The manor was granted in the reign of Henry VII. to Richard Edgcumbe, whose son, or grandson, in the second year of Elizabeth, conveyed it to the corporation, referring the right of a burgage-ship to his heirs for ever. Totnais was incorporated by charter of king John; and has had its privileges confirmed by several succeeding sovereigns. The corporation is vested in a mayor, recorder, thirteen burgomasters, and twenty common-councillors. The borough frilant representatives to parliament in the 23d of Edward I.: the right of election is in the corporation. At the period of the Norman survey, Totnais had immunity from taxation, excepting at those times when Exeter was rated. The parish church is a handsome edifice, having a well proportioned tower at the west end. The date of its foundation was unknown till the year 1799, when the south-east pinnacle was struck by lightning, and in its fall beat in the roof of a small room over the porch. In this room were two shells of old records, which becoming expired by this accident, among them there was found a grant of indulgence from bishop Lacey, "to those people who had or might contribute to the rebuilding of the church at Totnais." This was dated at Chudleigh, where the bishops of Exeter had a refence in 1432. The chancel is separated from the body of the church by an elegant screen of ornamental tracery in flone-work; but the altar-piece, instead of corresponding with the rest of the building, is of Greek design, having a semi-dome supported by Corinthian pillars. Totnais consists principally of one street, about three-quarters of a mile in length, terminated on the E. by a bridge over the Dart: the town was formerly surrounded by a wall, and had four gates: the east and north gate-houses are now standing. By the population return of the year 1811, the houses were estimated at 327, the number of inhabitants at 2725. Many of the labouring classes derive employment from the woollen trade, which is rapidly increasing. Five fairs are held annually, and a market weekly, on Saturday. Edward Lye, the learned author of the Anglo-Saxon and Gothic Dictionary, published in 1772, was a native of Totnais; as was also Dr. Benjamin Kennicott, well known for his collection of Hebrew MSS. The former died in 1769, the latter in 1783.

About two miles below Totnais, on the brow of a thickly wooded declivity which rises from the margin of the Dart, is Sharpham, the seat of Edmund Balfard, esq. The manor, an elegant building of freestone, was erected by captain Pownall, who loft his life at the moment of victory in a naval engagement during the American war. The daughter of that gentleman married Mr. Balfard.

On the eastern shore is Greenaway, a seat for many generations poessed by, and a residence of the family of Gilbert. Of this family, and born here, was sir Humphrey Gilbert, a celebrated voyager in the reign of Elizabeth: to him this kingdom is indebted for the discovery and settlement of Newfoundland. — Warner's Walk through the Western Counties, 8vo. 1800. Beauties of England and Wales, vol. iv. Devonshire: by J. Britton and E.W. Bralyey, 1803. Polwhele's History, &c. of Devonshire, folio. 1797.
TOU

part of the last century. The parish-church is built of hewn stones, flints, and pebbles, and consists of a chancel, nave, two aisles, and a square embattled tower. On the front side of the church is a large brick porch, built, as appears by the architecture, about the beginning of the sixteenth century. At the east end of the north aisle is the vestry, erected in 1696, by Henry, lord Colerane, and repaired, pursuant to his will, in 1702. The building is semi-circular at the east end; its roof is in the shape of a dome. The font is octagonal, richly ornamented with tracery, and the devices of a mermaid, pelican, &c. Monuments and other sepulchral memorials abound in every part of the church. David, king of Scotland, gave this church, in the twelfth century, to the canons of the Holy Trinity in London; after the dilution of that monastery, the rectory and the advowson of the vicarage were granted, in 1544, to the dean and chapter of St. Paul's, in whom they are still vested. There is a considerable Quakers' meeting in this parish, and a chapel belonging to the Methodists. An almshouse for four men and four women was founded and endowed, in 1660, by Balthasar Sanchez, a Spaniard. A similar establishment for six men and six women was built in 1735, pursuant to the will of Nicholas Reynardson, esq.; who also made provision for a school, for twenty poor children. By the bequests of Sarah, duchess dowager of Someret, the school-house was enlarged, and the benefits extended to all the children of such inhabitants of this parish as were not professed of an estate of 20l. per annum. A charity-school for girls was established in the year 1735; also a Sunday-school for boys, and a school of industry for girls, in the year 1790. According to the return made to the population act in 1811, the number of houses in this parish was 873; of inhabitants 4571. Lysons's Environs of London, vol. iii. quarto, 1792-1811. Dyson's History of Tottenham High-Crofts, 1792.

TOTTIUM, a town of Hindoostan, in the Carnatic; 24 miles W.N.W. of Trichinopoly.

TOTTWEIL, a town of Switzerland, in the county of Baden; 4 miles S.W. of Baden.

TOVALEY, a town of Hindoostan; 16 miles S.E. of Travancore.

TOUCAN, otherwise called anser Americanus, in Astro- nomy, a modern constellation of the southern hemisphere, consisting of nine small stars. See Constellation.

TOUCAN, in Ornithology. See RAMPIASTOS.

TOUCH, or TOQE, in Coinage, the manner of expressing the fineness of gold and silver in China, by dividing it into 100 parts, so called; thus, if it be 93 touch, it contains seven parts of alloy in 100. The Chinese in general take French silver coin at 95 touch (the better informed taking it only at 93), and English silver at 94 ditto; Spanish dollars at about 92; Siam ticals, and Madras rupees, at 98; and Rajamole rupees at 99 ditto.—Also, a method of trying the fineness of gold and silver in many places, by means of a flute called touch-flone.

TOUCH, in Music. An organ is said to have a good touch, or flup, when the keys close, and lie down well, being neither too loofe, nor too flitt.

TOUCH, in Ship-Building, the broadest part of plank worked top and butt, which place is fix feet from the butt-end; or, the middle of a plank worked anchor-lock fashion. Also, the angles of the flern-timbers at the counters, &c.

TOUCH the Wind, in Sea Language, is when the fleerfinan at the helm is bid to keep the ship as near the wind as may be. See Touching.

TOUC-HOLE, or VENT, in Gunnery, is the small hole at the end of the cylinder of a gun or musket, by which the fire is conveyed to the powder in the chamber.

In a fire-lock, carabine, or pistol, it is called the touch-hole; but in a piece of cannon, it is more properly called the vent.

TOUCH-NEEDLES, small masses of gold, silver, and copper, each pure and simple, and in all the different combinations, proportions, and degrees of mixture, prepared for the trying of gold and silver by the touch-flone; by comparison with the mark they leave on it.

The metals usually tried by the touch-flone, are gold, silver, and copper, either pure, or mixed with one another in different degrees and proportions by fusion. In order to find out the purity or quantity of base metal in these various admixtures, when they are to be examined, they are compared with these needles, which are mixed in a known proportion, and prepared for this use. The metals of these needles, both pure and mixed, are all made into lamins or plates one-twelfth of an inch broad, and of a fourth part of their breadth in thickness, and an inch and half long; these being thus prepared, you are to engrave on each a mark indicating its purity, or the nature and quantity of the mixture in it.

The manner of making the touch-needles is by the proportions of the mark, a weight of half a pound, or eight ounces, being divided into sixteen half-ounces, the half-ounces each into four drachmas, the drachm into four pennyweights, and this into two half-pennyweights.

TOUCI-NEEDLES, Silver: these must be only tempered with copper, and the proportion determined by the mark divided into half-ounces and grains.

You must use therefore for this purpose one mark of such a weight, that it shall constitute a sufficient mass of metal for the making of one needle; let it weigh, for instance, one drachm, then weigh such a mark of the purest silver, wrap it up in a small paper, and upon this write sixteen half-ounces, which will signify that the whole mark of this metal is the purest silver, and make the first needles of this mass.

Next weigh fifteen half-ounces of pure silver, and one half-ounce of pure copper; wrap these both in a paper, and write on it fifteen half-ounces, which will signify that there are in that small mass fifteen parts of pure silver, and one part of pure copper; make of this the second needle. In the same manner go on with the rest, add two half-ounces of copper to fourteen half-ounces of silver, mark it fourteen half-ounces, make the third needle of this; and in the same manner proportion the small masses of silver and copper for making the other needles, and put inscriptions upon every one in the following manner.

For the needle |

-8-9 half oz. of silver. |

7-8 half oz. copper.
When you have the metals in each of their due proportions, each being wrapped up in its separate paper; put each separately into a new crucible never used for any operation, and, adding a little borax, melt them together in a very quick fire, which must be well kindled before with bellows; or, what is yet better, throw them suddenly into a hot crucible, and as soon as they melt, stir them with a dry wooden peg, burn at the end, and pour them immediately into an ingot. When this is done, wrap up each mass, when cold, in its own paper again, and weigh them singly, in a nice balance; if they still weigh a whole mark, they are good; but if there is any considerable deficiency in their weight, it is a sign that your fire, having been too weak, or of too long duration, has consumed as much copper as is wanting in the weight; therefore these masses must be esteemed useless, and another made in its place in the same proportion.

When this is all finished, make with the hammer out of each of these small masses, a needle, making them a little hot; then engrave on each of these needles the number of half-ounces it contains, as before marked on its paper; that is, upon the first sixteen, upon the second fifteen, and so on; and then pierce them at one end, and running a silver wire through their eyes, collect them in order according to their different numbers. These are the silver touch-needles, made of the different alloys of silver and copper.

In Holland they make use of the mint mark, divided into grains, for the making of their needles. The first needle made of pure silver is said to be of twelve pennyweights. The second is made of eleven pennyweights, and eighteen grains, by the addition of six grains of copper. The third is made of eleven pennyweights and twelve grains, by the addition of twelve grains of copper; and so on, the proportion of silver decreasing always six grains, that is, one quarter of a pennyweight at a time, and that of the copper being always increased in the same proportion, till at last the weight of the silver is reduced to one pennyweight, and that of the copper increased to eleven pennyweights, which proportion constitutes the last needle.

It is needles, however, to go through the whole series of the needles, by so small progressions to the very last, for very delicate proportions cannot be very accurately distinguished in the operation.

**Touch-Needles. Gold.** These must be mixed either with silver alone, or with silver and copper variously intermixed. This mixture is called allowing or carating, and is determined with a mark divided into twenty-four carats, or weights of two-sixth parts of an ounce. There is nothing to be observed about the making of these needles, beside what has been already said in regard to the silver needles; except that the proportions of the weights are determined in another manner. These needles are made according to the following division and order; and they all weigh one mark.

The first is entirely of pure gold, or of 24 carats.

| 2 car. | 23 gr. | 6 gr. | 6 gr. |
| 3 car. | 23 gr. | 1 gr. | 1 gr. |
| 4 car. | 22 gr. | 6 gr. | 2 gr. |
| 5 car. | 21 gr. | 6 gr. | 3 gr. |
| 6 car. | 21 gr. | 6 gr. | 3 gr. |
| 7 car. | 20 gr. | 6 gr. | 4 gr. |
| 8 car. | 20 gr. | 6 gr. | 4 gr. |
| 9 car. | 19 gr. | 6 gr. | 5 gr. |
| 10 car. | 18 gr. | 6 gr. | 6 gr. |

The decrease goes on thus, by whole carats, till the weight of the gold is arrived at one carat, and that of the silver at twenty-three; for after the ninth needle, you cannot make so exact a distinction of the half-carats.

**N.B.** The carat is divided into twelve grains.

This mixture of the gold and silver is called the white alloy; but when copper together with silver enters into the mixture of the gold, then it is called a mixt alloy. The needles for trial of pieces thus debased, are made of mixtures analogous to the former, except only that those portions, which in the first case were pure silver, here consist of copper and silver mixt. Therefore you have a double series; for the mixture is either of two parts of silver and one of copper, or of two parts of copper and one of silver. For instance,

The first is of pure gold.

| 2 gr. | 23 car. | 6 gr. | 6 gr. |
| 3 gr. | 23 car. | 1 gr. | 1 gr. |
| 4 gr. | 22 car. | 6 gr. | 2 gr. |
| 5 gr. | 21 car. | 6 gr. | 3 gr. |
| 6 gr. | 21 car. | 6 gr. | 3 gr. |
| 7 gr. | 20 car. | 6 gr. | 4 gr. |
| 8 gr. | 20 car. | 6 gr. | 4 gr. |

If in this table you take pure copper instead of pure silver, and silver instead of copper, this gives you a third series of golden needles. And you may have a fourth by mixing with gold equal quantities of silver and copper in the same proportion. These alloys of gold are much in use, but workmen may easily employ a number of other variations, which, compared with those already mentioned, will be distinguished into a thousand different ways by an experienced person, so that it is neither possible, nor necessary to imitate them all.

But that these golden needles may not be too expensive, they may be made much shorter than those of silver, and afterwards folded to plates of copper, that may be sufficiently long for use.

The use of these needles is by means of the touch-flone; and arises hence, that every metal when pure must have its specific colour, that distinguishes it from the rest: but metals being the most opaque of all known bodies, the specific colour of every one appears most distinctly when you rub it against a very black hard flone; and if the colours of two or more metals are expressed by large lively spots, made near each other on the same plane, by rubbing them against the surface of the flone, you will by that means easily discern their difference, or their likenesses.

The flone adapted to this use, and called from its office the touch-flone, must have the following qualities. It must be of the deepest black, left the texture of the metal should be altered by furious rays of light shining among it: it must be capable of being pretty well polished, for when too rough, the colours of the metals rubbed against it cannot be clearly distinguished; and if it is too smooth, the metals are but faintly, and too slowly abraded or scraped by it, especially when gold is tried. It must also be neither too hard nor too soft. Tripoli, coal-dust, and tin-ashes, are used in rubbing off the thin metallic crusts, and in a short time the flone when very hard is apt to acquire too smooth a surface; and when it is too soft it easily wears, throws off a dust, and contracts furrows.

The flone is made in the form of a quadrangular prism, about an inch thick, and two or three inches long.

If the proper flone cannot be procured, moderately smooth pieces of flint are the best substitutes; and the more they approach in colour to the other the better. The
The method of using your needles and the touch is this: the piece of gold to be examined, being well cleaned in some convenient part of its surface, a stroke is to be made with it on the stone; and another, close by it, with such of the touch-needles as appear to come the nearest to it in colour. If the colour of any part of the stone, or of covering the bar or ingot with a thick coat of fine metal than the interior part, or of including malleous of bafe metal within it. A set of needles may be prepared, for this use, with silver alloy, in the series of the Chinese taches; or the needles of the European account may be easily accommodated to the Chinese, by means of a table formed for that purpose on the principles already explained. It may be observed, that the gold foines of China have a deprefion in the middle, from the shrinking of the metal in its cooling, with a number of circular rings, like those on the balls of the fingers, but larger: Dr. Lewis says, that when any other metallic mafs is included within, the fraud is discoverable at a fight, by the middle being elevated instead of deprefied, and the fides being uneven and knobby; but that the fame kind of fraud is sometimes practifed in the gold bars, where it is not discoverable by any external mark. See Cramer's Art of Allaying, p. 116, &c. Lewis's Com. of Arts, p. 122, &c. See also ASSAYING.

Touch-Stone, a black, smooth, glossy stone, used to try metals upon.

The ancients called it lapis Lydiae, the Lydian stone, from Lydia, a country of Asia Minor, whence it was brought. See Touch-Needles.

Touch-Stone, Izfib, called fasanus Hibernicus by Molyneux and some others, is a black stone, found in the county of Antrim, in that kingdom, in angular columns, forming that amazing pile called by the vulgar the Giant's Caufeway. See BANALTES and MARMARO-PROSERA.

The bafaltes being an excellent touch-stone, authors have confounded it with the touch-stone of the ancient Greeks, called by them bahanus, bafaltes, lapis Lydus or Helifas, &c. which were, probably, only black japhers; and they have derived bahanus and bafaltes from the fame Greek word, bahanus, to try or prove: but the bafaltes was not known to the Greeks, and Phin expressly tells us, that it is an Ethiopic or Egyptian name: whence it is probable that bafaltes is a corruption of the Hebrew word παυματί, hزان, which signifies iron, a very proper name for a stone, which they defcribe to be of the colour and hardness of iron. Many authors affirm, that the touch-stone is a kind of black marble, or that black marbles may serve for touch-stones: black marbles, it is true, take the colours of metals, and may be used as touch-stones in the ancient manner mentioned by Theophratus and Pliny; i.e. by touching them with needles of different alloys; which manner is still practiced in Germany and other countries; but in the manner of trying them with aqua fortis, it is absurd to use any caeleftris substances, as the acid will immediately destroy the fhalliance of the stone, and confequently affect and chmod that the strokes of the metals. For a good touch-stone, choice should be made of a black stone of the genus of marmaro-prosena, or of the jasper genus, on which the aqua fortis will only dilfolve the copper, filver, &c. without touching the gold, or affecting the stone. The firft genus should be preferred, as a nice touch-stone should only have a certain degree of polish, and should be of a compact fine texture, and neither too hard nor too foft; whereas the jasper are too hard, and do not fhow with fufficient exadnefs the different degrees of alloy; for the touches of the metal give them a higher fhine than their natural polish, and that fhine injures the diftinétnefs of the strokes made upon it. Cole's Hill. Poll. p. 264. See Touch-Needles.

TOUCH-NEEDLES.

The Chinefe are said to be extremely expert in the ufe of the touch-stone, fo as to diltinguish by it fo finall a difference in the finenes as half a touch, or a two hundredth part of the mixt. The touch-stone, fays Dr. Lewis, is the only tell by which they regulate the value of their gold to the European merchants; and in thofe countries it is infufet to fewer difficulties than among us, on account of the uniformity of the alloy, where there is almoft always filver; the lead appearance of copper being used in the alloy gives a fufpicion of fraud. An affay of the gold is rarely permitted in that commerce, it behoves the European trader to be well prac-

TOUCH-WOOD, in Botany, a name given to spung or agaric of the oak, on account of its readily taking fire.

TOU-CHAN, in Geography, a city of China, of the second rank, in Koei-tecun; 987 miles S.S.W. of Peking. N. lat. 25° 40'. E. long. 109° 3'. Also, a lake of China, in Chao-tung; 52 miles in circumference; 15 miles S. of Tei-AGON.

TOU-CHANG-TAO, a small island near the coast of China. N. lat. 36° 55'. E. long. 121°.

TOUCHE, Claude Guismon do la, in Biography, a French poet, was born in 1719, and entered among the Jesuits; but a comedy, acted in 1748, occasioned his alienation from their fraternity. The flight of this body was refented by him in a pastoral epistle, published in 1766, and entitled "Les Soupirs du Cloître, ou le Triomphe du Fornitisme," in which he has exhibited the Jesuits in the blackest colours. Upon abandoning their society, he attached himself to the theatre; and in 1757 introduced on the stage his tragedy "Iphigenie en Tauride," the subject of which he borrowed from Euripides. This play, though chargeable with many defects, was well received, and has, retained its reputation. Whili he was preparing another tragedy on the story of Regulus, he fell a sacrifice to a pulmonic disorder in 1760. Among his MSS. was found his "Epitre à l'Amitié," which has been read with pleasure. Nouv. Dict. Hist.

TOUCHE, in Geography, a town of France, in the department of the Saône and Loire; 7 miles N.W. of Châlons sur Saône.

TOUCHING is sometimes used for the sense of feeling. This sense may be injured by any thing that obstructs the nervous influence, or prevents its being regularly conveyed to the organs of touching, as prehension, extreme cold, &c. also by too great a degree of sensibility, when the nerve is not sufficiently covered with the scurfy skin, or there is too great tension, or it is too delicate. Whatever disorders the functions of the brain and nerves, hurts the sense of touching; and as it proceeds from the same general causes, as palsy and apoplexy, it requires nearly the same method of treatment. In a defect of touching, which arises from an obtrusion of the cutaneous nerves, the patient must be first purged, and then such medicines as excite the action of the nerves or stimulate the systole may be used, for which purpose spirit of hartshorn, sal volatile oleum, horseradish, &c. may be taken inwardly; and the disordered parts often rubbed with fresh nettles or spirit of sal ammoniac.

Blistering plasters and snaphins applied to the parts will likewise be of use, as also warm bathing, especially in the natural hot baths.

TOUCHING, in Geometry. See TANGENT.

TOUCHING, in Sea Language, denotes the state of a ship's sails when they first begin to fliver, with their edges in the direction of the wind. It is either occasioned by a sudden alteration of the ship's course, or by a change of the wind, in which it blows more obliquely along the surface of the sails, instead of falling into their cavities from behind, according to its usual direction. Falconer. See FULL-AND-BY.

TOUCHING-AI, denotes the circumstance of stopping, or anchoring occasionally, at some intermediate port, in the course of a voyage.

TOUCHIROA, in Botany, formed by Aublet, out of the Caribbean appellation Montouchbraun, which belongs to an aromatic tree of Guiana. See CRUDIA.

TOUCQUES, in Geography, a sea-port town of France, in the department of the Calvados, taken by the English in 1427; 6 miles S.W. of Honfleur.

TOUCQUES, La, a river of France, which runs into the sea, about 8 miles N. from the town of Touques.

TOUCY, a town of France, in the department of the Yonne; 12 miles W.S.W. of Auxerre.

TOUDARGA, a town of Asiatic Turkey, in Natolia: 26 miles W.S.W. of Boli.

TOUDSONG, a town of Thibet; 92 miles S.S.W. of Laos. N. lat. 25° 6'. E. long. 96° 42'.

TOUJOUR, a town of Hindooftan, in the cire of Nagore; 40 miles S.W. of Nagore.

TOUJOU, in Rural Economy, a term used provincially in some districts to signify a measure of half a bushel. It is sometimes written tojeel in books on agriculture and rural economy.

TOU-FANS, in Geography. See Si-FANS.

TOUGITO-HOTOC, a town of Chinese Tartary. N. lat. 44° 48'. E. long. 116° 54'.

TOUING, a town of Croatia; 24 miles S.S.W. of Carilcalt.

TOUINTCHOSE, a Tartarian standard of Chinese Tartary. N. lat. 41° 40'. E. long. 115° 14'.

TOUJOO, a small island near the W. coast of Sumatra. N. lat. 6° 38'. E. long. 99° 25'.

TOUI-YUEN, a town of Corea; 50 miles N.E. of King-ki-tao.

TOU-KIE, a city of China, of the second rank, in Quang-fu; 1137 miles S.S.W. of Peking. N. lat. 13° 10'. E. long. 166° 45'.

TOUL, a town of France, and principal place of a district, in the department of the Meurthe, on the Meofelle, over which is a stone bridge, and regularly fortified. Before the revolution it was the principal town of a government, and the seat of a bishop. It was formerly imperial, and the bishop a prince of the empire, and suffragan of Treves. The Toulous, with the city of Toul, and the two bishoprics of Metz and Verdun, in the year 1552, put themselves under the protection of France; and, in 1648, became a part of that country; 12 miles W. of Nancy. N. lat. 48° 41'. E. long. 5° 59'.

TOULA, a river of Tartary, in that part inhabited by the Kalkas, and called Kalka-pira, which takes its course from E. to W., and is often broader, deeper, and more rapid than the Kerlon, another river of the same country, which runs from W. to E., and discharges itself into the lake Koulon-nor, the waters of which again flow into the river Saghalen by that of Ergone; and the banks of which afford the best pastures in Tartary. The banks of the Toul are covered with woods and beautiful meadows. The mountains which hang over it on the northern side are covered with fields of aged firs, and present to the view a kind of amphitheatre. This river, after having received the waters of the Selinoe, loses itself in the lake of Pai-cal, which is the largest lake in Tartary, and lies in the territories of the Mefcovites. The Russian are also masters of the lower part of the Selinoe, where they have built a small city called the Selingfelt.

TOULICIA, in Botany, from the Caribbean name of the same plant Toulicia. See PONZA.

TOULOMBA, in Geography, a town and fortresses of Hindooftan, in the fubah of Moulton, on the Rave. This town was taken and plundered by Timur Bec; 50 miles N.E. of Moulton. N. lat. 30° 59'. E. long. 72° 25'.

TOULON, a city and seaport of France, and capital of the department of the Var, strongly fortified. Before the revolution, it was the seat of a bishop, and, besides the cathedral
cathedral and other parish-churches, contained nine convents, a feminary, and a college. The old and new harbour lie contiguous, and, by means of a canal, communicate with one another, both having an outlet into the spacious outer harbour, which is naturally almost of a circular figure, and very large, being surrounded with hills. The entrance on both sides is defended by a fort, with strong batteries. The new harbour, which is a work of Louis XIV., is well defended by batteries, and round it stands the arsenal, where every man-of-war has its own particular forehouse, but the guns and cordage are laid up separately. In it are spacious working houses for blacksmiths, joiners, carpenters, locksmiths, &c. The rope-houle is built wholly of freestone, being 320 toises in length, with three arched walks, in which as many parties of rope-makers may work at the same time. The general magazine here, which supplies whatever may be wanting in the particular forehouses for single ships, contains an immense quantity of all kinds of laces, disposed in the greatest order and convenience. In the month of August, 1793, the people of Toulon, and the French vice-admiral Trugoff, entered into a negotiation with the English admiral lord Hood, who was then cruising in the Mediterranean, and he took possession both of the town and of the shipping, in the name of Louis XIV., and under the express and positive stipulation, that he was to afford in recompensing the confiscation of 1793. Great expectations were formed on this occasion; and general O'Hara was sent with troops from Gibraltar, being appointed, under the king of England's commission, governor and commander-in-chief: the republicans were not negligent in attempting to recover a place of so much consequence, and soon succeeded. General O'Hara was wounded, and taken prisoner, and the city and port abandoned. On the 19th of December, the town was bombarded from noon till ten o'clock in the evening; when the allies, and part of the inhabitants, having set fire to the town and shipping, precipitated their flight. Two chaloupes, filled with fugitives, were f Tom under the batteries. The precipitation with which the evacuation was effected, caused a great part of the ships and property to fall into the hands of the French, and was attended with the most melancholy consequences to the wretched inhabitants. Of thirty-one ships of the line, which the English found at Toulon, thirteen were left behind, nine were burned at Toulon, and one at Leghorn, and four lord Hood had previously sent away to the French ports, Brest and Rochefort, with 4000 republican frigates, whom he was afraid to trust; 7½ toises E. of Marseilles. N. lat. 43° 7'. E. long. 6° 13'.

TOULON, a township of New York, near lake Ontario. TOULON, a town of France, in the department of the Saône and Loire, near the Arroux river; 16 miles N.W. of Charolles. N. lat. 46° 41'. E. long. 4° 13'.

TOULOUSE, a town of France, and capital of the department of the Upper Garonne, on the Garonne. In the fifth century, it was the capital of the kingdom of the Goths. Before the revolution, it was the capital of Languedoc, fee of an archbishop, and second parliament of France; it is recognized for size next to Paris; its streets are most broad, and the houses are built of brick. The number of inhabitants, by a late enumeration, is said to be 50,171. Though so finely situated, its trade is incomparable, the principal article being Spanish wool. The university here was founded in 1228. The town-houle is a spacious building, and called the capitoul, whence the aldermen are termed capitouls; and amongst other curiosities preferred here, are fifteen large parchment folios, delicately written and illuminated, being annals of the city, commencing from the year 1288, and annually continued by the eldest capitoul. These were drawn up originally in Latin, but under Francis I. were altered to French. The three first volumes are principally filled with the portraits and names of the capitouls, and the following contain all the memorable events and transactions throughout the whole kingdom. Here is also an academy of the sciences and liberal arts. At half an hour's distance below the city, the celebrated canal of Languedoc joins the Garonne, which here becomes navigable. In this city are made carpets, but of little value; together with some flint, flax and woollen fluffs; 3½ toises S.E. of Bourdeaux. N. lat. 43° 33'. E. long. 1° 32'.

TOUM, a town of Syria; 6 miles N.E. of Damascus.

TOUMANJDI, a town of Afsiatic Turkey, in Natolia; 32 miles W. of Kiataja.

TOUMAN Daghb, a mountain of Natolia, part of the ancient Olympus; 20 miles S.E. of Burfa.

TOUMANUGREE, a town of Hindoostan, in the circuit of Kitchwaja; 12 miles S. of Budwar.

TOUMEN, a town of Chinefe Tartary; 68 miles E.N.E. of Peking. N. lat. 42° 27'. E. long. 128° 51'.—Alfo, a river of Corea, which rises lat. 43° 8', long. 127° 34', and runs into the sea of Japan, N. lat. 42° 30'. E. long. 120° 34'.

TOU MET, a Tartarian ftandard of Chinefe Tartary. N. lat. 41° 7'. E. long. 110° 49'.

TOUN, a town of Perfia, in the province of Khorsafan; 90 miles N.W. of Herat.

TOUNA, or Shik Abdallah, a fmall ifland of Egypt, in lake Mënaleh, on which are the ruins of an ancient town; 3 miles W. of Tennis.

TOUNATEA, in Botany, fomently arbitrarily conftucted by Aublet, out of the Guiana name Touou. See SWARTZIA.

TOUSE, in Geography, a river of Hindoostan, which frrses about 20 miles S.W. of Mahur, in the circuit of Gourah, and runs into the Ganges, about 20 miles below Allahabad.

TOVOMITA, in Botany, an untenable name, alterd by Aublet, from the Caribbean Poimania. Juftus has, wo perfume, according to his declared intention, afforded it merely a temporary adoption, till the genus is fully under-AB. With the fame view we here admit this name, for the present only.—Juff. Gen. 256. Aubl. Guian. 956. Poiret in Lamarck's Dict. v. 7. 717.—Clafs and order, Polyandria Monogynia. Nat. Ord. Guttiferæ, Juss. Gen. Ch. Cal. Perianth inferior, of two roundifi, con- cave leaves. Cor. Petals four, rather longer, ovate, acute, concave, equal, inferted into the receptacle of the flower. Stam. Filaments numerous, twenty to twenty-five, inferted into the fame receptacle, creft, linear, shorter than the corolla; anthers of two diffir oat ovate cells. Pith. German inferior, felle, ovate, with four furrows; style none; stigma euriform, in four depreffed, rounded lobes. Fruit unknown.

1. T. guianensis. Aubl. t. 364.—The only species, found in the inland forests of Guiana, flowering in September. This is a tree, whose trunk rises to the height of ten feet, and is a foot in diameter, with a branching head. The wood is compact and hard. Bark reddish, exuding drops of a yellow transparent resin. Leaves on the young branches only, opposite, stalked, smooth, three inches long, elliptical, pointed, entire; green above; whitish, with red parallel veins, beneath. Flowers in little terminal three-forked pa-

K 2
TOUPOUR, in Geography, a lake of Thibet, 27 miles in circumference; 10 miles N. of Souc.

TOUR, TURN, a French term, often used among English writers for a journey. Thus we say the tour of Paris, or Rome, &c.

TOUR, in Geography, a town of France, in the department of the Calvados; 3 miles W.N.W. of Bayeux.

TOUR, a town of France, in the department of the Puy-de-Dôme; 12 miles W. of Béziers.

TOUR la Blanche, a town of France, in the department of the Dordogne; 9 miles N. of Ribera.

TOUR de Cordova, a fort on the coast of France, in the department of the Gironde, at the mouth of the Garonne, whose summit is 300 feet above the level of the sea. N. lat. 44° 35'. W. long. 1° 4'.

Tour de France, La, a town of France, in the department of the Eastern Pyrénées; 12 miles W.N.W. of Perpignan.

Tour d'Aiguèze, La, a town of France, in the department of the Moutons of the Rhône; 12 miles N.N.E. of Apt.

Tour Landry, La, a town of France, in the department of the Mayne and Loire; 6 miles W. of Vichiers.

Tour de Prat, La, a town of Switzerland, in the Pays de Vaud, on the lake of Geneva; 1 mile S. of Veyaz.

Tour du Pin, La, a town of France, and principal place of a district, in the department of the Ifere, situated on a small river of the same name, which runs into the Rhône; 27 miles S.E. of Lyons. N. lat. 43° 34'. E. long. 5° 37'.

Tour de Rijel, a cape of the island of Jersey; 5 miles N.N.E. of St. Helier.

Tour de Rouffillon, La, a town of France, in the department of the Eastern Pyrénées, on the Tet; situated on a spot where once flowed a city called Rufeino, which was destroyed in the ninth century; 3 miles E. of Perpignan.

Tour de Genève, a town of Switzerland, in the canton of Fribourg; 2 miles N. of Gruyeres.

Tour la Ville, a town of France, in the department of the Channel, celebrated for its manufacture of glass; almost joining to Cherbourg.

TOURAME, before the revolution a province of France, bounded on the E. by Orleavois, on the S. by Berry and Poitou, on the W. by Anjou, and on the N. by Maine; about 60 miles in length, and 54 in breadth: the river Loire runs through it, and divides it into Higher and Lower Touraine. Tours is the capital. This province had formerly counts of its own. In the year 1044, it was taken by the counts of Anjou; in 1202, united with the crown; and in 1356, raised to a dukedom and peerage. It has frequently been granted to the royal children; and after the death of Francis, Duke of Alençon, brother to Henry III., was again united to the crown, since which it has never been alienated. It was governed by laws of its own, but with a right of appeal to the parliament of Paris.

TOURAK, a river of Turkey, Armenia, which runs into the Batoue; 20 miles E.N.E. of Ipira.

TOURAN, Kingdom of, an appellation given to the vast regions of Grand Tartary, extending from Russia to China, and from Siberia to the Caspian sea.

TOURACO, in Ornithology. See Cuculus.

TOURANCOURCHY, in Geography, a town of Hindoostan, in the Carnatic; 35 miles S.S.W. of Trichinopoly.

TOURCALL, a town of Hindoostan, in Bahar; 9 miles S. of Arrah.

TOURCHENGADA, a town of Hindoostan, in Baramaul; 18 miles N.W. of Namacul.

TOURETTE, a town of France, in the department of the Var; 3 miles N.W. of St. Paul.

TOURFAN Hotun, a town of Little Bucharia, and capital of a province; 180 miles W.W.N. of Hami. N. lat. 43° 33'. E. long. 107° 17'.

TOURINA, Cape, a cape of Spain, on the W. coast of Galicia. N. lat. 43° 3'. W. long. 9° 20'.

TOURMALINE, in Mineralogy, a stone sometimes used as a gem by jewellers, and particularly remarkable for exhibiting electricity by heat or friction. It almost always occurs in large prisms which are deeply friated. The common form of the crystal is a six-sided prism, terminated by three principal planes, which on one extremity are flat on the sides of the prism, and on the other on the edges. The
TOURMALINE.

The edges of the prism are frequently truncated, and thus form prisms with nine or twelve sides. The primitive form of the crystal, according to Hauy, is an obtuse rhomb. The fracture of tourmaline is perfectly conchoidal; the internal lustre is vitreous. It is harder than hornblende, but less hard than quartz; it scratches glass, and is brittle. The principal form of the crystal has been before stated; but the most common of the fourteen or fifteen different varieties, is the prism with nine sides terminated by five planes at one end, and by three at the other; or by seven planes at one end, and three at the other. The end which has the smallest number of planes exhibits negative electricity, and that which has the greatest number, positive. This difference in the form of the electric poles is a general law of all crystallized minerals that are electric by heat. Before the blowpipe, the tourmaline melts into a greyish-white porous enamel, but the red Siberian tourmaline is infusible. The constituent parts of tourmaline are given by Vauquelin and Klaproth as under.

According to Vauquelin:

The tourmaline is a name given, as Dr. Watson has evinced, to the lycurium of the ancients. See Lycurium Lapis.

This stone is very common in several parts of the East Indies, particularly in the island of Ceylon, where it is called tournamal. Pliny mentions a red or purple stone which attracted light bodies. This is supposed to be the tourmaline. The first account of this stone, that occurs of late years, is in the History of the Royal Academy of Sciences at Paris for 1717, where we are told that M. Lemery exhibited an uncommon stone brought from Ceylon, which attracted and repelled small light bodies. Limnus, in his Flora Zeylanica, calls this stone lapsis electricus, and takes notice of Lemery’s experiments. M. Aepinus, having been informed of the attractive power of the tourmaline by Mr. Leechman, and furnished by him with two stones, made many experiments, the result of which was published in the History of the Academy of Sciences and Belles Lettres at Berlin, for 1756. The sublimity of his memoir is as follows: the tourmaline has, at the same time, a positive and a negative electricity; the one of its sides being in one state, and the other in the opposite; and this does not depend on the external form of the stone. These electricities he could excite in the strongest degree by plunging the stone in boiling water. The proper degree of heat for manifesting the electricity of the tourmaline, is from 106° Fahrenheit to 212°. If we raise the temperature above 212°, it loses its electricity, but regains it in cooling; but if we continue to raise the temperature, we arrive at a point in which the mineral again becomes electric, but has its poles reversed to what they were before. Hauy observed, that we may also change the position of the poles, by heating it unequally in the focus of a lens or mirror. If an electrified tourmaline be broken, the fragments immediately present electric poles, situated in the same direction as that of the large crystal.

If one side of the tourmaline be heated more than the other (as if it had lain upon a hot cake of metal), each of the sides acquires an electricity opposite to that which is natural to it; but if left to itself, it will return to its natural state.

If one of the sides of the tourmaline be rubbed, while the other is in contact with some conductor communicating with the ground; the rubbed side is always positive, and the other negative. If neither side be in contact with a conductor, both become positive. If, in the former of these cases, the tourmaline be rubbed so as to acquire a sufficient heat, and the side which is naturally positive be made negative, it will, upon cooling, return to its natural state; but if it has acquired no sensible heat, it will not return to its natural state while any kind of electricity remains. If it be heated, even when it is rubbed and insalated (in which case both sides become positive), it will still return to its natural state upon cooling.

The Duc de Noya, who, in 1758, procured two of these stones in Holland, and made a number of experiments with them, an account of which he published, mentions the experiments of M. Aepinus, but does not admit of a plus and minus electricity belonging to the tourmaline when heated. On the contrary, he lays that both the sides are electrified plus, but one of them more than the other. The tourmaline was introduced to the notice of the English philosophers by Dr. Heberden, who procured one (and, indeed, the only one known in England at that time) for Mr. Wilson, whose experiments confirmed the opinion of its positive and negative power, advanced by M. Aepinus. Dr. Franklin, likewise, in a letter to Dr. Heberden, in 1759, informs him of experiments on one of these stones, sufficient for establishing the fame theory. About this time Dr. Heberden procured some of these stones from Holland, and put them into the hands of Mr. Wilfon and Mr. Canton, gentlemen particularly conversant with the subject of electricity, and capable of using them with the greatest advantage to this branch of science. Mr. Wilson’s experiments and observations are very numerous; the result of which was, in the main, the fame with that of M. Aepinus, establishing the opinion of the two different powers of this stone; but he differs from him in afcertaining, that when the sides of the tourmaline are unequally heated, it exhibits that species of electricity which is natural to the hotter side; i.e. the tourmaline is plus on both sides, when the plus side is the hottest; and minus on both sides, when the minus side is the hottest. Both these gentlemen repeated their experiments, and each retained his own opinion; but Mr. Wilson’s apparatus was better calculated for the purpose of accurate experiments than that of M. Aepinus, and he used a greater variety of methods.
methods for communicating heat to his tourmaline. Mr. Wilfon imagined that this stone, as well as glafs, was permeable to the electric fluid, and that the refiftance to its entering the fubftance of it was lefs on what he calls the negative than on the positive fide; for rubbing the positive fide of the stone ftrongly, he found both fides electrified plus; by rubbing the negative fide in the fame manner, both fides were electrified plus, more ftrongly than before. Several experiments led Mr. Wilfon to conclude, that: the tourmaline refifted the exit and entrance of the electric fluid con-
diderably lefs than glafs, or even than amber; and he infers, upon the whole, that this stone differs in nothing from other electric bodies but in acquiring electricity by heat. Mr. Wilfon also conceived, that the tourmaline suffered the electric fluid to pafs through it only in one direction, hear-
ing in this refept fome analogy to the lead-line, and hav-
ing as it were two electric poles, which are not eafily de-
stroyed or altered. He also apprehended, that the electric fluid, flowing through all the ftones and gems which re-
feemble the tourmaline in their electrical properties, moves in that direction in which the grain happens to lie; the re-
ffistance, as he fuppofes, which the fluid meets with, being lefs in that direction than in any other.

Notwithstanding the attention given to this fubjeft by M. Aepinus and Mr. Wilfon, the moft important discovery relating to the electricity of the tourmaline was referred to Mr. Canton, who, in a paper read before the Royal Society in December 1759, obferves, that the tourmaline emits and absorbs the electric fluid only by the increase or diminution of its heat; for if the tourmaline, he fays, be placed upon a plain piece of heated glafs or metal, fo that each fide of it, by being perpendicular to the surface of the heated body, may be equally heated; it will while heating have the elec-
tricity of one of its fides poitive, and that of the other

negative. This will likewife be the cafe, when it is taken
out of boiling water, and fuffered to cool; but the fide
which was poitive while it was heating, will be negative
while it is cooling; and the fide which was negative will be
poitive.

In the Gentleman's Magazine for September 1759,
(vol. xxix. p. 434.) he publifhed the reffult of fome ex-
periments which he had made on a tourmaline procured from
Holland, in a feries of propofitions, comprifing the prin-
cipal part of what is known on this fubjeft. They are as fol-
follow: 1. When the tourmaline is not electrical or attrac-
tive, heating it, without friction, will make it fo; and the elec-
tricity of one fide of it (diftin guished by A) will be poitive, and that of the other fide (B) will be negative.

2. The tourmaline not being electrical, will become fo by
cooling; but with this difference, that the fide A will be
negative, and the fide B poitive. 3. If the tourmaline, in
a non-electrical flate, be heated, and fuffered to cool again,
without either of its fides being touched; A will be poitive
and B negative, during the whole time of the increafe and
decrene of its heat. 4. Either fide of the tourmaline will be
poitive by friction, and both may be fo made at the fame
time. He fuggfets that, if air be endanger with fimilar
properties, or be capable of becoming electrical by the in-
creafe or diminution of its heat (as is probable by attended
to its flate before and after a thunder-form), thunder-
clouds, both poitive and negative, as well as thunder-guffs,
may be eafily accounted for. Mr. Canton, with the tour-
maline which he received from Dr. Heberden, made other
and curious experiments, firft publifhed by Dr. Prifley.
He put one of them, which was of the common colour,
into the flame from a blowpipe, and burnt it white; when
he found that its electrical property was entirely destroyed.
'The electricity of another was only in part destroyed by fire.

He joined two others, made soft by fire, without destry-
ing their electrical property. The virtue of another was
improved by being melted at one end; and he found (con-
trary to what Mr. Wilfon had obferved of another tour-
maline, heated in the fame manner) that one tourmaline re-
tained its electrical property, after it had been frequently
made red-hot, and in that flate put into cold water. But
the molt curious experiment was made on a large irregular-
tourmaline, about half an inch long, which he cut into three
pieces; taking one part from the poitive and another from
the negative end. Trying these pieces separately, he found
the outer fide of the piece cut from the end that was nega-
tive when cooling, was likewise negative when cooling;
and that the outer fide of that piece which was cut from
the end that was poitive when cooling, was likewise poitive
when cooling; the opposite fides of both pieces being,
according to the general law of the electricity of the tour-
maline, in a contrary flate. The middle part of the fame
stone was aftened as it had been when it was entire; the
poitive end remaining poitive, and the negative end

negative.

Dr. Prifley, about the clofe of the year 1766, directed
his attention to the tourmaline: being in polleffion of Dr.
Heberden's large polished one, which weighed one hundred
and twenty grains, of an oval form, plane on one fide and
convex on the other, and which had pafied through the
hands of Mr. Wilfon and Mr. Canton, he purfued his in-
vestigation of the properties of this ftone in a variety of
experiments. Several of them were undertaken with a view of
determining, whether the tourmaline collected its electricity
from the neighbouring air: he was led to this conjec-
ture from the confequences of Mr. Wilke's experiments
on the production of fpontaneous electricity, by melting
one fubftance within another; and his experiments feem to
prove that his conjecture was juft. He also difcovered a
method of reverting all the experiments made upon the
tourmaline, making that fide which is poitive in heating or
cooling to be negative; and that which is negative to be
poitive; fo that the kind of electricity fhall be juft what
the operator fhall direft, by the application of proper fub-
fiances to the ftone. Dr. Prifley not only tried how
the tourmaline would be affected by being heated or cooled in
contact with various fubstances, to which only one of its
fides was expofed at once, but he also made other exper-
iments, in which the ftone was entirely furrounded by them.
Having covered the ftone to the thicknefs of about a crown
piece with fealing-wax, he found it to act nearly, if not quite
as well, through this coating of wax, as if it had been
expofed to the air: hence, if a tourmaline be concealed in a
flick of fealing-wax, the wax will feem to have acquired
the properties of the tourmaline. See on this article Phil.
&c. Franklin's Letters, &c. p. 376. Prifley's Elec-

The tourmaline, according to Mr. Kirwan, is a fihacious
earth, imperfeetly united with from 1.05 to 1.47 of its
weight of argil, from 0.3 to 0.4 of its weight of mild cal-
careous earth, and from 0.15 to 0.243 of its weight of iron.
This ftone has been found in Ceylon, Brazil, and the Tyrol: a fpecimen of each has been examined by Mr. Bergman; that of Ceylon is of a dark-brown or yellowish colour; its specific gravity 3.065 or 3.205: that of Brazil is green, blue, red, or yellow, and its specific gravity 3.07 or 3.18: that of the Tyrol, by re-
flected light, is of a blackish-brown, but by refracted light,
yellowish, or in thin pieces, green; its specific gravity 3.05.
In fire, none of them decrcepte: but thofe of Ceylon and
TOURNE-COUE-EN-BIGORRE, a town of France, in the department of the Gers; 9 miles S.E. of Tarbes.

TOURNEFORT, Joseph Pitton de, in Biography, the great leader of the French school of botany, of whom we have spoken (see Rivinus) as one of the three most distinguished didactic writers of the age preceding Linnaeus, was born of a gentleman's family at Aix, in Provence, June 5th, 1656. His mother, Ademara Fagouit, was of a Parian family, likewise in the French fæd, noble. Being destined by his parents for the church, he was educated at the Jesuits' college of his native town; but he soon imbibed a taste for natural knowledge, which led him at the age of 21, on the death of his father, to change his original determination, for the profession of physic. This latter indeed was but subvenient to a most ardent devotion for botanical science, which ever after made the object and the happiness of his life. Not that his education, in other respects, was neglected; for he proved a good scholar, well grounded in the studies necessary to his medical profession, particularly anatomy and chemistry, and no less versed in historical and critical knowledge; infomuch that he became an elegant writer and lecturer, as happy in his powers of communicating, as of acquiring, information. His personal character, manners, and address were also such as to prove a general recommendation in his favour through life.

Having soon exhausted the botanical richness of a physic-garden at Aix, and of the circumjacent fields, he extended his researches to the neighbouring Alps, and afterwards to the Pyrenees, where his hardy frame of body, and his observing enterprising mind, rendered easy to him the acquisition of the principal vegetable flowers of those romantic and fertile regions. Even the thistles and laurel-like, which often infest the borders of kingdoms, and which then abounded in the Pyrenean fastnesses, were fearedly formidable to a traveller, whose only riches were dried plants, and whose oftentimes provision for his journey consisted of a little black bread, in which he concealed his money. The intermediate winters between his several visits to Dauphiny, Savoy, Catalonia, the Pyrenees, &c.

The red-colored tourmaline from Siberia is regarded by some mineralogists as a distinct species; it differs from other tourmalines in being infusible: it has been denominated rubellite, (which sec.) The indigo-blue variety of tourmaline has been called by Karrlein and Dendrado an indicolite. The tourmaline occurs imbedded in gneis, mica-slate, talcous slate, and talc. It is sometimes found in granite. It is found in rolled pieces in alluvial ground: it was first discovered in the island of Ceylon in the 16th century. It has since been found in various Alpine districts of Europe and Asia, in the island of Madagascar, and in North and South America.

The tourmaline may be distinguished from common fchol by its colour; the latter is always black. The fracture in common fchol is small-grained and uneven, that of tourmaline conchoidal. The opacity of common fchol is always greater than that of tourmaline. It differs from common and basaltic hornblende in its structure, that of the latter being distinctly foliated. The following names have been given to different varieties of tourmaline.

Green tourmaline named Brazilian emerald
Berlin blue - - - Brazilian sapphire.
Indigo-blue - - - Indicolite.
Honey-yellow - - - Peridot of Ceylon.
Red - - - Rubellite, siberite, and tourmaline ayyre.

In the Memoirs of the Royal Academy of Sciences at Berlin for 1780, we have the following directions by Mr. Maergraf, for forming a composition similar to the tourmaline. Take magnesia, or that earth which is the basis of the frag: catharticus amarus; mix it with chalk, which has been diffused in spirit of nitre, and precipitated from thence by a solution of salt of tartar, and then well edulcorated; add to this mixture equal quantities of flint and clay (taking a scruple of each of the four ingredients), and four grains of the precipitate of sublimate of fusible spar, or what is here called the flour crude, i. e. the earth, which is not only fusible from the flour or Derbyshire spar, on heating it with oil of vitriol, but may also be precipitated from thence, and from the acid liquor in the receiver, by the addition of a solution of salt of tartar.

To two drachms of the above mixture add five grains of corpus maris, calcined according to the method of Kueckel, during four months, in a glafs-house furnace, and the refult will be the formation of a vitreous stone, similar to the tourmaline.

TOURNAN, in Geography, a town of France, in the department of the Seine and Marne; 13 miles N. of Melun.

TOURNAY, a city of France, in the department of Jemappel, on the Scheld, confidered as the most ancient town of Belgie Gaul, being founded 620 years B.C., and anciantly the capital of the Nervii. It was lately the capital of a district to which it gave name, and the fee of a bishop, erected in the 5th century. This city has often been taken and laid waste in the different wars between the French, English, and Flemings. By the peace of Aix-la-Chapelle it was ceded to France, and made one of the best fortified towns in Flanders. In 1709, prince Eugene and the duke of Marlborough invested Tournaï, and besieged it in form. The town capitulated, being in want of provisions. The citadel held out till the 30th of September, when the garrison surrendered prisoners of war. By the peace of Utrecht, in the year 1713, the States-General remained masters of the military, and the emperor of the civil government. In 1745, after the battle of Fontenoy, it was taken by the French, but ceded to the Austrians, by the peace of Aix-la-Chapelle, in 1748. The late emperor Joseph ordered the fortifications to be destroyed. In 1792 an action took place between the Austrians and the French near Tournaï, in which M. Dillot commanded the latter; and being fuppected of treachery, was murdered at Lille by the soldiers. On the 10th of May, 1794, the duke of York was assailed near Tournaï by the republican forces, in different columns, to the amount of 30,000 men; but they were compelled to retreat. In 1794, on the general evacuation of Flanders by the allies, the French entered Tournaï, where they found 20 guns spiked, 10,000 musket-balls, a large quantity of gunpowder, several magazines, and 14 barges laden with ammunition; 3 posts E. of Lille. N. lat. 50° 31'. E. long. 3° 25'.

TOURNAY, a town of France, in the department of the Pyrenees; 9 miles S.E. of Tarbes.

TOURNEFORT.

were spent in the university of Montpellier, where he first entered in 1679; but he is said to have taken his doctor’s degree at Orange. At Montpellier he enjoyed the intimacy of the excellent Magnol, of whom we have given an account in his proper place, and to whom the long-established botanical fame of that university is chiefly owing. Yet this able man narrowly escaped being hunted from his seat; as his no less eminent successor, professor Decandolle, has lately, in 1816, been, because he was a Protestant; nor could the appointment of his king protect the latter from that king’s wrath enemies. Tournefort was in no danger of this kind. He was nevertheless a liberal Catholic, whose frequent animadversions on the depraved superfluities that occurred in his travels, prove him to have been by no means the slave of any church or priesthood.

The merits of Tournefort, as a botanist, soon became conspicuous at Paris, and, aided by a fortunate introduction, procured him the ecapital favour of professor Fagon, then chief physician to the queen, (see FAGONIA,) who re-signed in his favour the superintendence of the royal garden. In this school he was soon attended by a numerous throng of students, eager to follow him in his herbarizations round Paris, and to profit by his practical remarks. We have already, in our account of WILLIAM SHERARD, mentioned that illustrious botanist as among his adulatory pupils. The subject of our memoir now became devious of further examining the productions of other countries than his own, in their native situations. For this purpose he travelled in 1688 to Spain and Portugal, afterwards into Holland and England; enriching by these means his own collection of dried plants, as well as the living collections of the Parian garden, and procuring the acquaintance and correspondence of all the most eminent cultivators of the science in which he excelled. Hence the great herbarium of Sherard became supplied with all Tournefort’s acquisitions, not only at that time, but after his subsequent voyage to the East, the fruits of which were transmitted to England with more particular care and exactness, than perhaps to any other country, as appears by what are still preferred at Oxford. The rudics and labours of Tournefort were facilitated and encouraged by a royal pension, which could certainly not come under the opprobrious denomination of a sinecure. In 1692 he became a member of the Academy of Sciences, and in 1694 published in French his Elements de Botanique, making three octavo volumes, dedicated to Louis XIV.—This was but a prelude to his immortal work, the Institutiones Rei Herbariae, of which the first edition, in three quarto volumes, with 476 plates, appeared in 1700. The second, which, with a reference to the “Elements,” is called the third, was published by Anthony de Jullien, at Lyons, in 1719, with the Carovalarium, composed of the author’s Oriental discoveries. In 1698, when he was admitted a member of the Medical Faculty at Paris, he published a little duodecimo volume, Histoire des Plantes qui naissent aux Environs de Paris, afterwards translated by professor Martyn into English. The reputed virtues of the plants are subjoined to their synonyms and descriptions. The arrangement is alphabetical, the style defunct, nor is this one of the best books of its kind.

We know not what period Tournefort received the order of St. Michael, but that he was decorated therewith appears by his portrait, published by Dr. Thornton, from an original picture; and the circumstance is alluded to by Haller, Bibl. Bot. v. 2, 3.

At the earnest recommendation of his friend Fagon, Tournefort was dispatched, under royal patronage, on a voyage to the Levant, the avowed object of which was to investigate the plants of ancient writers, as well as to make new discoveries. He was accompanied by a German physician, named Andrew Gundelfinger, (see GUNDERIA, and Claude Aubriet, one of the most exquisite botanical painters that the world ever saw. These travellers left Paris on the 9th of March, 1700, and embarking at Marseilles the 24th of April, anchored nine days afterwards in Crete. The investigation of the Archipelago, Greece, the shores of the Euxine, the countries of Bithynia, Cappadocia, Iberia, Armenia, Georgia, Galatia, Lydia, &c; occupied two years, and our adventurers returned in safety to Marseilles, on the 3d of June, 1702. Tournefort’s account of this expedition, written in French, and published soon after his death, is one of the most agreeable, intelligent, and valuable books of travels extant. De Thiés justly regrets the confines of the Abbaye Seltini, that it is written with the furia francese, or rage for every thing French. To the mode of its composition indeed something may be objected. The work is addressed, in the form of letters, to the comte de Pontchartrain, secretary of state, &c. &c; and as the etiquette of the French court required that fo illustrious a personage should of course be endowed with all human erudition and knowledge, the writer is obliged to treat him accordingly. We are therefore told nothing without the impertinence of “vous sçavez Monseigneur”; except perhaps the harmless description of a new plant, in writing which the author’s love of science made him flip, for a moment, the collar of patronage. The reader indeed soon forgets every thing but the delightful company of the narrator, who takes us along with him to every spot; details with equal intelligence the manners, drestes, and information of the people he visits; or carries us into the profoundest researches of ancient history and geography; tracing the fate of empires, countries, and cities, with the fame grace and facility with which he makes us enamoured with a new plant, or exposes the impostures or the ignorance of empirics of the soul or body. This work is illustrated with a very large number of plates, of which the botanical ones are peculiarly excellent. We have a good English edition, and Haller mentions one in Dutch. The curious grotto of Antiparos afforded the author an opportunity of detailing his favourite theory of the vegetation of stones, which is now refuted by more accurate chemical enquiries. (See STONES.) His travels were to have extended into Africa, but the plague raging in Egypt, he returned home directly from Smyrna. On arriving at Paris, it was his design to have turned to advantage the connections and reputation he had acquired, by devoting himself to the practice of physic. But whatever prospect he might formerly have had of success in this line, was defeated by his long absence; nor did the duties of his botanical appointments leave him sufficient leisure to court or to pursue his more lucrative profession. His time however was incessantly occupied; and the preparation of his Voyage du Levant for publication, which, considering the books necessary to be consulted, was no light or speedy task, led him too often to encroach on the night, after the superabundant labours of the day. His health became impaired, but this could not relax his ardour. His fate however was precipitated by the accident of a carriage in the street, which crushed his breast, and even threatened him with instant death, from which he was rescued by the exertions of a friend near at hand. He languished for a few months only after this event, and died December 28, 1708, in the fifty-third year of his age. We find no mention of his place of burial, nor of any monument erected to his memory. He was never married. He left his collection of plants to the king, who bestowed a pension of a thousand
thousand lives on his nephew, as an avowed return for this legacy, and a testimonio of royal ejectment for the deceased. The first volume only of his Voyage was printed at the time of its author's death. A second edition appeared at Amsterdam in 1716, to which are prefixed the elogies of Tournefort, delivered by Fontenelle to the Academy of Sciences, April 16, 1700; and a more ample composition of the famous kind by Lauthier, in a letter to M. Begon, the patron of Plumier, and the friend of Tournefort. This last account, in particular, is written with the affection and respect of a person intimately acquainted with the private character, as well as public merits, of the subject of his narrative. Tournefort is described by him as of the most simple though engaging manners, devoid alike of ostentation and of jealousy, as amiable and exemplary in private life, as he was zealous and exact to fulfill his public duties. Besides his knowledge of Latin and Greek, he was versed in the Italian and Spanish languages. The abundant riches of his mind were readily communicated, with clearness and facility, but without parade, in his conversation as well as in his lectures.

Of the principal works of this eminent man, we have already spoken, and shall not now offer any remarks upon his merits as a systematic botanist. He is said to have left several works in manuscript. One of these was entitled Topographie Botanique, containing the precise places of growth of the plants collected by himself in the south of France, as well as in Spain and Portugal, between the years 1676 and 1690. He also composed an universal critical history of plants, in alphabetical order, under the title of Plantarum Adversaria, in which the remarks of preceding writers were collected and compared, and his own opinions subjoined. The Schola Botanica a catalogue of the Paris garden, we have already mentioned in the biographical article of William Sherard. M. Laauthier removes all doubt respecting the real author of that little volume, by informing us he had seen a copy, with manuscript additions and corrections in Tournefort's own hand, where Sherard was named as the writer of the book.

Tournefort was led, by the philosophy of his time, to search for the medical qualities of plants by a chemical analysis. On this subject he is recorded to have left a volume of manuscripts. That it has never been published is no loss to the world; the work of Geoffroy, undertaken, and laboriously accomplished, with the same view, having proved that no real knowledge is to be acquired by this means, and having therefore let the question for ever at rest. Our readers will find the principles of Tournefort's system of botanical arrangement, under the article Classification. According to this, his Institutiones Rei Herbariae are divided; and the same system was adopted by several compilers of local Floras, or of garden Catalogues, in the early part of the eighteenth century. Even Linnaeus's earliest work, entitled Spolia Botanica, sive Plantae Rariores per Scandiam, Scotorum &c. Officinum observata & enumerata, the unpublished manuscript of which, dated Upal, 1729, and illustrated with drawings, is now before us, is claffed after Tournefort's method. Nor did any great difficulties attend the application of that method to any tribes of plants with which its author had been conversant. But when the productions of new continents came to be examined, it necessarily fell short; as we have remarked in the biographical article of Dr. Alexander Garden. No system of botanical classification, except the artificial sexual one of Linnaeus, has ever proved universally applicable to the vegetables of all countries, because no other depends on parts essential to the very being of every plant.

Tournefort's method, however, by its apparent facility,
TOU

left undone, he is the father of the French school of botany, and the traces of his principles, either confirmed, improved, or superceded by the labours of other teachers, are confluence in the works of his distinguished followers, Vaillant, Lamarek, and the Julliens. With the feelings of the first of these, as Vaillant could not but be sensible that, in some important points, he had the advantage of his great predecessor, somewhat of conscious superiority, not inconsistent with jealousy, was often intermixed, and too often betrayed. But the others, living at too remote a period from their idol to consider him otherwise than as the glory of their country, have made him ample amends in identifying his fame with that of France itself. The most valuable improvements, not only in classification, but in nomenclature, were, for a long time, not permitted to encroach even on the negligences or errors of Tournefort. The national spirit of the French still renders this libelous principle sacred. The homage long given to Tournefort is now transferred to Jullien. The term of lézé-nature is applied to the Linnaean system, as if his own were entirely a natural one, and as if what the great Swedish botanist modestly called fragments of a natural scheme of arrangement, were not, in fact, the basis of the best part of Jullien's. The mixture of these exclusive partialities is, that the really valuable improvements in science, which originate in other schools, are too much neglected by the pupils of the Parian one. In clear discrimination, and concise definition, in lucid order, elegant and classical terminology and nomenclature, in judicious combination, as opposed to futilidus and indiscriminate distinction, they generally, and sometimes very remarkably, fail. If any of them should deign to peruse this criticism, may they disfavor it by correcting the imperfections to which it alludes! Rivalship in science or philosophy ought only to lead to mutual improvement; for he who will learn nothing from an adversary, does but render apparent one indefeasible cause of his own imperfections. Tournefort's Works. Hall. Bibl. Bot. S.

TOURNEFORTIA, in Botany, bears that name in commemoration of the great French botanist, of whom we have given an account in the preceding article. This genus, founded by Plumier, was called by him Pittonia, after the family name of the person commemorated. Linnaeus altered it, according to his own rule, of retaining the appellation by which that person was most known. So he preferred Hippocrates to the Coa of Plumier, and Theophrastus to his Erasistr. French writers have subsequently acceded to this decision.—Linn. Gen. 78. Schreb. 104. Willd. Sp. Pl. v. 1. 791. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 1. 303. Brown Prod. Nov. Holl. v. 1. 496. Jull. 129. Lamareck Illust. t. 95. Poiret in Lam. Dict. v. 2. 355. Gaertn. t. 76. (Pittonia; Plum. Gen. 5. t. 3.)—Clafs and order, Penentoria Monogynia. Nat. Ord. Allegroficea, Linn. Boraginee, Jull.

Gen. Ch. Cal. Perianth inferior, of one leaf, small, in five deep, awl-shaped, permanent segments. Cor. of one petal, funnel-shaped; tube cylindrical, globose at the bottom; limb spreading, divided half way down into five pointed, horizontal segments. Stam. Filaments five, awl-shaped, in the throat of the corolla; anthers simple, within the orifice of the tube, converging, pointed. Pfi. German superior, globule; style simple, the length of the flammes, club-shaped; stigma bare, unlobate. Pet. Berry globose, of two cells, perforated by two pores at the summit. Seeds four, nearly ovate, separated by pulp.

A tropical genus of erect or twining shrubs, with simple, undivided, alternate, rough, hairy, or silky, rarely smooth, leaves. The flowers are numerous, mossy white or blueish, in dense, recurved, unilateral, often cymose, spikes, without bracteas. Berries white, blue, or black. In habit, this genus comes nearest to Heliotropium; Messerschmidia is united to it by Mr. Brown. (See those articles.) In the true Tournefortia, according to that learned botanist, the berry has only two seeds, or nuts, each with two cells. To these belong the Messerschmidia, and Heliotropium graphiades of Linnaeus. In T. birsiflifiora, the berry has four simple, or single-kernelled, seeds, and a straight embryo. In T. volubilis of Linnaeus, and scandens of Solander, to which we may add ferecia of Vahl, the segments of the corolla are awl-shaped, the berry with four simple seeds, of which two or three are often abortive, and a curved embryo. Mr. Brown would separate all these from Tournefortia, but whether the birsiflifiora should form a distinct genus from the species with awl-shaped segments of the corolla, he is doubtful. A consideration of the genera Onosina and Cerintus, to say nothing of others of this same order, makes us doubtful whether the number of parts, or cells, in the fruit, or rather the greater or less union of those parts, can here make a generic distinction. We submit it to the re-consideration of our learned friend; and in the meanwhile we shall attempt a display of all the species of Tournefortia, of which Linnaeus and Willdenow have given but a very incomplete list. Poiret in Lamareck's Dict. has added several to the number, but we pollexes some, even from Cosmmeron's collection, which are not to be referred to any of his. Some of the described ones have not come under our inspection, and the history of others is much confused, but we hope to leave the subject, if not fully elucidated, at least in a clearer state than we find it.—T. humilis, Linn. Sp. Pl. 202, belongs, according to Mr. Brown, to Heliotropium. See that article.

1. T. ferrata. Greater Serrated Tournefortia. Linn. Sp. Pl. 201. Willd. n. 1. (Pittonia arborescens, chamedrifolia major; Plum. l. 224. t. 228. f. 1.) Varronia mirabiloides; Poiret in Lam. Dict. v. 4. 262.)—Leaves ovate, serrated, on spineous footstalks. Spikes recurved, on axillary stalks, longer than the leaves.—Native of the West Indies, where it was found by Plumier, from whose figure alone it is known to us. The stem is said to be arborescent, with round zigzag branches. Leaves above two inches long, strongly serrated, on stalks nearly an inch in length, each with a joint about the middle, where the leaf seems finally to separate, the lower part hardening into a spine. Flower/stalks axillary, foliary, each bearing three recurved spikes, of numerous, large fleshy flowers, the limb of whose corolla is undulated, an inch in diameter. Berry the size of a pea, globose, undivided. Poiret says it is red. If his plant from Hispaniola be the same, this species must be removed to Varronia, which is rendered probable by the aspect of its corolla.

2. T. chamedrifolia. Lesser Serrated Tournefortia—(T. ferrata b; Linn. Sp. Pl. 201. Willd. n. 1. Pittonia arborescens, chamedrifolia minor; Plum. l. 224. t. 228. f. 2.)—Leaves oblong, serrated, on recurved spineous footstalks. Spikes capitate, terminal.—For this also our only authority is Plumier, who gathered it in some part of the West Indies. It appears to differ essentially from the former, in the characters above given, as well as in its much smaller spikes. The flowers however are nearly as large, but much fewer, with partial stalks, which become very conspicuous as the fruit ripens. Their corolla is represented very regularly crested, rather than undulated, but indicates a Varronia, as well as that of the foregoing.

3. T.
TOURENFORTIA.

3. T. hispiflolia. Hairy Tournefortia. Linn. Sp. Pl. 201. Willd. n. 2. Poiret n. 1. Swartz Obs. 56. (Pittonia hispiflolia et ramosiflolia, baccis albis; Plum. Ic. 226. t. 228. Heliotropio flore, frutex baccafer racemosus, folio rugoso fetido maximo subrotundo hifuro, frutet albo; Slane Jam. v. 2. 185. t. 212. f. 1.)—Native of bushy places in Jamaica, and other West Indian islands, as well as of Mexico, from whence it was first met with by Muts to Linn. This is a herb, three or four feet high, somewhat twining, its branches, flalks, foliage, and calyx clothed with dull down. The corolla is still more densely covered externally with silky hairs. Leaves frettb, fettb, elliptic, entire, pointed at each end, transversally ribbed, three inches long, and an inch and half broad; most hairy, and rather fettb, at the back. Spikes aggregate, on long, hairy, auxiliary and terminal flalks, about the ends of the branches. Flowers, as well as berries, white; the latter rough and hairy, Swartz says of two cells, with two seeds in each, which does not agree with Mr. Brown's account, given above.

4. T. satifliflora. Tobacco-leaved Tournefortia. Linn. Sp. Pl. 201. Willd. n. 5. Att. n. 2. Swartz Obs. 58. (Pittonia racemofa, nicotiana folis, fetidiflora; Plum. Ic. 226. t. 230.)—Leaves ovato-lanceolate, rough; downy and paler beneath. Flower-flalks branched. Spikes pendulous. Calyx shorter than the fytles. —Native of Jamaica. Dr. Wright. The leaves vary in size; but are not unlike those of T. hispiflolia in shape. Their upper surface is more minutely rough than that in its species, and their under one more softly and densely downy. The fytles are very remarkable for their extremely long linear form, and pendulous position. They measure frequently eight or ten inches, and are from six to eight on each auxiliary fettb leaf. The flowers are small, fettb, in a simple unifoliate line. Calyx hairy, with lanceolate upright segments. Tube of the corolla hairy upwards, about thrice as long as the calyx; its limb in five ovate, obtuse, keeled, reflected segments. Style projecting beyond the permanent calyx, after the corolla is fallen, with a very large pulpy-shaped pointed stigma. This is united, by Lamareck and Poiret, to the following, under the name of macrophylla; Poiret n. 21. 5. T. campylata. Drooping Cymose Tournefortia. Linn. Sp. Pl. 202. Willd. n. 8. Att. n. 4. Jacq. Coll. v. 1. 96. Ic. t. 91. (Heliotropio flore, frutex, folio maximo oblongo acuminato glabro; Slane Jam. v. 2. 185. t. 212. f. 2.)—Leaves elliptic-lanceolate, pointed, smooth. Flower-flalks much branched. Spikes drooping. Calyx as long as the fytles. —Native of the West Indies. This is certainly, as Linnæus observes, nearly related to the foregoing, but differs in the smoothest, and more elongated points, of the leaves, as well as in its more numerous, shorter, and less directly pendulous, fytles. The flowers are similar, but the fytles in our specimens does not project beyond the calyx. The corolla, at first white, turns tawny, and dark red, before it falls. Berry the fize of a small pea, white, with black dots.

6. T. fringifolia. Lilac-leaved Tournefortia. Vahl Symb. v. 2. 23. Willd. n. 4. Poiret n. 17.—Leaves ovate, somewhat heart-shaped, pointed, smooth. Spikes terminal, divaricated, hairy, as well as the flalks.—Native of Cayenne, and, if we mistake not, of Jamaica, where our specimen, perfectly answering to Vahl's description, was gathered by Dr. Wright. The young branches, as well as the flower-flalks, the main rib of the leaves on both fides, and the transverse ribs underneath, are all more or less hairy, like the flower-flalks, spikes, calyx, and outside of the corolla. Leaves two inches long, dilute of fine intermediate veins, quite smooth, except the ribs. Flower-flalk terminal, erect, forked, with spreading spike above an inch long. Flowers alternate. Segments of the corolla with long taper points.

7. T. bicolor. Pale-backed Tournefortia. Swartz Ind. Occ. v. i. 344. Willd. n. 7. (T. leviigata; Poiret n. 3.)—Leaves elliptical, pointed, smooth; slightly rugged on the upper side. Spikes terminal, cymose, crowded, erect, recurved, somewhat hairy.—Native of bushy places in Jamaica. A herb fix feet high, with smooth branches. Leaves three or four inches long, elliptical rather than ovate, acute at each end, finely reticulated with veins between the ribs, occasionally minutely hairy, as well as the branches and flower-flalks; paler beneath. Flower-flalks several, terminal, alternate, rather hairy, erect, each bearing six or eight sub-divided, cymose, dense spikes. Segments of the calyx ovate, scarcely hairy, except when the leaves are fo. Corolla greenish-white, externally covered with silky hairs. T. globular. Linn. Sp. Pl. cd. i. 144, is perhaps a variety of this.

8. T. madagascariensis. Four-dotted Tournefortia. Jacq. Amer. 47. Poiret n. 4.—Leaves ovate, pointed, smooth on both fides. Spikes much branched, pendulous, lax, recurved. Stalks slightly hairy.—Native of thickets in South America. Jacquin found it near Carthagena. He describes it as a fluris, with weak branches. Leaves fettb, entire, crenated. Berries yellow, with four round black dots at the base. Poiret says the leaves are at least four inches long, and two broad. Corolla yellow, with a long narrow tube, and five acute segments.

10. T. farinifera. Trailing Tournefortia. Poiret n. 5.—"Leaves ovate-oblong, acute. Spikes branched, very short, two-ranked. Stem twining."—Native of the Mauritius. Sonnerat. A specimen gathered by Commerson in the Philippine islands, answers very near to the following description of Poiret. The flalks are climbing, with long, digitate, trailing shoots, flaited, nearly cylindrical, clothed with short whitish hairs. Leaves alternate; downy, and whitish beneath, especially when young; rounded and dilated at the base; almost smooth on the upper surface; three or four inches long, and an inch and half wide. Flower-flalks short, very downy. Flowers terminal, in short, clock, branched, downy spikes, and disposed in two rows, fettb. Calyx short, with blunt segments.

11. T. brasiliensis. Brasil Tournefortia. Poiret n. 6.—"Leaves ovato-lanceolate, harsh, somewhat fatinated; whitish beneath. Stem round, acutely flaited."—Sent to Lamareck from Brazil. Allied to the last, but the leaves are of a different shape, and the whole plant nearly defifite of pubescence. Leaves two or three inches long, an inch or more in breadth, contracted at the base, hairy on both sides, whitish and downy beneath when young. Flowers in short, reflexed, downy, hoary, branched spikes, composing a terminal cyme. Segments of the calyx downy, very acute, slightly recurved. Poiret.

12. T. arboreafera. Arboreferent Tournefortia. Poiret n. 7.—"Leaves ovato-lanceolate, somewhat downy when young. Spikes branched, very short. Stem arboreferent."—Gathered by Sonnerat, in the East Indies. Branches woody, angular, rough and rugged, particularly the young shoots. Leaves oval-lanceolate, contracted at each end, veiny, ribbed, harsh, four or five inches long, an inch and half broad; white and downy beneath when young. We have nothing to answer.
TOURNEFORTIA.

an answering to this description, nor is the specific character such as to afford much allusion in determining the plant.

13. T. volubilis. Velvet-leaved Tournefortia.—Leaves elliptic-lanceolate, acute, filiform on both sides. Spikes dense, aggregate, cymose, from the forks of the branches, filiform. Stigmas slightly two-lobed. — Gathered by Commerson in Montevideo woods of the island of Bourbon. The branches, spikes, leaves, calyx and corolla are entirely clothed with fine silky pubescence, the globose blosse, and obtuse limb of the latter, on its upper side, being the only smooth parts, except the hermaphrodites, which are snow-white. The leaves are four or five inches long, somewhat undulated, various in breadth. We have from the Mauritius what may possibly be a variety, with very narrow, and nearly smooth, leaves. Its inflorescence betrays no difference.

14. T. arvensis. Blunt-leaved Silvery Tournefortia. Linn. Suppl. 133. Wilddl. n. 9. Poir. n. 8. Brown n. 2. (Buglosson lamurensi; Rump. Amboin. v. 4. 119. t. 55.) —Leaves ovate, obtusifob, filiform on both sides. Spikes in repeatedly compound cymes. Tube of the corolla very short.—Native of the sea-coast, in Ceylon, Ambon, Banda, and other parts of the East Indies. This hybrid is hardly so tall as a man; its main stem very short, the bark full of deep suture; the branches widely spreading, hairy. Leaves crowded about the ends of the branches, alternate, flabellate, about three inches long, entire; tapering at the base; rather felthy, beautifully clothed all over with the finest silky pubescence, which appears to vary in degree, and in one of our specimens, from the island of Bourbon, excels in splendour every plant of our acquaintance. The flowering-flax, longer than the leaves, are at first terminal, but the branch is long protruded at each side beyond them. They are subdivided into tufts of dense recurved spikes, above an inch in length. All the spikes, like the broad obtuse caulis, are filiform. Calyx white, with a short tube, and a recurved limb, altogether not extending beyond the calyx. Mr. Brown describes the stigma as bifid and two-lobed. Ramphius says the leaves are ciliate, and much effeemed in Ambon for their faithful flavour.

15. T. gnaphaloides. Cud-weed Tournefortia. See Brown 496. (Heliotropium gnaphaloides; Linn. Sp. Pl. 188. Wilddl. Sp. Pl. v. 1. t. 745.) H. gnaphaloides litoreae fruticosae americanum; Pluk. Phyt. t. 193. f. 3.) —Leaves linear, obtuse, densely downy on both sides. Spikes dense, downy, recurved, on cymose flaxes.—Native of the sea-coast in the West Indies. We follow Mr. Brown in removing to the present genus this elegant hybrid, whose snow-white downy covering is rather more cotty than filiform, and yet partakes of the filvery beauty of the leaf described. The leaves are crowded, thick, about two or three inches long, and hardly a quarter of an inch wide. Flowers small, white; in short, thick, woolly, solitary or twin, recurved spikes. Berries smooth, the size of a currant.

16. T. subfruticosa. Hoary-leaved Tournefortia. Linn. Sp. Pl. 202. Wilddl. n. 11. Ait. n. 5. (T. subfruticosa, foliis subfunicatis oblongis, fronde comosa; Browne Jam. 170, excluding the synonymy of Sloane, which belongs to Suriana maritima. T. indica; Poir. n. 9. Lamareck Illfr. n. 1880. t. 95. f. 7.) "Leaves nearly lanceolate, hoary. Stem somewhat shrubby."—Native of Jamaica, by the sea-side, near the borough of St. James's. Seldom rives above three or four feet from the ground. Browne. This is a very uncertain species, for which Dr. Browne feems the only authority, nor is there any specimen to reproduce it in the Linnean herbarium. The Thymelea ficte frutes, Sloane Jam. v. 2. 29. t. 162. f. 4, is certainly Suriana maritima, for which it was subtenbently quoted by Linnaeus. Confe-quentiy Willdenow cites it under both. It is sufficient to read Sloane, to see that his plant can be no Tournefortia. Possibly it may, nevertheless, have been what Browne intended. If so, the plant of Lamareck and Poiret has nothing to do with it, and may perhaps be the ferises of Vahl, hereafter described. Miller is recorded as having cultivated the T. subfruticosa, whence it has found a place in Mr. Aitton's work, but apparently without being known at the present day.

17. T. volubilis. Climbing Rough Tournefortia. Linn. Sp. Pl. 201. Wilddl. n. 3. Ait. n. 1. Poir. n. 10. Lamareck Illfr. n. 1884. t. 95. f. 2. Garthn. t. 75. Bryonia nigra fruticosa, racemae ramulæ variis integris, atque caudae fructisoribus in fibro consoitatis, baccis abbasun vel altera nigra macula notatis; Sloane Jam. v. 1. t. 234. f. 143. 2. Virga aurea americana fruticosa glabra, folis subulatis ciliatis, & c.; Pluk. Phyt. t. 235. f. 6.) —Leaves deflexed, ovate, acute, rough with minute points on both sides. Stem twining. Segments of the corolla awl-shaped. —Native of South America and the West Indies. It flowered with Linnaeus in the Uphal garden, and is preferred occasionally in our English hothouses. Sloane says the trunk near the ground is as thick as one's arm, twining round any thing it comes near, rising to the height of seven or eight feet. The branches are slender, round, somewhat zigzag, repeatedly sub-divided, minutely downy, or rather filiform, with close-preferred hairs. Leaves scattered, an inch or inch and half long, on slender, downy, deflexed flaves, about half an inch in length, single-rubbed, entire, flabellate, clothed on both sides with a very minute, white, callous prickles, but no hairiness. Flowers numerous; small, greenish, in lateral, or somewhat terminal, slender, divaricated, downy, cymose panicled, of lax spikes, or rather clovered. Calyx in five deep, hairy, narrow segments. Tube of the corolla filiform, hardly thrice the length of the calyx; limb in five narrow, awl-shaped, spreading segments, above half the length of the tube. Style shorter, with a large long-beaked stigma. Berry half the size of a pea, globose, often two-lobed, white, with black dots.

18. T. levigata. Climbing Smooth Tournefortia. —Leaves spreading, ovate, acute; smooth above; rough with minute points beneath. Stem twining. Segments of the corolla awl-shaped. —Native of Jamaica. Dr. Wright. This has altogether the habit of the last, of which it may possibly be a variety. The chief difference discoverable in the dried specimens is the upper surface of the leaves being perfectly defitute of the innumerable callous points which cover their backs, and which are found on both sides of the foliage of the foregoing. The leaves of the present are also perhaps less deflexed. The inflorescence and flowers afford no marks of distinction. The berries are most frequently of three globular lobes.

19. T. feroces. Climbing Hoary Tournefortia. Vahl Eclog. faci. i. 17. Wilddl. n. 10. Poir. n. 11. (T. indica; Poir. n. 9. Lamareck Illfr. n. 1880. t. 95. f. 3. Frutex; Margr. Brallfl. 78, excellent as to the leaves, but though cited by Vahl, without any exception, the description shews it to be a favenele of a plant.) —Leaves spreading, ovate, acute; rough with minute points above; downy and hoary beneath. Stem twining. Segments of the corolla awl-shaped. —Native of Hispianola, and other parts of the West Indies. Like the two last in size and general habit; but the footflakes are rather shorter; leaves more rounded, and often somewhat heart-shaped, at the base; their upper surface covered with much more numerous and minute, hair-pointed, white, callous tubercles, which produce somewhat of a hoary appearance; while the under
TOURNEFORTIA.

is white with fine close down, and furnished with very prominent ribs. **Inflorescence, flowers, and fruit**, much like the two foregoing. The **stigma** in all has a long conical point.

20. T. tomentosa. Climbing Downy Tournefortia. Mill. Dict. ed. 8. n. 5. Poiret n. 12.—Leaves heart-shaped; downy beneath. Stem twining. Segments of the corolla awl-shaped?—Discovered by Mr. Robert Miller, near Carthagea, in South America. The twining **flame** reach to the height of ten or twelve feet. **Leaves** two inches long, and one and a quarter broad near their base, very downy beneath, on very short **florets**. **Inflorescence** apparently like the last. **Flowers** small, dirty-white. **Berries** juicy, with two, three, or four seeds. We gather from Miller's account, our only authority, that this plant comes very near our laf, of which it may possibly be a variety; yet the leaves seem to be of a broader figure, and their **florets** shorter.

21. T. ferruginea. Climbing Rusty Tournefortia. Lamarck Illftr. n. 1882. Poiret n. 15.—"Leaves somewhat heart-shaped, acute; villous beneath. Stem somewhat climbing. Young branches very hairy."—Native of Hispaniola, where it is known by the name of **Kallakko**. Allied to **T. cohohlis**, but its branches are less elongated and trailing; its **leaves** and young shoots very much hairy, or shaggy, with fliff, straights, dull-coloured hairs, equally remarkable on the **florets**, and ribs at the backs of the leaves. The latter are pointed, thick, harsh above, downy beneath, a little fringed at the margin, dark green, two or three inches long and one broad. Their **florets** straight, very short. **Flower-flarks** much branched, hairy, divided into short **spikes**. **Flowers** small, unaltered, with a rough hairy calyx, and a short tubular corolla. Poiret.

22. T. semiplana. Rough Small-leaved Tournefortia. Lamarck Illftr. n. 1883. Poiret n. 14.—"Leaves reflexed, oblong, obtuse; very rough above; wrinkled and downy beneath. Flower-flarks branched, terminal. Berries conical."—Gathered in Hispaniola, by Joseph Martin. **Branches** slender and flexible, flattened, somewhat downy. **Leaves** flaked, slightly toothed, an inch long and four lines broad, rounded at the base, blunt at the extremity. **Calyx** hairy, rough, widely spreading, acute. **Berries** reddish, oval, almost conical. Poiret, whole description is our only guide, mentions a supoosed variety, with **leaves** twice as long, but narrower, of which, however, he had seen neither **flowers** nor **fruits**.

23. T. scandens. Climbing Brown-flowered Tournefortia. Mill. Dict. ed. 8. n. 4. Poiret n. 18.—"Leaves heart-shaped, hairy. Spikes reflexed, branched. Stem twining. Segments of the corolla awl-shaped."—Found in Jamaica by Houtfou, who sent fees to Miller. We presume it to be the same with what Mr. Brown mentions as **T. scandens** of Solander's manuscripts, and therefore we adopt from him the character of the **corolla**; though our **leaves** was marked by Dr. Wright, with doubt indeed, as the plant of Solander; but it does not at all answer to the description. The present has *hbrtbrh* brunching **flame**, ten or twelve feet high. **Leaves** near three inches long, one and a half broad near the base, acutely pointed, on short **florets**. **Flowers** in very **florets**, branching; terminal **spikes**, small, unaltered, of a dirty brown. **Berries** pulpy, with few **fruits**. Miller.

24. T. levifolia. Self-climbing Tournefortia. Poiret n. 19.—"Leaves felible, linear-lanceolate, villous. Flowers in roundish dense terminal **florets**. Stem **hbrtbrh**."—Gathered by Commeron at Buenos Ayres. **Branches** branny, round, clothed with *tiff* hairs. **Leaves** obtuse at each end, though a little contracted at the base, half clasping the **flame** an inch and a half long, three lines broad, downy on both sides. **Flowers** at the ends of the branches, on a common **flame**, which divides into two parts, each bearing several very dense crowded **spikes**. **Stalks** and **calyx** clothed with numerous, *tiff*, glandular hairs. Poiret.

25. T. carpesia. Flehy-leaved Tournefortia. Mill. Dict. ed. 8. n. 6. Poiret n. 20. (Pittonia frutescens, folio can pdfo, hirifuto et obtuso; Plum. Gen. 5.)—"Leaves flaked, oval; rugose and very rough above; paler and smoother beneath. **Spikes** branched, axillary. Stem *hbrtbrh*."—Gathered by Robert Millar, near Carthagea in South America. Stem woody, near 20 feet high, with strong rough branches. **Leaves** thick, oval, four inches long and three broad, on pretty long **florets**. **Flowers** small, white. **Berries** small, with two or three oblong *seeds*. Miller.

Besides all the above species, Poiret has a **T. bifida**, n. 16. Of this we find a specimen, gathered by Commerson in the island of Mauritius; but it appears to us totally foreign to this genus. The **flame** is *hbrtbrh*, with opposite, bluntly quadrangular, ragged branches. **Leaves** like-wise opposite, though Poiret says alternate, on downy channelled **florets**, ovate, about two inches long, entire, even, smooth, pale green, with a yellow mid-rib, slender lateral ribs hairy at their origin, and innumerable, excessively minute, reticulated veins. **Spikes** opposite, between the *fotfotfals**, and half as long, broad at the base, pointed, filky, deciduous. **Flower-falts** axillary, solitary, opposite, round, downy, longer than the **florets**, each bearing two, horizontally distended, fimple, unilateral **spikes**, of numerous, small, *_feeble* **flowers**, in two rows. **Germs** inferior, oblong, silky, crowned with a **calyx** of five deep, round, silky segments. **Corolla** funnel-shaped, white or yellowish, twice as long as the calyx and *germs* together, a little silky externally. **Stamen** within the tube; their **anthers** large, oblong, obtuse. Of the **style**, **stigma**, or **fruit**, we can give no account. This shrub appears to belong to the natural order of **Rubiaceae**, but we have not sufficient materials to determine its genus.

TOURNEFORTIA, in Gardening, contains plants of the shrubby exotic kind, among which the species cultivated are, the hairy Tournefortia (**T. hirifolifera**) ; the climbing Tournefortia (**T. volubilis**); the fist Tournefortia (**T. trifida**); the dwarf Tournefortia (**T. humilis**); the broad-leaved Tournefortia (**T. cymosum**); the fleshy Tournefortia (**T. argentea**); and the hoary-leaved Tournefortia (**T. hirifolícola**).

Method of Culture.—These plants may all be increased by seeds, which should be procured from the countries where they grow naturally, and be sown in small pots filled with light earth, and plunged into a hot-bed of tanners' bark. They sometimes grow the first year, but often remain in the ground a whole year: therefore, when the plants do not come up the same season, the pots should be plunged in autumn into a tan-bed in the stove, where they should remain all the winter, and in the spring be removed and plunged into a fresh tan-bed, which will soon bring up the plants, if the seeds were good. When these are fit to remove, they should be each planted in a small pot, and plunged into a tan-bed, where they must be shaded from the sun till they have taken root, and then be treated in the same way as other tender plants from the same countries, which require to be kept constantly in the bark-stove. They may also sometimes be increased by cuttings, which should be planted in pots, and plunged into the bark-bed.
Thee are all plants of the tender kind, which conflantly 
fland in need of the heat of the stove in this climate.

They afford variety in stove collections, among others in pots, 
mostly retaining their leaves the year round.

TOURENMÉ, in Geography, a town of France, in the 
department of the Straits of Calais; 9 miles N.W. of 
St. Omer.

TOUREMÉNE, René-Joseph de, in Biography, a 
learned Jesuit, was born at Remus in 1601, entered among the 
Jesuits in 1680, and took all the vows of their order in 
1695. In 1701 he reigned in the Jesuits college at Paris, for 
the convenience of conducting and superintending the jour- 
nal of Treuoux, or "Mémoires pour servir à l'Histoire des 
Sciences et des beaux Arts," printed at Treuoux, and 
periodically published from 1701 to 1767, when it fell with 
the society. In 1718, Tourneuine was made librarian of 
the Jesuits library, in the professed house of the society, 
where he died in 1739, at the age of seventy-eight years. 
Tourneuine published some other works of less note.

Moreri.

TOUREUR, Peter le, born at Vologne, in Nor- 
mandy, in 1736, gained prizes at Montauban and Bézançon 
for his literary pieces, which were reprinted at Paris, and 
admired on account of their philosophic spirit and eloquence. 
But he was brought more into notice by his free translation 
of Young's "Night Thoughts," which being favourably 
received, was followed with translations of "Hervey's Me-
ditations;" "The Life of Savage;" "Offian and other 
Gaelic Poems;" a great part of the "Universal History;" 
"Shakspere;" "Claraïa;" and other works. These 
translations are introduced by prefaces, abounding with bold 
and interesting ideas. His praisés of Shakspere provoked 
various attacks, and particularly from Voltaire. Le To- 
urneur, who died in 1788, is represented as one of the mildest 

TOURNIQUET, Fr. from tourner, to turn, a machine, or 
instrument, employed in the practice of Surgery, in order 
to stop bleeding. It is only applicable, however, to the 
limbs, and its use is merely intended to be temporary, that 
is to say, until some more permanent method of checking the 
haemorrhage can be practised. Thus, in the operation of 
amputation, the tourniquet is applied with a view of prevent-
ing the loss of blood, which would otherwise happen before 
the surgeon had done with the knife and the raw, and before 
he could possibly devote his attention to the ligation of the 
arteries. But it is never put on tightly with the design of 
leaving it any considerable time in this way, as the con- 
fined production would inevitably bring on mortification. 
Sometimes, after amputations, operations for aneurisms, 
and in cases of wounds, it is left loosely upon the limb, so 
that, in the event of a sudden haemorrhage, it may be 
tightened in an instant. Here, however, the surgeon does 
not regard it as the principal means by which the bleeding 
is to be stopped; but simply as a temporary, until an opportunity has been afforded of securing the bleeding 
veins in another way.

When haemorrhage takes place from a large artery in 
one of the limbs, where the veins can be conveniently com-
pressed above the wound in it, a tourniquet, judiciously 
applied, never fails in putting an immediate stop to the 
bleeding.

Before the invention of this instrument, which did not take 
place till the latter part of the seventeenth century, surgery 
was really a very defective art. No important operation 
could be undertaken on the extremities without placing the 
patient in the most imminent peril; and the want of the aid 
afforded by the tourniquet made many wounds mortal which 
otherwise would not have been attended with the least 
danger.

Perhaps we are not justified in stating that the tourniquet 
was not invented till the late period above specified; and it 
might be more correct to say, that it has been used in a 
rude and imperfect manner ever since surgeons have known 
that the flow of blood through a limb may be commanded 
by preasure. For when a tight band was tightly applied 
round a limb, in order to stop bleeding, it was, in fact, a 
kind of tourniquet. The records of surgery, indeed, in- 
form us, that the old surgeons used to surround the limb 
with a band, with which they made such a degree of con- 
striction, that the circulation was quite stopped. These 
practitioners also believed, that the pressure of the band was 
advantageous in benumbing the limb, and moderating the 
pain of operations.

The violent pain and contusion, however, which this sort 
of tourniquet occasioned, were frequently followed by 
floughing and abscesses, and therefore surgeons endeavoured 
to devise some other method of checking haemorrhage. The 
application of the circular band was first improved, so that 
it caused less pain and less mischief to the skin. The limb 
was surrounded with a very thick compres, over which the 
band was placed. Two small sticks were next put under the 
band, one on the inside, the other on the outside of the 
limb; and they were twisted till the band was rendered suffi-
ciently tight. It is in this manner, says Dionis, in his 
 Treatise on the Operations of Surgery, that carriers tighten 
the cords which fasten the bales of goods in their carts. A 
French surgeon named Morel is said to have made this first 
improvement in the application of tourniquets.

Although in the Armamentarium Chirurgicum of Scul-
tetus, there is an engraving of a machine invented by this 
author for compressing the radial artery by means of a screw, 
M. Petit is universally allowed to be the first who brought 
the tourniquet to perfection, by combining the circular band 
with a screw, in such a manner, that the greatest pressure 
operates on the principal artery. It was in 1718 that he 
prevented his improved instrument to the Academy of 
Sciences. It consists of two pieces of wood, one of which is 
superior, the other inferior. The inferior piece is about 
four inches and a half long, and nearly two broad. Its 
under surface is somewhat concave, while its upper one is a 
little convex; and the ends are hollowed out. From its 
middle part rises a round eminence, about four lines 
high, and eight and a half broad. The superior piece is 
almost the same as the inferior, but rather shorter. The 
eminent which ascends from its middle part is five lines 
high, and an inch and a half in diameter. This eminent is hollow 
within, and calculated to receive a wooden screw, the top of 
which is a sort of button for turning the screw. The 
grooves of Petit's screw were about four or five, and each of 
them four lines in diameter, in order that a half-turn 
might produce the necessary effect. Lastly, all the pieces 
of the instrument were fastened together with an iron pin, 
which went through the middle of the two pieces of wood, 
and through the whole length of the screw. This iron pin 
was riveted under the inferior piece, and at the top of the 
button; in such a manner, however, that the screw was ca-
pable of turning on it as a pivot.

In order to apply this tourniquet, the limb is to be sur-
rrounded with a double flap, about four finger breadths 
wide, and made of chamois leather, which is the softest 
material that can be used. To one end of the flap a small 
double cushion is fastened, of the same length and breadth 
as the lower piece of the tourniquet. A narrow compres, 
or cylindrical pad, is also requisite, for the purpose of com-
pressing
TOU

Treating the track of the vessels. This comprises consists of a very firm roll of linen, covered with chamois leather. The ends of a piece of tape are sewed to the outer part of the pad, and thus the tape leaves a passageway for the leather flap. By this means, the pad can be moved to any situation on the field which may be most convenient, according to the bulk of the limb. The middle of the tape is to be fastened to the outside of the leather flap. The cylindrical compresa, or pad, is to be put over the course of the vessels. The double cushion is to be placed on the opposite side of the member, while the leather flap is to surround the limb in a circular manner. All the different pieces of the apparatus are next to be retained by the tape, which is to be tied at the side of the cushion.

The tourniquet is now to be put over the cushion, on that side of the limb which is furthest from the track of the large vessels, and is to be fastened in this situation by a double band, with a hole in it for the reception of the upper part of the ferret.

In order to make proper compression, the screw is to be half turned round from the right to the left. The upper piece of the tourniquet becoming now further from the lower one, the double band draws the pad, and presses against the vessels, so as to make the due degree of compression for stopping the flow of blood through the main arteries.

The following are the advantages attending the use of Petit's tourniquet. 1. It comprises the lateral parts of the limb left than the tourniquet previously in use. 2. It requires the aid of no assistant either to hold, tighten, or loosen it. 3. The operator is able of himself to stop the flow of blood through the artery by means of the screw. 4. When there is any danger of hemorrhage after an operation, this kind of tourniquet may be left on the limb; and in case of bleeding coming on, the patient, if no one be at hand, can tighten the instrument himself as much as necessary. 5. The contrivance which this tourniquet produces may be continued longer than that of the old method, without hazard of loosening, because it does not altogether stop the flow of blood through the collateral arteries.

The tourniquet just described is certainly very complex, when compared with what is now used by the best modern practitioners; but still it is the original of the latter, and are constructed on the same principles. The several pieces of a modern tourniquet are always kept connected together, and, instead of two pieces of wood, used by Petit, there is contrived a brads bridge, which is capable of being elevated or depressed by means of a screw of the same metal. Over this bridge a very strong band proceeds, and, by passing under two little rollers at the ends of the bridge, it always remains connected with the instrument. A convex form pad is sewed to the band, and put immediately over the artery when the instrument is applied. There are no cushions for the opposite side of the limb under the screw; but a thick piece of leather, through which the band proceeds in two places, is sometimes put under the lower surface of the brads, and serves to prevent any bad effects of its pressure on the skin. It is usual, also, for the surgeon to fold some rag, and put it in this situation at the time of applying the instrument.

Cooper's Dict. of Pract. Surgery.

In the army, surgeons are provided with what are named field tourniquets, in addition to such as are always found in cafes of amputating instruments. A field tourniquet is more simple in its construction, and is particularly intended for use on the field of battle, where numerous soldiers frequently band in need of temporary compression of their bleeding limbs, until the surgeon has time to pay their accidents further attention. It consists merely of a strong band, a pad fixed to this band, and a buckle. It admits of being applied in an infant. Every military surgeon is commonly furnished with two or three dozen field tourniquets, and the plan is pretty good, as the preservation of many lives by it has confirmed.

The reader will have a better idea of the nature of a tourniquet, by referring to engravings of the instrument; but a sight of the thing itself will be still more useful.

Some tourniquets of different constructions are represented in Plate I. of the Surgical Instruments, where fig. 1. shews a tourniquet of the most simple kind, which is tightened by twisting the band D with the piece of wood B. C is the pad which is to be placed upon the main artery, and A is a fort of metallic or wooden guard, for preventing the twitlful part of the band from hurting the skin. Fig. 2. a tourniquet of a more modern and improved made. D the ferew. C, C, the two pieces of the frame or bridge of the tourni- quart, which tighten the band B, when the upper piece is raised by turning the screw. A is the pad. Fig. 3. repre- sents another kind of tourniquet, which is tightened by a contrivance resembling a windlass in principle; C the handle by which it is turned; E a fleet branch, which serves to prevent the handle from turning back again; B a short bit of chain, which fixes itself in the notch of the circle, and by carrying the hand with it when moved round, tightens the band D; A the bands of the tourniquet. Fig. 4. another kind of screw-tourniquet.

TOURNOS, in Coinage, the name applied to French money in the old system, as itformerly is to English money.

TOURNON, in Geography, a town of France, in the department of the Loir and Garonne; 12 miles E. of Villeneuve d'Agon.—Also, a town of France, situated on the river Creuse, one part in the department of the Indre, and the other in the department of the Indre and Loire; 7 miles S. of Preuilly.—Also, a town of France, in the department of the Ardèche, on the Rhône; 22 miles N.N.E. of Privas. N. lat. 45° 3'. E. long. 5° 3'.—Also, a town of France, in the department of Mont Blanc; 15 miles E. of Chambery.

TOURNUS, a town of France, in the department of the Saône and Loire, on the Saône; 3 polls S. of Châlons fur Saône. N. lat. 46° 34'. E. long. 5° 9'.

TOURO, a town of Portugal, in the province of Beira; 13 miles W.S.W. of Alfayates.

TOURON, in Geography, a town of Perse, in the province of Co- hælin; 80 miles S.W. of Neufabur.

TOUROULIA, in Botany, a Caribbean name, used by Aublet, but absolutely inadmissible into any classical work.

TOUROUFE, a town on the west coast of Sumatra. N. lat. 2° 50'. E. long. 97° 6'.

TOUROUVRE, a town of France, in the department of the Orne; 6 miles N.E. of Mortagne.

TOURRETTE, mark-AntoHia-Lewis-Clarej de la, in Biography, was born at Lyons in 1729, and having studied at the college de Harcourt, at Paris, settled in his native place, where for twenty years he occupied an important post in the magistracy. Strongly attached to the study of natural history, he formed, in 1764, a large collection of insects, and a series of specimens in mineralogy. In 1766 he introduced into a large park near the town of Arbelle all the foreign trees and plants that could bear that climate, and in his own garden at Lyon he cultivated more than 1000 species of rare plants. He was a companion of J. J. Rumphius.
feau, in his botanical excursions; and he maintained a correspondence with Linnaeus, Haller, Adanson, Jussieu, and other celebrated botanists of Europe. At length, overcome by fatigue at the siege of Lyons in 1793, he sunk under a disorder of the lungs, and died in his 60th year. His principal works are, "Demonstrations Elémentaires de Botanique," 2 vols. 8vo.; "Voyage à Mont Pèlerin," 1787; 8vo.; "Chloris Lugdunensis," 1785; 8vo.; "Conjectures sur l'Origine des Belemnites;" "Mémoire sur les Monstres Végétaux," and "Mémoire sur l'Helminthoepon PHYSIQUE."

TOURRETTIA, in Botany, was so named by its discoverer, the unfortunate Dombey, in honour of his countryman M. de la Tourrette, author of the Chloris Lugdunensis, and lecturer on botany in the Veterinary school at Lyons. Whether M. l'Heritier thought but moderately of the claims of this gentleman, we know not; but he chose the name of Dombeya for the plant in question, on account of its beauty and singularity. That appellation indeed is now bestowed on a much nobler genus, see Dombeya and Dombey, and we trust it will so remain, for the Dombeya of Canavilles, like most of that author's monadelphous genera, is too ill-defined to be the guardian of such a name.—Schreb. Gen. 406. Willd. Sp. Pl. v. 3. 263. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 4. 179. Fougeroux in Mem. de l'Acad. des Sciences for 1784. 200. t. 1. Lamarrck Illustr. t. 527. Poiret in Lam. Dict. v. 7. 719. (Dombeya; l'Herit. Stirp. Nov. 33. Salibb. Stirp. Rar. 5.)—Clas and order, Didynamia Angiosperma. Nat. Ord. Perfonate, Linn. Bignonie, Juss.

Gen. Ch. Cal. Perianth inferior, of one leaf, tubular, two-lipped, coloured in the bud, deciduous; its upper lip acute; lower obscurely four-toothed, furrowed with an acceseory membrane at the base. Cor. of one petal; tube compressed, the length of the calyx; upper lip vaulted, compressed, its edges converging; lower lip none, except a pair of minute teeth. Stam. Filaments four, thread-like, concealed under the upper lip, two of them shorter than the rest; anthers two-lobed. P. Germen superior, oblong, obsoletely quadrangular, granulated; style thread-like, the length of the lip, parallel to the stamens; stigma divided. Peric. Capsule oblong, coriaceous, more or less beft with prickles which are occasionally hooked, of four cells and two valves. Seeds from four to six in each cell, ovate, somewhat triangular, surrounded with a membranous notched border divided at its base.

1. T. Iappacea. Scarlet-flowered Tourettia. Willd. n. 1. Ait. n. 1. (Dombeya lappacea; l'Herit. Stirp. Nov. t. 17. Salibb. Stirp. Rar. t. 3.)—Found by Dombey in Peru. First raised in England by Mr. Salisbury, at Chapel Allerton, near Leeds, in 1788, from seeds communicated by M. l'Heritier. The plant is annual, of very luxuriant growth, filling a moderate-sized flore, so that few cultivators can be induced to allow it a place in their collections; the flowers, which are produced in abundance from midsummer till the end of autumn, being, though elegant and curious, less tawdry and glaring than many popular favourites. The stem is square, much branched in a forked manner, climbing, pale green, smooth, tender and pelliculose, as well as the leaves, which are opposite, falked, serrate or quinate, in pairs on a common stalk, which terminates in a very delicate, spiral, adhesive, compound tendrils: leaves ovate, acute, strongly and unequally serrated, about an inch long, shining, with one rib, and many oblique parallel veins.

Flowers from the forks of the branches, in solitary, simple, lax, ascending spikes rather than corymbs, each flower with a small nut-shaped bract at its base. The lower ones only are perfect and fertile, having a green calyx, clothed with fine yellow hairs, and a violet corolla; several of the uppermost confit chiefly of a dilated scarlet calyx, on which much of the beauty of the plant depends, and which emulates the coloured bracteas of the Barfiae and Ajuga. The calyptra, though usually mucrinated with hooked prickles, is sometimes smooth and bare, a variation similar to what is seen in Datura, and by no means indicating a specific distinction.

TOURS, in Geography, a city of France, and capital of the department of the Indre and Loire, on the Loire. Before the revolution the capital of Touraine, and fee of an archbishop. The number of inhabitants is about 33,000. In 722, the Saracens were defeated by Charles Martel, near this town, with the loss of 10,000 men ; 47 polls N.E. of Bourdeaux. N. lat. 47° 25'. E. long. 0° 16'.—Allo, a town of France, in the department of the Puy de Dôme; 12 miles E.S. of Billon.

TOURTERELLES, a cluster of small islands in the Indian sea, near the coast of Africa. N. lat. 11° 50'.

TOURVACORA, a town of Hindoostan, in Myource; 32 miles N. of Serigapatam.

TOUVES, a town of France, in the department of the Var; 4 miles S.E. of St. Maximin.

TOUVILLE, a town of France, in the department of the Eure; 10 miles W. of Louviers.

TOURY, a town of France, in the department of the Loiret; 12 miles W. of Pithiviers.

TOUSERA, a town of Africa, in the country of Bideulgerd, depending on Tunis. N. lat. 32° 30'. E. long. 10° 44'.

TOUSIEH, a town of Asiatic Turkey, in Natolia; 21 miles N.N.E. of Kiangari.

TOUT temps pris et encore ef, that is, always ready, and so at the present time; a kind of plea in way of excuse or defence for him that is sued for any debt or duty belonging to the plaintiff.

TOUT Ensemble, in the Arts. See ENSEMBLE.

TOUT, pur mes et per. See PUR MY.

TOUTERON, in Geography, a town of France, in the department of the Ardennes; 13 miles S. of Mezières.

TOUTS-I-TCHAMSSIA-LING, a town of Thibet; 30 miles N.W. of Tankerdong.

TOUTTI, a town of Nubia, on the left bank of the Nile; 90 miles N. of Sennar.

TOUVRE, a river of France, which runs into the Garente, about half a mile above Angoulême.

TOUY, a river of Tartary, in the country of the Kalkas, the waters of which are equally pure and fabulous with those of the Toula, (which see,) and waters plains as fertile as those adjacent to this river; and, after having traversed several very extensive cantons, suddenly loses itself in the bosom of the earth, and never appears again.

TOU-YANG, a city of China, of the first rank, in Kuang-fu; 1127 miles S.S.W. of Peking. N. lat. 23° 18'. E. long. 107° 0'.

TOU-YUN, a city of China, of the first rank, in Koeitehao. The jurisdiction of this city is but small, and comprehends not only two cities of the second order, and two of the third. It is in the neighbourhood of mountains, which are inhabited by the Seng-miao, a people whom the Chinese could never subdue, and who have their particular government. It is separated from them only by a river, and
and some steep mountains; 955 miles S.S.W. of Peking.
N. lat. 26° 12'. E. long. 107° 2'.

TOW, Te, derived from the Saxon tean, or teban, to draw, in Sea Language, is to draw a ship forward in the
water, by means of a rope attached to another vessel or boat
which advances by the force of rowing or pulling. Towing is
effected either when a ship is disabled, and rendered un-
capable of carrying sail at sea; or when her sails are not
fixed upon the masts, as in a harbour; or when they are de-
prived of their force of action by cession of the wind.
When a ship of war is dismasted, or otherwise disabled
from carrying sail at sea, she is usually towed by a cable reaching
from her bow to another ship a-head. In a harbour, towing
is practiced by one or more boats, wherein the force of all
the oars is exerted to make her advance. Falconer.

Tow-Chain, in Husbandry, a name given by our farmers
to a chain, that makes a part of the structure of the plough,
altering the plough-tail to what they call the plough-head.
See Plough.

Tow-Line, in Sea Language, a small hawser generally
used to remove a ship from one part of a harbour or road
to another, by means of anchors, capsterns, &c. It is also
employed occasionally to moor a small vessel in a harbour,
conveniently sheltered from the wind and sea.

Tow-Rope is the name given to any cable or rope used in
towing.

TOWA, in Geography, a river of Wales, in the county of
Caermarthens, which runs into the Tave, at St. Clare.
See St. Clare.

TOWACZOW. See Tobitschau.

TOWAGE, is a term used for money, or other recom-
pence given by bargemen to the owner of the ground near
the river where they tow a barge, or other vessel, for the
liberty of pacling along the side of it.

TOWAMENCING, in Geography, a township of Penn-
yvania, in the county of Montgomery, containing 488 inhab-
habitants.

TOWAMENSING, a township of Pennsylvania, in the
county of Northampton, containing 593 inhabitants.

TOWN HEAD, a cape of England, on the N.W.
coast of Cornwall. N. lat. 50° 26'. W. long. 4° 57'.

TOWNANDY, a township of Pennsylvania, in the county
of Luzerne, containing 788 inhabitants.

TOWAR, a small island near the north coast of Celebes,
in the East Indian Sea. N. lat. 1° 18'. E. long. 124° 23'.

TOWCESTER, commonly called T fluorfs, and in the
Domelday book Towceifier, a market-town in the hundred of
the same name, and county of Northampton, England; is
situated on a plain near the banks of a small river named
Tove, 10 miles S.W. by S. from the county-town, and
60 miles N.W. from London. Numerous Roman coins
have been found here, particularly about Berrymount Hill,
an artificial mount, composed of earth and gravel, on the
N.E. side of the town. It is flat on the top, about twenty-
four feet in height, and the diameter one hundred and two.
This hill was surrounded by a moat capable of being filled
with water from the adjoining brook, and has every appear-
ance of having been of Roman formation. Horley places
here the flatillon Laetodorum with great probability of cor-
rectness. Mr. Camden and Dr. Gile have fixed it at
Stony Stratford, deriving its British name from the two
British words, lach, a lane, and dour, water. On the
N.W. side of the town are vestiges of a foss, and the
ruins of a caffle or tower, probably a SAXON work; for
in that period Towceiffer appears to have been a place of
considerable strength, and is said to have been well
fortified, that the Danes who besieged it were unable to
take possession. It muil, however, have suffered severely
from them, for in the year 921, king Edward issued his
mandate for rebuilding and fortifying Towceifter. The
Danes of Northampton and Leicester, who had previously
made a truce with the Saxons, suddenly broke their engage-
ment; and marching to this place, carried on an assault for
the whole day; but by the vigorous resistance of the in-
habitants, and the aid of a Saxon army, the Danes were
obliged to retreat; Edward having fortified the town, and
encompassed it with a stone wall. Towceifter, in its present
state, consists principally of one long street, in general well-
built: and being a great thoroughfare, there are several
good inns. In the windows of one, the Talbot, are the
arms and name of William Sponne, archdeacon of Norfolk,
and rector of the parish; who, in the twenty-ninth year of
Henry VI., gave this inn and certain lands to the town;
the revenues to be applied to repairing and paving the
streets. A monument in the church commemorates his
benefaction. He is represented in a loofe robe, which de-
feends beneath his feet, with an ermine hood and sleeves.

The by returns under the population act of the year 1811,
the number of house in Towceifter are flated to be 485;
the inhabitants 1245. These houses principally manufacture
the clofe of flilk and lace; of the latter article great quantities
are made in the town and in the adjacent villages. Four
fairs are held annually; and a market weekly on Tuesdays.

Sir Richard Empfon, famous as the favourite of King
Henry VII., and one of the instruments of his avarice and
oppression, was the fon of a feeve-maker in this town.
By a rigorous enforcement of the penal statutes through
the kingdom, he and his associate Edmund Dudley incensed
the people to fuch a degree, that Henry VIII. was con-
strained to submit to popular renonfrance, and fign his
hand for their execution. Empfon was tried at North-
ampton, and beheaded Augulf 16, 1510.—Beauties of
England and Wales, vol. xi. Northamptonshire; by J.
Britton, F.S.A. Hiftory, &c. of Northamptonshire, by the
Rev. —— Brydges, 2 vols.

TOWER, Turm, a high building, confifting of feveral
flories, and ufually of a round form, though fometimes
square or polygonal.

Before the invention of guns, they used to fortify places
with towers, and to attack them with moveable towers of
wood, mounted on wheels, to fet the besiegers on a level
with the walls, and drive the befieged from under the fame.

These towers were fometimes twenty flories, and thirty
fathoms high: they were covered with raw flkins, and a
hundred men were employed to move them; and they were
affiliated by the caplern and other mechanical contrivances.

The moveable towers of the ancients were of an amonishing
magnitude. Hero [s]tiguishes three kinds: the smallell were;
he fays, of fifty cubits and ten flories; the bafe, which was flquare, measured fifteen cubits on each fide.
The larger were ninety cubits high, and had fifteen
flories: the grefteft, called double, were of twenty flages;
they were largest at bottom, and decreafed every flory:
the dimensions of the timber used for the uprights, the
trafvers, and other principal pieces, were proportioned to each
of their three fixes. The flength and thickness of the
wheels bore proportion alfo to the weight which they were
to carry; the number of the wheels was proportioned to
the fquares of their bases: they had at leaffix, and fometimes
eight. The towers or helfreys, as they were called,
of more modern times, were not fo large; they rarely ex-
cceeded three or four flages or flories, and were covered
with raw hides to protect them from fire; in three was a bridge
to be drawn on the parapet. When the works were to be
flormed. The lower flories or ground-floor was occupied by
a ram; the upper flories accommodated archers and
M
The Tower of London, the towers of the late Baillie, &c.

The Tower of London is not only a citadel to defend and command the city, river, &c. but also a royal palace, where our kings with their courts have sometimes lodged.

It contains a royal arsenal, in which are arms and ammunition for 80,000 soldiers; the offices of ordnance; a treasury for the jewels and ornaments of the crown; formerly a mint for coining of money; the great archive, in which are preserved all the ancient records of the courts of Westminster, &c. and is the chief prison for state criminals.

In the midst of it is the great square white tower, built by William the Conqueror, about the year 1079. Within the Tower is a parochial church, founded by king Edward III. and dedicated in the name of St. Peter in Chains, exempt from all jurisdiction of the archbishop, and a royal chapel, now diffused.

The chief officer of the Tower is a constable, or chief governor, under whom is the lieutenant-governor, who acts by his direction, and in his absence. He had, by grant of several of our kings, unam lagenam, two gallons and a pint of wine before, and as much behind the meal of all wine ships that come to London; and a certain quantity out of every boat laden with lobsters, oysters, and other shell-fish, and double the quantity out of every alien's boat palling by the Tower. Under the constable, besides the lieutenant, are a deputy-lieutenant, a major, a chaplain, a physician, a gentleman-porter, a gentleman-gaoler, a surgeon, and forty warders. The gentleman-porter has charge of the gates to lock and unlock them, and deliver the keys every night to the constable or lieutenant, and receive them of him the next morning: he commands the warders in waiting, and at the entrance of a prisoner has for his fee vestibula superiores, or else a composition for the same. For the yeomen warders of the Tower, see WARDEN.

In the Tower is likewise kept a court of record by prescription for the liberty of the Tower, of debt, trespass, and other actions of any sum.

The Tower liberty, subject to no jurisdiction but that of the Tower itself, includes both the Tower-hills, part of Earl Smithfield, Rosemary-lane, Wychelsea-square, Little Minoirs, Artillery-street, French-alley, Duke-street, Steward-street, Gun-street, Fore-street, and the other courts and alleys within their compass, in Spitalfields.

Tower, in Glass-making. See LEER.

Tower-Battions, in Fortification, are small towers, made in the form of bastions by M. Vauban in his second and third method; with rooms or cellars underneath, for accommodating men and guns. See FORTIFICATION.

Tower, Hollow. See HOLLOW TOWER.

Towers, Inclined, are those whose tops hang so far over, as to appear in danger to people walking below. Such is that of Pisa, 157 feet high, whose top overhangs the base 15 feet; and that of Bologna, 150 feet high, whose top overhangs the base 8 feet; and the reason why they do not fall is, that their centres of gravity are supported, or the lines of direction in them fall within their base. But if towers of this kind, that incline, were to be erected in height by any additional weight on their tops; in that case the centres of gravity would be raised, and their lines of direction fall without the base, so that the towers themselves must fall.

Tower Mustard, and Baifard Tower Mustard, in Botany. See MUSTARD.

Tower Pound, an old English weight for coins. This tower or moneyers' pound, with which gold and silver were weighed in England before the reign of Henry VIII. and which is still occasionally referred to on the subject of coins, was lighter than the pound Troy by fifteen pennyweights troy.

Tower-Hill, in Geography, a town of the state of Rhode Island, with a post-office; 17 miles S. of Providence. Alto, a town of North Carolina, on the Neuse; 30 miles W. of Newbern.

Tower Island, a small island in the East Indian sea, near the S. coast of the island of Flores. S. lat. 9° 2'. E. long. 124° 44'.

TOWIACHES, called Panis by the French, a tribe of Indians in Louisiana, who live on the S. bank of the Red river, by the cource of the river upward of 800 miles above Natchitoches, and by the nearest land distance about 340 miles. They have two towns near one another: the lower town, where the chief lives, is called Nitchera, and the other is called Towahach. Their present chief is named the Great Bear. They are at war with the Spaniards, but friendly to those French and American hunters who have lately been among them, according to the statement of Mr. Jefferson in the year 1806. They are likewise at war with the Ofages, as is every other nation. For many hundreds of miles round them, the country is a rich prairie, covered with luxuriant grasses, which is green summer and winter, with skirts of wood on the river bank, by the springs and creeks. They have many horses and mules. They raise more corn, pumpkins, beans and tobacco than they want for their own consumption, so that some of these commodities furnish articles of trade. They have but few guns, and very little ammunition, which they keep for war, and hunt with the bow. Their meat is principally bufalo, and they seldom kill a deer, though plentiful. They have also elk, bears, wolves, antelopes, and wild hogs in abundance, and white rabbits and hares, as well as the common rabbits. The men are generally altogether naked, and the women nearly so, with the exception of a small flap of a piece of skin. They have many Spaniards among them, taken from the settlement of Santa Fe, when they were children. Their language differs from that of every other nation, the Towakanoses excepted. Mr. Jefferson states the number of men at about 400; a great number of them having been swept away, about four years before, by the small-pox.

TOWING-PATH, the road or path which is formed along on the borders of navigable rivers and canals, for the purpose of drawing different sorts of materials for farm and other uses, in some kind of small vessels, on them, either by men or horses. (See E.C, fig. 16. Plate 1. Canals, and fig. 40. Plate V.) These paths constitute one of the great improvements in this fort of navigation, by removing the inconvenience and difficulty afforded by the mode of hauling the barges by means of men instead of horses, where they are formed with that intention.

In speaking of the inland navigation of the river Severn, and the county, in the Shropshire agricultural report, Mr. Telford observes, that with regard to adopting the mode of hauling barges by means of horses, instead of the present barbarous and expensive custom of performing this flave-like office by men, it is only necessary that a good towing-path for horses should be formed along the banks of the river, and which will no doubt take place, if any scheme of general
ival improvements should ever be adopted. That in the mean time, a laudable example has been shewn by Mr. W. Reynolds, of Ketley, who has formed a towning-path for horses near to the new manufacturies at Coalport, and has carried it on through his father’s property to the iron bridge, a distance of about two miles: this being along some rugged banks, and over some of the worst fords which are on the river, proves, beyond contradiction, it is thought, that this fort of towning-path is practicable at no very extravagant expense, and besides, that it completely destroys the common objection of horse towning-paths where many rapid or fordous interludes.

In constructing all sorts of towning-paths, they should be formed as much on the level as possible, and be well and firmly laid with some convenient fort of hard materials.

Where they are for men or small animals, they need not be of such breadths or depths of hard fubstances, as where large and many horses are in use. In carrying them over fords or runs of water, an experienced workman will molly be necessary.

**TOWING-Path Wall.** A wall under the bridges, A B C D, (Plate V. Canals, fig. 42.) for keeping up the towning-path. **TOWLGAW, in Geography.** A town of Hindooftan, in Dowlatabad; 6 miles W. of Tooliapour.

**TOWN,** a place inhabited by a considerable number of people, of an intermediate magnitude and degree between a city and a village, &c.

It is hard to give a tolerable definition of a town, because the idea is a little arbitrary and unfixed. A town is generally without walls, which is the character which usually distinguishes it from a city; but this does not hold universally.

Tithings, towns, and villages, have the same signification in law; and are said to have had, each of them, originally a church, and celebration of divine service, facraments, and burials; though that seems to be rather an ecclesiastical than a civil distinction. The word town or vill is, indeed, by the alteration of times and language, now become a general term, comprehending under it the several species of cities, boroughs, and common towns. A city is a town incorporated, which is or hath been the seat of a bishop: a borough is now understood to be a town, either corporate or not, that sends burgesses to parliament: other towns there are, to the number, according to Sir Edward Coke, of 8803, which are neither cities nor boroughs; some of which have the privileges of markets, and others not; but both are equally towns in law. To several of these towns there are small appendages belonging, called hamlets.

Entire vill, for H. Spelman conjectures, confounded of ten freemen, or frank-pledges, demi-villas of five, and hamlets of less than five. These little collections of houses are sometimes under the same administration as the town itself, sometimes governed by separate officers; in which last case they are, to some purposes in law, looked upon as distinct townships. These towns contained each originally but one parish and one tithing, though many of them now, by the incresce of inhabitants, are divided into several parishes and tithings; and sometimes there is but one parish where there are two or more vills or tithings. Blackfri. Com. b. 1.

We have several kinds of towns; borough-towns, market-towns, county-towns, &c. See Borough, &c.

**Town, Freedom of a.** See Freedom.

**Town, Hanse.** See Hanse.

**Town-Clerk, or Common Clerk,** an officer in the city of London, who keeps the original charters of the city, the books, rolls, and other records, wherein are registered the acts and proceedings of the city. He is to attend the lord mayor and aldermen at their courts.

**Town-Dung or Manure, in Agriculture,** that fort which is scraped up and collected from the streets and other places of large towns. This kind of manure is used in large quantities in some districts near the metropolis, as in Efllex and some others, with great success and advantage, though at very considerable expense. Mr. Hardy, near Bradford, in the above county, uses to the amount, it is said, of one waggon-load to every acre of summer fallow, at the expense, for the charge of the dung or manure only, of one guinea per acre: it is then mixed with his own yard-dung in heaps for the purpose of exciting fermentation, from a notion that it has this effect, and that having it, the benefit will be in proportion. In several other parts of the same district, the usual mode of measuring per acre, is one waggon-load of town-muck with about five times the quantity of fresh soil collected from road-sides and hedge-greens.

**Town-House.** See House.

**Town-Adjutant, in Military Language,** is an afliant to the town-major.

**Town-Major.** See Major.

**Town, Cape, in Geography,** a town agreeably situated somewhat above 32 miles from the Cape of Good Hope, in a valley, between the Table and Lion mountains. It contains about 200 houses, many of which are magnificently built.

**TOWSEND,** a town of the state of Massachusetts; 36 miles N.W. of Boston.

**TOWNSHEND,** a township of the state of Vermont, in the county of Windham, containing 1115 inhabitants; 25 miles S. of Windfor.

**TOWNSHEND, Cape,** a cape on the N.E. coast of New Holland. S. lat. 22° 13'. W. long. 209° 43'. See also VERMILLION Point.

**TOWPAAL,** a town of Meckley; 12 miles S.E. of Munnypour.

**TOWRIDGE,** a river of England, which passes by Biddeford, and joins the Taw near Appledore, in Devonshire.

**TOWY,** a river of Wales, which rises in the county of Cardigan, and runs into the bay of Caermarthan, 6 miles below Caermarthan.

**TOWYN,** or TYWYN, a small town in the hundred of Yfamaner, and county of Merioneth, North Wales, is 12 miles W. by S. from Machynlleth, and 223 miles W.N.W. from London. It is built of coarse fihilote stone, commands an unbounded view of the ocean, and is backed by a range of high mountains. During the bathing season, it is frequented by several genteel families. The town is surrounded by several populous hamlets, and respendable farmhouses. In the population return of the year 1811, the parish is stated to contain 1941 inhabitants, occupying 482 houses. Though the soil is rocky, and exposed to the influence of the western gales, yet industry has surmounted these obstacles; the marsh is converted into meadows and pastures; and corn overfloods the sterile rock and bleak shore. The church contains several ancient monuments. Gwendidydd, daughter of Brychan, and wife of Cadell, prince of Powys, about the middle of the fifth century, was buried here. In the cemetery are two rude pillars: one of them, called St. Cadfan’s stone, is shaped like a wedge, about seven feet in height, with a cross, and an inscription on each side in old British characters. St. Cadfan is supposed to have been interred in this church about the year
250; and this stone is preferred as a fragment of his tomb.

About a mile north-east of Towyn is Ynys Mac Gwn, the seat of Edward Corbet, esq.

In the vicinity of the town is a vast rock, called Craig-y-Dryn, or the Rock of Birds, so called from the numbers of cormorants, rock-pigeons, and hawks which breed on it. At its verge is a prodigious mass or stream of stones, which extends some hundreds of yards from the bottom of the rock, and is formed by the continual accumulation of fragments. The vale of Towyn extends two miles further. Near its end is a long and high rock, narrow on the top. Here stood the castle of Teberri, which extended lengthways over the whole surface of the summit, and was a fort of great strength. One apartment was thirty-six feet broad, and was cut out of the rock on two sides. The remaining walls are well built: the stones squared; the mortar, shells, and gravel are at present very rotten.—Pennant's Tour through Wales, 4to. 1783. Beauties of England and Wales, vol. xxvi. North Wales, by the Rev. J. Evans.

TOWYNMYN, a river of Wales, in the county of Montgomery, which runs into the Dowy, 5 miles N.E. of Machynlleth.

TOXANDRI, in Ancient Geography, the name of a people beyond the Scelds; or beyond the limits of Belgium, according to Pliny. The centre of their posessions is said to have been in the environs of Maefricht. In the time of Julian the Franks had an establishment in a place called by Ammianus Marcellinus "Toxandria Locus."

TOXICODENDRUM, in Botany, from τόξον, poison, and δένδρον, a tree, because the fruit is used at the Cape of Good Hope to poison hyenas. The same name has been employed in botany before, particularly for some very poisonous shrubs, reduced by Linnaeus to Rhus; see that article.—Thunb. in Stockh. Transf. for 1796, 188. Wildl. Sp. Pl. v. 4. 821. (Hyænanchè; Correa in Lambert's Cinnon. 52. Ait. Hort. Kew. v. 5. 422.)—Clas. and order, Diosc. Polyandra. Nat. Ord. Tricoce, Linn. Enphorbe, Jull.

Gen. Ch. Male. Cal. Perianth of from five to seven small, ovate, acute, hairy leaves. Cor. none. Stam. Filaments from ten to twenty, very short, crowded together at the base; anthers oval, of two cells, separated by a furrow at each fide.

Female. Cal. Perianth inferior, of seven or eight ovate, acute, erect, imbricated silky leaves, deciduous. Cor. none. Pfl. Germen superior, sessile, ovate; stye solitary, the length of the germen, triangular, cloven at the top; stigmas three, oblong, reflexed, fringed, glandular. Peric. Capsule coated, nearly globular, three lobed, three-celled, with five furrows and five valves. Seeds two in each cell, obonate, compressed, smooth, with a lateral tumid scar.

Obi. The stigmas, and cells of the fruit, often vary to four.

1. T. capense. Hyæna Poisin. Thunb. as above, 189. t. 7. Willd. n. 1. (Hyænanchæ globofa; Lamb. as above, t. 10. Jatropa globofa; Guett. t. 109. Croton; Burm. Afric. 122. t. 45.)—Found about two hundred miles from the Cape of Good Hope, in a rocky soil, on a single spot, on Wind-Eock mountains, near Elephant’s river. It was introduced into the green-house at Kew, by Mr. Francis Mafflon, in 1783, and it blossoms there from April to September, as well as in the earl of Tankettle’s collection. Mr. Lambert was informed by Mr. Mafflon, that a farmer who lived near the native place of this shrub, gained about 30l. a year by gathering the fruit, which, being beaten to powder, is used to poison the carcasses of lambs, &c. By feeding on these, the hyænas are infallibly destroyed. This is a shrub, or small tree, fix or seven feet high, with spreading branches, which appear jointed, from the scars where the footstalks have been incised. Leaves three or four in a whorl, flaked, spreading, about three inches in length, obvate or oblong, entire, emarginate, coriaceous, simple, opeque, with one red rib, and many branching lateral veins. Footstalks thick, channelled, about half an inch long. Male flowers in axillary, branched, yellowish panicles, shorter than the leaves; female ones on a separate plant, in simple, axillary, green tufts. Fruit smooth, about the size and shape of a Hickory-nut.

It has been debated between Mr. Miller and Mr. Ellis, whether our poison-ash, or winged-leaf American toxicondron, be the true Japan varnish-tree: Mr. Miller maintains the affirmative, and Mr. Ellis the negative: for the arguments on both sides, see Phil. Transf. vol. xlix. p. 866. vol. i. p. 430. p. 441. See VARNISH.

TOXICUM, τόξον, a word particularly used to express a port of poison, said to be used by the Indians to their arrows, in order to render wounds made by them incurable.

The word, in a more general sense, signifies any poison.

The Indians are suppos’d to poison their arrows, daggers, &c. with the virus of vipers, the mischievous effects of which continue a long time after the matter is quite dried up.

TOXICUS, in Botany, a name by which some authors have called the arundo farlha, of which walking-canes are made.

TOXILIS, TAxil, or Taxile, in Ancient Geography, a people of India, in the number of those who inhabited territories near the rivers Copes, Indus, Hyaudaps and Afini.

TOXOTAE, τόξον, among the Athenians, bowmen, a fort of inferior officers, or rather servants, who attended the lexicarch.

They were much like the Roman lectores: there were a thousand of them in the city of Athens, that lived in tents, erected first in the forum and afterwards in the areopagus. See LEXIARCH.

TOZER, in Geography, a town of Africa, in the country of Sahara; 50 miles S.S.W. of Gafsa. N. lat. 33° 30’ E. long. 8° 15’.

TOZZETTIA, in Botany, was so called by professor Savio of Pisa, in honour of his learned friend Dr. Octavian Targioni Tozzeti, the present possessor of the library and manuscripts of the celebrated Michelia, at Florence, and son of the botanist after whom Targonia was named, who afterwards took the name of Tozzetti; see the articles just indicated. Savio in Utr. Annal. v. 24. 50.—Unfortunately the plant thus denominated is a genuine species of Alopecurus; as professor Schayer has made it, in Fl. Germ. v. 1. 174; and as the writer of the present article has long ago shewn, in Tr. of Linn. Soc. v. 7. 245, as well as in Prod. Fl. Græc. v. 1. 437; that it is only the Phalaris urticulata of Linnaeus, but likewise his Cernuca alopecuroidea. We find it difficult to account for the mistake of Linnaeus in referring this graft to Phalaris, of which genus it has neither the habit nor characters.

TOZZI, ANTONIO, in Biography, a member of the Philharmonic society at Bologna, where he was born, and where he was a disciple of Padre Martini. In 1765 he was appointed
TOZZIA, in Botany, received its name from Micheli, in honour of the reverend father Bruno Tozzi, abbot of Vallumbrofa, who found this rare and curious plant, on the alpine heights of Tuscany, above the celebrated and romantic solitude, where his abbey is situated. This learned ecclesiastic, unlike many of his monkish brethren, delighted to adorn his Creator through his works, and was the cheerful and welcome companion of Micheli, in many of his botanical excursions, over the Italian Alps, as well as along the shores of the Mediterranean. He was a fellow of the Royal Society of London, and of the Botanical Society of France. A number of figures of rare Tuscan Orchideæ, drawn by him, may be seen in Petiver's Works, vol. i. t. 128.—Linn. Gen. 306. Schreb. 403. Willd. Sp. Pl. v. 3. 202. Mart. Mill. Dict. v. 4. Mich. Gen. 19. t. 16. Julf. 97. Lamarck Illutr. t. 522.—Clafs and order, Di dynamia Angioferma. Nat. Ord. Persfont, Linn. Ly fimachis affinis, Jull.

Gen. Ch. Cal. Perianth inferior, of one leaf, tubular, very short, five-toothed, permanent. Cor. of one petal, ringent; tube cylindrical, longer than the calyx; limb spreading; its upper lip in two, lower in three, segments, all nearly equal and roundish. Stam. Filaments four, concealed beneath the upper lip, unequal; anthers roundish, of two lobes, each with a furrow at the base. Petil. Germen superior, ovate; style thread-shaped, agreeing with the filaments in length and situation; stigma capitulate. Perf. Capsule globoso, of one cell and two valves. Seed solitary, ovate.

Obf. Surely the affinity of this genus to Euphorbiæ, Lathraea, &c. is apparently, even without the character of the spurred anthers, indicated by Jacquin. The fruit, which in this tribe affords such admirable distinctions, is here peculiarly marked, Melampyrum alone approaching it, by the fewness, size, and shape of its seeds. Venusia is erroneously described by Linnaeus, with a single-valved capsule. We would premise to remove this genus to the Pedi:carves of Jullien.

1. T. alpina. Alpine Tozzià. Linn. Sp. Pl. 844. Willd. n. 1. Savii Enr. v. 2. 164. Jacq. Aenr. t. 165. (T. alpina lutea, alines folio, radicis squamatâ; Mich. Gen. 20. t. 16. Euphorbia lutea alinefolia, radicis squamatâ; Bauh. Pin. 234. Prodr. 1. 111. Aonyma fratis Gregorii, radice dentarie; Column. Echpr. v. 2. 49. t. 50. Dentaria buguloides, &c.; Montz. Pugil. t. 9. f. 5. 3.)—Native of moist rocky alpine places, in Austria, Switzerland, Dauphinie, Italy, and the Pyrenees, flowering in May. Mentzelius gives an interesting account of his gathering it among the melting snows, on a lofty precipitous mountain, near the source of the Iser, in 1654. The perennial root consists of numerous, fleshy, imbricated scales, and bears a solitary, herbaceous, erect, branched, square, juicy stem, about a foot high, slightly downy at the angles only. Leaves opposite, fleshy, ovate, ribbed, succulent, smooth, thinly but coarsely notched, an inch long at most; the numerous floral ones much smaller. Flowers axillary, solitary, on simple slender stalks, shorter than the leaves, bright yellow, a little drooping, perfectly two-lipped, and rather more irregular than Micheli represents them. Calyx oblique, smooth, brownish. We know of no attempt to cultivate this plant, nor would it perhaps be possible.

TRAABURG, in Geography. See DRAABURG.

TRAARBACH, a town of France, in the department of the Sarre. Its neighbourhood is a fine wine country. Opposite the town, on the other side of the Mofelle, France, after the treaty of Nimyeguen, erected a fort, called Mont Royal; but the demolition of it was made an article of the peace of Rywick; 34 miles S.W. of Coblenz. N. lat. 50° 51'. E. long. 7° 31'.

TRABAY, a river of Spain, in the province of Grenada, which runs into the sea near Muskara.

TRABEATION, TRABEATIO, in the Antique Architecture, the name with entablature; which see.

TRABENKA, in Geography, a town of Sweden, in the island of Aland.

TRABIA, a town of Sicily, in the valley of Mazara; 2 miles W. of Termini.

TRABUNACTUM, in Ancient Geography, a town of Africa Propria, on the route from Tacape to Leptis Major, between Adagumadun and Tramulduis. Anton. Itin.

TRACANA, a town in the interior of European Sar- mania, in the vicinity of the river Carcineïtes. Ptolemy.

TRACE, a mark or impression which any thing leaves behind it in passing over another.

Traces of the Brain, among the Cartesian philosophers, are those impressions, more or less deep, which, they say, sensible objects make on the fine fibres of the brain, by means of the organs of sense.

These impressions are also called traces of the object; the course of the animal spirits, they say, serves to keep them up, and to renew them.

The vivacity of the imagination, they say, arises from the prodigious quantity of traces of different objects in the brain; which are so linked together, that the spirits cannot be sent into one of them, but they run into all the rest; by which means the ideas occasioned by the application of the spirits to those several traces, are all excited, as it were, at once.

Memory, according to the same, consists in the traces which the animal spirits have impressed.

Trace of a Hare, among Hunters, is her footing in the snow; distinct from other readings, called doubling and pricking, &c.

Traces also denote the traces of ravenous beasts, as wolves, wild beasts, &c.

Traces, Lady's, in Botany. See Ophrys.

Trachea, in Ancient Geography, a name which Ovid gives to Axur.

Trachea, in Anatomy, the wind-pipe, (from ῥαχιάνς ῥας, a rough tube containing air, (rough from its cartilaginous rings), whence the Latin nare arteria. It is the tube conveying air into the lungs, and commencing at the root of the tongue. See Lungs.

Tracheae, Wounds of. See WOUNDS.

Tracheae, in Vegetable Physiology, is the appellation given by Malpighi, Grew, &c. to the large spiral-coated vesicles of plants; which, being generally found filled with air only, are likewise termed air-vesels. The discoveries of Dr. Darwin, Mr. Knight, and others, have shown them rather to be sap-vesels, and that the empty state in which they are usually found, is owing to their contents having been expelled on diffusion, by the elasticity and irritability of their coats. Such is known to be the fact with regard to the arteries of animals. We have explained the nature of these vesels, and their functions, under the articles Circula-
Circulation of Sap, Leaf, and Spiral Vessels, the latter being now their most usual denomination. It is preferable to any of the above, as not involving any theoretical opinion.

TRACHEAL ARTERY, in Anatomy, a branch of the right subclavian, running up from it in a winding course, along the afferent artery, to the glanulose thyroides and larynx, depositing small arteries to both sides; one of which runs to the upper part of the caputula. The tracheal artery may likewise be called gularis inferior. See Artery, and Lungs.

TRACHELAGRA, formed of θαξιων, neck, and φυτεύς, flax, a term used by some medical writers to express the gostr in the neck.

TRACHELUM, in Botany, is not derived, as De Theis supposed, from ταξιων, rough, however applicable that sense may be to the plants to which the name was originally applied, our larger Campanula. The word comes from ταξιων, the neck, being synonymous with the Latin Cervicaria, and the English Throatwort. Old writers tell us, the plants so denominated were believed to be useful in complaints of the neck, or throat; whence also originated another of their synonyms, Uvularia. Tournefort, alluding to these reputed virtues, derives the above name from trachea arsissa, or afferent arteria, the wind-pipe, which is certainly not its real source. Being superfluous as a synonym to Campanula, he, as well as Linnaeus, retain Trachelium for a neighbouring genus, distinguished by the long tube, or neck, of its corolla.—Linn. Gen. 89. Schreb. 119. Willd. Sp. Pl. v. 1. 926. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 1, 355. Thunb. Prodr. 38. Jaff. 165. Tourn. t. 50. Lamarck Ill. t. 125. Gaertn. t. 31. Claus and order, Pentandria Monogynia. Nat. Ord. Campanaceae. Linn. Campanulae, Jaff.

Gen. Ch. Call. Perianth superior, very small, in five deep segments, permanent. Cor. of one petal, funnel-shaped; tube cylindrical, very long and slender; limb small, spreading, in five deep, ovate, concave segments. Stam. Filaments five, capillary, nearly the length of the corolla; anthers simple, oblong. Pjfl. German inferior, roundish, with three angles; style thread-like, twice as long as the corolla, rather swelling upward: stigma capitate, globose, slightly three-lobed. Peric. Capsule roundish, bluntly three-lobed angular, of three cells, burbling by pores at the base. Seeds numerous, minute.

Obs. Linnaeus himself corrected in his Systena Nature the error in his Genera, of the single-celled capsule. The remark subjoined in the last-mentioned work, of some bilocular species, properly belongs to the preceding genus, Phytonia.

1. T. cæruleum. Blue Throatwort. Linn. Sp. Pl. 243. Suppl. 143. Willd. n. 1. Ait. n. 1. (Trachelis azuro umbellifera; Pon. Bald. 44. Valeriana cærulea, urtica folio; Barr. t. 683, 684.)—Leaves ovate, serrated. Corymb compound. Native of shady shady places, in Italy, Spain, and Barbary. Frequent on the ancient walls of Rome, flowering in the spring and summer. It may be kept for many years with us in a greenhouse, though usually considered as a hardy biennial. The root is tapering, white, with many fibres. Herbage smooth, dark green, about two feet high. Stem roundish, often branched, leafy. Leaves alternate, ovate, acute, veiny, an inch or two long, and full half as broad, sharp, and sometimes very deeply, serrated. Feetfalls linear; the upper ones half the length of the leaves; lower longer. Flowers very numerous, of a fine blue, in a terminal, coriaceous, level-topped tuft, or panicel, with awl-shaped bracteas, in aspect, though not in colour, resembling a Valerian.

2. T. diffusa. Slender Shrubby Throatwort. Linn. Suppl. 143. Willd. n. 2. Thunb. Prodr. 38. Leaves awl-shaped, erect. Stem panicled, with divaricated branches. Found by Thunberg, at the Cape of Good Hope. Mr. Monf. sent it in 1787 to Kew, where it is a green-pale, flowering in August. Stem a foot or more in height, woolly, much branched in the lower part, the branches erect, straight, round, leafy, smooth, or very minutely downy. Leaves spinous, slender, an inch long, very narrow, revolute, entire, sharp-pointed, nearly or quite smooth. Flowers blue, with a pale tube, small, solitary at the ends of the numerous, widely spreading or deflexed, branches of the flender, rigid, smooth panicul.

3. T. tenuifolium. Slender Fringed Throatwort. Linn. Suppl. 143. Willd. n. 3. Thunb. Prodr. 38. Leaves linear, flat, recurved, fringed. Stem branched. Flowers lateral.—Brought by Thunberg likewise from the Cape, but as yet a stranger to our gardens. The long wooly root bears a bushy wooly stem, a few inches high, divided from the bottom into many branches, clothed with crowded, narrow, recurved, sharp-pointed leaves, half an inch long; strongly fringed at the margin; flat above; keeled beneath; often somewhat downy. Flowers numerous, axillary, solitary, feathery, slender, apparently white or yellowish, except the tips of the corolla. We must rely on the authors cited for the determination of the genus. The style does not project out of the flower. The germen is inferior.

TRACHELUM, in Gardening, contains a hardy herbaceous plant of the perennial kind, of which the species cultivated is the blue throatwort (T. cæruleum). It is a plant that is perennial in its nature, being very lasting in soils which are dry and not of a rich quality, but not to in the contrary fort.

Method of Culture.—It is raised from seeds, which should be sown in the autumn when well ripened, or in the spring, in a bed or border of close mould. And when the plants are two or three inches in height, they should be set out in narrow rows six inches apart, to remain till the following autumn, when they should be planted out where they are to remain.

These are flowering perennials which may have their seeds sown in the crevices of old walls, ruins, and rockworks with much effect and advantage, as the plants contain several years, and display many flowers.

They afford ornament in the above sort of works, and other situations where the earth is poor.

TRACHELO-MASTOIDEUS, in Anatomy, complexus minor; a small narrow muscle, situated at the posterior and lateral part of the neck, and extending from the mafloid process to the transverse process of the vertebrae. B-hind, it is covered by the splenius, and the transversalis coli, to which it is connected: in front, it covers the complexus, the obliqui capitis, the posterior extremity of the digastricus, and the occipital artery. Its inner edge is close to the complexus, and is sometimes united by a muscular flip to the longissimus dor. The outer edge is fixed by small tendinous and fibrous slips to the transverse processes of the four last cervical vertebrae; and is unattached above. The inferior extremity of the tracheo-mastoideus is slender and pointed, and fixed to the transverse process of the seventh cervical vertebra, or sometimes of the first dorsal; thence it ascends perpendicularly, growing thicker and broader to its upper end, which is fixed to the back of the mafloid processes in front of the splenius. It is attache to the
the vertebral processes by small tendons, which produce muscular slips united in the body of the muscle; a flattened tendon is the medium of infection in the head. When the right and left muscle act together, they restore the head, after it has been bent forwards, and they carry it backwards. The muscle of one side inclines the head and neck laterally.

**TRACHELOPHYMA**, a swelling of the thyroid gland. See Bronchocele, and Thyroid Gland.

**TRACHELOS**, a word used by some anatomical authors to express the neck.

**TRACHENBERG, or Drachenberg, in Geography**, a principality of Silecia, bounded on the N. by Poland, on the E. and S. by the principality of Oels, and on the W. by Wohla. It was formerly a part of Oels, but erected into a distinct principality, in the year 1741, by the king of Prussia, in favour of the count of Hazfeld and Gleichen, who was made a prince of the empire, by the emperor Francis, in 1748.

**TRACHENBERG, or Straburke, a town of Silecia, and capital of the principality of the same name**; 14 miles W.S.W. of Milititsch. N. lat. 51° 28'. E. long. 16° 50'.

**TRACHEOCELE**, an enlargement of the thyroid gland. See Bronchocele, and Thyroid Gland.

**TRACHEOTOMY, (from τράχηις, the wind-pipe, and τομή, to cut,) in Surgery**, denotes the operation of making an opening into the wind-pipe.

When a foreign body has entered the trachea, the only means of relief consists in making a longitudinal incision through the skin and cellular substance of the neck, in order to expose the wind-pipe, and let it open in the same direction. Several of the old practitioners conceived the propriety of this operation, which Junigers, in his "Conspexitii Medicina Chirurgica," preferred in the most positive terms.

How, indeed, would it be otherwise possible to put an end to the suffocation and convulsive cough, which the extraneous substance produces? Few practitioners, however, have ventured to do the operation. In the year 1650, the performance of it was recommended by Bonnet, upon a child seven years of age, who, in eating some rice-foup, swallowed a small bone, which passed into the trachea. The young patient pointed out with his finger the place where the foreign body had stopped, and which was exactly opposite the middle of the throat. A physician, who was consulted, gave it as his opinion, that the operation was improper, either because he was not convinced of the presence of the bone in the trachea, or because he thought that it could not be taken out without exposing the child to a certain death.

At the end of five days the boy died, and the trachea having been opened, the extraneous substance was taken out of it with the greatest ease. Raw and Heiler also successfully extracted foreign bodies from the trachea; the former, a piece of mushroom, which had been swallowed with some foup; the latter, a bean, which had fallen into the wind-pipe.

Louis was not equally fortunate, in a cafe where the operation would have infallibly saved the patient's life. A child seven years old, like that of Bonnet, was amusing herself with throwing up small dry beans, and catching them in her mouth. She supp ted the she had swallowed one of them; but was instantly seized with a difficulty of breathing, and a most fatiguing convulsive cough. It was assessed that the bean had lodged in the throat, and every thing was tried, which was thought to be likely to make it descend into the stomach, or cause it to be ejected from the mouth. The symptoms, however, recurring from time to time, with the addition of convulsions of the limbs. The cafe had gone on in this manner two days, when Louis was consulted. He found the child sitting up in bed, leaning upon her two arms, and breathing with difficulty. When he asked her where she felt any thing the matter, she placed her left fore-finger upon the trachea, betwixt the larynx and the sternum. The consideration of the various circumstances of the case made him conclude, that the bean had passed into the wind-pipe, and that the practice of bronchotomy was indispensible necessary for its extraction. Others, who were called into consultation, entertained a different sentiment. M. Louis could not bring them over to his opinion. The opposition which they made increased heavily, as the child appeared for a time a little better. But at length a new symptom occurred, which no one had yet observed, and which two hours previously did not exist. The child was evidently affected with an emphysematous swelling on each side of the neck above the clavicle. She took an emetic, which only had the effect of disturbing her. The third day she seemed more tranquil, though her respiration was always difficult. In the evening she died. When the trachea was opened, the bean was seen lodged at the upper part of this tube, whence it admitted of being most easily extracted with a pair of forceps.

The long intervals of cafe which the patient had, contributed particularly to throw doubts on the presence of the extraneous body in the trachea. It was supposed, that it would necessarily have kept up there a continual irritation, which could not have allowed of the alternations of suffering and cafe which took place. But the fact is, the body was smooth, and it had defended below the glottis, the feasibility of which is doubleless greater than that of the trachea, to that it only produced urgent symptoms, when it was forced by the action of respiration against the lower part of the glottis, whose ligaments it hurt, and whose aperture it closed in such a manner, that the air was no longer capable of passing through it with its wonted freedom. It is to this cafe that the emphysema, which has been spoken of, must be imputed; for the air being urged back into the lungs, must have ruptured some of the bronchial cells, inflating itself into the cellular texture of this viscus, and extending from below upward to the lower part of the neck, the integuments of which were elevated by it.

This symptom is truly pathognomonic. It was also imagined, that if the extraneous substance had been in the trachea, it would have cau ed more quickly a fatal suffocation; but there are many cafes on record, proving that patients have survived the accident a long while. It is possible the child, and another mentioned by Marcellus Donatus, did not die until the fifth day. The only symptom which the last experienced, was a flight cough, with a little irritation. The cough which occurred before death was attended with efforts, in which the child turned livid, as if it had been strangled with a rope. Other children also, who have swallowed beans, and whose cafes are related by Louis, died; one on the eighth or ninth day after the accident; the other at the end of three weeks, and after having in the interim followed the ameliorations of their age.

Perhaps it may be apprehended, that a foreign body, after its entrance into the trachea, will defend by its weight to the bottom of this tube; or, that after the proper measures are made, its extraction will be attended with too much difficulty; but to these two objections, experience gives the most decisive answer. In almost all cafes of this sort, the foreign body has been found opposite that part of the trachea which would have been opened, if tracheotomy had been performed; and the experiments relating to this operation which have been made upon living animals, for the
TRACHEOTOMY.

purpose of judging of the facility or difficulty of extracting foreign bodies from the trachea, have shewn, not only that they remain at the upper part of the trachea, (whither they are forced by the air which endeavours to find a way out from the lungs,) but that they even of themselves come out of this tube, and are thrown out to a distance by the same cause, immediately a sufficient opening for their escape has been practised by the surgeon. We are indebted for such experiments to M. Favier, then a student in surgery at the Hotel des Invalides, and since member of the college of surgery at Paris. A large dog, which was muzzled, had an incision made under his jaw, capacious enough to let the tongue be drawn out through it. M. Favier took an opportunity, when the animal was in the act of inspiration, of introducing into the glottis an extraneous substance of an irregularly spherical shape. The dog was feized with convulsive motions, which gave reason for apprehending immediate suffocation; but symptoms abated sufficiently, to allow the operation of tracheotomy to be deferred six hours. The wind-pipe was then opened by a longitudinal incision, which divided three of its cartilaginous rings. Scarcely was the bifurcous withdrawn, when a strong expiration propelled the foreign body out of the wound; and as soon as it was a second time introduced, it was expelled again.

The experiment was repeated ten times with the same result. M. Sabatier informs us, that he had seen M. Favier introduce into the wind-pipes of other dogs, extraneous substances of every description and figure, and amongst other things nails and small leaden balls. These were even pushed very far down with instruments; but notwithstanding this, they were thrown out with force as soon as they were left to themselves.

The difficulty of finding and extracting foreign bodies which are lodged in the trachea, must therefore be no longer urged as a pretext for omitting the performance of tracheotomy in all cases in which there is imminent danger of suffocation, in consequence of the presence of those bodies. If, after the integuments and trachea have been divided, they should neither make their escape nor present themselves at the opening, the surgeon should at once endeavour to find them with a pair of forceps, or any other instrument calculated to facilitate their extraction. All that now remains to be done, is to compress the wound in the most simple manner, and to promote its cicatrisation by the usual means. The operation which we have been speaking of, may be successfully resorted to in some other cases. When the function of respiration is materially impeded in inflammatory quinsies, or by the preffure which a foreign body in the esophagus makes on the trachea, and which foreign body cannot possibly be extracted, nor pushed down into the stomach, the patient's life may be saved by making an opening into the trachea or larynx. The necessity for such an operation was recognized in the very infancy of the art. With the same view, Hippocrates advised the introduction of a tube into the throat. This bad practice prevailed until Aesclepiades, who propofed the method of making an incision into the larynx of patients who were in danger of suffocation. This operation, however, met with opposition. Calibus Aurelianus considered it as fabulous and absurd. But it met with advocates in several other skilful practitioners, such as Antius, Orbisius, Ælius, and especially Paulus Ægineta, who defendes it in the following terms.

"The incision must be made into the trachea, under the larynx, about the third or fourth ring. This situation is the most proper, because it is not covered with flesh, and the vessels are not near it. The patient's head is to be carried backward, so that the wind-pipe may project more forward. We make a transverse section between two rings, so that the cartilages may not be wounded, but only the membrane which joins them together."

The Arabians, who succeeded the Greeks, were also advocates for tracheotomy. It does not appear, however, that they often practised the operation, on account of the dangers by which they supposed it was liable to be followed. Since the revival of learning, the possibility of doing it has been more generally admitted. The subfrequent frequent examples of wounds of the throat, where the trachea has likewise been divided, have now produced a conviction, that this canal may be successfully opened in such cases as require it. Fabricius ab Aquapendente was the first who propofed the operation in strong terms. He judiciously examined and considered every part of it, and was fully aware of its advantages. The cannula which has been employed for placing in the opening made in the wind-pipe, seems to have been invented by him. He recommends it to be introduced between two of the rings; to have a flat shape; and to be furnished with wings, by means of which it may be fastened in its place. Its length should not be great, lest it should reach too far, and hurt the back part of the wind-pipe. Laily; Fabricius advises it to be worn only during the impediment to respiration, since as a foreign body it may do harm, and cause pain and coughing.

Cafferius, his pupil, also carefully treats of bronchotomy. He describes the manner of performing it. By the first incision, the skin is to be opened longitudinally over the trachea. By the second, which is to be made betwixt the mucus going up to the larynx, the wind-pipe itself is to be brought into view. A transverse opening is then to be made in it below the thyroid gland. Morgagni gives much credit to this author for having first noticed this gland, which in its enlarged state may materially increase the difficulty of the operation. Cafferius approves of the cannula recommended by Fabricius, which he thinks ought to be made of silver, of a flat form, curved, every where pierced with small holes, and fastened to the neck with a ribband. He was quite apprized of all the inconveniences, which Fabricius points out as being liable to attend the employment of this instrument.

While these two skilful practitioners professed themselves to be in favour of bronchotomy in cases where the necessity for it exists, a French surgeon, M. Habicot, endeavoured to bring the operation into repute. The treatise which he has publifhed upon this subject, is entitled, "Quelion Chirurgicale, par laquelle il eit demontre que le Chirurgien doit affurer son pratiquer l'Operation de la Bronchotomie, vulgairement dite Laryngotomie, ou Perforation de la Flinte, ou Thyro." This treatise made its appearance in 1620. Besides the reasons upon which this author supports his observations, he relates several cases in which bronchotomy faved the patients' lives. The first is that of a young girl, who was shot in the throat. The ball, after having broken the larynx, and particularly the left side of the thyroid cartilage, made its exit below the inferior angle of the scapula. So considerale a degree of swelling followed, that the patient was almost suffocated. Habicot introduced into the trachea a leaden tube, which was worn three weeks, until the inflammation had subsided. The patient got well.

The second perfon upon whom he performed tracheotomy, was a young man, who had received twenty-two wounds in the head, face, throat, hands, arms, chest, back, yard, and thighs. These were done with a sword, knife, and pen-knife. In the evening of the same day, Habicot perceived that the patient was nearly suffocated in consequence of the inflammation and swelling of the throat. He was therefore determined
TRACHEOTOMY.

terminated to make an opening in the trachea, below the wound, opposite the upper part of the larynx. The respiration was immediately effablified again, and the wound was kept open with a groove; and until the tumefaction of the larynx was diminished. The cure was complete in three months. M. Louis was of opinion, that, in these two cases, the cannula only served to keep the lips of the wound in the skin apart, because, in the first, the thyroid cartilage was broken so extensively, that it could hardly be supposed to form an obstacle to the passage of the air; and because, in the second, the wound of the trachea had allowed the air to enter and come out again with ease, without the assistance of any tube.

We find in Habicot's effay a third instance in which tracheotomy was successfully performed. 'A lad, fourteen years of age, who had heard that, when swollowed, did no harm, having fold some merchandise at Paris, for which he had received about nine francs, wrapped them up in a piece of cloth and swallowed them, for fear of being robbed. But as they could not pass through the narrow part of the pharynx or oesophagus, his face became so frightful and deformed with swelling and blackness, that his companions could not recollect him. Hence, having caused him to be brought to my house, and not being able to make him void, nor get the obstacle into his stomach, so closely was it fixed by the swelling of the throat; and considering that he would be suffocated, I first made a favourable prononcement, and then performed bronchotomy, which being finished, he revived so rapidly from the violence of the air, that the by-standers were alarmed; but the tumour and unfaavourable colour of the face having disappeared, I assured them that he would recover,' &c. The foreign bodies were then pulled down into the stomach with a leaden probe, and thence were discharged about a week afterwards at different times with the faeces. As the patient was so promptly relieved, probably Habicot never thought of keeping the wound open with a cannula, but endeavoured to heal it as expeditiously as possible. In the two other cases, he employed this instrument, which he has described in the last chapter of his treatise.

Since Habicot, and before the end of the seventeenth century, the testimonies to be found in favour of tracheotomy are very numerous; but no one did anything to perfect the operation until Decker, who, in 1675, proposed to practise it with a small trocar, armed with a cannula. The method is more simple, more easy, and subject, as some have conceived, to fewer inconveniences, if the trachea be not pierced until this tube is exposed by an incision made in the anterior and inferior part of the neck, between the mucus and the hyoid bone, and under the larynx. The author who first proposed bronchotomy in the case of inflammatory quinsy, thinks that it may be done in a more expeditious manner, without pain, and in a way more calculated to procure a speedy cure, than the mode which was previously in use. This plan consists in performing the operation by one puncture, so that the laceration at once opens the interguments and the interface of the cartilages of the trachea, and the instrument is not withdrawn before the laceration of the probe, which is to serve as a conductor for the cannula. The advantages which Dionis ascribes to this method would merit the greatest attention, were they not counterbalanced by the inconveniences which result from it. There are not many subjests, whose necks are so entirely destitute of feel that the interface of the rings of the trachea can be felt. This tube, whose figure is cylindrical, easily slips under the fingers, and the change of position may render Dionis's manner of operating extremely difficult. The operation is not without danger of wounding the posterior parieties of the trachea, because one cannot penetrate into its cavity, through the thickness of the integuments and cellular substance, without using a degree of force which it is difficult to regulate with precision. Lastly, when the cannula is put into the wind-pipe, this canal rifes, and descends so considerably in various circumstances, and especially in the action of deglutition, that the instrument must be liable to slip out of it. Verdu, before Dionis, had made some remarks on the posture of the patient during the operation. His head was extended back, and the integuments were pinched up into a transverse fold before being divided. Verdu observed, that by inclining the head back, the difficulty of breathing would probably be increased, and that when this position was adopted, the integuments of the neck could not easily be pinched up into a fold. For such reasons, he thinks that posture best, in which the patient breathes with most freedom.

Tracheotomy had been practised only with a view of relieving the suffocation arising from the quinsy, and that which is produced by the pressure of a foreign body in the oesophagus upon the trachea. Detharding, professor of medicine at Rotrock, published in 1714, a dissertation, entitled "De Methodo subveniendi submeris per Laryngotomium," the object of which was to prove, that this operation is necessary in order to remove drowned persons. The principle with which he sets out is, that drowned perfons cannot breathe when taken out of the water, because the epiglottis is in contact with the glottis, and closes this opening so closely, as to leave no passage at all for the air. But some observations, carefully drawn up by M. Louis, have proved that the glottis is open and free in drowned persons, as well as in perfons who have perished of any other kind of death, and that their death is caused by the water which they have forcibly inspired, and which mixing with the air and mucus with which the bronchial and bronchial cells are naturally filled, obliterates and blocks up these organs, so that the air can no longer enter them. But if Detharding has been mistaken upon this point, he has not been deceived in regard to the advantages of tracheotomy in every other circumstance, and the little risk there is in practising it. He states, that the integuments, and the membrane which unites the rings of the trachea, being the only parts which ought to be cut, no vessels nor nerves of importance need be wounded.

Though there are no nerves of considerable size in the track which the incision must necessarily follow, the same observation cannot be made in respect to the blood-vessels. The thyroid gland sends down, to the left subclavian vein, which, after having ramified on its anterior surface, unite into two trunks, the left of which most commonly passes in front of the trachea, at the lower part of the interface, which lies between the sternohyoid and mucus. In the greater number of subjects, these trunks only form one at the place of their termination. Sometimes they continue separate. Sometimes, also, one of them terminates in the left subclavian vein, and the other in the right. The left may be injured in dividing the cellular substance which covers the trachea. This canal itself has likewise its own vessels, which may be cut, and bleed a good deal. This was

in the event of the trocar slipping. This risk may be avoided by fixing the trachea well, and particularly by using some instruments, which were invented by Bauchot, an old surgeon-major of the French navy. They consist of a cutting blade mounted on a handle, to which is adapted a flat cannula, the opening of which has a rim furnished with two small rings, and a fine body lodged in the cefophagus, which body can neither be extracted, nor pulled down into the stomac; and when an extraneous substance has fallen into the wind-pipe. In quinines, and in cases of foreign bodies lodged in the cefophagus, the operation consists in making an opening, through which the air can enter to the lungs. In the case of a foreign body in the trachea, an incision is required, which divides longitudinally several of the cartilaginous rings of this tube, which is of a fize proportioned to that of the substance to be extracted.

When merely an opening is required for the passage of the air, the surgeon may proceed in several different ways. In the oldfet method, the patient was placed in the recumbent posture, with his head supported on pillows, so that the skin of the front and lower part of the neck could be pinched up into a tranverse fold, of which one end was held by an assistant, the other by the surgeon himself with his left hand. This fold was divided from above downwards, and the incision was continued from the lower part of the larynx to the front of the upper edge of the sternum. The cellular substance between the sternio-hyoid and sternio-thyroid muscles, was next divided down to the fore-part of the thyroid gland and trachea. This canal being exposed, the surgeon puts his left-hand index-finger between two of the cartilaginous rings, and then passing along his nail the instrument of which he has made choice, he makes a tranverse incision in it. When he judges a cannula indispensible, Bauchot's instrument is the bell, the perforating part of which should be taken out immediately the trachea is divided, so as to leave only the tube, which is to be fixed in its place with suitable ribbands passed through the little rings. In this manner, there is no risk of blood falling into the trachea, because the wound is filled by the instrument with which it is made. If, on the contrary, the tube be considered useless, the surgeon should use a lancet with rather a long point.

Instead of practising tracheotomy, or bronchotomy, surgeons have been recommended to perform the operation of laryngotomy, as more safe and easy. The lower edge of the thyroid cartilage, and the upper edge of the cricoid cartilage, are connected together by a thick ligamentous membrane, covered in front merely by the integuments. This anterior part of the crico-thyroid membrane is also immediately opposite the highest and broadest portion of the cavity of the larynx, directly below the glottis, so that it is not only easy to bring it into view by a superficial small cut through the skin and cellular substance, but the incision may be made longitudinally, by which its union will be facilitated, and there can be no risk of hurting the opposite side of the larynx. In France, this mode of operating has had several distinguished advocates, and the celebrated Vic-d'Azyr Communicated to the Société de médecine some observations concerning it.

In whatever manner the operation may have been practiced, some attention must be paid to the dressing of the wound. If the folie object has been to restore respiration during the short period of time necessary for the removal of a foreign body lodged in the cefophagus, there is no reason why the wound should not be speedily healed. Supposing the trachea, or larynx, to have been opened by a transverse incision, the patient's head must be inclined forwards, and the edges of the longitudinal wound of the skin brought together. When the operation has been practised to relieve the suffocation caused by quinifey, the passage of the air through the wound must be promoted, until the diminution of the inflammation of the parts about the throat allows the air to pass the normal way. The cannula which is used must be covered with gauze, in order to prevent the entrance of extraneous substances in the atmosphere, or bits of the dressings. The wound should be covered with pletgets and compresses, and the whole supported with a suitable bandage.

Such are at least the means recommended by methodical writers; but Sabatier observes, that experience has not confirmed their propriety. To some practitioners she has proved, that it is difficult to keep the cannula in its place; to others she has shewn, that the tube becomes filled with mucus, by which it is rendered useless. Sabatier even thinks, that it might be better to omit altogether the employment of the cannula, and nothing would be more easy, were laryngotomy performed as above explained. The superficial small wound required in this operation, may be left uncovered with dressings, and no inconvenience will follow. Sabatier's Médecine Opératoire, tom. iii. p. 25, &c. edit. 2.

TRACHICHTHYS, in Ichthyology, a genus of fishes, first described by Dr. Shaw in the "Naturalist's Miscellany," the characters of which are as follows: head rounded in front; eye large, mouth wide, toothless, defending. Gill-membrane furnished with eight rays, of which the four lowermost are rough on the edges. Scales rough; abdomens mailed with large carinated scales. There is one species; viz.

T. AUSTRALIS, OR SOUTHERN Tr. With mailed abdomens; a native of the coast of New Holland. Its color is a bright pink-ferruginous, or fair reddish-brown. The middle part of all the fins of a deeper colour than the rest of the animal, and the edges lighter, or of a yellowish tinge.

TRACHIDNA, a name given by Jovius and some others to the draco marinus of the old authors, called by us the scraper.

TRACHINIA, in Ancient Geography, a canton of Thessaly, in the Pthiotides, near Mount Oeta. It is also called Melide. In this country was the town of Heracles, since called Heraclea Trachiniae. They did not.

TRACHINLÈ PETRA, high and inaccessible rocks which bordered a plain near the Malae gulf. They surrounded the Melide. Between these rocks and the sea flowed the river Melas, whence the territory had its name.

TRACHINUS, in the Linnean system of Ichthyology, the name of a genus of fish of the order of the Anguilli: the characters are, that the head is compressed and not smooth; the membrane of the gills has fix rays, and the lower lamina of the operculum is serrated; and the anus is near the breast. Linnaeus mentions one species, viz. the Draco. Artedi refers the Uranophis also to this genus.

The name is originally Greek, the word meaning signifying rough, sharp, or prickly. It was given to this fish from
the rays of its back-fin being remarkably rigid, and sharp like prickers.

Trachinus Lapis, in Natural History, a name mentioned by the writers of the middle ages, as possessing many great medicinal virtues. It seems to have been a kind of lapis nectaris, being described as bright, but not transparent, and being of two kinds, the one blackish, and the other green.

Trachis, in Ancient Geography, a town of the Thesaly, said to have been built by Hercules at the foot of Mount Oeta, towards the mouth of the river Apeus. It derived its name from its mountainous and rugged situation. On the site of this town, which is mentioned by Homer, the Lacedaemonians built another, to which they gave the name of Heraclae.

Trachoma, (from τράχυς, rough,) a roughness of the inner surface of the eyelids, caused by hardened mucus and scabs. It implies the same sort of disease as the Phthiriasis; which see.

Trachon, in Ancient Geography, a plain which bounded the territory of the king of the Cimmerian Bosphorus, on the side of Scythia.

Trachones, the name of two hills situated beyond the town of Damalcus, in Syria. Strabo.

Trachonitae Arabes, Arabs who inhabited Sacca, at the foot of Mount Aladamus. Ptolemy.

Trachis, or Trachin, in Geography, a town of Moesia, in the circle of Brunn; 21 miles S. of Brunn.

Trachurus, in Ichthyology, the name of a fish of the scorber kind, called in English a scad, and by several authors, scomber, scombrus, and acanthus marinus. See Scomber.

Trachurus Brasiliensis, a name given by Mr. Ray to a fish of the scorber kind, the scormer corvola of Linnaeus, known among writers on these subjects, by its Brazilian name guara-toba.

Trachynotia, in Botany, a genus of grasses, so named by Michaux, from τράχυς, rough, and νότιος, the back, because the glumes are rough in that part.—Michaux Bot. Rar. Amer. v. 1. 63.—This is the same plant with Linnetis de Richard and Persoon, adopted by Pursh, v. 1. 25 and 59, and referred to Triandra Monogynia, and thus defined.

L. Ch. Spike lateral-flowered; flowers imbricated in two ranks. Calyx of two valves; one smaller than the other. Corolla of two valves, pointed, compressed, keeled. Style elongated.—Three species are described.

Pursh.

2. T. cyprinoides. Michaux ibid. (Linnetis cyprinoides; Pursh n. 2.)—"Somewhat glaucous. Leaves very long. Spikes numerous, alternate, turned one way. Calyx pointed, awned; its keels prickly."—"Frequent on rocky ledges of North America. Perennial, flowering in July.

Pursh.

Pursh.

These are very coarse harsh grasses; the leaf is said by Clayton to have a rancid smell. We mention them here, because Linnetis is accidentally omitted in its proper alphabetical order. Which of the two above names is to be preferred, might require consideration; but we have already declared under Daublys that we do not see the necessity of dividing that genus. If otherwise, our British D. flabella, Fl. Brit. 110. Engl. Bot. t. 38o. Knapp. Gram. t. 63, must be associated with the above three American species.

Trachys Mons, in Ancient Geography, a mountain of the Peloponnesus, in Arcadia. Pausanias.

Tracing, in Husbandry, a term used by our planters for the method of preparing the maize, or Indian corn. This being a large grain, is apt to spoil, if not carefully preferred.

Some thresh out the corn as soon as the ears are gathered, and lay it up in holes of the earth, which are their granaries; but those who have not opportunities of doing this, trace it, that is, they leave it in the ear, and weave, or fallen together a great number of ears by the ends of the hulks: these traces of corn they hang up within doors, on such supports as will keep them from one another; and they will, in this manner, keep good the whole winter.

This is a method of ours introducing; but their own, of burying the clean corn, was at least as good, and was the same practised by the Egyptians of old, and by all the widely nations of the East at this time. But whether we have improved their husbandry in this particular, or not, it is certain that we have greatly assisted them in the planting of this corn, which we do by the plough, instead of the troublesome method they had of doing it with the hoe. The manner of our planting it is this: we plough single furrows the whole length of the field, and at about six feet distance one from another; we then plough others across at the same distance, and then, wherever the furrows meet, the corn is thrown in; it is then covered either by the hoe, or by running another furrow behind it with the plough; and when the seeds begin to overtop the corn, they plough the spaces again, and by this means destroy and turn in all the weeds, and give the earth a flaring, that greatly assists vegetation.

The famous method of horse-hoeing husbandry, so celebrated by Mr. Tull, in a book written on that subject, is no other than the bringing home this method of our American planters, on the culture of the maize, and applying it to our European corn. The Indians, and our planters, join in the method of raising a hill of earth round every flake of the maize; and when the ground is poor, or out of heart, they bury two or three hills, of a kind called by them the alofe, under every hill; and by this means they have a crop double to what would otherwise have been produced. The English have learned this manure from the Indians; and in New England, where they are near the fishing-flages, they bury the heads and garbage of the oaks, which succeed as well as the alofe, and cools nothing but the carriage.

The lands on which the maize or Indian corn has grown, are as well fitted for our European corn as if they had been laid fallow. The reason of this is, that, plants of the Indian corn standing at fix feet distance from each other, the far greater part of the ground has remained unoccupied, and at the same time has had the advantage of often ploughing to kill the weeds, which is a benefit equal to that of dung and reft. All this, though it tends to prove the doctrine of hohe-oeing husbandry not new, yet it strengthens the system greatly. Phil. Trans. No. 142.

Tracing, among Miners. See Training.

Tracing-Line, in Sea Language, a small cord generally passing...
passing through a block or thimble, and used to hoist up any object to a higher station, in order to render it less inconvenient. Such are the tracing-lines of the awnings, and thro' of the yard-tackles, which, by hanging down in a cavity or bight, would be awkward and incommmodious. Falconer.

Track, in Geography, one of the Nicobar islands. N. lat. 7° 30'. E. long. 94° 6'.

Track of a Ship. See Wake.

Track-road, the same as towing-path; which see.

Track-scout, a vessel employed to carry goods or passengers up and down the rivers or canals in Holland, and the countries bordering on the Baltic sea. It is usually tracked by a horse, who trots along the margin to a limited distance, after which he is relieved by another. Falconer.

Tracking, denotes the art of pulling any vessel or floating body along the stream of a canal or river, by means of a rope extending from the vessel, &c. to the adjacent shore, and drawn along the banks of the river by men or horses. Whence Track-scout; which see.

Tracopitis, in Ancient Geography, a rude and mountainous country of Palestine, on the other side of Jordan. M. d'Anville places it at the bottom of Anti-Libanus, inclosed within several branches of this mountain, extending towards the S.E. among which is found mount Hermon: the principal place was Ænon.

Tracossos, in Geography, a town of Spain, in the province of Leon; 30 miles W. of Zamora.

Tractus, Tractus, Tracto, or Tractatus, does also signify a small treatise or written discourse upon any subject.

Tract, in Hunting, denotes the trace or footing of a wild beast.

Tractation, Drawing, the act of a moving power, by which the moveable is brought nearer to the mover, called also attraction.

Tractation, Line of, in Mechanics. See Wheels.

Tractoriae, among the Romans, were diplomas or tickets given by the emperor to such as he sent into, or called out of, the provinces; by which they were entitled to the use of the public poll, and to be maintained at the expense of the government.

Tractrix, in Geometry, a curve line, called also catenarius; which see.

Trade, Traffic, Commerce, the act, or art, of dealing, buying, selling, exchanging, &c. of commodities, bull, money, &c.

For the origin, progress, &c. of trade, see Commerce and Navigation.

It is observed by Dr. Smith, that all wholesale trade, all buying in order to sell again by wholesale, may be reduced to three different sorts: viz. the home trade, the foreign trade of consumption, and the carrying trade. The home trade is employed in purchasing in one part of the same country, and selling in another, the produce of the industry of that country; and it comprehends both the inland and the coasting trade. The foreign trade of consumption is employed in purchasing foreign goods for home consumption. The carrying trade is employed in transferring the commerce of foreign countries, or in carrying the surplus productions of one to another.

The capital that is employed in the first kind of trade generally replaces, by every such operation, two distinct capitals, that had both been employed in the agriculture or manufactures of that country, and thereby enables them to continue that employment. When it lends out from the dependence of the merchant a certain value of commodities, it generally brings back in return at least an equal value of other commodities. When both are the produce of domestic industry, it necessarily replaces, by every such operation, two distinct capitals, which had both been employed in supporting productive labour, and thereby enables them to continue that support.

The capital employed in purchasing foreign goods for home consumption, when this purchase is made with the produce of domestic industry, replaces, too, by every such operation, two distinct capitals; one of which only is employed in supporting domestic industry. Though the returns of the foreign trade should be as quick as those of the home trade, the capital employed in it will give but one-half the encouragement to the industry or productive labour of the country. But, in fact, the returns of the foreign trade are very seldom so quick as those of the home trade; the former coming in before the end of the year, and sometimes three or four times in the year; and the latter seldom coming in before the end of the year, and sometimes not till after two or three years. The capital, therefore, in the home trade will sometimes make twelve operations, before a capital employed in the foreign trade of consumption has made one. If the capitals are equal, therefore, the one will give twenty-four times more encouragement and support to the industry of the country than the other.

That part of the capital of any country, which is employed in the carrying trade, is altogether withdrawn from supporting the productive labour of that particular country, to support that of some foreign countries. And though it may replace, by every operation, two distinct capitals, yet neither of them belongs to that particular country. See the illustration of these principles in Smith's Wealth of Nations, vol. ii. p. 69, &c. See Capital.

The offences against trade, confidered in a legal view, are violating, or the offence of transporting wool or sheep out of this kingdom, to the detriment of its staple manufacture, (see Offer,) smuggling, fraudulent bankruptcy, vyury, cheating, (see Cheats,) forgery, regating, (see Regator,) engraving, monopoly, exercising a trade in any town, without having previously served as an apprentice for seven years, punishable by satire 5 Eliz. c. 4, with the forfeiture of 40l. per month; and transporting and reducing our artificers and manufacturers to settle abroad. See each head.

Trade-winds, denote certain regular winds at sea, blowing either constantly the same way, or alternately this way and that; thus called from their great use in navigation, and the Indian commerce.

The trade-winds are of different kinds, some blowing three or six months of the year one way, and then the like space of time the opposite way; these are very common in the Indian seas, and are called monsoons; which see.

Others blow constantly the same way; such is that general wind between the tropics, which off at sea is found to blow all day long from east to west. For the phenomena of each, with their physical causes, see Winds.

Dr. Lister has a conjecture in the Philosophical Transactions, No 175, that the tropical or trade-winds arise, in great part, from the daily and continual upheavals of a flattus, called the fragassa, or laminella marina, which grows in vast quantities from 36° to 138° north latitude, and elsewhere upon the deepest seas. For the matter of wind, coming
coming from the breath of one only plant, must needs be constant and uniform; whereas the great variety of trees and plants at land furnishes a confused matter of winds. How, he adds, it is, that these winds are briskly about noon; the sun quickening the plant most then, curing it to breathe faster, and more vigorously. Lastly, the direction of this wind of ebb to well, he attributes to the general current of the sea; for a gentle air is observed to be constantly led along with the stream of the river; nor must it be omitted, that every plant is, in some measure, an heliotrope, and bends itself, and moves after the sun, and consequently emits its vapour thitherward; so that the direction of the trade-wind is, in some measure, also owing to the course of the sun.

Dr. Gordon has another hypothesis: the atmosphere, which surrounds the earth, and moves along with it in its diurnal motion, he supposes to keep pace with it; that part of it, at leaf, which is near the earth, if the remotest part should be judged to lose ground.

If, then, there were no changes in the atmosphere's gravity, he supposes it would always go along with the earth from well to ebb in an uniform motion, altogether inessential to us: but the portion of the atmosphere under the line being extremely rarefied, its spring expanded, and so its gravity and preffure much less than the neighbouring parts of the atmosphere, it is incapable of the uniform motion towards the ebb, and must, therefore, be preffed wellwards, and make the continual breeze from ebb to well, between the tropics.

TRADESCANT, John, in Biography, one of the fathers of natural history in England, having been the first who made any considerable collection of natural productions, (see Museum,) as well as one of the earliest cultivators of exotic plants in this country, is reported by Anthony Wood to have been a Dutchman. His name nevertheless appears to be English, and was originally of two syllables, Tradefcant, though it subsequently became Tra-def-caunt, as appears by a line in his family epitaph,

"—beneath this stone,

Lie John Tradefcant, grand sire, father, son."

Dr. Pulcenty thinks he was not settled in England during the life of Gerard, though often mentioned in the second edition of that author's Herbal, by its editor Johnfon, as well as in Parkinson's Works. He is recorded to have been for a considerable time in the service of the lord-treasurer Salisbury, and lord Wootton. He travelled into various parts of Europe, even as far Ruftia, and was on board a fleet sent against the Algerines in 1620. He brought home plants and other curiosities from these various excursions; but it does not appear what was their primary object. About the year 1629, he obtained the title of gardener to king Charles I., and about that time, or before, was settled at Lambeth, where his own garden was situated. Some remains of this were traced out by Sir William Watson 120 years afterwards. Tradescant's Ark, or Museum, became very famous as a collection of natural rarities. It was much visited by the great, and even by the royal family, all of whom took pleasure in enriching it, as in later times their descendants have done to other such collections. A catalogue of the Museum Tradescantianum, in 12mo., appeared in 1656, with portraits of the owner and his son, engraved by Holler; of which however most of the copies are plundered by mere print collectors, careles of the value of any thing beyond their own object. By this catalogue, the museum appears to have been furnished, not only with birds, quadrupeds, fish, shells, insects, minerals, fruits, &c. but also with warlike instruments, habits, utensils, coins, and medals. There is annexed a catalogue in English and Latin of the plants cultivated in the author's garden. His portrait represents him as greatly advanced in age; but the time of his death is not known. His son, of the same name, visited Virginia, and returned with several new plants; amongst others the original Tradescantia, hereafter mentioned. This son inherited his father's collections, and dying in 1662, bequeathed them to Mr. Elias Ashmole, so that they may be said to have laid the foundation of the Ashmolean Museum at Oxford, in which they, like the name of their original owner, are now sunk. The widow of the younger Tradescant, the mother probably of the grandson mentioned in the epigraph, is said to have erected the curious and rather splendid tomb, remarkable for its allusive decorations, which still exists in Lambeth church-yard. See Dr. Ducarel's account of this monument, in the sixty-third volume of the Philosophical Transactions. Pulteney's Sketches of Botany.

Obf. Mr. Brown, by whose and Gartner's observations we have endeavoured to improve the above generic characters, has most justly established a natural order of Commelinae, as distinct from Jussieu's Junici, from which they are, as he says, very different in habit as well as structure. Indeed we were never able to conceive how any professed natural system could allow of so strange an allembigence, of plants that have so little in common, as the above-named order of the great French teacher. Nor are we less surprized at the arbitrary assumption which will fill call the beautiful delicate and transient corolla of these plants, a calyx, though as different and distinct from the real external perianth, as in any flower whatever. But it is decreed that monocotyledonous plants can have but one integument to their flowers, and that this one must be a calyx; though here they have manifestly two, of which the internal one is, as usual, a self-evident corolla. Mr. Brown indeed feels the necessity of calling these internal parts petals with Linnaeus, though such phrasing oversteps the Jussieu hypothesis.

The genus before us confis of various species of herba-
cerous plants, some annual, others perennial, none of them natives of Europe. Their leaves are alternate, sheathing, simple, entire, with parallel ribs. Flowers clustered, short-lived, usually purplish, differing from those of Commelina, (see that article,) in being regular, with almost universally four-lobed anthodia. Mr. Kunth propounds to separate, into a distinct genus, certain species, the claws of whose petals are united, and whose two seeds, in each cell, are directed in a contrary manner, one upward, the other downward. The scar of these seeds, moreover, is said to be at the base, their embryo at the opposite extremity. In this predicament are T. axillaris, criftata, and some unpublished species. We proceed to augment Wildenow's list with some new species, most of them recently published by Mr. Kunth, among the discoveries of those illustrious travellers Baron Humboldt and Mr. Bonpland.

1. T. virginica. Common Virginian Spider-wort. Linn. Sp. Pl. 411. Willd. n. t. Ait. n. t. Pursh n. 2. Curt. Mag. t. 105. Sower. Drawing-book t. 6. Redout. Liliac. t. 95. (Phlaganthus ephemerus virginianum; Park. Parad. 152. t. 151. f. 4.) — Stem erect. Leaves lanceolate, smooth. Flowers numerous, in a fort of terminal fleshy umbel. Calyx hairy. — This, the original species of its genus, was brought from Virginia by the younger Tradescant, (see that article,) before the year 1629, as appears by Parkinson's Paradisus; and is now one of the most common hardy perennials of every country garden, blooming copiously throughout summer and autumn. Pursh says it occurs in sandy woods, from Pennsylvania to Carolina, flowering in May and June. The plant is readily increased, by parting its long fibrous roots, and thrives particularly well in flake and moisture. The flowers are eighteen inches high, round, leafy, febrately branched. Leaves sheathing, concave, taper-pointed, of a dark shining green. Flowers large, of a rich violet blue, each lasting but a day, or rather a few hours in the early part of a day, after which they roll up into a liquefying pulp mass; but there being a great number in each umbel, or tuft, there is a long succession. The five golden anthers are brilliantly contrasted with the dark purple fraggly filaments.

3. T. sphaerica. Roughish Spider-wort. Curt. Mag. t. 1597. Ait. Epit. 375. (T. criftata; Walt. Carol. 149.) — Stem erect. Leaves ovate-lanceolate, recurved, rough-edged. Umbels lateral and terminal, many-flowered. Calyx hairy. — Native of North America, from whence it is reported to have been brought by Mr. Lyon in 1812. The plant is a hardy perennial with us, flowering from June to September, but has little superiority to claim over T. virginica, except what arises from novelty. The foliage is broader, and more divaricated, than in that species, as well as very roughish, especially at the edge. Flower-flasks reddish or purple, becoming wrinkled as the flowers fade.

4. T. crista. Thick-leaved Spider-wort. Curt. Mag. t. 77. Ait. Epit. 216. — Stem erect. Leaves ovate, cornaceous; filgy at the margin and under side; with very short stalks. Umbels terminal, hairy. — Native of New Spain, flowering in September. A rove plant in England, introduced by the late marchioness of Bute. The root is tuberous, perennial. Mr. Ker Bellenden describes the stem as pro-cumbent, but by every other account it is erect. The broad thick ovate leaves, densely silky with white hairs at the base, are united to the stem, as well as both the petioles, all the foregoing. The flowers are of a pale violet, expanded but for three or four hours in a morning; their size equal to our first and third species. Calyx hairy.

8. T. Zanonia. Gentian-leaved Spider-wort. Swartz Ind. Occ. v. 1. 624. Willd. n. 4. (Commelina Zanonia; Linn. Sp. Pl. 61. Redout. Liliac. t. 392. Cephalia Zanonia; Kunth 164. Zanonia grandis; perfollata; Plum. Gen. 38. x. 38. Periclymenum rectum herbaceum, gentianale foli; foli pediculico caulême ambiente; Sloane Jan. v. 1. 243. t. 147. f. 1.) — Stem erect. Leaves elliptical, tapering at each end. Flowers capitate, on long, lateral, solitary flanks, pointed in the middle, with a pair of bracteas. Capsule clothed with the permanent pulp corolla. — Native of woods in the West Indies and South America, flowering in autumn. A not unfrequent flower plant in Europe, though less remarkable for the beauty of its flowers, which are small and white, than for the peculiarity of its dark-purple juicy fruit, formed of the thickened and enlarged corolla, which completely encloses the seeds. The root is perennial. Stem two or three feet high, mostly branched, smooth, juicy, leafy in the upper part. Leaves near a foot long, downy, beneath, fringed at the base, often red at the edges; their sheaths tumid, densely fringed. Flower-flasks opposite to each leaf, and nearly as long, with a sheath in the middle, and two ovate, spreading, leafy bractea at the top, Accompanying a head of eight or ten flowers.
9. **T. discolor.** Purple-leaved Spider-wort. L’Herit. Sert. Angl. t. 12. Willd. n. 5. Ait. n. 6. Swartz Ind. Occ. v. 1. 567. Sm. Ic. Pit. t. 10. Curt. Mag. t. 1192. Redout. Liliac. t. 168. — Smooth, with feebly any stem. Bractes compressed, embracing each other. Leaves lanceolate, coloured on the under side. — Native of South America, about the gulf of Mexico. Naturalized in Jamaica, and now very common in our stones, flowering early in the day throughout the summer. The leaves, forming a large tuft, are very conspicuous and handsome, in consequence of the rich violet hue of their under side, contrasted with the fine green of the upper. Flowers very copious, small, white, in flaked axillary umbels, much shorter than the leaves, and subtended by a pair of strongly compressed and keeled purple bractae.

10. **T. malabarica.** Grasf-leaved Spider-wort. Linn. Sp. Pl. 412. Willd. n. 6. Ait. n. 7. (Tali pullu; Rheede Hort. Mal. v. 9. 123. t. 63.) —Stems erect, angular; hairy at one side. Leaves linear, channelled, recurved, clasping the stem. Flower-flanks lateral and terminal, hairy, two or three together. — Native of the East Indies. Perennial, flowering in our stones in June and July. About a foot high, with many slender, slightly branched, stems, most leafy in their lower part, and small flowers. The calyx is hairy. Capsule exquisitely polished, as if varnished.

11. **T. diuricicata.** Spreading Spider-wort. "Vahl Eclog. v. 1. 34." Willd. n. 8. (Comnelina hexandra; Aubl. Guian. 35. t. 12.) — Stem branched, trailing. Leaves ovate, somewhat flaked, smooth, with bearded sheaths. Panicles terminal. Filaments naked. — Found by Aublet, in the Cayenne and Guiana, flowering almost all the year. **Root** perennial. **Stems** rising to the height of ten feet, supporting themselves upon the neighbouring bushes. **Leaves** two or three inches long. **Flowers** blue, in compound clusters, or panicles. Their **flames** are fited to be smooth, white, and fleshy.

12. **T. geniculata.** Knotted Spider-wort. Linn. Sp. Pl. 412. Willd. n. 9. Ait. n. 8. Jacq. Amer. 94. t. 64. (Ranunculus aut Himamomum repens, paranetis foliis villosis; Plum. Ic. 106. t. 116. f. 2.) — Stem decumbent, with a hairy lateral line. Leaves ovate, faggzy at the base and sheath. Panicles terminal, compound, capillary, nearly smooth. — Native of the West Indies, in shady moist places, flowering in our flowes about July and August. **Root** perennial. **Stems** weak; decumbent and creeping at the bottom; branched and leafy above. **Leaves** rather above an inch in length, pointed, hairy, especially at the margin and base; their sheaths tumid, membranous, densely faggzy at the border. **Flowers** small, white, in loofe di variasated panicles. **Calyx** smooth. **Capsule** pellucid, polished.

13. **T. monandra.** Small Monandrous Spider-wort. Swartz Ind. Occ. v. 1. 597. Willd. n. 10. —Stems diffuse, with a hairy lateral line. Leaves ovate-heart-shaped, smooth. Stalks axillary, many-flowered. Stamen solitary. — Discovered by the scrutinizing eyes of Dr. Swartz in bushy places on hills in the western part of Fiji-nia, flowering from June to March. A delicate perennial herb, creeping by means of long fibrous radicles. The **leaves** are not an inch long, very smooth, pointed, finely reticulated when dry, with pale fringed **flaments.** **Flowers** minute, white, in little axillary umbels. **Calyx** hairy. **Stamen** but one, slender, smooth.

14. **T. multiflora.** Many-flowered White Spider-wort. Swartz Ind. Occ. v. 1. 595. Willd. n. 11. — "Stem erect, branched. Leaves heart-shaped, fringed at the margin and sheaths. Flower-flanks axillary, crowded, many-flowered. **Stamen** three." — Found in shady woods on the mountains of Jamaica. Stem one or two feet high, round, furred, smooth. **Leaves** an inch long, acute, with short **flamines.** **Flowers** small, white, short-lived, in little flaked umbels, from the sheaths of two or three of the upper leaves.

16. **T. procumbens.** Procumbent White Spider-wort. Willd. n. 13. (T. multiflora; Jacq. Coll. v. 3. 226. 1c. Rar. t. 355.) — Stem procumbent, creeping. Leaves ovate, fringed at the base. Stalks axillary, cymose, many-flowered. Three of the flaments short and bearded. — Found in moist situations at the Caracas. It flowers in the flowe from August to December, and is perennial. **Jacquin.** This appears to be a much larger and stronger plant than the preceding, the **flames** being four feet long; their numerous flowering branches ascending. **Leaves** an inch and half or two inches in length, dark green, with ribbed sheaths. **Flowers** in many axillary, as well as terminal cymose tufts, small and white; their three longer flaments only bearded at the summit.

17. **T. axillaris.** Grasf-leaved Axillary Spider-wort. Linn. Syll. ed. 13. 260. Willd. n. 14. (Comelina axillaris; Linn. Sp. Pl. 61. Ephemerum phalangoides maderafatunum minimum, fucundum sema quasi ex utriculis floridum; Pluk. Phyt. t. 174. f. 3. "Nir-pullu; Rheede Hort. Mal. v. 10. t. 28. f. 18." — Stem branched, decumbent. Leaves linear, acute; with short, fringed, tumid sheaths, which are longer than the axillary flower-flanks. — Native of the East Indies. **Root** small, fibrous, annual. Stem much branched, decumbent, taking root at the joints, leafy, smooth, a foot long or more. **Leaves** graffy, smooth, from three to six inches in length, and one-third of an inch in breadth; their leaflets, smooth, but strongly fringed. **Flowers** rather small, blue, slightly flaked, fearfully projecting beyond the sheaths of the leaves, not always solitary in our specimens. **Calyx-leafes** lanceolate, but half as long as the tube formed by the united bafes of the petals. **Stamens,** according to Koenig, fix, with jointed hairs.

18. **T. crioflata.** Crefted Spider-wort. Willd. n. 16. Ait. n. 9. Jacq. Hort. Vind. v. 2. 64. t. 1. (Comelina crispata; Linn. Sp. Pl. 62. Burm. Ind. 18. t. 7. f. 4.) Ephemerum zeylanicum procumbens crififlata; Herb. Parad. 148. — Stem branched, decumbent. Leaves lanceolate, reflexed. Spikes terminal, recurved, with irricated crescent-shaped bractees. — Native of Ceylon; introduced at Kew in 1770 by M. Richard. It is annual, flowering in the flowe from July to September, and is remarkable for its long-flaked bracteated recurved **spikes,** of pretty little bright blue **flowers,** whose **flamines** are all bearded at the summit. The habit of the **herb** is like the latt, but with shorter, broader and blunter, deflexed leaves.

Spikes terminal, with three clasping bracteas.—Native of the East Indies. Burmann's figure indicates a very distinct species from the last, with longer and linear leaves. Each spike moreover seems completely enfolded in one large external bractea. Yet the Linnaean specimen, from the Upal garden, appears scarcely different from T. ebriflora, as Linnaeus himself suspected. He says the flowers are violet, not fleshy-blue. Those who pollins both plants, in a living state, can alone clear up the uncertainty which envelopes these species.

20. T. gracilis. Slender Purple-veined Spider-wort. Kunth n. 1. — Stem branched, procumbent. Leaves ovate, acute, fringed as well as their lach heathes. Umbels terminal, aggregate, on downy filakis. Calyx coloured, rather deep. — Native of the cooler regions of Quito, near Tarqui and Chillo; perennial, flowering in February. Stems smooth, a foot long. Leaves thickish, eight or nine lines in length. Umbels three or four together, with about four flowers in each, whose corolla is white, veined with purple. Staminis hairy at the base. Cells of the anthers widely separated.

21. T. dilbils. Weak White Spider-wort. Kunth n. 2. — Stem erect, weak, nearly simple. Leaves oblong-oblong, acute, fringed as well as their lach heathes. Umbels solitary or in pairs, on smooth filakts. Calyx hairy at the summit. — Found with the last, to which it is confessedly nearly akin; but the leaves differ somewhat in shape, and the umbels consist of ten or twelve flowers, whose calyx is green, and their petals pure white.

22. T. patulella. Dwarf Purple Spider-wort. Kunth n. 3. — Stem procumbent, branched. Leaves oblong-oblong, pointed, smooth; rough with minute ferratures at the margin. Sheaths lax. Umbels in pairs, on smooth thills. Calyx gibbous at the base, smooth. — Native of a temperate climate, on the Mexican mountains, between Guanaxauto and Santa Rosa de la Sierra, flowering in September.—Root perennial. Stem six inches or more in length, round, smooth, sometimes simple. Leaves an inch and a half long, membranous, with about thirteen ribs. Umbels terminal, of about nine purple flowers. Calyx-leaves linear-lanceolate, bluntish, gibbous at the base. Cap-sule oblong, smooth, of only two cells, with solitary seeds, rough with dots.

23. T. biriflota. Hairly Procumbent Spider-wort. Kunth n. 4. — Stem procumbent, branched. Leaves oblong-lanceolate, pointed, rough-edged, waved, beneath hairy, as well as their lach heathes. Stalks three or four-flowered, terminal, in pairs, hairy like the slightly coloured calyx. — Native of the cooler mountains of New Granada, near San Miguel on the banks of the river Putés, Teindala, and the village of La Cruz, flowering in November. The root is perennial. Stem two or three feet long, round, hair dotted, smooth. Leaves rounded at the base, flat, with about nine ribs, an inch and a half or more in length, four lines broad; their upper surface nearly smooth. Sheaths petiolate, frilated, half an inch long. Calyx-leaves lanceolate, acute, purplish-green. Petals twice as long, purple. Filaments hairy at the base.

24. T. fornitia. Tall Cape Spider-wort. Willd. n. 15. (T. speciosa; Linn. Suppl. 192. Lamarck n. 9. T. nodiflora; Lamarck n. 6, according to Willdenow. Commelina speciosa; Thumb. Prodr. 58.) — Stem erect, zigzag. Leaves opposite, combined at the base. — Found by Thunberg at the Cape of Good Hope. The stem is two feet, or more, in height, round, smooth, except a little woolly line at each fide, running down from the joints. Stem-leaves opposite, awl-shaped, keeled, from two to four inches long, VpL XXXVI.

rather woolly at the margin, inferted in pairs into a tumid, entire, woolly or hairy sheath, about half an inch in length. Flowers in dense, axillary, aggregate heads, with lanceolate bracteas; the lower heads filaked. Leaves of the calyx lanceolate, keeled, combined at the base. Filaments very hairy. Style bearded at the upper part. Willdenow seeks, in transferring from the Supplementum, to have written the name fornis for speciosa. The latter being now applied to a different species, see n. 5, we retain the former here. Lamarck may possibly have inferred the same plant twice, once after Linnaeus, without seeing a specimen.

The most singular circumstance in the botanical history of Tradescantia relates to what Linnaeus has named T. nervosa, Mant. 223. Willd. n. 7. This proves, by the original specimen from Mutis, accompanied with a drawing, to be a very curious plant of the Orchis family. Mutis justly remonstrated with Linnaeus against making it a Tradescantia, and called it an Epidendrum. Mr. Kunth, who has seen our specimen, informs us it belongs to a new genus, and is named by him Thelypogon angustifolius. The style, or column, is exceedingly hairy, or rather bristly. The lip is very little broader than the two petals, all of them being marked with numerous parallel ribs. The whole flower is above an inch wide, and seems to be very handsome.

Tradescantia, in Gardening, furnishes a plant of the hardy herbaceous perennial kind, the species of which that is chiefly cultivated, is the common Virginia spider-wort, or flower of a day; but there are other species that may be cultivated.

And there are varieties with pale blue flowers, with deep blue flowers, with white flowers, with red flowers, and with purple flowers.

Method of Culture.—They are readily increased by parting the roots, and planting them out in the autumn, or early in the spring, in a bed or border of common earth. And also by seeds sown at the same feasons in similar situations, the plants being pricked out into other beds in the summer, and removed to the autumnal places to which they are to grow.

These plants are durable in the roots, but the flalks decay annually; they mostly fend forth a new flower every day, hence the common name, during some weeks in the fumerous feson, and are proper for planting out in various places in pleasure-grounds.

They afford ornament in the common borders among other flower-plants.

TradeWater, in Geography, a river of Kentucky, which runs into the Ohio, N. lat. 37° 17'. W. long. 88° 30'.

Tradita Nucu. See Abalenaion.

Tradition, Traditio, the act of delivering a thing into the hands of another. The sacle of a movable is completed by a simple tradition.

Tradition, in Matters of Religion, is applied to those laws, doctrines, relations, &c. which have been handed down to us from our forefathers, without being written.

Taking tradition in this sense, for every thing relating to faith, or the rites and ceremonies of religion thus derived down to us from the primitive church, there are two kinds, viz. apofolitical and ecclesiastical tradition.

Tradition, Apofolitical, which is what we properly call tradition, is defined by the Romanists to be the unwritten word of God, defended from the apostles to us, through a continual succession of the faithful.

By this tradition, say they, it is, that the Holy Scriptures have been kept entire, both as to the letter, & c. the text, and as to the spirit or sense thereof. This tradition the Council
council of Trent declares to have the same authority with the Holy Scripture itself, and pronounces every one who rejects it an heretic.

It is a question of some difficulty, when the church of Rome began to derogate from the authority of the Scriptures, and to raise these traditions to an equality with them. It is generally supposed, that pope Nicholas ordained, that the decretal epistles of the popes should be of the same authority as the Scriptures, about the year 855. Du Plessis (Mylt. Inq. Progr. 31.), indeed says, that pope Agatho had, 150 years before, pronounced openly, "that all decrees made by the see apostolic, ought to be received as if they had proceeded from St. Peter's own mouth." But as this doctrine had gained no canonical authority in the pontificate of Nicholas, it ought not at so early a period be placed to the account of the church. Nor did that diligent inquirer find any formal decree to such effect till the year 1415, when the council of Constance, in the condemnation of the 38th article of Wickliffe's heresy, ordained, that such of the decretal epistles as should be found upon examination to be rightly subscribed to the popes whose names they bore, should be of equal authority with the epistles of the apostles. (L'Enfant's Hist. Council of Constance, vol. i. p. 229.) From this period, the sufficiency of the Scriptures alone to salvation became a formal heresy, as appears by the 12th of the interrogatories exhibited to Lambert with Fox's Martyrology in the year 1538. Hitherto, however, the Scriptures stood upon even ground with papal constitutions; and the inconformities between them were kept sufficiently out of sight, by depriving the people of the ordinary means of studying the sacred oracles, and entertaining them only with the ignorant and mythical comments of the monks upon them. When these would no longer pass upon mankind, it then became necessary to degrade the Scriptures to an inferior clafs.

Traditions, Ecclesiastical, are certain statutes and regulations regarding the rites, customs, and circumstances of religion, introduced since the time of the apostles, by councils, popes, &c. and continued to our time through a constant observance of the church. The Romanists make another division of tradition, viz. into written and unwritten.

Tradition, Written, is that of which we find some traces in the ancient fathers and doctors.

Tradition, Unwritten, is that of which there appear no signs or relics in any of the fathers extant.

The church of Rome pretends to be the depository of each kind; tradition she holds to be absolutely necessary in the church, grounding this necessity on the promise of infallibility which Jesus Christ is pretended to have made her.

Yet others of that communion deny tradition, how excellent soever it may be for the reclaiming of heretics, to be absolutely necessary; maintaining, that the church would not be less infallible, nor less the rule of doctrine, &c. if the fathers had never written at all.

Traditionary, Traditionarius, a name given among the Jews to such of them as acknowledged tradition, follow it, and explain the Scriptures by it; in opposition to the Caraites, who refuse any thing but the pure Scriptures themselves.

The traditionaries are what we more usually call rabbis, and rabbinists, or talmudists. Hillel alone among the traditionaries, and Shamai among the textuaries.

Traditores, a name given in the first ages of the church to such Christians as, in times of persecution, to avoid death and martyrdom, delivered up the sacred writings to the persecutors.

The enemies of religion, even under the old law, made their utmost efforts to deprive the world of the Holy Scriptures; in that cruel persecution which Antiochus raged against the Jews, the books of the law were very solicitously sought after, torn, and burnt, and such as kept them were put to death; as we read in the first book of Maccab. ch. i. v. 56, 57.

Dioecletian renewed the same impiety, by an edict published in the nineteenth year of his empire, commanding all the sacred books to be brought to the magistrates, and burnt.

Many weak Christians, and even some bishops, overcome with the fear of punishment, carried in their books to the persecutors: which the church detesting, made very severe laws against them, and gave them the infamous names of traditores, from traduo, I deliver, betray.

As the great pretence of the felchins of the Donatists was, that the Catholics tolerated the traditores, it was decreed in the council of Arles, held in 314., that such as should be found guilty of having delivered up any of the holy books or volutes, should be deposed from the order of the clergy, &c.

Traducian, Traduciani, a name which the Pelagians anciently gave the Catholics, because of their teaching that original sin was transmitted from father to children, or that it was communicated to the children by the father in the way of generation.

The word is formed of the Latin tradux, which was made use of to express that communication; and which comes from traduo, I transmit, or propagate from one to another.

At present, some give the appellation traduciani, to such as hold, that the souls are transmitted to the children by the father.

Traduction, formed of trans, beyond, and dux, I lead, draw; the act of translating, or turning out of one language into another. See Translation.

Traeth Buan, in Geography, a bay of the Irish sea, on the west coast of Wales, in the county of Merioneth; 2 miles N. of Harlech.

Traeth Coed. See RedWharf Bay.

Traeth Mawr, a bay of the Irish sea, on the west coast of Wales, between the counties of Merioneth and Caernarvon; 4 miles N. of Harlech.

Traetta, Thomas, in Biography, a Neapolitan composer of the first clafs during the last century. We have a very spirited and accurate account of the rapid progress of this master to the temple of Fame, in M. Laborde's "Effai sur la Musique," drawn up, we believe, by the animated and discriminative pen of count Benincasa; who says that, "Traetta, one of the last disciples of Durante, quitted the conservatory at the age of twenty-one, and two years after he was chosen to compose an opera for the great theatre royal of San Carlo, at Naples, entitled 'Farnace.' His success in this first attempt was so great, that he was employed in the same city to compose six other operas, serious and comic, successively.

"The reputation of this young composer soon reached Rome, whither he was invited, and composed for the Alberti theatre 'Ezio;' which, though it had been previously set by so many great masters, that of Traetta was, and is still, the most esteemed. All the great theatres of Italy now wished to engage him, and he composed for them all more than once, till he was fixed in the service of the court of Parma, in the splendid reign of Don Philip, where he had the honour of instructing in music the late archdukes, confort of the emperor Joseph II., and the princes of A}[315].
ris, her filer. The operas which he then composed at Parma were entirely in the French taste, which was that of the court. The choruses and the ballets are not yet forgotten. It is this totality that unites the charms of all the fine arts together. The Italians have long known and applauded such splendid spectacles, and often exhibited them successfully in the last and preceding century; but with them the occasions cannot be frequent. A great capital, like Paris, is necessary, which constantly furnishes an audience and spectators able to pay for their amusements all the year round; or magnificent courts, such as those of the princes of the house of Este, Medici, Farnefe, and Parma, in former times.

"The first of the six operas which Traetta composed in this style, was 'Ipolito and Aricia,' written by the famous poet, the abate Trugoni, in 1759. At this period Traetta was twice called to Vienna to compose 'Armida' and 'Ifigenia,' two grand operas with choruses and ballets, which were crowned with the greatest success. (This was five years previous to the performance of Gluck's 'Orfeo' at Vienna.)"

"These two operas were afterwards represented at Milan, Florence, Mantua, and Naples. After the decease of the infant Don Philip, Traetta was called to Venice, where he was appointed maestro to the conservatorio of Opiffioletto; but he could not there refit the proposals made to him from all parts of Europe. After two years' residence at Venice, he suffered himself to be attracted to Petersburg, where he was engaged for five years; at the end of which period he was detained two years longer, during which periods he composed seven operas, and many cantatas."

"England wished to have him in its turn; but he arrived there too late; his health was so impaired, that he seemed never to have enjoyed a day's cafe and comfort while he was here. And Sacchini, who was still in London, had taken such possession of our hearts, and so firmly established himself in the favour of the public, that he was not to be supplanted by a composer in the same style, neither fo young, so graceful, nor so fanciful as himself.

"Sacchini's person and address had contributed towards enduring him to the English; but, on the contrary, Traetta's countenance and general appearance were so chilling as to be almost frightful. A skin extremely adult, a settled gravity, deficient and gloom covered his vigafe so constantly, as to make a beholder shrink at the sight of him, and imagine it impossible that any thing pleasing, even to rapture, should flow from its matter. But all this only proves that Horace, who says, 'Fronti nulla fides,' was a much better physician than Lavater."

"Though many excellent tones and scenes of his composition had been introduced in patficio operas on our stage, yet we can remember but two entire dramas of this matter that were executed here, 'Germone,' a serious opera; and 'La Sera rivale,' a burletta. But the dramas which he composed in and for different parts of Europe, must amount to more than fifty."

"On quitting England, he returned to Italy in an alarming state of health; however, we find that, in 1778, he produced two operas there: 'La Disfatta di Dario,' and 'Il Cavalieri Menate;' but 1779 was the last year of this admirable musician's existence."

"TRAFAGNOL, in Geography, a river of Germany, in the county of Tyrol, which runs into the Lavis, 4 miles N. of Caffellier."

"TRAFALGAR, Cape, a cape of Spain, on the coast of Andalusia; about 60 miles E. of Cadiz. N. lat. 36° 10'. W. long. 6° 8'. This cape has been rendered famous by the complete victory obtained October 21, 1805, by the British fleet, commanded by Lord Nelson, over the combined fleets of France and Spain off this cape. (See the biographical article of NELSON.) Among the Arabs there is a tradition, that the province of El Garb, in Morocco (feet Garb), was originally united to Trafalgar and Gibraltar, shutting up the Mediterranean sea, the waters from which passed into the Western ocean by a subterraneous passage: and at this day they call Trafalgar Traf-el-garb, i.e. the piece or part of El Garb; and Gibraltar, Jibbel-trajf, i.e. the mountain of the piece, or part of El Garb."

"TRAFARIA, a fort of Portugal, in the province of Estremadura, on the south side of the Tagus; 6 miles S.W. of Lisbon."

"TRAFFICK. See Trade and Commerce."

"The word is formed from the French traffie, and that from the Italian, traffico, which is again borrowed from the Arabic."

"The principal traffic in Muscovy and the North is in furs and skins: the great traffic of the Dutch in the East is in spices: the traffic of money is mostly carried on at the Exchange."

"TRAFINE. See TREPAN."

"TRAGACANTHA, in Botany, Τραγακάνθα, of Dioscorides, book 3, chap. 23, is so called from Τραγακάνθα, a goat, and ακάνθα, a thorn, probably because of its growing in mountainous situations, frequented by goats; or perhaps from being the food of (those animals, to whom its thorny footstalks may fearfully prove any impediment. There are several species, almost all confounded by Linnaeus under his Afromalus Tragacantha, but distinguished by Tournefort, as well as more recently by Willdenow, Lamarr, and others."

"Three of them are defined to appear in the Flora Graeca. They all produce more or less of the mucilaginous substance called Gum-Tragacanth, or Gum-Dragon, and are remarkable for their dense, bushy, thorny habit, and copious, not inelegant, flowers. Tournefort, in his Corolla, p. 29, 30, has added nineteen Oriental species to the four mentioned in his Institutiones, p. 417; but these, though for the most part truly dininæ, are some of them probably mere varieties, and are so confounded by Lamarr; see his Dictionnaire de Botanique, v. 1. 320; where these plants compose a section of the genus Afromalus, characterized by the permanent, finally spinous, common footstalks of the leaves."

"TRAGACANTHA, in the Materia Medica. The naked hillocks of mount Ida, in Candia, M. Tournefort tells us, produce much of the plant tragacantha, or goat's thorn, which gives the gum spontaneously towards the end of June, and in the following month; when the nutritious juice of the plant, thickened by the heat, bursts most of the vefels in which it is contained."

"This juice coagulates in threads, which make their way into the pores of the bark, where being pushed forward by new juice, they get through the bark, and are at length hardened in the air, either into little lumps, or into twisted pieces in form of little worms, more or less long, according to the quantity of the matter of which they are formed.

"It should seem, too, that the contraction of the fibres contributes to the exprefion of the gum; those fine fibres, like the fibres of hemp, laid bare and trampled under foot by men and horses, contract themselves, and facilitate the expression of the extravagated juice. The plant grows also in several places of the Levant, particularly about Aleppo."

O 2 M. de
M. de la Billardiere's account of the manner in which this gum is produced, differs in some respects from that of Tournefort. Having visited mount Lebanon in August, 1736, the seafon when this gum is collected, he found the species which afforded it to be different from that figured and described by Tournefort, and consequently not the tragacantha of Linnaus. The stem of the Cretan tragacanth is blackish, that of Lebanon is yellow: the leaves of the first are downy, of the second smooth: the flowers of one are red, those of the other are of a pale yellow. Hence he infers that there are several species of tragacanth which produce gum-tragacanth. He also contradicts the statement of Tournefort, who attributes the flowing of the gum to the contraction of the fibres of the bark, occasioned by the intensity of the solar heat; observing, that it is only during the night, or when the sun is obscured by clouds, that the gum issues from the plant, and that the fame has been remarked at Crete.

The gum is of different colours and qualities, some being white, some greyish, some reddish, and some almost black. The white is the best: it must be chosen clear, smooth, and twirled, or vermicular. It is dry, and yet somewhat soft to the touch.

Gum-tragacanth differs from all the other known gums in giving a thick consistency to a much larger quantity of water; and in being much more difficultly soluble, or rather dissolving only imperfectly. Rotty affords, that in five or six hours it will dissolve in cold water. Put into water, it slowly imbibes a great quantity of the liquid, swells into a large volume, and forms a soft but not fluid mucilage; with the addition of more water, a fluid solution may be obtained by agitation, but the liquor appears turbid and wheyish, and on standing the mucilage subsides.

It is smooth and softening, and is therefore good to ob-}

The mucilage of tragacanth of the Edinb. Ph. is prepared by macerating one ounce of gum-tragacanth in powder, in eight ounces of boiling water for 24 hours, and triturating the gum so that it may be disintegrated and创伤 the mucilage through linen. The mucilage of gum-tragacanth of the Dubl. Ph. is obtained by macerating two drachms of gum-tragacanth in powder, in eight fluid-ounces of water, in a covered vessel, until the gum is disintegrated, and创伤ing the mucilage through linen. The compound powder of tragacanth of the Lond. Ph. is formed by taking of tragacanth powdered, acacia gum powdered, and starch, of each an ounce and a half; and of refined sugar three ounces. Rub the starch and sugar together to a powder; then add the tragacanth and the acacia gum, and mix the whole together. This powder is used with effect as a demulcent in hectic fever, and to allay the tickling cough of catarrh; in gonorrhoea and strangury it is given combined with nitre, and in dysentery with ipecacuanha powder. The dose is from 5s to 3ij, mixed in water or any bland fluid.

TRAGACANTHUM Venereum Indicum, in Natural History, a name given by some writers to the bird's-nests so famous in soups in China, and in some parts of Europe, for their cordial, retorative, and provocative virtues. They are the nests of a kind of Indian sea-fowl, and are made up of a substance resembling gum-tragacanth, and, like it, melting in a jelly in any warm liquor.

TRAGÆA, in Ancient Geography, a town of the island of Naxos, in which particular worship was paid to Apollo Trojan.

TRAGAN, in Geography, a town of Africa, in Fez-}

TRAGARTH, a river of Wales, in the county of Brecknock, which runs into the North Sea.

TRAGÆA Saline, in Ancient Geography, salt-pits of Africa Minor, in the Troade, near Hamaxitum. Strabo.

TRAGASIAN SALT, a term used among the ancients for a sort of sea-salt, very little different from the common kind, being made by the evaporation of the water of some salt-ponds near the sea-flores.

TRAGÆA, in Pharmacy, an aromatic powder grossly beaten and mixed with sugar; taken by way of carminative.

TRAGEA, or Tragia, in Ancient Geography, an island situated in the vicinity of the Cyclades.

TRAGÆA, islands situated on the coast of Ionia, but they were joined to the continent by the depopulations of the Meander. They served as a retreat for pirates, according to Strabo, and lay N. of the promontory Podium, S.E. of that of Troglilium, and W. of the town of Miletus.

TRAGÆY, a dramatic poem, representing some signal action performed by illustrious perons, and which has generally a fatal issue or end. Accordingly, it has been always reckoned a more dignified entertainment than comedy. The former directs our attention to the high passions, the virtues, crimes, and sufferings of mankind; the latter to their humours, follies, and pleasures. Terror and pity are the great instruments of tragedy; and ridicule is the sole instrument of comedy.

Tragedy exhibits the characters and actions of men, says Dr. Blair, in some of the most trying and critical situations of life, and serves as a direct imitation of human manners and actions. It differs from the epic poem, in which the poet narrates and describes characters, by excluding the poet, and letting before us the personages themselves, acting and speaking what is suitable to their characters. As no kind of writing affords so great a trial of the author's profound knowledge of the human heart, none, when duly executed, has so much power to raise the strongest emotions. It is, or ought to be, a mirror, in which we behold ourselves, and the evils to which we are exposed; a faithful copy of the human passions, with all their direful effects, when they are suffered to become extravagant.

Aristotle scientifically defines tragedy, the imitation of one grave and entire action, of a just length, and which, without the aidfulness of narration, by raising of terror and compassion, refines and purges our passions.

This definition has given the critics some perplexity; and Corneille declares he cannot reconcile Aristotle with himself; the instances Aristotle cites, he thinks, defeat his own definition. He even denies the purging of our passions to be the end of tragedy.

Our English authors are more favourable to the definition; by the purging of our passions, they understand not the extinguishing of them, but the reducing them to just bounds; by frowning the miseries that attend a subjection to them, they lay it to us to watch them more narrowly; and by feening the great misfortunes of others, it lessens the feme of our own.

The
The ingenious writer already cited, disapproving the statement of Aristotle with regard to the design of tragedy as somewhat obscure, thinks its intention may be more shortly and clearly defined, "to improve our virtuous sensibility." If an author interests us in behalf of virtue, forms us to compasion for the distressed, inspires us with proper sentiments, on beholding the vicissitudes of life, and by means of the concern which he raises for the misfortunes of others, leads us to guard against errors in our own conduct, he accomplishes all the purposes of tragedy. Tragedy is, therefore, a moral species of composition; and the impressions left by it on the mind are, upon the whole, favourable to virtue and good dispositions. In order to produce this beneficial effect, it is necessary that the author should choose some interesting and moving story, and then conduct it in a natural and probable manner. The end of tragedy is not like that of epic poetry, to elevate the imagination by the marvellous, but to affect the heart by a stricter imitation of the life and actions of men. This principle, duly regarded, excludes from tragedy all machinery, or fabulous intervention of the gods; and, therefore, the mixture of machinery with the tragic action, is a blemish in the ancient theatre. Hence some critics have required, that in order to produce and maintain the impression of probability upon which the succefls of tragedy depends, the subject should not be a pure fiction, but founded on real history, or known facts. This, however, seems to be an extreme; as a fictitious tale may affect the heart as much as a true history, provided that the events related be such as might easily have happened in the ordinary course of nature. Some of the most pathetic tragedies are altogether fictitious as to their subject; such as Voltaire's Zaire and Alzire, the Orphan, Douglas, the Fair Penitent, &c.

For the regulation of the conduct of a tragedy, critics have established the famous rule of the three unities, to which we shall presently advert.

Tragedy, in its original, M. Hedelin observes, was only an hymn sung in honour of Bacchus by several persons, who, together, made a chorus of music with dances and instruments. A goat was the sacrifice offered to that god; and from ταύρος, a goat, and δίς, a fold, was formed the appellation tragedy.

As this was long, and might fatigue the fingers, as well as tire the audience, they bestowed themselves on the singing of the chorus into several parts, and to have certain recitations in the intervals.

Accordingly, Thespis (see his article) first introduced a person to speak upon the stage with this view.

Phrynichus, the disciple of Thespis, selected that kind of verse which is most suitable to the drama, and introduced some other changes, but left tragedy in its infancy. He, it is said, introduced women's parts on the stage.

Æschylus, the father of tragedy, as he has been called, finding one person insufficient, introduced a second to entertain the audience more agreeably by a kind of dialogue: he also clothed his persons more decently, and first put on them the bulkin. For his other improvements in this species of drama, see his article ÆSCHYLUS.

The persons who made their recitations on the scene, were called adiores; so that tragedy at first was without many actors. And what they thus rehearsed, being things added to the singing of the chorus, of which they were no necessary part, were called epides.

Sophocles found that two persons were not enough for the variety of incidents; and accordingly he introduced a third: and here the Greeks seem to have flopped; at least, it is very rare that they introduce four speakers in the same scene.

The progress of the art under the culture of Æschylus, and his immediate successors, was extremely rapid. He had for contemporaries and competitors, Chersilus, Pratinas, and Phrynichus already mentioned, whose glory he eclipsed; and Sophocles, who rivalled his own. Sophocles confounded in Æschylus three defects: the excessive elevation of his ideas, the gigantic style of his expressions, and the difficult conduct of his plots; and these faults he flattered himself for having avoided. By reducing heroism to its just standard, Sophocles lowered the style of tragedy, and banished those expressions which a wild imagination had dictated to Æschylus, and which diffused terror through the souls of his spectators. His style, like that of Homer, is full of strength, magnificence, sublimity, and mildness. Even in depicting the most violent passions, he happily suits his style to the dignity of his personages. See the article SOPHOCLES.

Euripides, at an early age, emulated the fame of Sophocles, and aspired to the sovereignty of the stage. See the biographical article EURIPIDES.

Notwithstanding the prejudices and hatred of Arilophanes against Euripides, his decision in assigning the first place to Æschylus, the second to Sophocles, and the third to Euripides, was conformable to the opinion of the greater part of the Athenians. Æschylus, it is said, painted men greater than they can be, Sophocles as they ought to be, and Euripides as they are. The two former had neglected passions and situations, which the latter thought capable of producing great effects. He sometimes represented princes inflamed with love, and respiring only adultery and crime; and sometimes kings debauched by calamity to such poverty, as to be covered with rags, and solicit a wretched alms. These scenes, in which no resemblance was discernible of the manner of Æschylus or Sophocles, at first disconcerted the spectators. It was said, that under no pretext ought the character and rank of the heroes of the stage to be fo degraded; that it was highly reprehensible to pourtray with so much art images so shameful, and dangerous to supply vice with the authority of great examples. But at this time the Athenians in general were left offended at the attacks which the pieces of Euripides made on received ideas, than hurried away by the sentiments with which he had atonised the passions of the soul, is especially admirable when he paints the furies of love, or excites the emotions of pity; then, surpassing himself, he sometimes attains the sublime, for which he seems not to have been intended by nature. While he was accused of enervating tragedy, he had proposed to render it the school of wisdom. Euripides, whose eloquence sometimes degenerated into a redundant profusion of words, and whose rhetorical phrases, learned digressions, and idle disputes reduced him much below Sophocles, who has said nothing which has not its utility, is nevertheless said to have fixed the language of tragedy. He retained scarcely any expressions that are especially appropriated to poetry; but he judiciously selected and employed those of ordinary language, that, under their happy combination, the feelings of the thought seemed to disappear, and the most common word to become emblazoned. Such was the magic of that enchanting style, which, preferring a just medium between meanness and inflation, is almost always eloquent, clear, harmonious, flowing, and flexible, that it seems to adapt itself without effort to every feeling of the soul. Whilst Sophocles admitted into his choruses the Phrygian
TRAGEDY.

Phrygian harmony, the object of which was to moderate and temper the passions, and which was adapted to the worship of the gods; Euripides, favouring the innovations made by Timotheus in the ancient music, employed almost all the modes, and especially theo, the sweetest and softest of which accorded with the genius of his poetry. Accordingly the audience were accustomed to hear in the theatre effeminate tones, and sometimes divisions on a single syllable. Hence the author was represented as a feeble artist, who, incapable of raising himself to the sublimity of tragedy, had deprived tragedy to the level of his own inferior abilities.

Euripides rarely succeeded in the disposition of his subjects; sometimes he offends against probability, sometimes the incidents are forced, and sometimes the action wants unity; almost always the complications and developments of his plots are in some respects imperfect; and his choruses have frequently only an indirect relation to the action.

He invented the method of explaining his subject in a prologue, or long preface, almost entirely detached from the piece, in which usually one of the persons of the drama comes forward, and frigidly details all the events antecedent or relative to the action, gives his own genealogy, or that of one of the principal characters, informs us of the occasion of his departure from heaven, if he is a deity, or who has called him forth from the tomb, if a mortal; and announces himself to the spectators by declaring his name. It is hardly necessary in this connection to mention Dionysus the elder, king of Syracuse; who was aided in the composition of his tragedies by some men of genius, but was indebted to their assistance for the victory he obtained in this species of literature. Aeschylus, Sophocles, and Euripides were, and ever will be, placed at the head of those who in ancient times rendered the stage illustrious. Nevertheless, though the number of pieces which prevailed in the theatrical competitions was very great, the first obtained the crown only thirteen times, the second but eighteen, and the last only five times; because the victory was decided by the multitude, which had patrons whose passions it espoused, and favourites whose interests it supported. It is remarkable, in how short a space of time tragedy grew up among the Greeks, from the modest beginning to the most perfect state. For Sophocles, the greatest and most correct of all the tragic poets, flourished only twenty-two years after Aeschylus, and was little more than seventy years posterior to Thebais. The chorus was the basis of the ancient tragedy, and the dramatic dialogue was superadded to it. In procons of time, the chorus, from being the principal, became only the accessory to tragedy; till at last, in modern tragedy, it has disappeared altogether; which forms the chief distinction between the ancient and the modern stage.

Each tragedy required three actors for the three leading parts; and the same actors sometimes performed both in tragedy and comedy; but persons very rarely excelled in both. Actors who had acquired great celebrity received considerable pay; not less than a talent (or 225/. sterling) in two days. The kind of verse generally employed in tragedy was the iambic, a species of measure that frequently occurred in conversation. The actors had habits and symbols suited to their several parts; and tragedy almost from its earliest invention employed the mask, which was completed under the hands of Aeschylus. In tragedy the stature of the actors was frequently increased to four cubits (fix English feet and nearly half an inch); which was effected by bukias, that raised them four or five inches; gauntlets also lengthened their arms; and their breasts, sides, and every part of the body, were rendered apparently thicker in proportion. The subject, in the composition of the Greek tragedy, was diversified by variety in the fable, which was simple or complex; by variety in the incidents, which excites terror and pity; by variety in the discoveries, which are one of the most copious sources of the pathetic, especially when they produce a sudden revolution in the condition of the persons of the drama; by variety in the characters, and by variety in the catastrophe, in which latter respect some dramatic pieces conclude happily, and others drastically; and there are some, in which, by a double revolution, both the virtuous and the wicked experience a change of fortune. The first of these terminations, however, seems only suitable to comedy. The manners in this species of drama, as well as in others of a similar kind, teach the exact conformity of the actions, sentiments, thoughts, and language of the performer with his character; and it is, therefore, necessary, that from the very first scenes, we should be able to discover, from what he does and what he says, the nature of his present inclinations, and his ultimate designs. Accordingly, the manners should be proper and uniform; suitable to the age and dignity of the person; neither contrary to the idea of the hero delivered down to us by ancient tradition, nor inconsistent in any part of the piece. The writers of tragedy should, like our actors, inspire spectators and judges with pity, terror, or indignation; and like them, demonstrate a truth, or refute an objection, aggravate or diminish an object. In many of the ancient tragedies we perceive beauty of thought and elevation of sentiment in all their parts; triumph in the language of truth, and the eloquence of the unfortunate. With this view behold Merope, Hecuba, Eleftra, Antigone, Philoctetes, succeeded sometimes by the horrors of death, and sometimes plunged in shame or despair, or bitten to the very accents of grief, those piercing exclamations, those passionate expressions, which, from one end of the theatre to the other, make the voice of nature resound in every heart, and compel all eyes to dilate in tears. The style of tragedy, though not pompous, should nevertheless be suitable to the dignity of the ideas. All mean expressions should be avoided. See Travels of Anacharsis the younger, in Greece, vol. vi.

Tragedy and comedy were at first confounded with each other; but they were afterwards separated; and the poets in general applied themselves to the cultivating of tragedy, neglecting comedy.

When tragedy was got into a better form, they changed the measure of its verse, and endeavoured to bring the action within the compass of a day, or of a revolution of the sun.

We now proceed to give some account of the three unities of action, place, and time, which have been considered as essential to the proper conduct of the dramatic fable. The first of these is the most important, and it consists in a relation which all the incidents introduced bear to some design or effect, so as to combine naturally into one whole. This unity of subject is more essential to tragedy than to epic poetry; for a multiplicity of plots or actions, crowded into fo short a space as tragedy allows, must necessarily detract the attention, and prevent passion from rising to any height.

(See Action and Epic Poem.) All under-plots should be rendered subservient to the main action. Addison's "Cato" is defective in this respect. The subject of the tragedy is the death of Cato, which the author supports with dignity; but all the sub-plots in the play are mere episodes, unconnected with the principal action.
TRAGEDY.

Unity of the action should not be confounded with the simplicity of the plot. The plot is simple, when a small number of incidents are introduced into it; but it may be complex, in the language of critics, or include a considerable number of pertons and events, and yet not be deficient in unity, if all the incidents tend towards the principal object of the play, and be properly connected with it. Congreve's "Mourning Bride" is adduced as an instance which stands in perfect opposition to the simplicity of the ancient plots. The incidents succeed one another too rapidly, and the play is too full of buffoon. Unity of action must not only be regarded in the construction of the fable, or plot, but it must also regulate the severa1 acts and scenes into which the play is divided. The division of the play into five acts is altogether arbitrary, and rests merely on common practice, and the authority of Horace, De Arta. Poet. (See Acts, in Poetry.) The pauses between the acts should be duly adjusted; so that there are corresponding pauses in the action. The fifth act is the feat of the Catastrophe; which fee. For the several parts of tragedy, see Act, Action, Character, Fable, Plot, Manners, and Scene.

It has been a question much agitated among philosophical critics, how it comes to pass that those emotions of sorrow which tragedy excites, afford any satisfaction to the mind? Sorrow, it is faid, is a painful passion; feenes of misery exhibited in tragedies excite a degree of sympathy and agitation that occasions anguish and diftrefs. The spectators cannot suppress their feelings: they are indicated by their tears: and yet they applaud such exhibitions, and recur to them with satisfaction and pleasure. That such exhibitions should draw fuch crowds of spectators, and that they should be fo highly gratified by them, appears to be somewhat mysterious. The fact is acknowledged, and many hypotheses have been propofed for the fatisfaction expiained. In order to account for it, we can by no means recur to an innate principle of malice, which prompts us to extract delight from the fufferings of others, and as it were to enjoy their calamities. Dr. Campbell, in his "Philofophy of Rhetoric," (vol. i. chap. 11.) has detailed and examined the various hypotheses that have been devised by ingenious men for the solution of this difficulty. The theory of the abbe du Bos, in his "Reflections on Poetry and Painting," is as follows. Few things, according to him, are more difagreable to the mind; than that littlefelnies into which it falls, when it has nothing to occupy it, or to awake the paffions. In order to get rid of this moft painful fitation, it feeks with avidity every amusement and pufuit; buffoons, gaming, news, shows, public executions, romances; in short, whatever will roufe the paffions, and take off the mind's attention from itself. It mafts not what the emotion be, only the stronger it is, so much the better. And for this reafon, those paffions which, confidered in themselves, are the moft afflicting and difagreeable, are fuperior to the paffion, in as much as they moft effeétually relieve the fpirit from that oppreflive languor which preys upon it in a state of inactivity. They afford it ample occupation, and by giving play to its latent movements and springs of action, convey a paffion which more than counterbalances the pain.

Mr. Hume, in reference to this theory, obferves, that the fame object of delight which pleases in a tragedy, were it really felt before us, would, without doubt, give the moft undesigned uneafiness, though it fhoald be the moft effeétual cure of languor and indolence; and Dr. Campbell fafs, that the moft which can be concluded from the abbe's premife is, the utility of exciting paffion of fome kind or other, but nothing that can evade the superior ffinews of the diftrefful affections.

The next hypothesis is that of M. Fontenelle, in his "Reflexions fur la Poetique." According to this writer, pleafure and pain, which are two sentiments fo different in themselves, differ not fo much in their caufe. From the inftance of tickling it appears, that the movement of pleafure, pulsed a little too far, becomes pain; and that the movement of pain, a little moderated, becomes pleafure. Hence it proceeds, that there is fuch a thing as a forrow, loft and agreeable. It is a pain weakened and diminished. The heart likes naturally to be moved and affeeted. Melancholy objects fuit it, and even diftrefsful and sorrowful, provided they are softened by fome circumference. It is certain that, on the theatre, the representation has almost the effect of reality; but yet it has not altogether that effeét. However we may be hurried away by the fpectacle, whatever dominion the fenes and imagination may usurp over the reafon, there still lurks at the bottom a certain idea of fadness, in the whole of what we fee. This idea, though weak and dilguised, fuffices to diminifh the pain which we fuffer from the misfortunes of thofe whom we love, and to reduce that affeftion to fuch a pitch as converts it into a pleafure. We weep for the misfortunes of a hero to whom we are attached. In the fame inftant we comfort ourselves by reflecting, that it is nothing but a fiction: and it is pricipally that mixture of fentiments which compofes an agreeable forrow, and tears that delight us. But as that affeftion which is caufed by exterior and fensible objects, is ftronger than the confusion which arises from an internal reflection, they are the effects and fymptoms of forrow, which ought to prevail in the composition. To Mr. Hume this folution appeared juft and convincing; but to Dr. Campbell it appeared unfaflisfactory. The ingenious author begins with laying it down as a general principle, that however different the feelings of pleafure and of pain are in themfelves, they differ not much in their caufe; that the movement of pleafure, pulsed a little too far, becomes pain; and that the movement of pain, a little moderated, becomes pleafure. Dr. Campbell has fhown, that on this principle, exemplified in a few inftances, and not warranted by others more immediately connected with the subject in quefion, we are not juftified in founding a general theory. "The only truth," fays our author, "which I can difcover in the preceeding hypofhes is, that the mind, in certain cafes, avails itself of the notion of fadness, in order to prevent the refentment or narrative from producing too ftrong an effeét upon the imagination, and confequently to reliefe itself from fuch an excess of paffion, as could not otherwife fail to be painful. But let it be obferved, that this notion is not a neceffary concomitant of the pleafure that refults from pity, and other fuch affections, but is merely accidental. It was remarked above, that if the pathetic exceeds a certain measure, from being very pleafant it becomes very painful. Then the mind recurs to every expedient, and to difbelief amongst others, by which it may be enabled to difburden itfelf of what difrelevant it. And, indeed, whenever this recours is had by any, it is a fure indication that, with regard to fuch, the poet, orator, or historian, hath exceeded the proper meafure.

"But that this only holds when we are too deeply interefled by the fympathetic forrow, will appear from the following considerations: firfl, from the great pains often taken by writers (whofe defign is certainly not to shock, but to please their readers) to make the moft moving stories they relate, he firmly believed: secondly, from the tendency, in fome fondnefs of the generality of mankind, to believe what
what moves them, and their averfions to be convinced that it is a fiction. This can refult only from the confciousnings that, in ordinary cafes, difbelief, by weakening their pity, would diminish, instead of increafing, their pleafure. They must be very far then from entertaining Fontenelle’s notion, that it is neceffary to the producing of that pleafure; for we cannot well fufpet them of a plot againft their own enjoyment: thirdly, and laftly, from the delight which we take in reading or hearing the moft tragical narrations of orators and historians, of the reality of which we entertain no doubt; I might add, in revolting in our own minds, and in relating to others, diffticult incidents, which have fallen within the compass of our own knowledge, and as to which, confequently, we have an abfolute afurance of the fact.

The third hypothesis produced and examined by Dr. Campbell is Mr. Hume’s, which he propofes as a supplement to the former two, in the doctrine of both which he, in a great meafure, acquiesces. “What is it then,” says Mr. Hume, “which in this cafe (that is, when the forrow is not softened by fiction) raifes a pleafure from the bottom of uneafines, fo to speak; and a pleafure, which still retains all the features and outward symptoms of diftrefs and forrow? I anfwer: This extraordinary efffect proceeds from that very eloquence, with which the melancholy scene is prefented. The genius required to paint objects in a lively manner, the art employed in collecting all the pathetic circumstances, the judgment difplayed in difpofting them; the exercise, I fay, of thofe noble talents, together with the force of expreffion, and beauty of oratorical numbers, diffufe the highest satisfaftion on the audience, and excite the moft delightful movements. By this means, the uneafines of the melancholy passions is not only overpowered and efcafed by fomething fronger of an oppofite kind, but the whole movement of thofe passions is converted into pleafure, and aflwells the delight which the eloquence raifes in us. The fame force of oratory employed on an uninterefting fubjeét, would not pleafe half fo much, or rather would appear altogether ridiculous; and the mind, being left in absolute calmnes and indifference, would relift none of thofe beauties of imagination or expreffion, which, if joined to paffion, give it luch exquifite entertainment. The impulfe or vehemence arifing from forrow, compaffion, indignation, receives a new direction from the fenfiments of beauty. The latter being the predominant emotion, feize the whole mind, and convert the former into themselves, or at leaft tincture them fo strongly, as totally to alter their nature; and the foul, being at the fame time roufed by paffion, and charmed by eloquence, feels on the whole a strong movement, which is altogether delightful.”

The insufficiency of this hypothesis is very fatisfactorily evinced by Dr. Campbell; and he has fhewn, that inftead of being supplementary to M. Fontenelle’s, as he intended it to be, it is subservive of the principles on which the French critic’s theory is founded. The effeét, according to the latter, refults from moderating, weakening, softening, and diminishihng the paffion: according to the former, it refults from what is direcdy oppofite, from the arts employed by the orator for the purpofe of exaggerating, altenating, heightening, and inflaming the paffion. Indeed, neither of thofe writers feems to have attended sufficiently to one particular, which of itfelf might have fhewn the insufficiency of their ftems. The particular alluded to is, that pity, if it exceed not a certain degree, gives pleafure to the mind, when excited by the original objects in diftrefs, as well as by the rcprefentations made by poets, painters, and orators; and, on the contrary, if it exceed a certain degree, it is on the whole painful, whether awakened by the real objects of pity, or roufed by the exhibitions of the historian or of the poet. Indeed, as fenee operates much more strongly on the mind than imagination does, the excess is much more frequent in the former cafe than in the latter. But our limits will not allow our enlarging.

A fourth hypothesis is that of thofe who maintain that compaffion is “an example of unmixed felfifhnefs and malignity,” and may be “referred into that power of imagination, by which we apply the misfortunes of others to ourfelves;” that we are laid “to pity no longer than we fancy ourselves to suffer, and to be pleased only by refleeting that our fufferings are not real; thus indulging a dream of diftrefs, from which we can awake whenever we please, to exult in our fecurity, and enjoy the comparison of the fiction with truth.”

This is no other, as Dr. Campbell obferves, than the antiquated doctrine of the philofopher of Malmebury refuced from oblivion, to which it had been faft defending, and re-published with improvements. Hobbes, indeed, thought it a fufficient reftretch, in order to render the sympathetic forrow purely felfifh, to define it “imagination or fiction of future calamity to ourfelves, proceeding from the fene of another man’s calamity.” This paradoxical conceit, as our author has denominated it, has been adopted by Hawkeftowf in the “Adventurer.” In the felfifh fystem, it appears to be a great objeétion, that in pity we are affected with a real forrow for the fufferings of others, or at leaft that men have univerfally underftood this to be the cafe, as appears from the very words and phrases expreffive of this emotion to be found in all known languages. But to one who has thoroughly imbibed the principles and fpirit of a philofophic fect, which hath commonly as violent an appetite for myffery (though under a different name, for with the philofopher it is paradox) as any religious fect whatever; how paltry must an objeétion appear, which hath nothing to fupport it but the conviction of all mankind, thofe only excepted whole minds have been perverted by feholastic fophiftry?

It is remarkable, that though it has been contended by a great number of perfon’s, that some fiction of the imagination is absolutely neceffary to the production of pity, and that the examples (to which we are fo frequent, as to give ample scope for examination, they disagree with re-gard to their fiction. Some contend only, that in witneffing tragedy, one is under a sort of momentary decepfion, which a very little reflection can correct, and imagines that he is actually witneffing thofe diftrefses and miferies which are only reprefented in borrowed characters, and that the actors are the very perfon’s whom they exhibit.

Others, who refer every thing to felf, maintain, that by a fiction of the mind, we infantly conceive fome future and fimilar calamity as coming upon ourfelves; and that it is folely this concepion, and this dread, which call forth all our forrow and our tears. Others not fatisfied with this, maintain boldly, that we conceive ourfelves to be the perfon’s fuffering the miferies related or reprefented, at the very infant that our pity is raifed. When nature is deftroyed by us, it is no wonder that we fhould lose our way in the devious tracks of imagination, and not know where to fettle.

Dr. Campbell’s hypothesis is illuftrated by the following general obfervations, of which the following detail is an abftract. He obferves, if, that almofl all the fimple paffions, of which the mind is fucceptible, may be divided into two claffes, viz. the pelfiant and the painful, differing confiderably both in kind and degree. zedly. Among the paffions,
TRAGEDY.

passions, as well as among the ideas of the mind, there is an attrac
tion or affection. 5thly. Pain of every kind generally makes a
deeper impression on the imagination than pleasure does, and is longer retained by the memory. 6thly. From a
group of passions associated together, and having the same
effect, some of them pleasant, and others painful; if the
pleasant predominate, there arises often a greater and a more
durable pleasure to the mind, than would result from thefe,
if alone and unmixed. 5thly. Under the name pity may be
included all the emotions excited by tragedy. It has been
usual, however, to comprehend pity and terror under the
class of passions that are moved by tragedy; but our author
observes, that this enumeration is more popular than philo-
sophical, though adopted by the Stagirite himself. For
what is pity but a participation by sympathy in the woes of
others, and the feelings naturally consequent upon them, of
whatever kind they be, their fears as well as sorrows:
whereas, this way of contradiflinging terror from pity,
would make one, who knew nothing of tragedy but from
the definition, imagine, that it was intended to make us
compassionate others in trouble, and dread mischief to our-
selves. If this were really the case, Dr. Campbell thinks
there are few or none who would find any pleasure in this
species of entertainment. If all the sympathetic affections
excited by theatrical representations were enumerated, our
author cannot see why hope, indignation, love and hatred,
gratitude and resentment, should not be included as well.
6thly. Pity is not a simple passion, but a group of
passions intricately united by association, and as it were,blended,
by centering in the same object. Of these, some are plea-
sant, some painful, but commonly the pleasant preponderate.
In pity there are three different emotions: self, commiser-
ation, purely painful; secondly, benevolence, or a desire of
the relief and happiness of the object pitted, a passion, as was
already observed, of the intermediate kind; thirdly, love,
in which is always implied one of the noblest and most ex-
quite pleasures whereof the soul is susceptible, and which
is itself, in most cases, sufficient to give a counterpoise
of pleasure to the whole.
The principal pleasure in pity arises from its own nature,
or from the nature of those passions of which it is com-
pounded, and not from any thing extrinsic or adventitious.
Nevertheless, certain adventitious circumstances may contrib-
ute to heighten the effect; but they cannot be regarded as
effential to the passion. Of this fort is the satisfaction which
arifeth from a fene of our own cafe and security, compared
with the calamity and the danger of another.

"'Tis pfeafant, fafely to behold from shore
The roling flip, and hear the tempeft roar:
Not that another's pain is our delight;
But pain unfelt produce the pleafing fight.
'Tis pfeafant alfo to behold from far
The moving legions mingled in the war."

Another adventitious fource of pleafure is, the fatisfac-
tion that refults from the confcious exercife of the humane
affections, which it is our duty to cherifh and improve.
Senfe, as we have frequent occafion to observe, invariably
makes a stronger impression than memory, and memory a
stronger than imagination; yet there are particular circum-
stances which appear to form an exception, and to give an effec-
tivity to the ideas of imagination, beyond what either me-
memy or fene can boaft. So great is the anomaly which
sometimes displays itfelf in humane characters, that it is not
impoible to find persons who are rapidly made to cry at
feeing a tragedy, or reading a romance, which they know to
be fictitious, and yet are both inattentive and unfelcing in
Vol. XXXVI.

respect of the actual objects of compaffion who live in their
neighbourhood, and are daily under their eye.

Men, fays our author, may be of a felfifh, contracted,
and even avairicious disposition, who are not what we
ought to denominate hard-hearted, or insensible of sympathetic
feeling. Such will gladly enjoy the luxury of pity, (as
Hawkefworthis terms it,) when nowe interfieres with their
more powerful passions; that is, when it comes unaccom-
panied with a demand upon their pockets. With the tragic
or the romantic hero or heroine they moft cordially sympa-
thie, because the only tribute which wretches of their dig-
ity exact from them is fighs and tears. And of these their
confidences inform them, to their inexprefible conflation,
that they are no niggards. But the cafe is totally different
with living objects. Barren tears and fighs will not satify
thefe. Hence it is that people's avarice, a moft formidable
adversary to the unhappy, is interefled to prevent their
being moved by fuch, and to make them avoid, as much as
possible, every opportunity of knowing or feeing them.
See this observation admirably exemplified in the parable of
the compassionate Samaritan, Luke, x. 30. Our author
concludes with obferving, that compaffion alone, efpecialy
that displayed on occasion of witneffing public spectacles, is
at felf but a very weak evidence of philanthropy.

Dr. Blair, agreeing in the main with the hypothesis of
Dr. Campbell, introduces the following obfervations on this
fubjeft, which we cannot forbear transcribing. "By the
wife and gracious constitution of our nature, the exercife
of all the focial passions is attended with pleafure. Nothing
is more pleafing and grateful than love and friendship.
Where-
ever man takes a frong interefl in the concerns of his fellow-
creatures, an internal fatisfaction is made to accompany the
feeling. Pity, or compaffion, in particular, is, for wife
ends, appointed to be one of the frongest inftruments of our
frame, and is attended with a peculiar attractive power.
It is an affection which cannot but be productive of fome
diftrefs, on account of the compaffion with the fufferers,
which it necessarily involves. But, as it includes benevo-
ence and friendship, it pastakes, at the fame time, of the
agreeable and pleafing nature of fome affections. The heart
is warmed by kindnefs and humanity, at the fame moment
at which it is afflicted by the diftrefs of thofe with whom
it sympaffhes: and the pleafure arifing from thofe kind
emotions prevails fo much in the mixture, and fo far coun-
terbalances the pain, as to render the flate of the mind,
upon the whole, agreeable. At the fame time, the imme-
diate pleafure, which always goes along with the operation
of the benevolent and sympathetic affections, derives an
addition from the approbation of our own minds. We are
pleafed with ourfelves for feeling as we ought, and for en-
tering, with proper forrow, into the concerns of the afflicted.
In tragedy, besides, other adventitious circumstances concur
to diminish the painful part of sympathy, and to increafe
the fatisfaction attending it. We are, in fome meafure, reliev-
ed, by thinking that the caufe of our diftrefs is fcigned,
not real; and we are also gratified by the charms of poetry,
the propriety of fentiment and language, and the beauty of
action. From the conccrnce of thofe caufes, the pleafure
which we receive from tragedy, notwithstanding the diftrefs
it occafions, feems to me to be accounted for in a fatisfac-
tory manner. At the fame time, it is to be obferved, that,
as there is always a mixture of pain in the pleafure, that
pain is capable of being fo much heightened, by the repre-
sentation of incidents extremely direft, as to check our
freedom of mind, and to render us averse, either to the reading
of fuch tragedies, or to the beholding of them upon the
stage."

Under the general head of the unity of action, to which
TRAGEDY.

after a long digression we now return, it may not be improper to make a few remarks on the conduct of the several scenes which make up the acts of a play. See Scene.

The entrance of a new personage upon the stage forms, what is called, a new scene. These scenes, or successive conversations, should be closely linked and connected with each other. For this purpose, two rules should be regarded. The first is, that, during the course of one act, the stage should never be left vacant; for whenever the stage is evacuated, the act is closed. This rule is very generally observed by the French tragedians; but the English writers, both of comedy and tragedy, seldom pay any regard to it. The second rule, little better regarded by English writers than the former, is, that no person should come upon the stage, or leave it, without a reason appearing to us, both for the one and the other.

In order to render the unity of action more complete, critics have added the other two unities of time and place. The unity of place requires, that the scene should never be shifted; but that the action of the play should be continued to the end, in the same place where it is supposed to begin. The unity of time, strictly taken, requires, that the time of the action be no longer than the time that is allowed for the representation of the play; though Ariosto seems to have given the poet a little more liberty, and permitted the action to comprehend the whole time of one day. During the course of each act, the unities of time and place ought to be strictly observed; that is, during each act the scene should continue the same, and no more time should be passed to pass, than is employed in the representation of that act. This is a rule which the French tragedians regularly observe. To violate this rule, as is too often done by the English; to change the place, and shift the scene in the midst of one act, shews great incorrectness, and destroys the whole intention of the division of a play into acts. Mr. Addison’s “Cato” is remarkable beyond most English tragedies for regularity of conduct. The author has limited himself, in time, to a single day; and in place, has maintained a most rigorous unity. The scene is never changed; and the whole action passes in the hall of Cato’s house, at Utica.

The characters most proper to be exhibited in tragedy have been usually considered by writers on this subject. (See Character.) Several critics require that the principal personages should be of high or princely rank, because their misfortunes and sufferings interest the imagination, and impress the heart more forcibly, than those of persons in humbler condition or more private life. But this observation is more specious than solid, and is refuted by facts. The dietresses of Delfdemoa, Monimia, and Belvlera, affect us as much as if they had been princesses or queens. The moral characters of the perfons represented are much more important than the external circumstances in which they are exhibited. The personages presented to view, and the incidents relating to them, should be so described, as to leave upon the spectators impressions favourable to virtue, and to the administration of Providence. Mixed characters, such as occur in the world, afford the most proper field for displaying, without any bad effect on morals, the vicissitudes of life; and they interest us the more deeply, as they display emotions and passions, of which we have all been conscious. The subjects of the ancient Greek tragedies were too often founded on mere delity, and inevitable misfortunes; and though in the course of the drama, many moral sentiments occurred, the instruction conveyed by the fable of the play was seldom any more than that reverence was owing to the gods, and submifion due to the deities of delity. Besides, their tales about oracles, and the vengeance of the gods, led to many incidents more melancholy and tragic than moral and useful. Modern tragedy has aimed at a higher object. An Othello, hurried by jealousy to murder his innocent wife; a Jaffier, ensnared by repentent and want to engage in a conspiracy, and then flung with remorse, and involved in ruin; a Sifred, through the deceit which he employs for public spirited ends, bringing destruction on all whom he loved; a Calista, induced into a criminal intrigue, which overwhelms herfelf, her father, and all her friends in misery: these, and such as these, are the examples which tragedy now displays to public view; and by means of which, it inculcates on men the proper government of their passions.

The sentimens of a tragedy should be suited to the characters of the persons to whom they are attributed, and to the situations in which they are placed. Moral sentiments and reflections should not occur too often, because they would thus lose their effect, and they would render the play pedantic and declamatory. This is the character, in a great degree, of Seneca’s tragedies. Nevertheless, moral reflections, properly introduced, give dignity to a composition, and, on many occasions, are extremely natural. Much of the merit of Addison’s Cato depends upon that moral turn of thought which distinguishes it. The fyle and verfification of tragedy should be free, easy, and varied. Our blank verse is happily suited to this purpose. The fyle of tragedy ought always to poffefs force and dignity, but at the fame time that ease and brifkness, which are adapted to the freedom of dialogue, and the fluctuations of passion.

Of the Greek tragedy and tragedians we have already given some account. In the compositions of some of the French dramatic writers, particularly Corneille, Racine, and Voltaire, tragedy has appeared with much Iuftrce and dignity. But though they have improved upon the ancients; though they are attentive to all the unities, and to all the decors of sentiment and morality; and though their fyle is generally very poetical and elegant; yet they want fervour, strength, and the natural language of passion; too declamatory, when they should be paffionate; and too refined, when they should be simple. These defects of the French theatre are freely acknowledged by Voltaire. (See their respective biographical articles.) The general character of tragedy in Great Britain, is, that it is more animated and passionate than French tragedy, but more irregular and incorrect, and less attentive to decorum and to elegance. See the biographical articles of Shakespear, Dryden, Otway, Rowe, Young, Congreve, Thomson.

We shall close this account of tragic compositions with the following extract from Dr. Blair’s Lectures, vol. iii.

“An Greek tragedy is the relation of any diftrifful or melancholy incident; sometimes the effect of passion or crime, oftener of the decease of the gods, simply expofed; without much variety of parts or events, but naturally and beautifullly fet before us; heightened by the poetry of the chorus. A French tragedy is a series of artful and refined converfations, founded upon a variety of tragical and interesting situations; carried on with little action and vehemence; but with much poetical beauty, and high propriety and decorum. An English tragedy is the combat of strong passions, fet before us in all their violence; producing deep diftrefs; often irregularly conducted; abounding in action; and filling the spectators with grief. The ancient tragedies were more natural and simple; the modern are more artful and complex. Among the French, there is more correctness; among the English, more fire. Andromaque and Zayre, soften; Othello and Venice Prefered, rend the heart. It deferves remark, that three of the greatest masterpieces of the French tragic theatre turn wholly upon religious subjects: the Athalie of Racine, the Polythee of Corneille, and the Zayre of Voltaire. The first is founded upon an historical
hitorical passage of the Old Testament; in the other two, he differentiates from the zeal and attachment of the principal personages to the Christian faith: and in all the three, the authors have, with much propriety, avoided themselves of the majesty which may be derived from religious ideas."

The English received the first plan of their drama from the French, among whom it had its first rise towards the end of the reign of Charles V. under the title of the chantroyal; which consisted of pieces in verse, composed in honour of the Virgin, or some of the saints, and sung on the flag: they were called by the title chantroyal, because the subject was given by the king of the year, or the person who had borne away the prize the year preceding.

The humour of these pieces took wonderfully among the people, in so much that in little time there were formed several societies, who began to vie with each other in them; and one of these, to engage the town from the rest, began to intermix various incidents or epistles, which they distributed into autos and scena, and had as many different persons as were necessary for the representation.

Their first essay was in the Bourg St. Maur, and their subject the passion of our Saviour. The prévôt de Paris prohibiting their continuing of it, they made application to court; and to render it the more favourable to them, erected themselves into a frawy, or fraternity, under the title of "Brothers of the Passion!" which title has given some occasion to suspect them to have been an order of religious.

The king, on seeing and approving some of their pieces, granted them letters of establishment in 1464, upon which they built a theatre, and for an age and a half acted none but grave pieces, which they called moratiliti; till the people growing weary of them, they began to intermix farces or interludes taken from profane subjects. This mixture of farce and religion displeasing many, they were re-established by an act of parliament in 1548, on condition of their acting none but profane, yet lawful and decent subjects, without intermeddling with any of the mysteries of religion; and thus were the Brothers of the Passion depoited of their religious character; upon which they mounted the flag no more in person, but brought up a new set of comedians, who acted under their direction.

Thus was the drama established, and on this foundation arrived in England. In process of time, as it was improved, it became divided into two branches, agreeable to the practice of the ancients, and the nature of things, e. g. into tragedy and comedy properly so called; and this last again was subdivided into pure comedy and farce. See each under its proper head, Comedy, &c.

TRAGEDY, Hilario. See Hilario-tragedia.

TRAGEIN, in Geography, a town of Austria; 10 miles E.N.E. of Steyregg.

TRAGELAPHUS, in Zoology. See Cerbus and Ovis.

TRAGEN, in Geography, a town of Africa, in Fezzan; 25 miles E. of Mourzouk.

TRAGIA, in Botany, received its name from Plinius, in memory of Hieronymus Tragus, or Jerome Bock, a famous old German botanist, who was both a divine and a physician, and discovered a number of rare plants in Germany, which Haller enumerates, Bibl. Bot. v. 1. 266. He is chiefly known to us by the Latin edition of his herbal, published in quarto by David Kyber in 1552, with a learned historical preface, by his illustrious friend Conrad Gesner. Some of the cuts, often coloured, give a ludicrous exhibition of the medical qualities of the plants, or of some particulars in their history. Tragus died in 1554, aged 56.

Adanfon always called him Le Bouc, as if we were to say in English Mr. He-goat; and would not retain the Linnaean name of the present genus, preferring that used in the Hortus Malabaricus, Scherrigernum, spilling it, by a fatality incident in orthography, to many of his countrymen, Scherigerum, which blunder he seems to have copied from Linnaeus. Nobody has attended to this erudite alteration.

Gen. Ch. Male, Col. Perianth in three deep, ovate, acute, flat, spreading segments. Cor. none. Stem. Filaments three, the length of the calyx; anthers roundish.

Obs. Linnaeus remarks, that Plunier took this calyx for a funnel-shaped monopetalous corolla.

Female, on the same plant, Col. Perianth inferior, in five, sometimes six, deep, ovate, concave, acute, permanent segments. Cor. none. Pf. Germ. Superior, roundish, with three furrows; style one, erect, longer than the calyx; stigma in three spreading segments. Petiole. Capsule of three globular lobes and three cells, brilly, each cell marked at the base externally with a pair of dots. Seeds solitary, globose.

Eif. Ch. Male, Calyx in three deep segments. Corolla none.

Obs. Some species have the style more or less deeply split into three parts.

Tragia is an unsightly genus, with the aspect of a nettle, or a Crotan. The flowers are green and inconspicuous; the herbage mostly hifpid or hairy; the stem either twining, often shrubby and perennial; or erect, herbaceous, with an annual root.

Sect. 1. Stem climbing.

1. T. volubilis. Twining Tragia. Linn. Sp. Pl. 1390. Willd. n. 1. Ait. n. 1. "Trew Pl. Rar. v. 2. t. 15." Lamarck f. 1. (T. ala scandens, urticce folio; Plum. Ic. 251. t. 252. f. 2.) — Leaves ovate, somewhat heart-shaped, pointed, strongly serrated, rather hairy. Foot-flaks brilly above. Segments of the female calyx undivided. Stem twining. — Native of dry, calcareous situations in the Weft Indies, blooming in our flowers in June and July, provided it be admitted there. The stem is round, hairy, leafy, branched, twining from recht to east. Leaves alternate, about two inches long; paler beneath. Flowers axillary; the males in long bracteate clusters; the females solitary, on a long flalk at the base of each cluster. Capsule the size of a large pea. Brown's specimen has the leaf more soft and downy beneath than in the original one from the Upfield garden. Whether the 8 of Linnaeus, Plum. Ic. t. 252. f. 1. be a variety, or a distinct species, we have no means of determining.

2. T. cordata. Heart-leaved Tragia. Vahl Symb. v. 1. 76. Willd. n. 2. (Jatropha pungens; Forl. Egypt.-Arab. 163.) — "Leaves heart-shaped, pointed, serrated; brilly beneath. Segments of the female calyx pinnatifid, hairy. Stem twining." — Gathered by Forskall near Yemen, in Arabia Felix, where it is called Hâreklat, Mehberkia, or Hâm-jia. Vahl says the stem is shrubby, twining, and, like the whole plant, brilly. Leaves paler beneath. Stipula terminal.

3. T. hispida. Brilly Tragia. Willd. n. 3. — "Leaves lancelate;
TRAGIA.

lanceolate, pointed, hispid, nearly entire; heart-shaped at the base. Segments of the female calyx pinnatifid, rough with bristles. Stem climbing. —Native of the East Indies. Leaves on very short, very hispid footstalks, mostly brightly beneath, two inches long, occasionally furnished with an oblong tooth at the base, or near the point. Spike axillary, flaked. Calyx densely covered with white bristles.

4. T. macrocarpa. Large-fruited Tragia. Willd. n. 4. Pursh n. 3. (T. cordata; Michaux Boreae-Am. v. 2. 176.) — "Leaves ovate, sharply toothed, hispid; deeply heart-shaped at the base. Stem twining." —Found by Michaux in Kentucky. Annual, flowering in July. Pursh. Each lobe of the calyx is said to be the size of a large pea.

5. T. villosa. Shaggy Tragia. Thunb. Prodr. 14. Willd. n. 5. — "Leaves heart-shaped, crenate; hairy beneath. Stem climbing." —Gathered at the Cape of Good Hope by Thunberg, who alone appears to have seen this or the next species.

Sect. 2. Stem erect, herbaceous.

The name of urens seems to have remained with this species on the authority of Plukener. Its pubescence appears to be of a very fine kind; nor has any recent botanist attributed it to any flinging property. The herb of the herb is like a Mercurialis. The leaves are from one to two inches long, very variable in breadth; usually deeply toothed, or almost sinuate; rarely linear and entire. Clusters axillary, longer than the leaves. Capules slightly hairy.

13. T. Chamaelea. Lance-leaved Tragia. Linn. Sp. Pl. 1391. Willd. n. 13. Ait. n. 4. Lamarck n. 13. (Chamaelea foliis linearibus, foliis aspicatis, echinato frutet; Burm. Zeyl. 59. t. 250. Cod. avanacu; Rhodee Hort. Mal. v. 2. 63. t. 34.) —Leaves linear-lanceolate, ferrated, obsdite, fringed with close bristles. Stem branched, diffuse. Lobes of the capule toothed at the back. —Native of the East Indies, in gravel places; rare on the coast of Malabar. It was first in 1793 by Dr. Roxburgh to Sir Joseph Banks, and flowered in the rose at Kew, in the middle of summer. The root is annual. Herb twice or eighteen inches high, nearly smooth, and somewhat glaucous. Stems slender, angular, diffuse. Leaves very variable in length and breadth, undivided, entire, curiously fringed with dense, close, white, callous, bristly teeth. Clusters small, pimpled, axillary. The lowest leaves are sometimes nearly orbicular.

6. Croton urens; Linn. Sp. Pl. 1426. (Ricinus urens, cannabinae foliis triphillos; Pluk. Phyt. t. 120. f. 6.) —Leaves deeply three-lobed, or ternate, toothed; the middle lobe longest; ribs most bristly beneath. Stem erect. —Native of the coast of Malabar, in gravel places. A perennial herb, whose foliage bears a considerable resemblance to the Venice Mallow, Hibiscus Triumnum. The lobes of the leaves are obtuse, jagged and toothed, bristly on both sides, but particularly along the ribs and veins beneath the. The footstalks and branches are also bristly. Clusters on long, axillary, very bristly, flaky. Calyx of the fruit pinnatifid, thickly covered, as well as the capule, with pale rigid bristles. When the lobes of the leaves are quite separate to the very base, the plant becomes Croton urens of Linneus; but this affords no permanent specific distinction. Plukener's figures of both varieties are infinitely preferable to Durmarn's plate.

Sect. 3. Stem erect, frutaceous.

prickly.—Native of the East Indies. Commeron gathered it in the Mauritius. The stem is shrubby or perhaps arborescent, with angular branches, finely downy when young. Leaves flat, two or three inches long; their midrib and margin flayed with a vireous red, as are sometimes the fine transverse veins. Stiripatæ rounded. Flowers all axillary; the males in dense spiral spikes, sometimes compound, half the length of the leaves; females solitary, sessile, separate from the males, though sometimes on the same branch. Capsule befit with stout spines.

16. T. marginata. Pale-bordered Tragia. Lamarck n. 10. —Leaves ovate-lanceolate, acute, toothed; finely downy on both sides. Stem erect. Male flowers in axillary cylindrical spikes. Capsule hairy.—Gathered by Commeron in the isle of Bourbon. The young branches are finely downy, as well as the footstalks, spikes, and foliage. Leaves three or four inches long, sometimes more, dilated by a pale marginal discoloration, more or less dilated or limited. Male spikes somewhat flaked, two inches in length. The female flowers we have not seen. The capsule is said to be hairy; its calyx deciduous.

17. T. reticulata. Reticulated Tragia. Lamarck n. 11. —Leaves ovate, obtuse, smooth; reticulated with fine veins beneath. Stem erect. Male flowers in lax, finely downy clusters.—Gathered in the isle of Bourbon, by Commeron, whose specimén is before us, agreeing in every point with the description of M. Poiré in Lamarck, except that the leaves are not crenate, but quite entire. They are an inch or two long, thin, not coriaceous, obtuse at the base, pale and shining at the back. The branches are woody, much divided, round, smooth, scarred with pale warts. Male clusters about the ends of small lateral shoots, somewhat flaked, an inch and half long. Flowers on short, distant, partial spikes, with a little bractea at the base of each. We know nothing of the female flowers, or the capsules.

18. T. irigata. Wand-like Tragia. Lamarck n. 15. Illust. t. 754. f. 2. —Leaves on short stalks, ovate-lanceolate, acute, serrated, smooth. Stem erect. Male spikes axillary, as long as the leaves.—The native country of this species has not been ascertained. We know it only from the materials above cited. The leaves are delineated about an inch long, strongly serrated. If the plate be exact, the female flowers compose a long lax terminal spike, and the segments of their calyx are finely pinnatifid. But of this nothing is said in the description. The male spikes are like those of several preceding species in the present section, axillary, solitary, slightly flaked.

19. T. filiformis. Thread-shaped Tragia. Lamarck n. 16. —Leaves ovate-lanceolate, pointed, smooth, dilately toothed. Stem erect. Spikes thread-shaped. Bracteas of the female flowers rounded, very large.—Described by Poiré from Lamarck's herbarium. We have seen no specimén. The stem is shrubby, with smooth, cylindrical, flattened branches. Leaves thin, an inch or two long, pale green, blunt with a point, smooth on both sides, on almost capillary smooth footstalks, half an inch long, accompanied by falcate bracteas. Flowers in very slender axillary spikes; the male minute, greenish, sessile; females in the lower part of the same spike, accompanied by very large, roundish, smooth, somewhat crenate bracteas, which give this plant the aspect of an Acalypha. Poiré.

We are posséd of several incomplete and undetermined speciméns, which by their habit should feem probably to belong to this last fection, but there being no positive certainty of their genus, we must leave them undescribed.

TRAGIC DANCE. See Emmelia.

TRAGI-COMEDY, a kind of dramatic piece, representing fome action passed among eminent perons, the event of which is not unhappy or bloody, and in which is sometimes admitted a mixture of fels serious characters.

The ancients, M. Dacier observes, knew nothing of fuch compositions, in which the serious and comic are blended; nor does the epître M. Corentin give them, of heroic comedies, exclude their irregularity.

Their foundation is certainly bad; for, endeavouring both to make us laugh and cry in their turns, they endea- vour at contrary emotions, which the heart can never undergo; every thing that disposes for the one, indiposing for the other.

The tragi-comedy was formerly very common on the English stage; there was farce, or a thing in the fever- seventeenth century as a pure tragedy, without a spice of comedy or farce to make the people laugh. Now that the stage and our tale are brought nearer to the model of nature and the ancients, the tragi-comedy is diffused.

Tragi-comedy is the only cafe wherein comedy is allowed to introduce kings and heroes.

TRAGICUS, in Anatomy, a muscle of the external ear. See EAR.

TRAGILUS, in Ancient Geography, a town of Thrace, between the Chersonesus and Macedonia. Steph. Byz.

TRAGIUM, in Botany, a new umbelliferous genus of Sprengel's, separated by him from PLIMPINELLA; see that article. The name is borrowed from Dioscorides, whose TEGNUS appears to belong to our PLIMPINELLA, and has been so denominatod from TEGUS, a goat; because when the wild goats fed upon it, the arrows with which they were wounded would drop out; as Ælian relates of the Cretan Dittany.—Sprengel Prodr. Umbellif. 26.—Clafs and order, Pentandria Digynia. Nat. Ord. Umbellata, Linn. Sect. 5. frutica armata, Sprengel.

The learned author whom we have just quoted, in his new mode of arranging the Umbelliferæ, of which, as well as of other attempts of the fame kind, we propofe to treat hereafter in its proper place, lays considerable stress on the hairy or brilly clothing of the feeds in some species. Such are all separated by him from thofe with smooth feeds, and difposed in different genera, compofing by themselves a particular fection characterized of frutica armata. Among them is TRAGIUM, distinguished from PLIMPINELLA chiefly by the circumstance just mentioned, and the almost total abfence of ribs to the feeds.

Obf. The ftemp, commiffura, is the line by which the two feeds touch each other.

The species enumerated by profefsor Sprengel are

1. T. Colurnna. (Pimpinella Tragium of Villars. See our PLIMPINELLA, p. 4, where notice is taken of the importance of the downief of the feeds, as a foefic distinction; and where for COLUMNA read Colurnna.)

3. T. aromaticum. (P. aromatica; March. a Bieberli. Taur.-Cauc. v. 1. 241.)—"Woely with down. Leaves pinnate; leaflets all wedge-shaped, lineated; with deep fur- ratureis at the extremity."—Native of the borders of woods, and banks of torrents, on the east side of mount Caucaius, flowering in July. Root biennial. Akin to PIMPINELLA Anisum, with which it exactly agrees in the shape and smell of its feeds. But the present plant has all the leaves pinnate and glaucous, more flirightly frisated, or nipped, and the seeds are downy.

4. T. villifimum. (Pimpinella villofa of Schousboe; unknown to us.)

5. T.
5. T. Broteri. (P. bubonoides; n. 5.)

The fruit of this last is much more hairy than that of the first species. On a review of the whole genus of *Pimpinella*, there appears to us not the slightest difference in the form of the seeds, nor in the diffuseness of the ribs in the several species, except that the latter are concealed by the hairs in *P. bubonoides*, though this is by no means the case in *P. Tragium*, whole ribs are more prominent than in any other under our inspection. There seems to be no reason for changing the specific name *bubonoides*, which is singularly expressive of the habit of the plant.

*Tragium Germanicum*, a name given by some authors to the *atriplex alba*, or living orach.

TRAGOI, in Geography, a town of Bulgaria; 24 miles E. of Ternova.

TRAGONELLE, a town of Africa, in the kingdom of Bambouk.

TRAGONERA. See Dragoneera.

TRAGONICE, in Ancient Geography, a town of Aisa, in the interior of the Periade, according to Ptolemy and Ammianus Marcellinus.

TRAGONISI, or Dragonis in Geography, an island in the Grecian Archipelago, so called from the number of goats, which are almost its only inhabitants; 2 miles W. of Myconis, N. lat. 39° 27', E. long. 25° 36'.

*Tragopogon*, in Botany, Goat’s-beard, from *trago*, a goat, and *poos*, a beard, a name adopted from Dioscorides, whose *tragonos* may very well belong to the genus which now bears it. His description applies in every particular to our *T. porrifolius*, except the shortness of the stem. He says it is "an eatable herb, with leaves like Garlic or Saffron, a short stem, a long sweet root, with a large flower-cup on the top of the stalk, and a black, or dark, feed," according to some readings, "of whence," it is observed, "the name is derived." But Scaracenus, the best commentator on this ancient author, instead of καλυξ μυκώς, and κατος μαλακ, would read καλυξ μικρος and κατος μυκώς; for he justly remarks that "a black seed could never have given rise to the name of Goat’s-beard." With this explanation, the dark calyx, and the large pappus, or feed-down, are intelligible enough, as describing the deep purple florets lining the calyx, and the feathery feed-down, of *T. porrifolius*. So Matthias likewise understands the matter. Dr. Sibthorp indeed did not meet with this plant in Greece, and it finds a place in his *Prodr. Fl. Græc.* merely as having been observed by the abbate Seftini, near Constantinople; but it might have been cultivated in Greece, as well as elsewhere.—Linn. Gen. 398. Schreb. 525. Willd. Sp. Pl. v. 3. 1492. Mart. Mill. Dict. v. 4. Sm. Fl. Brit. 812. Prodr. Fl. Græc. Sibth. v. 2. 120. Ait. Hort. Kew. v. 4. 432. Jaff. 170. Lamarcch Illustr. t. 640. f. 1. Geitna. t. 159. T. pratensis.—Clas and order, *Ammi*; Synonym, *Polygama-equis.* Nat. Ord. *Composita*—*Senecio.* Linn. Cibaraceae, Jaff.

3. *T. undulatus*. Wave-leaved Goat’s-beard. *Jacq. Misc.* v. 2. 316. *C. Rar. t. 157*. Willd. n. 2.—Calyx as long as the corolla. Leaves lanceolate, rough-edged; recurved at the point; somewhat ovate at the base.—Supposed to be a native of Siberia, the seeds having been sent to Jacobin by Pallis. We have seen no specimen. The leaves appear to be broader at the base, and less shining, than in the foregoing, and their points rather revolute than falcate. The flowers, which open at sun-rise, and close about ten in the forenoon, for three succedaneous days, are usually whitish; in some individuals rose-coloured, with red stigmas; in others yellow, with purple ones; but these varieties are not common from feed.

4. *T. orientalis*. Oriental Goat’s-beard. Linn. Sp. Pl. 1199. Willd. n. 4. Ait. n. 3. (Barbula hirici; Camer. Epit. 312.)—Calyx shorter than the corolla. Leaves tapering, somewhat wavy, with spiral points.—Found by Tournefort in the Levant, and by Camerarius, as it seem, in Germany. M. Thouin sent feeds to Kew garden in 1787. It is a hardy biennial, flowering, like all the foregoing, in June and July; nor does the plant seem to differ much from the first, or moit common, kind, except in the greater size of its golden flowers, whose marginal florets extend far beyond the calyx.

TRAGOPOGON.

6. T. major. Great Goat's-beard. Jacq. Auct. v. 1. t. 19. n. 6. Wild. n. 4. Marfch. von Bieberlf. Taur.-Caucas. v. 2. 233.—Calyx longer than the corolla. Leaves tapering, straight. Flower-flalks swelling upward. Flores round at the tip.—Native of meadows, vineyards, &c. in Germany and Austria, as well as near Branson, in Switzerland, where it was found blooming in Aug. by the late Mr. Davall, who sent its seeds to Kew in 1788, and whose own specimen is now before us. The gradual dilatation of the flower-flalks upward, the great size of the flowers, at least of their calyx, which extends much beyond the corolla, and consist of a greater number of leaves than the generic character requires, even as many as twelve or thirteen; these circumstances led Jacquin to consider the present plant as a distinct species from T. pratensis, or at least as a remarkable variety. We believe it remains confant from seed. Some of the preceding are but too nearly akin, or this ought to stand next to the pratensis.

7. T. porrifolius. Purple Goat's-beard, or Saffafae. Linn. Sp. Pl. 1110. Wild. n. 7. Fl. Brit. n. 2. Engl. Bot. t. 638. Jacq. 1c. Rare. t. 159. Fl. Dan. t. 797. (T. purpuracae ; Ger. Em. 735. T. alterum ; Matth. Valgr. v. 1. 491.)—Calyx almost twice as long as the corolla. Flores tapering, abrupt. Leaves straight. Flower-flalks swelling upwards.—Native of meadows in Switzerland, Germany, England, and about Conflantimophe, flowering in May and June. Cultivated in the kitchen gardens of the more opulent, the roots being esteemed a delicacy, and known by the name of Saffafae. They resemble Scorzonera hispanica, and have a sweeter delicate flavour, when dressed with cream, but are esteemed chiefly for the sake of variety. This plant having been perhaps more cultivated than fcelent vegetables were fewer in England, has become naturalized in various situations, chiefly of a low or moift description. We have alluded to it above as the true τραγόπογον of the Greeks. The herb is biennial, erect, glaucous, fmooy, four or five feet high. Leaves slightly, or not at all, wavy. Flowers of a violet-purple, with black anthers; they close before noon. Linnaeus, in his Difer- tation on the Sexes of Plants, English ed. 544, relates that he obtained a small plant, by propagating the stigma of T. pratensis with the pollen of the present fpecies. The progeny of the seeds had purple flowers, yellow at the base, evidently of an intermediate nature between the two parents; nor can any thing, as Linnaeus observes, more decidedly vince the generation of plants.

8. T. angustifolius. Narrow-leaved Goat's-beard. "Bel- lardi M.S.S." Wild. n. 8.—"Calyx of eight leaves, longer than the corolla. Leaves ftraight, fmooy."—Found near Nice. Biennial. Like T. cotofolius, but the calyx consists of eight leaves, and the follege is entirely smooth at the base. The ftem is but four inches high. Willdenow. We are not sure whether one of our fpecimens from Dauphiny be referable to this fpecies. It is hardly three inches high; the follege is quite smooth and naked throughout; but the calyx has only fiv leaves. Another from the fame country fens intermediate between it and cotofolius. The fpecies of few genera are lefs satisfactorily defined than thofe of Tragopogon.

9. T. cotofolius. Crecus-leaved Goat's-beard. Linn. Sp. Pl. 1110. Wild. n. 9. Ait. n. 6. Sm. Fl. Grec. Sibth. t. 779, unpublished. (T. cotofolium montanum, flore nigro-purpureo ; Column. Ecphr. v. 1. t. 230.)—Calyx longer than the corolla. Leaves tapering; loosely woolly at the base on the upper fide.—Native of Italy, the south of France, and the ille of Cyprus. Miller is said to have cultivated this fpecies, but we do not remember to have met with it in gardens. The root is tapering and biennial, like all the reft of this fection. The ftem is fcarcly above a foot high, branched, nearly or quite smooth, clothed with numerous, narrow, spreading, drooping, white-ribbed leaves, very remarkable for a quantity of loofe, thagy, cottony wool, about their base on the upper fide, which is sometimes found also on the branches and flower-flalks. Flowers of a violet-purple, with yellow flefts and blackish anthers; their flores more spreading than in T. porrifolius, and their calyx greatly defiexed, twice as long as the corolla, confliting of from five to eight acute leaves. Columna represents five broad ones only ; Dr. Sibthorp found eight, which are narrower. The humble nature of the plant, and its woolly leaves, afford its moft flirting diftincions. The flores are beautifully adorned with ascending fcales, which prevent their escaping, when once lodged in the earth, the agitation of their feathery wings, by the wind, serving only to force them further down, till each wing thrives at its base, and easily breaks off. The fame economy is apparent in other fpecies of this and fimilar genera, but peculiarly admirable in that before us. It is analogous to what has been observed in the firft fpecies of STIPA; see that article.

10. T. villatus. Hairy-Goat's-beard. Linn. Sp. Pl. 1110. Wild. n. 10. Ait. n. 433.—Calyx longer than the corolla. Stem much branched, corymbe, clothed, like the bafes of the ovato-lanceolate leaves, with fhanggy wool. Native of Spain and Siberia; introduced at Kew, in 1794, by Mr. Hunnemann. Root biennial. Herb as tall as T. porrifolius, but the ftem is very much more branched, and more flender, clothed with loofe, fattered, cottony wool, as well as with numerous, fhort, ovato-lanceolate, pointed leaves, thoje about the corymbe upper part of the item measuring from one and a half to two inches in length. Flowers a little drooping, pale yellow, rather smaller than thofe of porrifolius, on cylindrical fluted flalks. Calyx of about nine leaves, nearly half as long again as the corolla. Anthers brownish. Rays of the fcll-drawn rough, very woolly, with long, naked, taper points. This, at leat, is an unquefionably diftinct fpecies.

For Tragopogon virginicum, Linn. Sp. Pl. 1111. (Hysperis pendantis of Willd. Sp. Pl. v. 3. 1615.), as well as the two fpecies of Linnaeus and Willdenow, see TRONISSON.

Other Linnaean fpecies are separated, as we have already faid, into a no lefs diftinct and natural genera, for which we here retain Willdenow's name.

Gen. Ch. G. mmon Calyx limple, of one leaf, ovate, tu- mid at the base, deeply divided into eight equal, lanceolate segments. Cor. compound, imbricated, uniform. Flores numerous, all perfect, of one petal, ligulate, abrupt, with five teeth; their tubes about the length of the calyx. Stem Filaments,
TRAGOPOGON.

Filaments, in each floret, five, capillary, short; anthers united into a cylindrical tube, projecting out of the tube of the floret. *Pill.* German in each floret obovate; style tu-
mid and oblique at the base, with a kind of joint, then thread-shaped, straight, the length of the filaments; stigmas two, revolute. *Peric.?* none, except the permanent closed turbinated calyx, shorter than the feed-down, finally reflexed. *Sched.* tolytic, obovate, oblique, angular, rough, each crowned, at an obtuse angle, with a flalk, various in length, turmid and inflated at the base, bearing the spreading feathery feed-down. *Recept.?* naked, flat, roughish.

Eff. Ch. Receptacle naked. Calyx turbinated, of one leaf, in eight long segments. Seed-down feathery, on an oblique inflated flalk.

1. *A. Dalechampii.* Great-flowered Sheep’s-beard. Willd. n. 1. Ait. n. 1. Sm. Fl. Græc. Sibth. t. 780, unpublished. (Tragopogon Dalechampii; Linn. Sp. Pl. 1110. Hieracium magnum ; Dalech. Hift. 569, bad. H. purpureum, incisus folios, montanum; Bar. Ic. t. 209.)—Calyx finely downy, without bristles. Leaves runcinate, toothed.—Native of Spain, the south of France, Italy, and the Levant. We have seen it, admiring funny hills about Genoa, in the early part of a summer’s day, when its copious large flowers, of a delicate sulphur-colour, purple underneath, make a fine appearance, intermingled with the blue Catanaeche, and other hardy plants, while the great Myrrhobolus libelluloides is seen softly flattering over their blossoms. Miller appears to have cultivated this plant, which is a tolerably hardy perennial in warm dry situations, flowering from June to October, but not often seen in gardens. The *fem* is from two inches to a foot high, purplish at the base, leafy, roughish, as well as the alternate, clasping, runcinate *leaves*, of which the upper ones are obovate, and nearly entire. *Flowers* two inches wide, follicary, on long, very simple, terminal, round, rough, furrowed flalks. Calyx even, covered with peculiarly soft flalks. *Florets* hairy at the back. Stalk of the feed-down tapering, hollow throughout, nearly vertical, about thrice the length of the feed.

2. *A. pereoides.* Prickly-cupped Sheep’s-beard. Willd. n. 2. Ait. n. 2. Sm. Fl. Græc. Sibth. t. 781, unpublished. (Tragopogon pereoides; Linn. Sp. Pl. 1111. Sonchus asper lacinatus creticus; Bauh. Prodr. 60.)—Calyx hifid, with prominent bristles. Leaves divided, toothed; those of the fem oblong, contracted towards the rounded clasping base.—Found on the shores of Montpellier, Italy, and Aifa Minor. Sent to Kew by M. Richard in 1774. Annual, with the habit and flowers of the last, but the *leaves* are very different, at least those of the fem, which, instead of being dilated and deeply jagged, are merely oblong and toothed. The flalk of the feed-down morefeem much shorter, though equally timid at the base. — A. capensis. Cape Sheep’s-beard. Willd. n. 4. (Tragopogon capensis; Jacq. Coll. v. 2. 320. C. Rar. t. 577.)—Calyx hifid, with prominent bristles, and deeply channelled. Leaves runcinate, toothed; the upper ones arrow-shaped at the base, nearly entire. The seeds were received by Jacquin from the Cape of Good Hope, and produced biennial plants, three or four feet high, branched, having much of the appearance of a Sow-thistle, like our second species. But the *leaves* are much lefs dilated at the base, and the calyx is more deeply channelled, having eight timid ribs, or angles. The slender and elongated flalk of the feed-down is very like that species, of which it is possible the present may be but a variety. We know it only from Jacquin’s works.

TRAGOPOGON, in Gardening, contains plants of the hardy, herbaceous, biennial, and perennial kinds, among which the species mostly cultivated are, the purple goat’s-beard, or fafalfe (T. porrifolius); the common yellow goat’s-beard (T. pratenfis); the crocus-leaved goat’s-beard (T. croci-
folius); and the great-flowered goat’s-beard (T. Dalechampii).

The first fort is cultivated in gardens under the name of fafalfe principally for the use of the root parts of the plant and the young shoots. The roots, when boiled or stewed, have a mild sweetish flavour. The flalks are also cut in the spring, when they are four or five inches high, and dressed like alfargan, in which way they eat very tender and well.

Method of Culture.—The first fort is only raised from seed, which should be sown in the spring, in an open situation to remain, either broad-cast and raked in, or in hollow drills eight or nine inches asunder, scattering the seeds thinly, and covering them half an inch deep; and when the plants are come up two or three inches in height, they should be thinned and weeded by hand or the hoe, leaving them eight or ten inches asunder, repeating the weeding as required during the summer, which is all the culture they require, and they will have large roots by the autumn, as September or October, when they may be begun taking up for use; and in November, when the leaves begin to decay, a quantity be preferred in sand for use in time of severe frost, when thoile in the ground cannot be got up.

In the spring, when those remaining in the ground begin to shoot, the shoots, when a few inches high, may be cut for use, which, when quite young and tender, on being boiled, are excellent eating. A few plants should be suffered to run up to flalk every spring, to produce seeds.

The shoots are brought to market in bunches during the autumnal and winter seasons.

The two following forts may also be raised from seed in the same way, and the plants, when a little advanced in growth, be planted out if they are required for variety in any particular part.

The third fort may also be propagated by parting the roots in autumn and spring, and planting them where they are to remain.

The first is cultivated wholly as a culinary plant, but the others afford variety in the borders of pleasure-grounds, &c.
TRAGORCHIS, in Botany, from τράγος, a goat, and Orchis, see that article, has been used by several old authors to designate certain species of that beautiful and curious tribe, whose flowers were thought to have a goat-like scent. Two in particular have thus been called; the Satyrium hircinum of Linnaeus, now Orchis hircina, and his Orchis coriophora.

TRAGORIGINUM, from τράγος, a goat, and ὄρχις, marjoram, is a name applied by the older botanists to several plants, mostly belonging to our present genus ORIGANUM, which may be found in its proper place, or to some aromatic plants allied thereto. The original meaning of the word was founded in the idea of Marjoram being agreeable to goats, and especially of the Cretan Marjoram, or Dittany, being a sovereign remedy for such as were wounded by arrows. Tragyrganum natum, Baffard Goat-marjoram, Dalechamp Hill. 889, has indeed no connexion or affinity with other plants that bear this name, being the Lithospermum Fruticosum, whose leaves only possess a slight resemblance to the ringent plants, without any of their flavour or qualities.

TRAGOSELINUM, from τράγος, a goat, and σέλινος, parley, a name first used by Tabernaemontanus for the Pimpinella Fagrinago of Linnaeus, which some have called Traganum; see that article and Tragus.

TRAGULÉA, among the Romans, a strong kind of javelin, with a barbed head.

TRAGUM, in Ichthyology, the name given by Arilitote, and others of the old Greek writers, to the tragum of Atheneus, Athenaeus, and Oppian. Both names are used to express the fish called by authors the poixinaeux marinus, and by us the fire-fly, or fire-fly.

TRAGURIUM, in Antiquity Geography, a town of Dalmatia, famous for its marble. Pтолем.,

TRAGUS, a river of the Peloponnesus, in Arcadia. Pausanias.

TRAGUS, in Anatomy, an eminence of the external ear. See EAR.

TRAGUS, in Botany, a name which has been variously applied. One ῥυγός, of Dioscorides, book 2. chap. 115, appears to be a kind of meal or flour. Hence perhaps Haller was led to use this name for a genus of griffles, now denominated Lepisorus; see that article. Such an application is like the old derivation of lucus, "a non lucendo" few of the tribe being likely to yield lefs meal. Another τραγος of the above Greek author, book 4. chap. 51, is described by him as a "maritime shrub, of humble growth, without leaves, whose branches are beset with a kind of reddish berries, the size of grains of wheat, pointed, and very alringent." Whether this may be the Ephedra, or any thing else, it is difficult to determine. Valerius Cordus thought it Sedum album, which is a common Greek plant. We might rather indicate S. anglicum, that were found in Greece, the leaves, in both cafes, being taken for herbs. Camerarius gives Salsula Kali for the plant of Dioscorides, annexing an abstract of his description of its form and qualities, the former of which, at least, does not agree with this Salsula; any more than with S. Tragus, so called by Linnaeus, apparently beacuse the name was at hand when he was intent on distinguishing it from S. Kali; see Amoen. Acad. v. 4. 310. We collect these particulars to shew the difficulty of the enquiry, as well as its inutility. Dioscorides is amusing enough, as a botanical riddle-book, because, while some of his descriptions are elaborate and precise, others are just sufficiently vague to afford room for conjecture. Theophrastus, though far more philosophical, is in but a few instances clearly intelligible. The greater number of his plants are merely named, as being supposed well-known to his readers, and therefore he scarcely affords matter to found any conjectures upon.

TRAHINA, in Geography, a town of Sicily, in the valley of Demona; 28 miles N.W. of Catania. N. lat. 37° 40'. E. long. 14° 40'.

TRAHONA, a town of Italy, in the Valteline, on a small river which runs into the Adda, 2 miles N. of Morbegno.

TRÁJAN, M. Ulpius Trajanus, in Biography, a Roman emperor, the son of a distinguished commander under Veprian in the Jewish wars, was born at Italica in the Spanish province of Barcina, entered betimes into the army, and accompanied his father in several military expeditions; acquiring the hardiness, submitting to the discipline, and uniformly practicing the duties of a soldier. In the career of public honour, he was first made prætor A.D. 86, consul A.D. 91, and raised by Nerva to the rank of Caesar A.D. 97, being at this time in the 42d or 43d year of his age, according to the statements of different writers, and poising a majestic figure, manly features, and dignified aspect. Upon the death of Nerva in the following year, Trajan succeeded, without opposition, to the imperial throne. He was at this time at Cologne, and remained for some time in Germany. In 99 he set out for Rome, and entered the city on foot preceded by the lieutors as an ordinary magnificer, and followed by a few soldiers exhibiting the demeanour of citizens. Affable in his manners, bountiful in his largesse to the Roman people, and anxious to procure a supply of corn by allowing free importation from the colonies, Trajan acquired and maintained a very great degree of popularity. He likewise very much contributed to the tranquillity and good order of the city, by removing to exile the infamous tribe of delators, who had been encouraged by the tyranny of Domitian, and not sufficiently repressed by the lenity of Nerva, and by infusing an edict with some penalties against all false accusers. He also reduced the tax of the twentieth upon collateral successions, imposed by Augustus, and formed a fund for the exercise of liberality by his own economy and frugality. He encouraged merit, and advanced to posts of public service those who had distinguished themselves in the public wars, in the public service, and in the public war, and in the public service, and in the public service.
dered important and interesting, by the appointment of Pliny, A.D. 103, as governor of Pontus and Bithynia, and by the correspondence to which this appointment gave occasion, and which pourtrays in the most pleasing characters the enlightened and benignant spirit by which he was actuated. (See Christian Religion and Pliny.) In the following year the war with Decebalus was renewed, and on this occasion Trajan constructed a bridge over the Danube, which was long admired as one of the most considerable relics of antiquity. When Decebalus had dispatched himself after the loss of his capital, Dacia was constituted a Roman province, and colonized from other parts of the empire. (See Dacia.) Upon his return to Rome, he employed himself in carrying on some works of public magnificence and utility: but successes in his military expeditions unfortunately confirmed the innate propensity of war, which seems to have been his most consumable foible; and accordingly the subsequent period of his reign was too ardent devoted to the gratification of his ambition, in extending the boundaries of the Roman empire. In the year 187, he reduced Armenia into a Roman province; the whole of Mesopotamia was also subdued; Arabia Petraea was likewise made a Roman province; and all the barbarous tribes situated north of Armenia, between the Euxine and Caspian seas, were reduced to submission. After the lapse of some years, of which no regular account remains, we find Trajan, A.D. 114, dedicating the magnificent forum, which he had constructed at Rome, and erecting the column on which his exploits are sculptured (see Column and Forum); and also renewing the war with the Parthians. In 115 he crossed the Tigris on a bridge of boats, and subdued Adiabene and the whole of Assyria; and having captured Ctesiphon and Susa, he defended the Tigris with his fleet, and had the honour of being the first and last Roman general who navigated the Indian ocean, ravaging the coast of Arabia Felix. He even indulged the ambition of visiting India. On his return he laid siege to Atra, the capital of an Arabian tribe, which he was obliged to raise and to withdraw to Syria. In the year 117 he was attacked with a paralytic disorder, attended with dropsy, and he therefore hastened his return to Italy. At Selinus in Cilicia he had another attack, which proved fatal. In his last moments, the empress Plotina secured the adoption of Adrian for his successor. Trajan died in the sixty-fourth year of his age, after a reign of nineteen years and a half, and his remains were deposited under his own column. This emperor's virtues were shamed by weakneſs and vices. His passion for war had been already mentioned; he was also addicted to sensual indulgences, of which intemperance in drinking was the least scandalous. Notwithstanding the blemishes of his character, his memory was long held in veneration, insomuch that 250 years after his death, the senators, in their acclamations on the choice of a new emperor, vociferated the wish that he might be "more fortunate than Augustus, and better than Trajan." Anc. Un. Hift. Crevier's Rom. Emp.

Trajan Column, a famous historical column, erected in Rome, in honour of the emperor Trajan. See Column, Colossal.

Trajan, in Geography, a town of European Turkey, in Moldavia, on the Pruth; 16 miles N. of Galatz.

Traiana, or Trea, in Ancient Geography, a town of Italy, in the interior of Picenum. Ptol. and Itin. Anton.

Trajanopolis, in Geography, a town of European Turkey, in the province of Romania, on the Mariza. This is an ancient town, and took its name from the emperor Trajan, who repaired and adorned it; it afterwards became very considerable, and now, though much reduced from its ancient splendour, is still the see of a Greek archbishop; 40 miles S. of Adrianople.

Trajanopolis, in Ancient Geography, a town in the interior of Thrace, upon the banks of the river Hebrus. In the Itin. Anton. this town is placed between Brizezes and Cypfsela. Allo, a town of Mythis, near the sea, between Antandrus and Adramyttium. Allo, a town of Apha, in Cilicia Trachea, where the emperor Trajan died: the name with Solumine.

Trajanopolis, or Transpolis, a town of Apha, in Phrygia Pacatiana.

Trajanus Portus, a port of Italy, on the coast of Etruria, at the mouth of the Tiber; constructed by the emperor Claudius, and repaired by Trajan, who rendered it more secure and commodious, and gave it his name.

Trajectory of a comet, is its path or orbit, or the line it describes in its motion.

This, Inelius, in his Cometographia, will have to be very nearly a right line; but Dr. Halley concludes it to be a very eccentric ellipsis.

Sir Isaac Newton, in prop. xli. of his third book, shews how to determine the trajectory of a comet from three observations; and, in his last proposition, how to correct a trajectory graphically described. See Comet.

This term is often used, in general, for the path of any body moving either in a void, or in a medium that refits its motion; or even for any curve passing through a given number of points. Thus Newton, Princip. lib. i. prop. 22. propodes to describe a trajectory that shall pass through five given points.

Trajectum, in Ancient Geography, a town of the Batavi upon the Rhine. Trajectum is thought to be one of the fifty mansions erected by Drusus in this country, to afford security to the course of its rivers. This place sustained a variety of vicissitudes, till at length it was established by the Romans. It had the name of Trajectum Ulpii, in honour of Ulpius Trajan. In its environs are found many ancient remains. See Utrecht.

Trajectus, a place in the ile of Albion, upon the route from Calleva to Icē, between Abone and Aquae Solis. Anton. Itin. Antiquaries are generally of opinion, that Trajectus should have been placed before Abone, and that it was situated at Oldbury, where, as they suppose, was a ferry over the Severn; but Mr. Horley imagines that Trajectus was situated at the passage of the Avon, near Henham, 9 miles from Bath.

Trajetto, in Geography, a town of Naples, in the near the mouth of the Garigliano, the see of a bishop, built on the ruins of the ancient Minturnae; 6 miles S.W. of Sezza.

Traguera, a town of Spain, in Valencia; 12 miles N.W. of Penifcola.

Trail-Boards, in Ship-Building, a term for the carved work between the cheeks of the head, at the heel of the figure.

Trailing Arbutus, in Gardening, the common name of a curious ornamental plant. See Epigaea.

Train, the attendance of a great person, or the trail of a gown, or robe of flate.

In Falconry, it denotes the tail of a hawk.

Train is likewise used for the number of beats which a watch makes in an hour, or any other certain time. See Watch-word.

Train is also used for a line of gunpowder laid to give fire to a quantity thereof, in order to do execution, by blowing up earth, works, buildings, &c.

Train or Train of Artillery. See Artillery.
Train-Bands, or Trained-Bands, a name given to the militia of England, particularly to those of the city of London.

Train-Oil, the oil procured from the blubber of whales, by boiling. See Whale and Whale-FISHERY.

Train-Roads, a flight kind of rail-ways for small wagons, used in mines.

Train-Scents, in the Manager, a method of trying the speed and goodness of the horses assigned to the sport of hunting, io denominated because the scent which the hounds hunted, proceeded from some animal which had previously been trained along the fields and over hedges and ditches, according to the pleasure of the person who trained or dragged it after him. The rival horses were to follow the hounds which hunted this scent, and give proofs of their speed and merit, in competition with one another. Of all chances this was reckoned the twiftest and most trying, because the scent lies the bottom; so that the hounds run all the time at the utmost stretch, and the horfes must have been exerted to their utmost powers to keep pace with them.

Behind, in this manner of hunting, the sport was always ready when a fox or hare might not easily be found; and this mode of matching and running hunters, in order to try their speed against one another, while they followed the dogs, was thought to be more pleasing both to the riders and horses, than to make them run simply against one another, or against time, as the present practice is. When neither the hunting of the hare, nor the running of the trains, could not decide which horse is the best, recourse was had to another kind of chase, called by horfemen the wild-goofe chase or chace. See Chase.

Train, in Geography, a river of France, which runs into the Dyle, about 9 miles S. of Lovain.—Also, a town of Bavaria, on the Ambs; 5 miles S. of Abenberg.

TRAINA, a town of Sicily, in the valley of Demona, on a river of the same name; 56 miles S.E. of Cefalu.

Trained Trees, in Gardening, such young fruit-trees as are designed for walls and espaliers, being trained in the nursery to the intended form, by planting them against any kind of walls, pales, reed-hedges, or other close fences; when a year old from the grafting or budding, training them in the manner of wall or espalier trees, for two, three, or more years, till they obtain a good spread of branches, and are arrived to a fruitful late, in order that those who are in haste to have their walls or espaliers covered at once with bearing trees, may have it accomplished in one season. The trees thus trained in the nursery, &c. on being planted out in autumn or spring to the places intended, cover the wall or espalier in some manner at once, and often bear fruit the ensuing summer, when the feason proves favourable for the purpose.

In the public nurseries, large quantities of these kinds of trees are always kept ready trained for ale, particularly peaches, nectarines, and apricots for walls; in many places also, cherries and plums, &c. likewise apples, pears, and other fruit-trees, for espaliers; and are proper to furnish the walls and espaliers of new gardens, and occasionally those of old ones, to bear fruit till younger trees, trained untrained, become fruitful, or for supplying the places of old trees that fail, or bear bad fruit. In all cases of this sort, this mode of planting may often be adopted with great propriety and benefit, and besides much time and trouble be saved by it, in waiting for the trees to become in a bearing late, as well as the expense which is constantly incurred in carrying on the operations and procures of preparing young fruit-trees. The difference in the prices of trained trees over those of untrained ones is a mere trifle, and of no consideration in such undertakings. Therefore, in all nurseries some of the best kinds of these trained fruit-trees, both for walls and espaliers, may be kept ready for these purposes with great utility and advantage.

When, of course, it is intended to raise trained fruit-trees for walls and espaliers, a quantity of the best young plants of the respective sorts, dwarfs and half-standard, of one year old, with the first shoots from the budding and grafting entire, should be planted out in autumn against some kind of fence in a free open situation, not less than four or five feet high, placing them from five or six to eight or ten feet distant, to remain for training. These in the spring following, just as they begin to make an effort for shooting, should be headed down, with a clean sloping cut upward, to within four, five, or six eyes or buds of their origin, or place of infection in the stock, especially those intended for dwarfs, and the half-standard, if worked on tall stocks; which prevents their running up too high with a single naked stem, and causes them to throw out lateral shoots from the lower part to fill the wall or espalier regularly with branches quite from the bottom upward; as they soon after push forth strong shoots from all the remaining lower buds, sufficient to give the tree its first proper formation as a wall-tree, &c.; which shoots, when advanced in length in summer, should be trained along to the fence equally to the right and left, in a somewhat slanting or inclined position at full length till next spring, when these shoots may also be cut down to the length of six or eight inches, to force out a further supply of more branches near the bottom, as it is proper that they should be well furnished with branches below, in order to cover the wall, &c. at the bottom part, that none of it may be left or left in an uncovered state. The summer shoots should be shortened in this manner; more or less the two or three first springs, as may be necessary, in order to obtain a proper spread of lower branches to give the tree its intended form; though this work of cutting in short to obtain laterals, may also be performed occasionally in summer, in May or early in June, on the strong young shoots of the year, cutting or pinching them down to a few eyes; but the first is the best mode. This last mode, by forcing out lateral shoots the same year, often saves time.

As the supply of branches thus obtained arrive at proper lengths, in the summer they should be all trained in along close to the wall, and if any fore-right or back shoots come out, they should be rubbed off close, leaving all the well-placed side and terminal shoots in every part, and letting the whole, or as many as possible, be trained in during this season, to have a plenty to choose from in the general pruning seasons of winter and spring, laying them in close to the wall, &c. equally to the right and left, on each side of the tree, in a spreading somewhat horizontal or fan-like manner, no where crossing one another but at parallel distances, and mostly all at full length during the summer's growth, to remain till the general winter or spring pruning.

In the winter pruning, where more wood was trained up in summer than appears necessary, or that can be trained in with due regularity, it should be retrenched, as well as any remaining fore-right or back shoots and other irregular growths omitted in the summer, be now all pruned out, cutting them quite close to their origin. The whole should then be close-nailed to the wall, in somewhat the same manner, removing in the first place all the irregular side and other shoots of the different branches before they are laid in and nailed. See PRUNING.

Having thus procured proper heads, they should afterwards be pruned or cut in according to the method peculiar to
to each respective fort, as directed under the culture, some requiring the branches to be shortened annually, others to be mostly trained at full length. See Dwarf and Espalier Trees, Pruning, &c.

The training of espalier trees is effected exactly in the same manner, only these may be trained as they stand in the nursery lines, in the open quarters or borders, &c., by ranging some stout stakes in the ground along one side of each tree, not in a continued straight line immediately the way of the row, but those of each tree ranged separate and obliquely, somewhat crosways the row as it were, that the branches of the different trees may range beside one another, and thereby have more room to extend the branches both ways, than the common distance in the nursery lines would admit, if ranged directly the way of the row.

It may be noticed, that occasionally it may happen that some particular trained trees of both the wall and espalier kinds may assume in the course of their training a state of extremely vigorous and luxuriant shootting and growth either in the whole of them, or in some particular parts, by which very strong rampant, rude shoots that have a peculiar unfruitful-like nature and appearance are sent forth, which in all such cases and circumstances should be ordered and directed in a particular manner, according to their nature and situation, until they have in a great measure exhausted their too great abundance or redundance of sap which caused their excessive luxuriancy, and then begin to take on a more moderate state of shootting and growth. In consequence of which, therefore, wherever there appears to prevail a general luxuriant and excess of growth in the whole trees, or parts of them, while under the course of training, or afterwards, it will be advisable to use proper and necessary caution in the work of pruning, employing the knife in rather a moderate manner in the way of thinning out and shortening the branches, and in some degree humouring, as it were, the trees in their natural tendency of shootting and growth, by leaving the young shoots and branches thicker and closer together than what is the common rule in all such cases, the whole being left at their full lengths particularly during their summer's growth; and to all those which are usually shortened in their winter pruning, as in the peach, nectarine, and other similar sorts of trees, they should be shortened much less in proportion than the other kinds; but those of the apple, pear, plum, cherry, and others of the same sorts, should always be continued at their whole length; that, on the whole, by thus dividing the sap-juice among a greater number, as well as larger extent of branches, that luxuriancy may be checked which would take place in the case of a smaller number and less extent of growth. As, in general, the more wood can be cut out of a vigorous shootting tree, and the more the shoots are shortened, practices which are erroneously too frequently had recourse to, the more vigorously it will continue to shoot, without ever becoming properly fruitful; and if severe cutting-in be repeatedly practised and continued, the tree will often exhaust itself so greatly by its luxuriant shootting, that it suddenly becomes in a weak, imperfect, and decayed state of growth. But, on the contrary, if the natural inclination of the very vigorous-shootting young trees be somewhat consulted and indulged, in the first instance, by training in as many branches as can be conveniently had for the purpose, and those which require shortening, be cut in moderately only, or some which are very luxuriant hardly at all, and these methods continued to be practised for two or three years with proper dierenion, the trees will be gradually reduced to a moderate state of growth, and good condition of bearing, after which they may be managed and directed in the common way which is proper for each of the different sorts.

And, on the other hand, such trees as are only vigorous in particular shootings, may, in some cases, have such shoots radically retrenched, but in others referred; and if a very vigorous shoot runs considerably stronger than all the rest, and seems to support its vigour at the expense of the others in its vicinity, it should be retrenched to its very origin as early in the summer as it is perceived; in other cases, if a luxuriant shoot arises in any vacant space, especially towards the bottom part, where a supply of more wood is wanted, it may be retained, and pinched off or topped down in a few weeks in the late spring or beginning summer months, when it will send out several lateral shoots below, the fame seafon, and instead of one rude luxuriant shoot, there will probably be four, five, or more of a moderate state to fill the vacancy in a more effectual manner, and which will much sooner attain the state of fruitfulness.

The trees having been thus in training in the nurseries for the space of three, four, or five years, they will have obtained a handsome spread of fruitful branches famed in the regular proper and necessary forms for the different purposes which are intended, so as that when planted out, they may at once cover a large space, and become quickly fruitful and productive. The particular method of culture which is proper for each of the sorts, is more fully given in speaking of them individually under their several heads.

But it may be remarked that, in general, unless good trained trees can be readily obtained, of from three or four to five or six years old, of a clean free growth, it will be better to plant entire young untrained trees of one or two years old, immediately from the nursery, putting them at once where they are to remain, managing them afterwards as the trained trees, to give them the proper form of head.

Some, in order to have as great a chance as possible, plant young untrained trees to remain, and trained trees of a bearing state, dwarfs and half-standards between, to cover the wall more effectually at once, and furnish a supply of fruit, until the young ones are trained and arrive at the bearing state; then, according as the trees of both sorts advance in that state of growth, those which appear the most promising are retained, and the others are gradually cut away, leaving the more thriving trees to occupy the wall wholly at last.

In most of the public nurseries, they raise trained trees for sale, which occupy all their clofe fences of walls, pales, &c. where they may be procured of almost any size, differing in price from three to five or ten shillings or more per tree, according to the sorts, age, and goodness of growth.

TRAINEL, in Geography, a town of France, in the department of the Aube; 6 miles S. of Nogent fur Seine.

TRAINING, in Planting and Gardening, the practice of regulating the forms and growth of forell and fruit trees, by the proper lopping and retrenching of their side or other branches in the first kind, and by the cutting-in and distribution of their shoots and branches in the latter. What is principally necessary in the management of the former of these sorts of trees, in this respect, has been already pointed out under the heads to which it properly belongs. See Pruning and Timber.

And in regard to the latter, or garden kinds of trees, it has been remarked, that when by fixtures it is properly a practice much connected with that of pruning, and which is employed, either for the purpose of protecting exotics of the tender fruit-tree kinds from the wind, for improving their climate by spreading them in a regular manner upon a wall or fence, or for supporting climbing or trailing
trailing plants. In the first case, it is performed in a great
variety of modes and manners, according to the nature and
kind of support which is made use of for the purpose. In
the second intention too, it is done differently, as the cir-
cumstances may be, and mostly against walls, as in the fan
and horizontal modes; the former of which is said to be
calculated for fonnell covering the walls, and to be likewise
the most proper for such kinds of trees as do not abound in
superfluous wood, as the cherry, peach, and apricot.
The latter mode, however, is said to fill the walls more com-
pletely, though longer in accomplishing the businets; and
to be the best fitted for such trees as run much to wood, as
is the cafe with many apple and pear trees. See thefe
different sorts of trees.

In the work of training for the support of climbing
plants, nature fhould, it is supposetl, be imitated as nearly as
possible. That with the kinds which twine round other
trees or supports, or that fall themselves to walls, nothing
more is thought necessary, than to put them on similar ob-
jects which are within their reach; but that with others,
which support themselves by claspers or tendrils, it is re-
quite to fallen them by art when these claspers fail; which,
in nature, is commonly the second year; when the whole
turning frab or climber falls down, or hangs by its latt-
formed tendrils in fuch a manner, as that its fhoots are
bent, twifled, or inclined in almost every direction. This
is the cafe with many forts of tree plants, such as vines,
apfion-flowers, and others, and strongly fuggets the ad-
vantage of training fuch kinds in a twifled or ferpentine
manner; as nothing can be more unnatural than to train
them in an upright mode, as is too commonly done with the
firit of these fhoots, where set againft the back wall of hot-
houses, &c. In training them along a treill, under the
floping glafs of fuch fhoots, they are faid to be in a more
natural situation, and are more likely to fend out fhoots, or
to break, as it is often termet, at every joint; but till ex-
perience has, it is thought, proved the falt advantage of
training in a ferpentine or twining direction in every sit-
uation.
In a great many houfes of the above fort in all
parts of the country, nearly two-thirds of the crops which
might annually be produced, are, it is fuppofed, loft for want
of attention to this circumstance. And, that as the practice
is natural, uniformly fuccefsful, fo far as it has been yet
tried, and without injury, it ought to be more generally had
recourse to in the businets.

Great udes and benefits are capable of being taken of
the fame principle in the training of other forts of trees; as
whenver the fap is contrained by twifling a fhoot or
branch, it is fure at fuch places as are most bent, or which
have most of the angle of the curve, to fend out a fhoot,
as has been well noticed, illustrated, and taken advantage of
by both ancient and modern writers on horticulture. See
Hitt's and Forthly's Treaties on Fruit-Trees, &c.

In the training of fruit-trees, few who have been engaged in
the work have, it is fuppofed, fully uniforderd or fufficiently
avoided themselves of the advantages which might be taken
of this general law in vegetable economy, that the extreme
branches bent downward, or the extreme roots turned up-
ward and exfosed to the air, throw the tree more or les into
a fruiting state. It has lately, however, been done by
turning the branche of fuch trees over the tops of walls,
or in other modes, with allfounding effects in the production
of fruit. The great effects of this fort of training are evi-
dent too in many other infances, where beds, twills, and
downward directions are given to fhoots and branches by
different circumstances in the obiects to which they are
trained. The powerful and excellent effects of cutting the
roots of trees either at some distance from or near to the
chief ftem, as well as thoef of cutting the item itself, in
order to throw them into a fruiting condition, have, it is
faid, been fully recorded by former writers on gardening,
and been recently prafticed with complete success. See
Espallier Trees, Pruning, Trained Trees, and Wall-

TRAINING, or TRACING, in Mineralogy, a term used
by our miners to exprfes the tracing up of the mineral ap-
pearances on the surface of the earth to their head or ori-
ginal place, and there finding a mine of the metal they
contain: or, tracing or tracing a lode, denotes the fame
with backing of it; that is, laying open the bryle, and
discovering the back of the lode, by many pits for feve-
ral fathom in length, ealt and weft. The bryle of a
lode, is that mineralized fubfiance which lies loofely upon
the top of it under the loose mould and rubbish of the earth.
The principle on which this practice depends, is the
change wrought in the face of the earth by the deluge, of
the effects of which thofe remains are a very great proof.
The superficial or upper part of veins, or lodes of ore, is
always the poorer, the richer ores lying deeper down, the
poor ones only serving to lead the way. Thofe poor ores,
or flones impregnated with the metalline matter of the mine,
and cailed by our workmen fhoad-stones, were, probably,
at the creation of the earth, brought regularly up to the
surface, and threw the place of the metals below. But at
the time of the covering of the earth by the waters of the
deluge, they were, with the reft of the surface, washed off,
and carried with the defcent of the water down into the
plains, or into the beds of rivers, and there carried many
miles down the fream. This being an allowed truth, the
art of training a mine is easy; for though this carrying of
the fhoad-stones and poor ore was done fo many ages ago,
yet all the way that fome pieces were carried on, others
would be depofited by the way, and the heaviest and richest
falling firft, the lightest would always be carried farthest,
and there would be always left a fream of the matter all
the way from the place where it was firft produced, that
is, where the mine now is: for the breaking of the surface
of the earth at this great catafrophe was not fo deep as to
reach that, and this fream or train of matter will be found
richer and richer as it approaches the mine, and finally will
flop at the place where it is.

Where there is fuppofed to be a mine of any metal, the
hills and country abut all are diligently fearched; the situ-
ations and defcent of the lands, and the earth, flones, and other
folid bodies, are examined, particularly the colour and na-
ture of the various forts of earths and flones which are
found on the hills where the mine is fuppoted to be, that
they may be readily known again if any of them are found
in the neighbouring valleys. The flones which denote the
lodes, and are called fhoad-stones, are found two, three,
four, or even five miles from the hills where they originally
lay; but if the fame fort of flones are remembered on the
hills, the train is to be made out. After any great land-
flood, in which it is fuppofed there are usually fome new
crets made in the banks of the rivers, there are carefully ex-
amined, to fee whether any metalline flones may be found
in their fides and bottoms, all being then fcoated, that the
smallest fhoad-stone may ufually be fett. If no flones of
this fort are found, it is fuppofed the mine is of lfe, in order to far-
ther rearches, to examine whether any pieces of earth, of a
different colour and nature from that of the reft of the bank,
be found; for thefe being, if any fuch are found, washed also from the neighbouring hills, afford a great di-
rection which fide of the hill to search into.
If no flode-stone or grew of a different nature from the reef be found in these frets or newly worn banks, the miners leave the place for the present. For though the bed of the river afford many metallic stones, they never regard them, the continual change of place they receive from the current of the water rendering them only tokens that there is metal somewhere in the country; but they confound and perplex rather than instruct in the search after the places where it is.

If there be found indeed stones of the flode-kind, full of protuberances, or having sharp angles, as if newly broken, it may be worth while to see whether they are not washed out of some part of the neighbouring banks by the late floods; as this sort of appearance is a token of their having been newly taken into the bed of the river. But if they are rounded and smooth, it may be concluded they have been long subject to the action of the water, and brought, perhaps, many miles from the places where they were originally lodged in the earth, and where only they could have been of any use to the tracers of the mine.

When the frets in the sides of rivers have been traced in vain, the searcher after a mine goes up to the sides of the hills most suspected to have mines in them, and there seeks for a convenience of bringing a little stream of water to run down. When this is found, he cuts a trench about two feet over, and as deep as the shelf. The water is turned into this cut, and after two or three days running in it, all the silth will be washed away, and the loose part of the earth cleared off; and if any flode-stones are lodged within the whole course of this cut, they will be found. If any such are found, it is an unquestionable proof that there is ore in the higher parts of the hill; this encourages the work, and there is always found a mine, or at least a squat, which will, without much danger, repay the expense and trouble. The squats are flat parcels of the ore, lying in different and different places of the hills, and not communicating with one another.

Sometimes a great deal of this labour is saved, and the flode-stones are found on the surface of the ground, either turned up by the plough, or thrown up in small quantities in mole-hills, or raised by some other accident, for they are seldom found naturally lying on the very surface of the earth; for the putrid remains of vegetable and animal substances, and other adventitious matter, has raised the surface of the earth in all places, since the time of the flood, and made indeed a sort of new surface. These stones were certainly laid bare on the surface of the ground, at the time of their being carried down from the mines; but this adventitious matter has buried them in this long tract of time, and they are generally found under about a foot of a sort of vegetable mould. If, by any of these searches, a fossil is found, the miners have nothing to do but to follow it to its head, and there make the opening; but if no such direction can be had, nor any fossil found, and there is yet suspicion that there is a mine in the hill, the method is to make an effay-hatch, as it is called: this is sunk near the foot or bottom of the hill, and is an opening of about six feet long, and four feet broad, made in search of a vein as deep as the shelf; this is a caution that must be always carefully observed, for if they are made less deep than this, they may miss of the vein, though there is one. And the shalling thus deep is always attended with certainty, for if no fossil is found on this, it may be concluded there is none there; except that sometimes it is found that the flode has been washed clean away, within two or three feet from the land; and then the lode or vein is two feet farther or thereabouts up in the hill. If any flode is found in the

---

If no flode-stone or grew of a different nature from the reef be found in these frets or newly worn banks, the miners leave the place for the present. For though the bed of the river afford many metallic stones, they never regard them, the continual change of place they receive from the current of the water rendering them only tokens that there is metal somewhere in the country; but they confound and perplex rather than instruct in the search after the places where it is.

If there be found indeed stones of the flode-kind, full of protuberances, or having sharp angles, as if newly broken, it may be worth while to see whether they are not washed out of some part of the neighbouring banks by the late floods; as this sort of appearance is a token of their having been newly taken into the bed of the river. But if they are rounded and smooth, it may be concluded they have been long subject to the action of the water, and brought, perhaps, many miles from the places where they were originally lodged in the earth, and where only they could have been of any use to the tracers of the mine.

When the frets in the sides of rivers have been traced in vain, the searcher after a mine goes up to the sides of the hills most suspected to have mines in them, and there seeks for a convenience of bringing a little stream of water to run down. When this is found, he cuts a trench about two feet over, and as deep as the shelf. The water is turned into this cut, and after two or three days running in it, all the silth will be washed away, and the loose part of the earth cleared off; and if any flode-stones are lodged within the whole course of this cut, they will be found. If any such are found, it is an unquestionable proof that there is ore in the higher parts of the hill; this encourages the work, and there is always found a mine, or at least a squat, which will, without much danger, repay the expense and trouble. The squats are flat parcels of the ore, lying in different and different places of the hills, and not communicating with one another.

Sometimes a great deal of this labour is saved, and the flode-stones are found on the surface of the ground, either turned up by the plough, or thrown up in small quantities in mole-hills, or raised by some other accident, for they are seldom found naturally lying on the very surface of the earth; for the putrid remains of vegetable and animal substances, and other adventitious matter, has raised the surface of the earth in all places, since the time of the flood, and made indeed a sort of new surface. These stones were certainly laid bare on the surface of the ground, at the time of their being carried down from the mines; but this adventitious matter has buried them in this long tract of time, and they are generally found under about a foot of a sort of vegetable mould. If, by any of these searches, a fossil is found, the miners have nothing to do but to follow it to its head, and there make the opening; but if no such direction can be had, nor any fossil found, and there is yet suspicion that there is a mine in the hill, the method is to make an effay-hatch, as it is called: this is sunk near the foot or bottom of the hill, and is an opening of about six feet long, and four feet broad, made in search of a vein as deep as the shelf; this is a caution that must be always carefully observed, for if they are made less deep than this, they may miss of the vein, though there is one. And the shalling thus deep is always attended with certainty, for if no fossil is found on this, it may be concluded there is none there; except that sometimes it is found that the flode has been washed clean away, within two or three feet from the land; and then the lode or vein is two feet farther or thereabouts up in the hill. If any flode is found in the
each tide, being the lefser or concomitant veins. Five in the
same manner sometimes lie in this order, the grand lode in
the middle and two on each side; but the more common
method is three, a large one, and two smaller.
Every lode has a peculiar coloured earth or green about it,
which is found aloft with the shod, and this always in a
greater quantity the nearer the shod lies to the lode, and
becomes lessened by degrees to the distance of about a
quarter of a mile, farther than which that peculiar green is
never found in any quantity with the shod; so that this is
a proof that the lode or vein is near, when it is found in
any quantity.
A valley may chance to lie at the foot of three several
hills, in such a manner as to contain three several greets, or
that earth which was moved with the shod in the concussion
of the strata at the deluge, with as many different shods or
trains of shod-roles in the midst of each: in this case it will
be very necessary to know the caln of the country, and of
each hill in respect to its green, for the purer training of
them one after another as they lie in order: according to the
foregoing rules of eflay-hatching, the uppermost in this case
always directs which hill to begin with first.
It sometimes happens, that after having trained the shod
found in a valley up to the upper parts of a hill, there is only
a fquit, or boney, found instead of a right vein of ore; for
these detached parcels of ore have their shods as well as the
right veins. These are usually about two or three fathoms
long, and a fathom broad, few of them are larger, most large,
and they never communicate with any other lode or vein, nor
ever send forth any of their own. The extremities of these
beds of ore terminate without sending out any frings, not
lying within walls as the lodes; but though they are in the
shelv or fad ground, not moved by the flood, their surface
is equal every where: with that of the imaginary fheely one,
and they go down five or six fathoms deep, and there termi-
nate at once. The ore contained in these is rich, and they
are always wrought out to the conderable advantage of the
owners.
These are the general rules of tracing mines, and though
somewhat tedious and expensive, they are certain, and never
subject to the error and disappointment the other shorter
ways, as they are called, are liable to. These short ways are by
the virgula divinatoria, or the hazel-wood, whose bending in cer-
tain places without any external visible force, is to point out
where the place the vein of ore lies; the waters thought
to effuse from the particular lodes are also used by fome as a short
means of finding the veins; other of these ways aro also by
mineral streams and effluvins, by the barrenefs of the foil,
and the pifting of nofturnal lights on the fuppofed or-
fees of mines. But these methods are too exaevant or too
uncertain to be used in cafes of fo much conféquence.
Another way of discovering lodes, is by working drifts
acros the country, as it is called, that is, from north and
forth, and vice verfa.
When the mine is found by the more certain rules of
tracing, the digging of it is a matter of lefs difficulty. Phil.
Cornub. book iii. cap. 1.
Trains of Cattle, in Agriculture, the practice of taming
and breaking in oxen and other neck cattle for the purpofe of
team-labour. It is performed in many different ways in
different districts and places; but principally by boys gradu-
ally accoufmifying them to be led by means of a halter or
ropne, and then ufing them to travel in other forts of teams after
the yoke or halter has been put on and rendered familiar to
them; when afterwards they may be wrought in the plough-
teams with the old laburing oxen, being placed between
them both before and behind, and with such as are not too
free workers. See TEAM, Yoke, and YORK.
TRAISENDORF, in Geography, a town of Germany,
in the principality of Cumbach; 5 miles N.E. of
Bayreuth.
TRAIT, Fr. Traiti, is the name of an ancient musical
character, called likewise in old Latin treatises, plica;
which fee.
TRAIT, or Tedia, in Geography, a town of Romania, on
the Mariza; 12 miles S.W. of Filippopolis.
TRAITOR. See Traitor.
Traitor's Cove, in Geography, a harbour on the west
coast of the island of Revilla Gigedo, in the North Pacific
ocean; so called by captain Vancouver, from the circum-
fance of being attacked, and two of his men wounded,
by the natives of this place. N. lat. 55° 42'. E. long.
228° 31'.
Traitor's Head, the north-east point of Erromango,
one of the New Hebrides, so called by captain Cook in 1774,
from the treacherous conduct of its inhabitants. S. lat.
18° 43'. E. long. 106° 28'.
Traitor's Islands, a cluster of small islands, in a bay of
the Pacific ocean, on the coast of New Guinea. S. lat.
1° 12'. E. long. 132°.
Traitor's Island, an island in the Pacific ocean, di-
covered by Le Maire and Schouten in 1616, and so called
from an attempt made by the natives to seize the vessel. M.
Peroufe discovered this island to be divided into two parts,
by a channel about 150 toises wide. It belongs to the
Friendly islands, and is called by the natives Neota-boots-
boo; 16 miles from mount Cocos. N. lat. 15° 55'.
W. long. 173° 48'.
Traitor's Island. See Keppel's Island.
TRAITTE. See Foreign Traitee.
TRALEE, in Geography, a pott-town in the county of
Kerry, Ireland, pleasantly situated at the bottom of Tralce
bay, on the banks of the river Lee. It is the shire and affize
town of the county; was incorporated in 1612 by James I.;
and sends one member to the imperial parliament. There
were formerly four strong castles erected in this town, of
which only one remains, which was the chief residence of the
Defmond family, in which they exercised the feign jurifdiction
during the continuance of the Pale nation. Tralce bay is fhal-
low and unsafe, and therefore not much frequented. Near
the town is a chalybeate spring, which is drunk medicinally
with success. Tralce is 1448 miles S.W. by W. from
Dublin, and 48 S.W. from Limerick.
TRALLEBOE, a sea-port town of Sweden, in the
province of Skone, near the Baltic; 19 miles S. of Lund.
N. lat. 57° 20'. E. long. 13° 54'.
TRALLIES, BALTHasar-LEWIS, in Biography, an
eminent physician, was born at Breilau in 1708, and
having studied medicine at Hall under Frederic Hoffman,
settleed in his native city, where he gained great reputation.
His works were numerous and valuable, and caused him to be
admitted into the Imperial Academy at Vienna, and the
Royal Society of Berlin. But his most celebrated work was
that on opium, entitled "Uges Opii fablbris et novitius
in Morborum Medica, solides et certis principis superfruc-
tus," 1757-1762, 2 vols. 4to. He also published a treatise
against the materialism of La Mettric. He declined, in
1767, accepting the offer of Dril physician at Warsaw to
Standehus, king of Poland, partly on account of his advanced
age, and principally from his attachment to the reformed
religion. Halier, Eloy.
TRALLIA, called also Troaldida, in Ancient Geo-
ography, a country of Illyria.
TRALLIANA, in Botany, was so named by Loureiro, from whom alone we have any knowledge of this genus, in memory of Alexander Trallianus, a celebrated physician and naturalist, whose works are said by De Theis to have been published at Paris in 1548, and reprinted by Haller in 1748. He wrote a letter on insectum worms, which is mentioned in Dryander's Bibl. Banks. v. 2. 356; but we find no traces of his botanical information. Loureir. Cochinch. 157.—Clafs and order, Pentamnia Monogynia. Nat. Ord. Menifjirma. Julf?

Gen. Ch. Cal. Perianth inferior, of five short, rounded, permanent leaves. Cor. Petals five, oblong, spreading, reflexed, longer than the calyx. Nectary large, erect, with ten notches. Stam. Filaments five, short, inserted into the receptacle; anthers roundish, of two cells. Pet. German superior, roundish; stipe the length of the stamina; stigma (simple?) Peric. Berry roundish, of two cells, with two seeds, which are angular on the inside, rounded externally.

E. Ch. Petals five, oblong, reflected. Nectary with ten notches. Calyx inferior, of five leaves. Berry of two cells, with two seeds.

1. T.ficandus. Cay râc of the Cochinchinèse.—Found running up all kinds of trees in Cochinchina. Stems numerous, shrubby, long, climbing, without thorns or prickles; their branches copious, jointed. Leaves alternate, roundish-heart-shaped, pointed, crenate, smooth. Clusters lateral, forked, each on a long commonstalk. Flowers of a whitish green.

TRALLIANUS, in Biography. See Alexander TRALLIAN.

TRALLICON, in Ancient Geography, a town of Afa Minor, in the vicinity of Caria, watered by the river Harpalus.

TRALIS, or Tralles, a town of Afa Minor, in the interior of Lydia, which, according to Strabo, was rich and populous, and strongly fortified by nature. According to Plutarch, here was a temple of Victory. The town had been denominated Antha, Eutania, Seleucia, and Antiochia.

TRALOS-MONTES, in Geography. See TRASOS-MONTES.

TRAM, in the Silk Trade. See SILK.

TRAM—Road, the name with RAIL—Road; which fee.

TRAMACASTREL, in Geography, a town of Spain, in Aragon; 12 miles S.S.E. of Albarazin.

TRAMAND, a town of Brazil, on a river of the same name, which runs into the Atlantic, S. lat. 27° 15'.

TRAMARICUM, in Ancient Geography, a place of Africa Propria, upon the route from Carthage to Alexandria, between Scina and Aubboorn, Ant. Itin.

TRAMAYE, in Geography, a town of France, in the department of the Saone and Loire; 9 miles W. of Macon.

TRAMAZA, a town of Sardinia; 8 miles from Oristagni.

TRAMBLING of Tin-Ore, among Miners, is the washing of it very clean: which is done with a shovel, and in a frame of boards. See T'ix.

TRAMIN, in Geography, a town of the county of Tyrol, on a small river which runs into the Adige, 8 miles S.S.W. of Bolzano.

TRAMIS, a word used by some medical writers, to express the line running along the middle of the ferotum from the penis to the anus.

TRAMMEL, an instrument or device, sometimes of leather, more usually of rope, fitted to a horse's legs, to regulate his motion, and form him to an amble.

It is also taken in many places for an iron moveable instrument in chimney's, to hang pots over the fire.

TRAMMEL-Net, or TRAMEL, is a long net with which to take fowl by night in champaign countries, much like the net used for the low-hill both in shape, size, and meshes.

The word comes from the French tremal, formed of the Latin tremalum or tremulum; of trees and nuda, because it is composed of three rows of meshes.

To use it, they spread it on the ground, so as the nether or farther end, fitted with small plumbets, may lie loose thereon: then the other part being borne up by men placed at the fore-ends, it is thus tralled along the ground. At each side are carried great blazing lights, by which the birds are railed; and as they ride under the net, they are taken. See LARK.

TRAMMELLED, in the Manager. A horse is said to be trammelled, that has blues and white marks upon the fore and hind-foot of one side; as the far foot before and behind. He is so called, from the resemblance the white foot bears to a half-trammel.

TRAMMELLED-Forfe, Crofs, is one that has white marks in two of his feet that stand crofs-ways, like St. Andrew's crofs; as in the far fore-foot and the near hind-foot, or in the near-foot before and the far-foot behind.

TRAMMELS, in Mechanics, an instrument so called by the joiners, and used by them for drawing ovals upon boards. One part of it consists of a crofs with two grooves at right angles. The other is a beam carrying two pins which slide in these grooves, and also the describing pencil. All the engines for turning ovals are constructed upon the same principles with the trammels: the only difference is, that in the trammels the board is at reft, and the pencil moves upon it: in the turning engine, the tool, which supplies the place of the pencil, is at reft, and the board moves against it. See Decription of the principal properties of these instruments, by Mr. Ludlum, in Phil. Trans. vol. lxx. part ii. p. 378, &c.

TRAMONNEL, in Geography, a town of France, in the department of Mont Blanc; 14 miles W. of Chambery.

TRAMONTANE, or TRAMONTAIN, formed from the Italian tra, of the Latin trans, which signifies beyond; and non or mont, mountain; something beyond, or on the farther side, the mountains.

The term is particularly applied, by the Italian painters, to all such as live on the other side the Alps, i.e. all out of Italy: as the Germans, Flemifh, French, &c.

The French lawyers give the same title of tramontane, or ultramontane doctors, to the Italian canonists, Gomez, Holfiems, Panorm, &c. who go upon rules and maxims too favourable to the court of Rome, and contrary to those of France, &c. On the Mediterranean, and in Italy, a north wind is called tramontane, a tramontane wind.

Some also call the pole-star, tramontana. Hence the proverb, to loft the tramontane, that is, to be out of one's aim, to be difconcerted.

TRAMORE, in Geography, a small port-town of the county of Waterford, on a bay of the same name, where there is a very fine strand, from which it takes its appellation. It has a handfome market-houfe and assembly-room, and is much frequented for sea-bathing. It is 82 miles S.S.W. from Dublin, and about 6 S. from Waterford.

TRAMUTUL, a town of Naples, in Bafilicata; 13 miles S.S.E. of Potenza.

TRANADUXTA, in Ancient Geography, a town of Hifpania, in Beticca, in the country of the Betuli, between Meirala and Barbeofa. Potelmy.

TRANCALUT, in Geography, a town of France, in the department of the Aube; 9 miles S. of Nogent fur Seine.
TRANCHE, or Tranchet, is used by the French
armourers, to express that manner of partition called among
us, party per bend dexter.

A fauchetoon is said to be tranche cut, when it is divided in
two diagonally, the division coming from the dexter angle
of the chief to the sinister angle of the point. When it is
divided contrariwise, it is said to be taile, or party per bend
sinister.

TRANCHEFILE, in the Maems, the crois chain of a
bridle, that runs along the bit-mouth, from one branch to
the other.

TRANCOSO, in Geography, a town of Portugal, in
the province of Tra-os-Montes. In the beginning of the
17th century, Albacon, a Moorish king of Badajoz, laid
siege to this town, and perjured with great obstinacy, till
the inhabitants were driven to the last extremity, but were
relieved by king Alphonfo Henriquez, who defeated the
Moors with great slaughter; 9 miles W. of Pinhel.

TRANE, a town of Sweden, in the province of Skone;
9 miles W. of Christiansland.

TRANEKAR, an ancient fortress of Denmark,
in the island of Langeland.

TRANEMO, a town of Sweden, in the county of
Skane; 46 miles E.S.E. of Gothenburg.

TRANENT, a market-town in the presbytery and shire
of Haddington, Scotland, is situated on the eastern side of
a narrow valley, 10 miles E. from Edinburgh, and 380 miles
N. by W. from London. It was anciently called Tree-ar-
rient and Travernent, signifying the habitation in the vale.
The church is an ancient incommodious fabric, of a very
peculiar form. On the outside, it appears to consist of
three separate oblong houses; but when entered, is found
to be only one building. A square tower rises from the
centre, supported by the side-walls of the middle building,
and by crofs arches. Two weekly markets are well sup-
plied with butcher's meat. The parifh of Tranent extends
about six miles in length, and three miles in breadth, and is
divided by the great cafl road into two nearly equal parts.
It comprises the villages of Cockenzie, Port Seaton, Seaton,
St. Clement's Wells, and Welter Falfide. The surface is
level and well cultivated. The coaf abounds with oyster-
beds, but they are nearly exhausted by over-dredging.
Coal is abundant, and is worked at three collieries to a great
extent. At Cockenzie is a great manufacturé of common
fatt; and at St. Clement's Wells is the most confiderable
fifillary in Scotland. According to the population return
of the year 1811, the inhabitants of this parish were 2356,
occupying 649 houses. Here is a parochial school, with a
salary to the maller of 300 marks and perquisites: here are
also seven other schools. After the reformation, the parifh
of Seaton was annexed to that of Tranent; but it was re-
duced in 1666, by making the baronies of Prellon-Grange
and Prellon-Pans a new parifh, under the name of Prellon.
In 1695, the parifh of Tranent was further diminished, by
the north-east corner of it being annexed to the new parifh
of Glades-Muir. In 1493, a collegiate church was founded
in the village of Seaton, by George, lord Seaton, which is
still nearly entire. The molf ancient edifice in the parifh
is that of St. Germans, now the seat of David Anderson, eqq.
where an hospital was founded previous to the year 1296.
It was afterwards possessed by the Knights Templars; and
after its suppreffion, was granted in 1494, with molf of its
revenues, by King James IV., to the King's College of
Aberdeen. The battle of Prellon, in 1746, was fought
partly in this parifh.—Beauties of Scotland, vol. i. 1805.
Chalmers's Caledonia, vol. ii. 1810. Carlile's Topo-
ographical Dictionary of Scotland, 1812.

Vol. XXXVI.

TRANFRANT, a town of Algiers, near the coast;
30 miles S.W. of Oran.

TRANG, a river of Lower Siam, which runs into the
Indian sea, N. lat. 7°. E. long. 69° 33'.

TRANANGO, a town of Afia, in the kingdom of Jo-
hore, near the fea, on the side of a river, which has a shallow
bar and several rocks scattered about. There are about
1000 houses; 110 miles N. of Pahang. N. lat. 5° 30'.
E. long. 104° 15'.

TRANGARDE, a town of Hindooftan, in the county of
Calicut; 8 miles N.E. of Paniany.

TRANJE, in Heraldry, the diminutive of a felle,
cornerly called a bar.

TRANI, in Geography, a city of Naples, and capital of
the province of Bar; the see of an archbishop, and residence
of the governor; 21 miles W. of Bar. N. lat. 41° 19'.
E. long. 16° 28'.

TRANKEY, a name given in the island of Carrick,
near the Persian shore, to a veffel about the fize of a Peter-
boat, sharp at both ends. It is built of very rough pieces
of wood, rudely put together, and covered over with a thick
coat of bitumen, with which the country abounds. These
veffels fail with great speed with either end foremost, having
no diſtribution of head from stern. The island of Carrick is
about twelve miles long and benv broad, and contains be-
tween 600 and 700 inhabitants. It abounds with goats, but
has very few cows, and no beafts of prey; nor are there any
fowls, tame or wild, except firk and turtle-doves. It pro-
duces few vegetables, but has wheat, rice, and barley,
though not in fufficient quantity for the inhabitants, whole
food is fish, with which they are plentifully supplied from
the vicinity of the island. Here is also very fine turtle, but
not eaten by the natives.

TRANQUEBAR, in Geography, a fea-port town of
Hindooftan, in the country of Tanjore, situated on the
coff of Coromandel, with a harbour, at the mouth of one
of the branches of the Cauvery, defended by a fortrefs,
erected by the Danes in the year 1621, who had obtained
a grant of the town, and a fertile territory, from the rajah
of Tanjore, for an annual rent of about 720l. In the be-
ginning of the preffent century, the prince of Tanjore at-
temted to feize on Tranquebar, and began a regular fiege;
but by the affiftance of the English, he was compelled to
give over the attempt, and make peace. The town is be-
tween two and three miles in circumference, and surrounded
with a wall and several balifons, well provided with artil-
illery; within the walls are three Christian churches, one
of which is for Roman Catholics, defendants of Portuguese
in poftiffion of the town before the Danes: a large moftage
for the Mahometans, and several pagodas for the Gentoons.
The territory belonging to the town is confiderable, and is
full of populous villages; 56 miles S. of Pondicherry. N.
lat. 11° 3'. E. long. 79° 54'.

TRANQUILITY, a town of New Jersey; 8 miles
S. of Newtown.

TRANQUILLO, a cape at the south end of the island
of Rhodes. N. lat. 36° 21'. E. long. 27° 28'.

TRANS, a town of France, in the department of
the Ille and Vilaine; 6 miles S.E. of Dole.

TRANSCACCO, a town of Naples, in Abruzzo Ultra;
8 miles S. of Colano.

TRANSACTION, Transactio, in the Civil Law,
an accommodation of some bimelines or dispute between
two parties, by a mutual and voluntary agreement or contract
between them.

TRANSACTIONS, Philosophical, are a kind of journal of
Transcendental Quantities, among Schoolmen. See Quantity.

Transcendental Quantities, among Geometricians, are indeterminate ones; or such as cannot be expressed or fixed to any constant equation. Such is a transcendental curve, or surface.

M. Leibnitz has a dissertation in the Acta Erud. Lipf. in which he endeavours to shew the origin of such quantities; viz. why some problems are neither plain, solid, nor sur-solid, nor of any certain degree, but do transcend all algebraical equations.

He also shews how it may be demonstrated without calculus, that an algebraic quadratrix for the circle or hyperbola is impossible: for if such a quadratrix could be found, it would follow, that, by means of it, any angle, ratio, or logarithm, might be divided in a given proportion of one right line to another, and this by one universal construction; and consequently the problem of the section of an angle, or the invention of any number of mean proportions, would be of a certain finite degree.

Whereas the different degrees of algebraical equations, and therefore the problem, understood in general of any number of parts of an angle, or mean proportions, is of an indefinite degree, and transcends all algebraical equations.

Transcendental Curves, in the Higher Geometry, is such a one as cannot be defined by any algebraical equation; or of which, when it is expressed by an equation, one of the terms is a variable quantity. See Curve.

These curves are the same with what Descartes, and, after his example, several others, call mechanical curves, and which they would have excluded out of geometry; but for Isaac Newton and M. Leibnitz are of another sentiment. For, in effect, in the construction of geometrical problems, one curve is not to be preferred to another, as it is defined by a more simple equation, but as it is more easily described than that other. See Geometrical Line.

And some of these transcendental or mechanical curves are found of greater use than all the algebraical ones together, except the circle.

Add, that M. Leibnitz, in the Acta Eruditor. Lipf. gives us a kind of transcendental equations, by which these transcendental curves are actually defined, and which are of an indefinite degree; that is, are not always the same in all the points of the curve.

Whereas algebraists use to assume some general letters or numbers of the quantities sought, in these transcendental problems; M. Leibnitz assumes general or indefinite equations for the lines sought; e. g. putting $x$ and $y$ for the absciss and ordinate, the equation he uses for a line sought is $a + bx + cy + dx + ey = f$, &c. = 0. By the help of which indefinite equation, which in reality is finite, for it may always be determined how far forever it is necessary to raise it, he seeks the tangent; and comparing that which results, with the given property of tangents, he finds the value of the assumed letters $a, b, c$, and thus defines the equations of the line sought.

If the comparison above mentioned do not proceed, he pronounces the line sought not to be an algebraical, but a transcendental one.

This supposed, he goes on to find the species of transcendence; for some transcendals depend on the general division or section of a ratio, or upon the logarithms, others upon the arcs of a circle, and others on more indefinite and compound inquiries.

Here, therefore, besides the symbols $x$ and $y$, he assumes a third, as $e$, which denotes the transcendental quantity; and
and of these three forms a general equation of the line
fought, from which he finds the tangent according to the
differential method, which succeeds even in transcendental
quantities. What he finds he compares with the given pro-
properties of the tangent, and so discovers not only the value of
\( a, b, c, \) &c. but also the particular nature of the tran-
scendental quantity.

And though it may sometimes happen that the several
transcendents are so to be made use of, and these of dif-
ersent nature, too, one from another; also, though there
be transcendents, or transcendentials, and a progression of
thee in infinitum; yet we may be satisfied with the most
easy and useful one, and for the most part may have re-
course to some peculiar artifices for shortening the calculus,
and reducing the problem to as simple terms as may be.

This method being applied to the busineses of quadratures,
or to the invention of quadratrices, in which the property
of the tangent is always given, it is manifest not only how
it may be discovered, whether the indefinite quadrature may
be algebraically impossible, but also how, when this impos-
ibility is discovered, a transcendental quadratrix may be
found; which is a thing which had not before been shown.
So that it seems that geometry is by this method carried in-
finitely beyond the bounds to which Vietr and Descartes
brought it; since, by this means, a certain and general
analysis is established, which extends to all the problems
which are of no certain degree, and consequently not com-
prehended within algebraical equations.

Again, in order to manage transcendental problems
(wherever the busineses of tangents or quadratures occurs)
by a calculus, there is hardly any that can be imagined
shorter, more advantageous or universal, than the differential
calculus, or analysis of indivisibles and infinites.

By this method we may explain the nature of tran-
scedental lines by an equation. Let \( a \) be the arc of
a circle, and \( x \) the vered sine; then will
\[
a = \frac{\int f dx}{\sqrt{2x - x^2}}
\]
and if the ordinate of the cycloid be \( y \), then will
\[
y = \sqrt{2x} - x + \frac{\int f dx}{\sqrt{2x - x^2}}
\]
which equation perfectly ex-
preffes the relation between the ordinate \( y \) and the abscissa \( x \);
and from it all the properties of the cycloid may be demon-
strated.

Thus is the analytical calculus extended to those lines
which have hitherto been excluded, for no other cause but
that they were thought incapable of it.

TRANSOLATION, in Pharmacy, the same with
filtration, or percolation.

TRANSCRIPT, a copy of any original writing, par-
icularly that of an act, or instrinent, inserted in the body of
another.

In this sense we say, transcript of a fine, &c. See Fine
and Duplicate.

TRANSCRIPTO recognitionis falsely coram justitiariis
inunicatibus, &c. in Law, is a writ for certifying a recog-
nizance into chancery, taken before the justice in eye.

TRANSCRIPT petitus facti levandi mitten in cancellarius, is
a writ for certifying the foot of a fine levied before justices
in eye, &c. into chancery.

TRANSEAT, in the Schools, &c. a term purely Latin,
figurifying, let it pass, or suppose a proposition to be true,
without granting it.

Hence the proverb, transeat, Gratex om b, non legitur: the
phrase is said to have taken its rise from some ancient com-
mentators, or glossographers of the civil law, who, not
understanding Greek, paffed over all the words that oc-
curred in that language, without explaining them.

In the Roman chancery, a nil transeat is a kind of oppo-
sition made to the sealing of a bull, or to the delivery of
some other instrument, till the parties, against whose interest
it is directed, have been heard against it.

TRANSELEMENTATIUN, a change of the ele-
ments or principles of one body into those of another.

Such is that which Roman Catholics contend for in the
eucharist, where the elements of bread and wine, they say,
are changed into those of flesh and blood. See Transub-
stantiation.

Transformation, wherever it happens, is always allowed
miraculous, or an effect beyond the ordinary powers of
nature.

TRANSEPT, the cross aisle, extending from north to
south across the nave and main aisles of our ancient churches.
In some churches, as in the cathedral of Salisbury, there is
a double transept, which makes it resemble an archepisco-
cal cross in its ichnography.

TRANSFER, in Commerce, &c. an act by which a
person surrenders his right, interest, or property, in any
thing moveable or immoveable, to another.

The sale or donation of an inheritance, &c. transfers the
property, rights, &c. of it.

The term is principally used, in the commerce of flocks,
for the affigning and making over of subscriptions or shares
therein to such as purchase them of the proprietors. In the
South Sea Company, the Bank, East India, &c. transfers
are made by entering the flock under the name of the pur-
chaser under his proper letter of the alphabet.

A counterfeit, in this case, is by act of parliament made
a capital crime.

TRANSFIGURATION, among Divines, that mira-
culous change wrought by Jesus Christ, in presence of
St. Peter, St. James, and St. John, on mount Tabor,
where he appeared in his glory, in company with Moses
and Elias. See the description of it in St. Matthew,
chap. xvii.

The term is also applied to a feast held in the Romish
church on the 6th of August, in commemoration of that
miracle.

TRANSFORMATION, a metamorphosis, or change
of form.

The chemists have been a long time seeking the tran-
formation of metals, that is, their transmutation, or the
manner of changing them into gold.

Among the mythics, by transformation is understood
a change of the contemplative soul, by which it is in some
measure defined, or converted into the subsistence of God,
and in which it is, as it were, both loosed and swallowed up
in the divinity, so as not to perceive its own differentiation
from God.

The word transformation is very liable to be abused:
but many of the mythics use it innocently enough; meaning
no other by it than what St. Paul did, Vvivo ego, jam non
ego, vivi vero in me Christus.

Transformation is also sometimes used for what we
more properly call transubstantiation.

Transformation of Equations, in Algebra, is a method
of changing equations into others of a different form, but
of equal value. This operation is necessary in order to
prepare equations for a more easy solution. We shall sub-
join some examples of the most common and useful kind
under this head. The affirmative roots of an equation are
changed into negative roots of the same value, and vice
versa, by only changing the signs of the terms alternately,
beginning with the second.

Thus,
Thus, the roots of the equation \( ax^4 - x^3 - 19x^2 + 49x - 30 = 0 \) are \( 1, +2, +3, -5 \); whereas the roots of the same equation having only the signs of the second and fourth terms changed, \( a'x^4 + x^3 - 19x^2 - 49x - 30 = 0 \) are \( -1, -2, -3, +5 \).

If it be required to transform an equation into another that shall have its roots greater or less than the roots of the proposed equation by a given difference, the method is as follows. Let the proposed equation be the cubic \( px^3 + qx - r = 0 \); and let it be required to transform it into another, whose roots shall be less than the roots of this equation by some given difference \( \delta \), i.e., suppose \( y = x - \delta \), and consequently \( x = y + \delta \); then, instead of \( x \) and its powers, substitute \( y + \delta \) and its powers, there will arise this new equation.

\[
(A) \quad y^3 + 3\delta y^2 + 3\delta^2 y + \delta^3 - p'y^3 - 2p'y y - p^2y + q'y + q\delta = 0;
\]

whose roots are less than the roots of the preceding equation by the difference \( \delta \).

To find an equation whose roots shall be greater than those of the proposed equation by the quantity \( \delta \), suppose \( y = x + \delta \), and \( x = y - \delta \), and the equation will have this form.

\[
(B) \quad y^3 - 3\delta y^2 + 3\delta^2 y - \delta^3 - p'y^3 + 2p'y y - p^2y + q'y - q\delta = 0.
\]

If the proposed equation be in this form, \( px^3 + qx - r = 0 \), then by supposing \( x + \delta = y \), there will arise an equation agreeing in all respects with the equation \( (A) \), but that the second and fourth terms will have contrary signs.

\[
(C) \quad y^3 - 3\delta y^2 + 3\delta^2 y - \delta^3 + p'y^3 - 2p'y y + p^2y + q'y + q\delta = 0.
\]

By supposing \( x - \delta = y \), there will arise an equation agreeing with \( (B) \) in all respects, but that the second and fourth terms will have contrary signs to what they have in \( (B) \) as:

\[
(D) \quad y^3 + 3\delta y^2 + 3\delta^2 y + \delta^3 + p'y^3 + 2p'y y + p^2y + q'y + q\delta = 0.
\]

Hence we see how the second or other intermediate term may be taken away out of an equation; for, in the equation \( (A) \), whose second term is \( 3\delta - p \times y^2 \), if we suppose \( \delta = \frac{1}{2}p \), and consequently \( 3\delta - p = 0 \), the second term will vanish. In the equation \( (C) \), whose second term is \( -3\delta + p \times y^2 \), supposing \( \delta = \frac{1}{3}p \), the second term also vanishes. But the equation \( (A) \) was deduced from \( px^3 + qx - r = 0 \), by supposing \( y = x - \delta \), and the equation \( (C) \) was deduced from \( px^3 + qx - r = 0 \), by supposing \( y = x + \delta \), whence may be deduced the following rule for exterminating the second term out of any cubic equation; viz. add to the unknown quantity of the given equation the third part of the co-efficient of the second term with its proper sign, viz. \( \frac{1}{3}p \delta \), and supposing this aggregate equal to a new unknown quantity \( y \). From this value of \( y \) find a value of \( x \) by transposition, and substitute the value of \( x \) and its powers in the given equation, and there will arise a new equation wanting the second term.

E.g. Let the equation be \( x^3 - 9x^2 + 26x - 34 = 0 \); suppose \( x = 3 = y \), or \( y + 3 = x \), and substituting according to the rule, we shall have,

\[
\begin{align*}
y^3 + 9y^2 + 27y + 27 & \quad - 9y^2 - 54y - 81 \\
+ 26y + 78 & \quad = 0,
\end{align*}
\]

or

\[
y^3 - y - 10 = 0, \text{ an equation wanting the second term.}
\]

If the equation proposed be of any number of dimensions \( n \), and the co-efficient of the second term with its sign prefixed be \( -p \), then supposing \( x - \frac{p}{n} = y \), and \( x = y + \frac{p}{n} \), and substituting this value for \( x \) in the given equation, there will arise a new equation that shall want the second term; whence the second term may be exterminated out of any given equation by the following rule. Divide the co-efficient of the second term of the proposed equation by the number of dimensions of the equation; and affixing a new unknown quantity \( y \), add to it the quotient having its sign changed; then supposing this aggregate equal to \( x \), the unknown quantity in the proposed equation; and for \( x \) and its powers, substitute the aggregate and its powers, and the new equation will want its second term.

Let the proposed equation be a quadratic, as \( x^3 - p \times x + q = 0 \); then suppose \( y + \frac{1}{2}p = x \) according to the rule, and substituting this value for \( x \), we shall have,

\[
\begin{align*}
y^3 + py + \frac{1}{4}p^2 & \quad - py + \frac{1}{4}p^2 \\
+ q & \quad = 0.
\end{align*}
\]

Having found the value of \( y \), that of \( x \) may be had by means of \( y + \frac{1}{2}p = x \); e.g., since \( y^3 + q - \frac{1}{4}p^2 = 0 \), \( y^3 + \frac{1}{4}p^2 - q \), and therefore \( x = y + \frac{1}{2}p \) or \( x = y + \frac{1}{2}p \), an equation shall arise having no second term. And if the proposed equation is of five dimensions, we must suppose \( x = y + \frac{1}{3}p \), &c. It is plain, that in a quadratic equation wanting the second term, there must be one root affirmative and one negative, and thee must be equal to one another. In a cubic equation wanting the second term, there must be either two affirmative roots equal, taken together, to a third root that must be negative.

Let an equation \( x^3 - p \times x^2 + qx - r = 0 \) be proposed, and let it be required to exterminate the second term. By supposing \( y = x - \epsilon \), the co-efficient of the second term in the equation \( y \) is found (see equation A supra) to be \( 3 \epsilon^2 - 2p \epsilon + q \). Suppose that co-efficient equal to nothing, and by resolving the quadratic equation \( 3 \epsilon^2 - 2p \epsilon + q = 0 \), you will find the value of \( \epsilon \), which substituted for it in the equation \( y = x - \epsilon \), will shew how to transform the proposed equation into one that shall want the third term.

The quadratic \( 3 \epsilon^2 - 2p \epsilon + q = 0 \) gives \( \epsilon = p \mp \sqrt{p^2 - 3q} \), so that the proposed cubic will be transformed into an equation
Multiply $a + \ldots$ and $\ldots$; $x$ is become $= f$ since $+ = r = o$. Then it after $a \ldots$ Therefore, and $P \ldots^2 = \ldots$ cleared of terms, fore, proposed as equal the only proposed as equal $x$ or $x = \frac{y}{n}$; therefore, if $\ldots$ producing the highest $x$, if then $\ldots = m \ldots r = o$. Then transforming the equation into one that shall have unit for the co-efficient of the highest term, you find $y - n p x y + m^2 e n q x y - m^3 n r e = c$. Or, neglecting the denominator of the last term $\frac{r}{e}$, you need only multiply all the equation by $m n$, which will give $m n x - n p x + m q x - \frac{m n r}{e} = o$, and then $y^3 - n p x y^2 + m^2 n q x y - \frac{m^3 n r}{e} = o$. After the values of $y$ are found, it will be easy to discover the values of $x$; since, in the first case, $x = \frac{y}{m n}$; in the second, $x = \frac{y}{m n}$. E. g. The equation $x^3 - 3 x - \frac{146}{27} = 0$ is first reduced to this form $3 x^3 - 4 x - \frac{146}{9} = 0$, and then transformed into $y^3 - 12 y - 146 = o$. Sometimes, by these transformations, fluids are taken away. E. g. The equation $x^3 - p \sqrt{a} x^2 + q x - r \sqrt{a} = o$, by putting $y = \sqrt{a}$, or $x = \frac{y}{\sqrt{a}}$, is transformed into this equation $\frac{y^3}{\sqrt{a}} - p \sqrt{a} x^2 + q x + \frac{y}{\sqrt{a}} - r \sqrt{a} = 0$; which, by multiplying all the terms by $a \sqrt{a}$, becomes $y^3 - p a y^2 + q a y - r a^2 = 0$, an equation free of surds. An equation, as $x^3 - p x^2 + q x - r = o$, may be transformed into one whole roots shall be the quantities reciprocal of $x$, by supposing $y = \frac{1}{x}$, and $y = \frac{a}{r}$, or by one supposition $x = \frac{r}{a}$, become $x^3 - q x^2 + p r x - r^3 = o$. By this transformation, the greatest root in the one is transformed into the least root in the other: for since $x = \frac{1}{y}$, and $y = \frac{1}{x}$, it is plain that when the value of $x$ is greatest, the value of $y$ is least, and conversely. See on this subject Macfarlin’s Algebra. part ii. chap. iii. iv. Saunders’ Algebra. vol. ii. p. 687, &c. See Reduction of Equations. TRANSMUGA, in Antiquity, a defirer. Among the Romans, defirers were commonly punished by cutting off their hands, it being thought that living in such a miserable truncated condition would strike more terror than death itself. We find, however, that defirers were likewise crucified, burnt alive, thrown from the Tarpeian rock, or exposed to wild beasts at public shows. TRANSPERFUSION, Transfusion, compounded of the preparation trans, beyond, farther, and funder, i pour, the act of pouring a liquor out of one vessel into another. In the preparations of chemistry and pharmacy there are frequent transusions of liquors, syrups, &c.

TRAN-
Transfusion of the Blood, in Physiologus, the transfer of the blood of one animal into the vascular system of another, by means of a tube connected with a vein of the receiving animal, and an artery of the other. A vein is first opened, to allow the efflux of the animal's own blood, and thus to make room for the fresh supply. This preliminary evacuation produces syncope; the animal ceases to move, and appears dead; but when the end of the tube connected with the artery of the other animal is introduced into the vein, and the stop-cock is turned, the current of arterial blood produces reanimation; the power of motion and the former strength are restored.

The experiments on this subject were first tried in England, where T. Clarke failed in his attempts in the year 1657; Phil. Trans. N° 35. Lower succeeded in 1665, and communicated his success to the Royal Society; Phil. Trans. N° 30. This was on dogs: Th. Coxe did it on pigeons; Birch, vol. ii. p. 50. Coxe and King exhibited the experiment on dogs before the Society, transfusing the blood from vein to vein; ibid. p. 123; Phil. Trans. N° 19, 20, 21, 27. It was again performed from a sheep to a dog; Birch, vol. ii. p. 133; and the experiment was afterwards frequently repeated; Birch, vol. ii. pp. 112, 179, 180, 191. It was also performed in France and other countries.

The first proceedings in this matter seem to have been ingrafted merely by curiosity, or at least by a disposition to inquire into the powers of the animal economy. But higher views soon opened themselves: it was conceived that invertebrate species, such as reptiles, fish, and others, supposed to retire in the blood, might be expelled with that fluid, while, with the blood of a sheep or calf, the health and strength of the animal might be transferred to the patient. The most ingenious anticipations were indulged on the occasion, and the new process was almost expected to realize the alchemical reveries of an elixir of life and immortality. The experiment was first tried in France, where the blood of a sheep was transfused into the veins of a stupid youth, with the effect, as was asserted, of sharpening his wits. (Phil. Trans. 27, 32.) And a similar experiment was made without injury in a healthy man. (Ibid.) Lower and King transferred blood from a sheep into the sylem of a literary man, who had offered himself for the experiment, at first without inconvenience, but afterwards with a lefs favourable result; the Royal Society still recommending perseverance in the trials. Birch, vol. ii. pp. 216, 225, 227, 312. Phil. Trans. N° 30.

These events were not calculated to keep up the expectations that had been raised, of brilliant results; and other occurrences produced still more severe disappointment. The French youth first mentioned died lethargic soon after the second transfusion: the physicians incurred great disgrace, and were judicially prosecuted by the relations. (Phil. Trans. 28, 32. 36, 37, 54.) Not however discouraged by this unlucky cafe, they soon after transfused the blood of a calf into a youth related to the royal family, who died soon after with the interlins inflamed. (Phil. Trans. 28, 30.) The parliament of Paris now interfered, and proscribied the practice. (Du Hamel, Hist. Acad. Reg. Societ. p. 21, 22.) Two perfons having died after transfusion at Rome, the pope also issued a prohibitory edict. (Eph. Nat. Cur. Dec. 1., ann. 1, obf. 149. Merclin de Transfus. Sanguinis, p. 25, 85.) From this time the practice has not been repeated in the human subject; although it has been repeatedly done, as a matter of philosophical curiosity, on animals who have suffered no interruption of their health and strength. Haller, Elementa Physiologiz, lib. iii. fect. 3. § 15—29.

Transgression, Transgression, compounded of trans, beyond, and gradire, to go, an offence against some law, or a breach or violation of it.

The term is chiefly used in respect of the laws of God. In the doctrine of original sin, all mankind are supposed to share with Adam in the guilt of his first transgression. See Original Sin.

Moses threatens the transgressors of his law with a variety of temporal punishments.

Transgression, in our law, a writ, usually called a writ of trespas.

Of this Fitzherbert has two forts; one vicountial, thus called because directed to the sheriff, and not returnable, but to be determined in the country. Its form differs from that of the other, as wanting the words quare et armis, &c. See Vicountial.

The other is termed a writ of trespass, and to be sued in the common pleas and king's bench. See Trespass.

Transient Action. See Action.

Transient Air. See Air.

Transitory, in lat. 14 Car. II. c. 11, is used for a sudden-bouse warrant, or let pass; from the verb transire, I pass forth.

Transit, Transitus, from transire, to pass over, of trans and co, I go beyond, in Astronomia, signifies the passage of any heavenly body over the meridian, or of one body over another having the same apparent declination. When the smaller body is behind the larger, it is said to suffer an occultation; but when it passes before, it is said to transit the other. Thus a star behind the moon suffers an occultation, but a planet passing over the sun's disc is said to transit him.

Mercury and Venus, &c. in their transits over the sun, appear like dark specks. See Meridian and Parallax.

Transit-Instrument, or Transit-Telescope, is an astronomical instrument, by which the transit or meridian passages of the heavenly bodies are taken. Before telescopic fights were introduced into the practice of astronomy, the instruments for finding a meridian line, and for observing meridian passages, were very different from what they are at the present day. So early as about the year 1700, Sir Christopher Wren, Mr. Gray, and Dr. Derham (see Phil. Trans.) had contrived instruments for this purpose; the last and first of which we shall briefly notice, by way of contrast with the modern transit-instrument, to shew the improvements that have taken place within the last century. In fig. 11. Plate XXXII. of Astronomical Instruments, A B is a horizontal bar of hard wood or metal, turning freely on the central stem of a tripod, and carrying two upright bars, C D and E F, which are bent a little near the lower extremity, and turned to a right angle at top; where there is a horizontal joint, as seen in the figure. From each of these upright bars are suspended a plumb-line, so as to come close to the ends of the horizontal bar A B respectively. At the ends A and B are two vanes, or sight-holes, from the former of which the sun, S, may be seen through a smoked glass, and from the latter the pole-star, P, with the plumb-line interposed. The portions of the horizontal bar A C and B E are moveable round the joints at C and E, and the plumb-lines are long enough to be tangents to the angles of elevation required to the radius A B, which therefore will be proportional in any given latitude, whatever the dimensions may be. The use of this meridian instrument may be thus explained: when P is the pole-star, the whole instrument must be turned round till the eye at A sees the pole-star very.
very nearly in contact with the suspended line; and the con-
tact or bilection may then more conveniently be effected by
turning the vane a little round the joint E: in this situation,
if the ear be at the moment on the true meridian by cal-
ulation, the direction of light will be in the meridian line,
and bodies passing to the north, may be seen passing the
plumb-line B F at any altitude below the pole. Suspend
now the plumb-line A D from D, and turn the horizontal
part on its joint, till this line bisects the vane at A, and
move the vane at B gently round its joint E, till it is also
intercepted by the other plumb-line A D, and the two lines
will be both suspended in the meridian line; consequently,
an eye looking through the vane at B, will see any body to
the south transit the line A D, provided it be below the
ecliptic.

The condition to be attended to in the construction of
a modern transit-instrument is, that while the telescope,
through which the object is viewed, undergoes a change of
elevation, its line of collimation shall move exactly in the
plane of the meridian circle of the place of observation,
after it has been once adjusted accurately into a line that
lies truly parallel with the north and south line. To effect
this purpose, it was found necessary that the axis of motion
should be exactly horizontal, in the direction of a line that
joins the east and west points; that it should not bend by
the superincumbent weight in any position whatever;
and that the line of collimation should always cut the line of
the axis at right angles, without the least perceptible devia-
tion; for it is only while these conditions are fulfilled, that
the line of collimation will ascend from the horizon in a
truly vertical line, during an increase of altitude; and that
this vertical line will continue also in the meridian. The
first person, we believe, who used an astronomical instrument
poising the essential properties which we have described,
was Dr. Halley at Greenwich Observatory, soon after the
year 1719, which was the year in which he succeeded Flam-
nel as astronomer-royal. According to Dr. Smith, the
tube of Halley’s telescope was five feet and a half long,
and its axis of motion about an ell; it had also cross-hairs
with the requisite adjustments in the eye-piece, with Y sup-
ports for the pivots of the axis, likewise adjustable, and
the axis was levelled by a spirit-level, so that but little room
remained for subsequent improvement, except in what re-
lates to the achromatic object-glasses, and the method of illu-
minating the hairs, and of limiting the quantity of light
necessary for particular observations. In the older instru-
ments, the reflected light of a lamp or candle was received
at the aperture of the telescope, as shown in fig. 15.

Plate XXIX. of Astronomical Instruments; but this mode of
illuminating the hairs was found inconvenient, on account
of the change of elevation of the telescope in successive ob-
servations, which required as many new adjustments of the
lamp; and it was not till about the year 1787, that Dr.
Ufer of Dublin contrived the new method of transmitting
light through one end of the horizontal axis to a diagonal
perforated reflector, in the body of the tube, which brings
it to the hairs after reflection, whatever the altitude
may be to which the telescope is pointed. In our descrip-
tion of the different transit-instruments, it will not be nec-

Transit-instruments, as they are now constructed, may be
considered either as they are stationery or portable; the
former of which was the original construction, and con-
tinues to be used in fixed observatories, for the purpose of
determining, in conjunction with a good astronomical clock,
the right ascensions of the heavenly bodies; but the latter
may be used in any place, for ascertaining the rate of a
clock or chronometer, and when nicely brought into the
meridian, for determining also the right ascensions with con-
considerable accuracy.

Fig. 1. Plate XXXII. of Astronomical Instruments, repre-
sents a transit-instrument of the most approved stationary
construction, which may be made of any dimensions that
the aperture and focal length of the object-glasses will allow;
but is usually made with a tube of from 30 to 120 inches
long, and of proportional thickness, according to the degree
of accuracy that is required. A and B are either a pair of
solid blocks firmly fixed in the ground, or a pair of pillars
of firm masonry, sufficiently high to allow the eye of the
observer to reach the eye-piece when the angle of elevation is
about 45°. Fig. 2. exhibits a lateral view of the fame, ex-
cept that only one of the pillars is seen, in the direction of its
breadth; while fig. 3. is an enlarged representation of the
eye-end of the telescope; and figs. 4. and 5. are appendages
attached to the superior end of the pillars; all which we
shall describe in due succession. The tube of the telescope
does not unfually of brass, of which the eye-end is at a, and
the object-end at b: in this instrument before us it is five feet
long; c and d, which appear to be two cones, are united to
the central part of the tube, and form the axis of motion
about three feet long; they are of brass also, and hollow,
but are rendered very strong by circular pieces of metal, of
different diameters, that are forced into the hollow space one
after another at equal intervals; so that this axis has all the
strength without the weight of solid metal. The pivots at
the extreme ends of the axis are of bill-metal, and turned
in the lathe to precisely the fame dimensions, so that they may
at any time have their positions reversed without afflicting
the horizontal line. The pieces, seen by figs. 4 and 5, are
made fast to the upper extremities of the pillars, and receive
the pivots of the axis, each having an angular notch, called a
Y, which are adjustable by proper screws, one in a vertical,
and the other in a horizontal direction. The situation of
each of these screws is seen by the handle inflected on the
axis of the screw to which it belongs, and the manner
in which the moving parts are made to slide by the ac-
tion of the screws, between the parallel checks of the
small frames, requires no particular description. When
the weight of the telescope and of its axis is considerable, some
part of this weight is supported by a loaded lever, as seen in
fig. 4., which, by acting on the ponderous matter at some distance
from the pivots, relieves them from a portion of the fires
that would otherwise be laid on them by the whole weight.
Hence the pivots have their friction diminished; and conse-
quently their dimensions, as well as those of the Y’s, remain
unaltered. When the weight is small, such appendage may
be dispensed with, provided the Y’s and pivots be rectified
occasionally, when they are a little altered by attrition.
At a small distance from one end of the axis a graduated
circle is made fast, which moving with the axis, shews the
degree and minute of elevation, that the telescope has in any
position, on two opposite adjustable verniers, which carry a
spirit-level, and are clamped in a horizontal position, as seen
in fig. 2. The extreme end of the axis, which is remote
from the graduated circle, has a lens screwed into it, through
which the light of a lamp is made to pass in its way to the
diagonal reflector, contained between the two conical por-
tions of the axis, within the tube; and by the light thus
transmitted and reflected, the spider’s lines, substituted for
hairs or wires, are illuminated; without which illumination
they would be invisible by night, except when the Moon or
Venus
VENUS is observed. The spirit-level, which hangs on two vertical rods over the axis, is capable of being reversed in position, and is used, in the first place, for placing the axis of the telescope perfectly horizontal, and in the next, for watching the permanence of such position by the situation of its bubble. As the ends of the brafs tube that contains the level revolve on two opposite pins, projecting from the rods of suspension respectively, the bubble will always occupy the upper part of the glass tube in every flate of the telescope's elevation; but in the reversed position of the axis c d, the level will be underneath it, though the bubble will retain its place. The infide of the tube is ground to such a long radius, that single seconds of deviation from a true horizontal position may be read on an ivory scale by the end of the bubble. When, however, the telescope is large, and the axis confluently bulky, a spirit-level cannot be so well applied, as with telescopes of ordinary size; and if this be the case, a bason of pure mercury may be substituted with great advantage: for when the pole-star is on the meridian, and shins brightly, its reflected image, and also the star itself, will both pass together over the central vertical ipider's line, at corresponding degrees of elevation and depression of the telescope, provided the axis be truly horizontal, and as little time as possible be suffered to elapse between the superior and inferior observations: but to render this operation easy, flops may be clamped to the graduated circle, to limit the space that is necessary to be described by the object-end of the telescope. There is in the instrument before us, moreover, a plumb-line apparatus for levelling the axis, which is seen in fig. 3, and partly on a larger scale in fig. 2, at a is a pin, from which a fine silver wire may be suspenfed; and at c is a horizontal screw, between two threads of which the wire refts, so as to be capable of adjutment in a lateral direction: the long narrow tube, which lies parallel with the main tube of the telescope, then receives the wire, and is put into a perpendicular direction, so that the suspenfed plummet may be immerfed in a vefsel of water; the microscope at f, next the eye-piece, now uppermost, views the image of a transparent dot, as a point to which the wire is referred, and to cover which it is now brought by the screw c: at the opposite end of the main tube, near b, is a similar microscope with a point of suspension and adjusting screw; so that when the object-end of the telescope is placed uppermost, the same adjutment is required to bring the fretched wire over its luminous image: and when this is done, the wire will befeét the lower luminous image also, if the axis be perfectly level, but not otherwise. To produce this coincidence, it will usually be necessary to adjut partly by the vertical screw of the proper Y, and partly by the fcrews of the plumb-line apparatus after each inverion of the tube.

When the achromatic object-glafe does not produce a round and well-defined point, as the image of a large star, in any observation, it will be advantageous to diminish the aperture till this appearance takes place, which will generally be the case when the central part of the object-glafe only transmits the light of such a star; but for small stars, it will always be better to allow the whole aperture to be open: not only because more light is thus admitted, but also because the image of a small ftar is always a point free from luminous irrations, even in inferior achromatif telescopes. In the ten-feet telescope which Mr. Troughton has lately converted into a magnificent transit-instrument at Greenwich (viz. in 1816), he has ingeniously contrived a species of iris, that will contract or enlarge the effective part of the aperture by the simple turning of a milled nut, within reach of the hand, while the eye is at its place for making the observation; so that the proper quantity of light can at any time be proportioned to what the nature of the observation may require. There are lally fcrews of adjutment of the ipider's lines in the eye-piece both for horizontal and vertical motion, and, in the bife instruments, the eye-piece itself has a ftilling horizontal motion, which enables the observer to keep the celestial body, though in motion, at the centre of the field of view during the whole passage over the five lines.

The bife construction of a portable transit-instrument which we have yet seen, is that represented by figs. 6 and 7, which exhibit all the parts that arenee necessary for description, and which was one of the numerous inventions which we have had occasion to notice as the offspring of Troughton's ingenuity. The telescope of this instrument is 20 inches long, and magnifies from 20 to 35 times, according to the eye-pieces that are used, two of which are usually of the prismatic or diagonal kind, to be used in high altitudes; the aperture is 1.75 inch, and the power is competent to see the pole-star by clear day-light. The construction of the tube and axis is similar to that of the stationary instrument, except that the graduated circle and double vernier, with the level, lie beyond the Y of the support, and the iris is wanting: otherwise it has all the adjutments for levelling the axis, and bringing the line of collimation to a meridian mark that the larger instrument sofizies, as well as those that rectify the position of the ipider's lines in the focus of the negative objective. The tube of the iris is a thick ring or rim of brafs, that receives three equi-distant fcrews for feet, besides the four fcrews that fix the two vertical frames thereto, which confluence the supports of the axis, one of which is seen entire in fig. 7. These supports are kept perpendicular by the interior bracing-bars, of which two are discoverable in fig. 6, attached by thumb-fcrews at both ends to the ring and upright frames respectively. The circular figure of the bafe is not only firm, but preserves its shape in all degrees of temperature; and when the parts are detached by loosening the thumb-fcrews, they will all pack into a box that is of a convenient size for carriage. The diameter of the circular bafe, and the confluence length of the axis, is a foot within, and the height of the supports thirteen inches. The graduated circle being of six inches diameter, admits of readings by each of the two opposite verniers to the accuracy of one minute, which is sufficient for finding the meridian altitude of any celestial body, of which the declination is known when the latitude is given; or for determining the latitude, when unknown, to the accuracy of one minute. If the circle were made a little larger, and three verniers substituted for two, a longer level might be used, and the readings might be accurate to 20" or 25": but as the instrument was never meant to be used as an altitude-instrument, the inventor considered only what dimensions are requisite for constituting an useful transit-instrument in a portable form. The level of this instrument is entirely detached, and equal in length to the axis itself; its shape is delineated in the upper part of fig. 9, and the notches of its end-pieces stand upon the pivots of the axis, so that the reversion of the ends is performed without the least impediment. It is however necessary to remove the level from the axis, when the horizontal adjutment is finished, to avoid its being displaced and broken by an alteration in the elevation of the telescope. There are usually three fluids of brafs included, with the darkening-glafees, lantern, and other appendages; two of which fluids have conical holes, to receive the points of the fcrews, or feet of the circular bafe: and for this purpose, all the fluids must be made fast to the flab or pillar which supports the instrument, by plate of Paris or putty injecte into many holes in the plate of the marble or stone,
Mr. Thomas Jones, of Charing-Cros, has made several 30 and 42-inch transit-instruments of the portable fort, supported by oblong frames of cast-iron, which look very neat, and answer the purpose very well, a drawing of which construction we should have introduced into our plate, if it would have admitted of such addition. These instruments have all the properties of the instrument we last described, and have of course greater powers in their telescopes, and are also cheaper in proportion to their size. He has also made some of them with telescopes of only twenty inches, for the sake of greater portability.

Before any useful observation can be made with a transit-instrument of either the stationary or portable construction, it is necessary that all the adjustments be nicely made, and also that they be examined occasionally after a few observations are finished, in order to prevent errors that cannot be detected, or at least appreciated, at a subse-quent period. These adjustments are nearly the same for all the common transit-instruments, and may be explained under eight heads, as follow; viz.

1. **To adjust the Spirit-Level.**—When the level hangs on, or is made fast to the axis, put the telescope in its place, and see to which end of the level the bubble runs, which will always be the more elevated end; bring it back to the middle by the Y-screw for vertical motion, or by the foot-screw under the end of the axis, if it be a portable instrument, and then invert the axis, end for end; then, if the bubble is again found in the middle, the level is already parallel to the axis; but if not, adjust one half of the error by the adjusting-screw of the level, and the other half by the Y-screw, or foot of the support, as the cafe may be; and let the operation of re-verting and adjusting by halves be repeated, until the bubble will remain stationary in either position of the axis, in which case the level will be right. When the detached level is used, that notch must be made a little deeper, by scraping with a penknife, which has the bubble resting on it, instead of using an adjusting-screw, with which it is not usually provided; and when the notches that rest on the pivots are once made right, they will seldom require a second rectification. In the hanging level there are side-screws also, which adjust for parallelism of the level, as it regards a line joining the pivots of the telescope's axis; and this adjust-ment is known to be truly made, when the bubble does not run to one end, when the level is moved some degrees by a rotatory motion round its pivots, or central pins of sus-pension.

2. **To place the Axis of the Telescope truly horizontal.**—If the spirit-level is made use of, which is generally the cafe in instruments of ordinary dimensions, the same operation which we have just described will put the axis level, at the same time that it puts the level parallel to the axis; for unless both these conditions are fulfilled, the adjustment of the level will be deranged by reversion, and when this is not the case, it is a proof that both the level and the axis are truly horizontal. Hence, when the level is previously adjusted, it will be sufficient to bring the bubble to the middle of the level by the Y-screw, or foot-screw alone, as the construction may require.

This adjustment may also be made, in the larger instruments particularly, by means of a plum-b-line, either applied to a frame, suspended by the pivots of the axis, that will leave the telescope parallel to the line of col-limitation, as we have deferred Troughton's in figs. 2 and 3; in either case, a dot is bisected by the plum-bl ine near the point of suspension, and another near the lower end of the line, in both the reversed positions of the axis, when the adjust-ment is truly made by the proper screws, as above directed. But the most accurate, as well as probably the most conve-nient method of levelling the axis of a large instrument, is by reflection, by the aid of a bafon of pure quicksilver, as we have already intimated; and the pole-star, being slow in its apparent motion, particularly at the time of its greatest elongation, is the most proper object by which to make the adjustment in question; for when the axis is level, and the star is made to cover any one of the spider's lines, its image reflected from the surface of the mercury will cover the same line, pro-vided the depression of the telescope is effected instantane-ously; and if this is not the case, the proper screws must be used for effecting this purpose without any reversion of the axis; for by this experiment, the line of light of the telecope is proved to have a motion truly vertical, which is what the horizontal position of the axis is intended to produce. Hence, if the exact coincidence of the places of the star and of its reflected image takes place in an instrument both before and after the reversion of its axis, this is a proof that both the pivots and Y are respectively similar. This method of adjusting the axis of the large transit-instrument at Greenwich has been lately adopted, after a trial had been made by the astronomer-royal, of the application of a plum-bl ine, suspended in a detached plate from a point of considerable elevation.

3. **To produce distinct Vision.**—Before the subse-quent adjustments can be made, it is necessary that the telescope should be put into a state of perfect vision; viz. that the object fixed upon should be seen well defined. This may be accom-plished by sliding either the object-glasses or the eye-piece within the tube, till the desired effect is produced; but when wires, hairs, or lines of any kind are made full in the common focus of these glasses, a motion given to the eye-piece will make those lines disappear, and a motion given to the object-glasses is in danger of deranging its best position; therefore, when a meridian mark is necessarily at so short a distance, that the same adjustment of the eye-piece will not suit it that has been made for a celestial object, by which the parallel lines have been fixed in the focus, an auxiliary object-glasses, or glasses of long focus to be added to the proper object-glasses, is provided to remedy these inconveniences, whenever the meridian mark is the object viewed. The method of de-termining the focus of such additional glasses, as shall shorten the compound focus of the object-glasses agreeably to what is requisite for a given distance, is explained under our article Telescope.

4. **To put the Wires, Hairs, or Spider's Lines perpendicular to the Axis.**—The parallel lines in the eye-piece of the telescope are usually attached to a circular piece of brass that turns right within the interior end of the tube, and if, when the telescope changes its elevation, a point in the meridian, or other mark, travels along one of these lines, so as to be bi-sected by it through the whole field of view, the said line will be perpendicular to the axis of motion; or if a long plum-bl ine be suspended at a distance, and a vertical line in the eye-piece is found to coincide with it while the telescope alters its angle of elevation, this will not only be a proof of the same thing, but will moreover shew that the axis is level; and when this is not the case, the piece holding the lines must be turned till they are found by trial to be truly verti-cal. The similarity of the intervals between the lines, and
also the angle measured by each, may be ascertained by a
graduated staff, and the tables which we published under
TELESCOPE.
5. To make the Line of Collimation perpendicular to the Axis.
—After having adjusted for distinct vision to some distant
known object, make the middle line in the eye-piece bisect
some well-defined point in it, and, having reversed the ends
of the axis, observe if the same line again bisects the same
point exactly; if it does, the line of collimation is right;
but if not, the error may arise either from the situation of
the point observed, or of the centre of the object-glass, as they
respectively regard the vertical line in the eye-piece; that is,
one or other of those lines may deviate a little from a true
perpendicular to the line of the axis of motion, or both may
be erroneous in their respective degrees; therefore, when
reversion has taken place, bring the vertical line one half way
towards coincidence with the observed point, by the hori-
izontal screw at the end of the axis, which alters the azimuth,
and the other half by the side-screws of the eye-piece, which
move the plate of the parallel lines, releasing one screw and
tightening the other, so as to leave the said plate half; then
reverse again, and repeat the operation, till the same point is
bisected in both positions of the axis.
6. To illuminate the Wire, Hairs, or Spider's Lines.—Before
an observation of a star or planet can be taken, the parallel
lines must be rendered visible to the eye of the observer, and
the quantity of light to be admitted will depend on the magni-
tude of the body to be observed. A lantern containing a lamp
must be fixed opposite that end of the axis which has its
aperture closed by a lens, and so much of the light must be
excluded as is superfluous for the observation; for when a
small star is the object, much light will render it invisible,
and yet it is necessary to have light enough to render the
parallel lines visible; hence observations on very small stars
require management of the quantity, and sometimes of the
quality too of the external light; on which account prisms of different coloured glasses have been interposed be-
tween the lens and the end of the axis, with sliding mor-
tions, to produce various modifications in the illumination,
according to the exigencies of the moment.
7. To adjust the horizontal Wire or Hair for taking Altitu-
des.—When the altitude of an object is to be accurately
taken, bring the bubble of the double vernier to the middle
of the level, and turn the telescope on its axis of motion,
till vernier 1 has its zero at 0 in the circle, or at 90°, if the
circle is graduated for zenith distances, as is mostly the case;
then notice what distant point is cut by the horizontal
wire; reverse then the axis, and bisect the same point again,
and in this situation see what quantity is read by the fame
vernier; or, which will be still better, half the sum of the
readings of both verniers 1 and 2 may be taken at both times,
and the difference of the two average readings may be con-
siderable; then one half of this difference, + or —, is the
real error of each observation, accordingly as the axis is
situated in position; and if this error is not obviated by a
proper adjustment, it must be allowed for in the reading of
every observation. But this error may be owing partly to
the unadjudged state of the vernier level, and partly to the
situation which the horizontal wire occupies in the eye-piece;
therefore the screws which elevate and depress the hori-
zontal wire, which, however, are not in all instruments, may
correct one half of the error, and the errors of the vernier
level the other, in each reversed position till the error dis-
appears; i.e. till there is no difference perceived in alti-
tudes of the same object taken in reversed positions of the axis
of the telescope’s motion. But it is usual with astronomers,
who take altitudes in reversed positions of a circle, to ascer-
tain the error arising from want of true collimation in alti-
tude, from a repetition of observations, and to apply it to
each observation as a correction, rather than attempt an
exact adjustment in this respect, when the error is inconsider-
able.
8. To make the Line of Collimation move in the Plane of the
Meridian.—In order to fix a transit-instrument well in the
meridian of any given place, it is necessary that the pole-
star be exposed to its view; for as the polar point is situated
in the centre of its diurnal circle, this circle must be bisected
by the middle wire, or spider’s line, that passes through the
zenith, before it will move in the plane of the true meridian.
Formerly it was usual to place the instrument, by double
altitudes of the sun, or by a knowledge of the solar time
obtained by observation of the altitude on a given day, nearly
in the meridian of the place, and then to observe which of
the two semicircles, to the right and left of the approxi-
mate meridian line, were passed through in the shorter time,
by means of taking both the upper and lower tranflets of
the pole-star successively; after which an allowance was
made for the deviation from the meridian, and the obser-
vations were repeated till both semicircles were performed
in the same time. But by this method of finding the centre
of the circle surrounding the pole, the accuracy of the
result depended on the rate of the clock that was used.
during the whole time that the successive observations
were employed; consequently some uncertainty remained as to
the comparative times intervening between the successive
tranflets, and the true polar point was, therefore, not easily
ascertained: but this difficulty has recently been obviated,
by fixing on two stars nearly at opposite fides of the circle,
so that their difference of right ascension may be very nearly
12°; for, when the two semicircles are alike, the time that
elapses between the superior tranflet of one, and the inferior
one of the other, will not be altered by a change of situation;
the difference of the times will remain the same, whichever
of the two stars makes the upper tranflet; but if the semi-
circles are unequal, the intervals of time will differ accord-
ingly; so that if one star precede the other two minutes at
its upper tranflet, and only one at its lower, half of this
quantity will be the time corresponding to the deviation in
position from the true meridian, which may be rectified by
repeated observations of the short intervals, according to
which the two stars follow one another, in tranfleting first
above and then below the pole respectivly; and all that
the clock has to do, according to this method, is to count the
seconds in each of those short intervals. When an in-
strument that is adjusted to have its line of collimation pafs
through the zenith by means of the horizontal position of
its axis of motion, is thus made to bisect a polar circle, it
will also pafs through the pole, and will consequently move
in the plane of the true meridian of the place. Various
other methods of placing a common transit-instrument truly
in the meridian have been recommended, but this is not
only the easiest, but the best; and if the right ascensions of
Dr. Maskelyne’s or Mr. Pond’s stars come right, when ob-
served after the final verification, it may safely be con-
cluded that the position of the instrument is in the true
meridian.
When a transit-instrument is well constructed, and
properly adjusted in all respects, it is one of the most useful
instruments in astronomy, for without it the right ascensions
of the heavenly bodies would not be accurately taken by
direct observation, neither could the time, either solar or
fisheidal, be ascertained with that degree of precision which
may
may be done by its aid. Indeed a perfect transit-instrument and a good sidereal clock is the indispensable furniture of every fixed observatory, and as companions, that mutually assist each other, they ought never to be separated.

We might now proceed to illustrate the use of the transit-instrument by a few examples in practice, if we had not anticipated this part of our article under the heads Ascension and Chronometer; in one or other of which articles we have explained both the method of determining the right ascension of any body, and also of ascertaining, without much calculation, the rate of a chronometer or astronomical clock. See the respective problems under Chronometer.

The transit-instruments which we have above described are necessarily expensive, even in the portable form; and encouragement has been held out, by the Adelphi Society, for further improvements in the portable kind, so that they may become more common. And the frequent enquiries that have been made for a cheap portable instrument, induced Sir H. C. Englefield, bart. to contrive a very simple one, which was first made by Mr. Thomas Jones, mathematician-instrument-maker in London, and is now sold at his house at Charing-Cross. A description of this instrument, called a side transit-instrument, written by the contriver, is sold along with it, from which it appears, that it is not to be considered an original instrument, but an improvement on an old transit-instrument formerly belonging to Mr. Aubert, and purchased at his sale by the late Mr. W. Walker. We propose to copy the description nearly as it has been published. "It is well known," says the ingenious author, "that the transit-instrument, in its usual form, is liable to great injuries from blows, or other violence affecting the perpendicularity of the telescope to the axis; that it necessarily takes up much room in package; that, unless of a very small size, it is not easily fixed in a window or other opening in a common dwelling-house; and that it is quite impossible, except in fixed observations, to make it sweep the entire area between the southern and northern points of the horizon. In windy weather its use is also very difficult and inconvenient. In the instrument now offered, all these inconveniences are avoided. It may be fixed almost anywhere; in many places it may be made to describe the entire circumference of the meridian; the observer is put to no difficulties by change of place, as he always looks directly along the axis; it is packed in one-eighth of the space required to pack a common transit-instrument of the same real size; its weight is not more than a fifth of the other; from its simplicity it will be afforded at half the price; and its verifications and adjustments are easy and simple. It has also another advantage, that the mark by which it is placed in the meridian may be either in the zenith or at right angles to it; or, if convenient, two marks may be erected, one to the south or north, the other east or west; and if so used, it will be always seen, by inspection only, whether the mirror needs adjustment or not. In many confusion situations, such as occur in cities, the power of having a mark at right angles to the meridian may be eminently useful. The general description of the instrument is as follows: The telescope is included in a brass cylinder, having a small cylinder at each end, turned true in the usual manner, and resting in Ys of the usual construction. These smaller cylinders are both pierced. In one is the eye-piece of the telescope, with its wires, &c. The other is open, for the purpose of seeing through it, if necessary, the eastern or western mark; and for adjusting by direct vision the line of collimation of the instrument. It also serves for the illumination of the wires. The object-glasses of the telescope is placed so near this cylinder, as only to allow room for an unsilvered plate glass mirror to be placed before it at an angle of 45°. It is obvious, that as the telescope revolves on its axis in the Ys, every celestial object at right angles to it may successively be seen by reflection from the mirror; and of course, if the axis be placed due east and west, the transits of all celestial bodies over the meridian will be observed with the utmost accuracy and convenience. The aperture in the axis beyond the object-glasses is not only of use for the adjustment of the instrument to an eastern or western mark, or for the illumination of the wires, but affords a means of seeing the mark at the same time with the body whose meridian passage is to be observed, and thereby being certain of the true adjustments of the instrument at the very moment of observation; which is impossible in any other construction of the transit-instrument, and seems to be a very material advantage. I am convinced that transit-instruments of the largest size might, with very great advantage, be constructed on this principle. It is true, that where very much light is wanted, as in observations of stars in the day-time, the loss by reflection will be some disadvantage; but the loss of light from an unsilvered mirror is very small; and the convenient and simple form of the instrument; by its lightness less subject to flexure: by its position much less liable to errors from unequal change of temperature; and extremely commodious in its use; present advantages of a very important nature, and such as might introduce it into the most extensive observatories with profit. The advantages may perhaps be even greater in small transit-instruments. When in the present construction the telescope is long, as its whole weight rests on the most disadvantageous point of the axis, this is of necessity made very large towards its centre, to avoid flexure; and the whole instrument is so heavy, that an additional apparatus of counterpoise must be added to the pivots, lest they should wear away the Ys, and the reverting the instrument becomes a work of some difficulty and danger: whereas in the construction proposed, the small comparative weight of the object-glasses and eye-glasses lies very near the pivots, and the middle of the tube is the lightest part of it. The operation of reverting is performed with great ease, both from the form and lightness of the instrument; and it may be added, that the comparative facility of observations is of greater advantage the larger the instrument. Having so far explained the general principles of this transit-telecope, which was executed very much to my satisfaction by Mr. Thomas Jones, it will be proper to describe more particularly its construction. The transit-stand is represented by either the upper or lower part of fig. 1. "The first is constructed for being placed or fixed on a vertical surface; the second for a horizontal one, A B; in both are the Ys, or supports for receiving the axis of the telescope. The end A, intended to be always next the eye, is furnished with both the horizontal and vertical adjustments, such as are usual to transit-instruments. The telescope's axis is represented by the lower part of fig. 9. The eye-end being at C, the object-end at D turns round in the Ys; A B upon its cylinders n n: the screw-head r, at the object-end D, is for the purpose of adjusting the parallel glasses. The telescope is adjusted to direct vision by means of the head or knob at P. The wires of the telescope are adjusted by means of the four capstan head-screws at the eye-end t t. The circle R is divided on the surface next to the eye. The eye-tube has a sliding motion for viewing the wires distinctly: the short piece of tube at the object-end turns round on the telescope's tube, and serves as a cover for the object-glasses. The upper part of fig. 9. is the riding level, and is placed upon the axis in the Ys, and ad-
TRANSIT-INSTRUMENT.

..julted by means of the screw S. *Fig. 8.* represents the
stand, telescope, and level, displacing the position in which
they are used; *fig. 12.* for placing the transit in the meri-
dian. Of the verifications of this instrument, two are com-
mon to every construction; one only is peculiar to this.
The line of collimation is adjusted by looking direct at some
distant small point (the cover being turned over the lateral
aperture), and turning the telescope gradually round on its
axis, and moving the screw of the wires, if necessary, till
the spot is in every position covered by the interference
of the wires. The axis is brought to a horizontal position,
and the level is in the same mode adjusted by reversing the
telescope or level, and correcting half the error by the level-
screw, and half by the vertical screw of the \( Y \), in the usual
mode. The verification peculiar to this instrument is that
of the mirror, and perhaps the best mode of doing this is
by the pole-star, when nearly in an easterly or westerly position
from the pole; its motion in azimuth is then so slow as to
give ample time for the adjustment. Bring the pole-star to
the vertical wire (the line of collimation having been pre-
viously adjusted); then reverse the telescope in its \( Y \); and
if the star is still on the wire, the mirror is in adjustment;
if not correct half the difference by the mirror-screw, and
half by the horizontal of the \( Y \), till the error vanishes.
This adjustment may also be performed, by setting up a
board with two parallel perpendicular lines drawn on it,
distant from each other exactly the space between the posi-
tions of the mirror when the telescope is reversed in its \( Y \).
If the vertical wire be brought to cover one of the marks,
and on being reversed, the wire covers the other mark, it is
right: if not, the error must be made to vanish by cor-
recting it half and half, as before directed, for the adjus-
tment by the pole-star. The following method of placing
the instrument correctly in the meridian, is equal if not
superior to any that has yet been devised. Let \( Z \) (*fig. 12.*)
be the zenith; \( P \), the pole; \( H \), the horizon; \( Z \ P \), the
meridian circle; \( Z \ K \), a circle of altitude, distant from
the meridian by a small quantity \( I K \) (suppose a degree);
the diurnal circle of the pole-star, whose radius is \( 1^\circ 45' \)
and let the altitude of the pole be \( 51^\circ 30' \). Then
when the pole-star is on the northern meridian, its al-
titude \( 3 \) will be \( 49^\circ 45' \), and its zenith distance \( Z \) \( 3 \) \( 20^\circ 15' \);
and \( A C \) will be a part of the diurnal arc of a star which
has \( 40^\circ 30' \), and \( N \) meridian altitude \( 5\). Now
suppose the transit-instrument, whose axis is accurately le-
velled, and of course in the meridian at \( Z \), to point at the
horizon to \( K \) (it is obvious from its construction the tele-
scope’s axis will be at right angles to the meridian line) in-
stead of \( I \), the true meridian; then at \( 3 \) (the altitude of the
pole-star under the pole) it will point at \( B \), and the arc
of \( 3 \) \( B \) will be to \( I \), as the cosine of the altitude \( 3 \) \( I \) to
radius; but \( 3 \) \( B \), measured on the diurnal circle of the
pole-star, will be the sine of its distance from the meridian
to the radius \( P \) or \( P \); and, as in small arcs, the arc of
a great circle, or of a small circle, or their sines, are nearly
coincident, we shall have very nearly, as \( Z \) \( 3 \) (the zenith
distance) is to \( P \) (the polar distance), so is the value of
3 \( B \), in degrees of the pole-star’s circle, to its value in degrees
of a circle whose radius is \( Z \). And as the radius \( Z \) \( 3 \) is
to \( P \) nearly as \( 23 \) to \( 1 \), the error of the transit-telescope
at the altitude \( 3 \) \( I \), will be measured by a scale
(if it may be so called) 23 times as great as itself. Now,
let there be another star \( A \), whose northern meridian alti-
ude is as small as it conveniently can be, for example \( 5\),
whose polar distance is, therefore, \( 46^\circ 30' \), and whose
right ascension is the same as that of the polar star; then, if
the transit-telescope be in the meridian, both these stars
will pass through it at the same time; but if it be out of
the meridian by the quantity \( I K \), the star \( A \) will pass
through it when it comes to \( C \), but the polar star not till it
comes to \( B \), when the \( A \) has got to \( D \), in its diurnal
circle. The value of \( A C \) being therefore found, by multi-
plying \( I K \) by the cosine of its altitude \( A I \), that value,
being reduced to the angular value from the radius \( P \ A \),
will give the time of the \( A \) passing through the transit-
telecope, after the time of its passing the meridian; and
the same operation being performed for the pole-star as
before directed, the difference of these times will be the
error in time of the transits, answering to the given devia-
tion \( I K \) of the transit-telescope. And tables having been
previously constructed for such stars as shall be thought
convenient, the transit-telescope may, in a very short space
of time, be set to the meridian, with a degree of precision
unattainable by any other method. If the \( A \) precedes the
pole-star in its passage under the pole, no tables are re-
quiiite, nor any thing necessary to be known but the exact
difference of the right ascension between the two stars; for
having observed the transit of the \( A \), (the instrument
being previously brought near the meridian, suppose half a
degree,) then elevate the telescope to the pole-star, by
moving the horizontal adjustment of the axis; keep the
pole-star on the middle wire, till the due interval of time
between their transit is elapsed; the instrument will then be
extremely near its true position; and, by repeating the ob-
servation once more, will be brought to a perfect exact-
ness. Or, if another star, following the pole-star in its passage,
be observed on the same evening, if the times elapsed between
their transits are equal to the tabular difference or their right
ascensions, which will probably be the case, the accuracy of
the first placing the instrument will be immediately ac-
quired. Other stars near the pole may be made use of in
the same manner as is here described for the pole-star, but
with proportionally less advantage as the polar distance is
increased. It is also obvious from the figure, that the
transit of the pole-star above the pole may be also used,
and that with nearly, though not quite, the advantage of the
transit below the pole. The same method may also be
applied with equal ease, if the second star \( A \) passes the
southern meridian instead of the northern.

"The flow of the pole-star’s motion, though it renders
its transit uncertain to a few seconds, cannot materially affect
the accuracy of this method, as an error of ten seconds in
time, in the estimation of its passage, which is certainly
more than can be committed, would not cause an error of
a third of a second in time of the passage of stars near the
equator."
that had will and evenio or, dicam • fen • ct • ne-and, I nil paper J pine tin, Gratified illud which ervations venly and, at cenfion liberty that quefion deseription subject, and introducing with by Mr. S. Groombridge at Blackheath, and which has proved itself to be an instrument of the first clas ; and we there flated a report, that a large one was in contemplation for Greenwich, which we faid we might possibly have occasion to defcribe. That instrument has been finifhed by Troughton in his bell manner, and though the plan of the confruction is unique, and the mode of uing it novel, its application to the purpofes for which it was intended answers the moll fanguine expectation of the maker, and in the hands of the prefent alronomer-royal, affords the means of making more accurate and at the fame time more numerous obervations in a given time, than ever were effected by any other instrument. Though this instrument has a long axis paffing through a solid pier of mafonry, and is capable of being ufed for tranfits, it has lithero been principally ufed for determining polar diilances, by actual measurement from the polar point; according to which mode, the uncertainty in the refults, which commonly arises from variable refraction in ordinary measurements, is almost entirely obviated, and a repetition of any feries of obervations may be made on any part of the circle ad libitum, and with any number of readings to the number of fix at the fame time; fo that a fingle obervation is made with as much accuracy, as can be obtained from an average of several fucceffive obervations taken with a repeating-circle of the fame diimensions; and yet there is the power of re- pating any obervation in various positions. Mr. Pond has already published one volume of obervations taken with this instrument, which completely verifies our affertions, and in this firft volume he has given a plan and fection of this instrument, the circle of which is fix feet two inches in diameter; but as Mr. Troughton intends to give a complete defcription thereof himfelf, as a paper fuitable for the Philosophical Tranfactions, which, to be published therein, must be an original communication, Mr. Pond was not at liberty to defcribe the drawing which he has given as a frontifpiece to his firft volume; and as the defcription in quefion is not yet finifhed, we are in the fame predicament with the alronomer-royal, and muft confequently for the prefent forego the pleafure we had promifed ourfelves, of introducing this magnificent instrument to the notice of the public.

TRANSITION, in Myft., is nearly fynonimous with modulation; it implies little more, in its technical ufe, than a change; and, in general, a change of key, from major to minor, or the contrary; or, indeed, from any one genus or key to another. Luckily no laws were laid down by our forefathers for tranfition, as for modulation, which we fo long feared to violate.

TRANSITION, in Rhetoric, a kind of connection in difcourfe, by which the feveral different parts and members of it are joined, fo as to confitute one regular whole: or, as Volfius defines it, is a form of speech, by which the speaker, in a few words, tells his hearers both what he has faid already, and what he next designs to fay. Sometimes, however, in paffing from one thing to another, a general hint of it is thought fufficient to prepare the hearers, without particular fpecifying what has been faid, or is next to follow.

Some place tranfition in the number of figures; others, with Quineflian, exclude it from that rank.

F. de Colonia makes two kinds of tranfitions, the one perfect, and the other imperfect.

TRANSITION, Perfect, is in that in which we briefly intimate what is faid, and what remains to be faid. As, Now that we have fpoken of war, there remains something to be fpoken of peace. Satis multa de turpitudine: dicam deinceps, quod proponis, de periculo. Uni epiplae respondit: veniam ad alteram. Sed hoc volvere; illud recons: Cafforem me confilio interfatum.

TRANSITION, Imperfect, is in that which only one of these is exprefsed. As, Let us now confider the confequences of, &c. Posfularer hie locus, ut discremer de — sed fumit fit; neque enim praecuramis jam loqui poftulum; et hic fe lacrymis defendi negat.

TRANSITION Rocks, in Geology, a name introduced by Werner to difignify thofe rocks which, on account of their containing few organic remains, and lying immediately over other rocks which contain none, are fuppofed by him to have been formed when the world was paffing from an uninhabitable to a habitable flate. According to the fame geologist, tranfition rocks are of more recent formation than the lower or primary rocks, and older than the flate or flratiéed rocks, and are intermediate between both, being partly of mechanical and partly of chemical formation. The rocks which are enumerated in this clas by Werner, are tranfition lime-flone, tranfition trap, greywacke, and flinty flate. It is now, however, admitted, that the dif- tinction made between tranfition rocks and the lower ftrati- fied or flate rocks, has little or no foundation in nature, as these rocks are not unfrequently obferved to alternate with each other. (See Rocks.) Nor is the abfence of organic remains in the lower rocks, called primary, a decisive proof that they were formed preceiently to the eftinction of organic life upon our planet; for in a feries of ftratiéed rocks containing organic remains, we fometimes meet with other beds interpofed, in which no vegeflage whatever of fuch remains can be traced. Hence we may infer, that the proccfs by which the latter was confolidated, has destroyed the organic matter which they may have once contained. The abfence of organic remains in flatice beds that have a cryftalline granitic ftucture, is, we conceive, owing to the pecu- liar mode by which they were cryftallized, as fuch beds fometimes repofe on other beds abounding in marine shells. Nor can we be certain, that the lowest rocks of granite were formed before the eftinction of animal life on our planet. The more extensively modern geologists have carried their obervations, the more numerous are the infances found of marine shells or vegetables occurring in alpine districts formerly regarded as primary; and if granitic rocks, where- ever they occur, are invariably deftitute of extraneous foills, we must attribute it to the peculiar mode of their formation, rather than to their priority of age.
The only circumstance which makes it probable, that the rocks classified as transition rocks, are the lowest in which the remains of organic substances have ever been imbedded, is, that the fossils found in such rocks belong almost exclusively to different species of zoophytes and shell-fish, which may be regarded as the first or lowest links in the chain of animated beings. It is only in the upper strata that we meet with remains of animals possessing the faculties of vision and locomotion, and a more complex organization. See Rocks, Strata, and Systems of Geology.

TRANSITIVE, in Grammar, an epithet given to such verbs as signify an action which passes from the subject that does it, to, or upon, another subject which receives it. Under the head of verbs transitive, come what we usually call verbs active and passive: other verbs, whose action does not pass out of themselves, are called neutrals, and by some grammarians intransitives.

In the Hebrew, the verb הָמָה, hajab, in the Greek ὑπάρχει, and in the Latin fumus, are verbs purely neutral, or intransitive; or, as the Latin and Greek grammarians more usually express it, verbs substantive, signifying the mere existence of the thing, without the active or transitive conjugations.

TRANSITORY, in Common Law, stands opposite to local. See Action.

TRANSITORY Choice. See Choice.

TRANSITORY Tripos. See Trespass.

TRANSLATION, formed of trans, beyond, and Latin, of ferre, to carry; the act of transferring or removing a thing from one place to another.

We say, the translation of a bishop's see, a council, a seat of justice, a parliament; the translation of the relics of a saint, the translation of the empire, &c.

The translations of bishops from one see to another are prohibited by the council of Nice, which declares them null, and appoints the translated bishop to return to his former church. The council of Sardica excludes translated bishops from communion. It has been observed, that no bishop was ever removed from a greater church to a lesser; and that those who thus quitted their churches, only did it out of ambition or avarice.

This discipline was generally observed for nine hundred years; and the first instance of any translation of note, was that of pope Formosus, who was bishop of Porto. One of his successors took hold of this pretence to have him dug out of his grave; and a council, held soon after, forbade this translation to be made a precedent.

However, the same church allowed of some legitimate causes of translations; as the apparent advantage of the church; under which pretence, translations soon became so frequent, that for 500 or 600 years last past, they have been esteemed a kind of common law.

The translation of a religious from one order to another cannot be effected without the consent of the pope; it is added, that it is not allowed to translate from a secular rule to a clerical one.

TRANSLATION is also used for the version of a book or writing out of one language into another. See Version.

TRANSMARINE, TRANSMARINUS, something that comes from, or belongs to, the parts beyond sea.

TRANSMARISCA, in Ancient Geography, a town of Lower or Second Macia, upon the route from Viminacium to Nicomedia; between Apollonia and Candiaiana. Anton. Itin.

TRANSMIGRATION, the removal or translation of a whole people into another country, by the power of a conqueror. See Migration.

TRANSMIGRATION is particularly used for the passage of a soul out of one body into another; the same with what we otherwise call metempsychosis; which see.

The Siamese, F. Tachard informs us, from a belief of the transmigration of souls into other bodies, forbear killing any beasts; lest, by that means, they should dispossess the souls of their deceased relations.

TRANSMIGRATION, Ionic. See Ionic.

TRANSMISSION, in Optics, &c., denotes the property of a transparent body, by which it suffers the rays of light to pass through its substance; in which sense, the word stands opposed to reflection.

Transmifion is also frequently used in the same sense with refraction, because most bodies, in transmitting the rays, do also refract them.

For the cause of transmission, or the reason why some bodies transmit, and others reflect, the rays, see Transparency and Opacity.

The rays of light, sir Isaac Newton observes, are subject to fits of easy transmission and reflection. See Light and Reflection.

TRANSMUTATION, the act of transforming or changing one nature into another.

The term is chiefly used in chemistry and medicine. It has been greatly questioned, whether the transmutation of silver into gold, and of tin into silver, so much sought by the chemists, be possible or not.

The purest and fubtilest parts of the food are transmuted or assimilated into the proper substance of the body. See Nutrition.

Nature, sir Isaac Newton observes, seems delighted with transmutations: he goes on to enumerate several kinds of natural transmutations; gros bodies and light, he fupposes, may be mutually transmuted into each other; and adds, that all bodies receive their active force from the particles of light which enter their composition.

For all fixed bodies, when well heated, emit light as long as they continue so; and, again, light intermingles itself and inheres in bodies as often as its rays fall on the solid particles of those bodies.

Again, water, which is a fluid, volatile, tallowy falt, is by heat transmuted into vapour, which is a kind of air; and by cold into ice, which is a cold, transparent, brittle fline, easily disfolvable; and this fline is convertible again into water by heat, as vapour is by cold.

Earth by heat becomes fire, and by cold is turned into earth again: dense bodies are rarefied into various kinds of air, and that air reverts into gros bodies.

Quicksilver sometimes puts on the form of a fluid metal; sometimes it appears in the shape of a pellucid, fragile falt, called sublimate; sometimes of a pellucid, volatile, white, tallowy earth, called mercurius dulis: by distillation, it becomes vapour; and by agitation in vacuo, it shines like fire, &c.

All bodies, beafts, fishes, insects, plants, &c., with all their various parts, grow and increase out of water, and aqueous and saline tinctures; and, by putrefaction, all of them revert into water, or an aqueous liquor, again.

Farther, water exposed awhile to the open air, puts on a tincture, which, in process of time, has a fement and a spirit; and, before putrefaction, yields nourishment both for animals and vegetables.

TRANSMUTATION, in Alchemy, denotes the act of changing or exalting imperfect metals into gold or silver. This is also called the grand operation; and, they fay, it is to be effected with the philosopher's stone.

The trick of transmuting cinna-bar into silver is thus; the
the cinnabar, being bruised grossly, is stratified in a crucible with granulated silver, and the crucible placed in a great fire; and, after a due time for calcination, taken off; then the matter being poured out, is found to be cinnabar turned into real silver, though the silver grains appear in the fame number and form as when they were put into the crucible; but the mifchief is, coming to handle the grains of silver, you find them nothing but light friable bladders, which will crumble to pieces between the fingers.

Mr. Boyle, in his Sceptical Chemist, tells us, that two friends of his did, by urging mercury in a skillfully managed fire, turn it, almost weight for weight, into water; but he does not say what was the specific gravity of the produced water, nor of the remaining untransmuted mafs of mercury. He likewise affures us, that rain-water, being distilled and re-distilled, by a friend of his, nearly two hundred times, did, after distillation, leave at the bottom of the glass body, a considerable quantity of a white earth; and that more plentifully in the latter distillations, than the former.

This he believed to be a certain quantity of water actually transmuted into earth, adding, that it was above twice as heavy specifically as common water, and of so fixed a nature, that it lay a considerable time, in a red-hot crucible, without losing any thing of its weight, or even emitting any smoke.

For the transmutation of iron into copper, see COPPER AND VITRIOL.

Transmutation, in Geometry, denotes the reduction or change of one figure or body into another of the same area or solidity, but of a different form; as a triangle into a square, a pyramid into a parallelepiped, &c.

Transmutation, in the Higher Geometry, is used for the converting of a figure into another of the same kind and order, whose respective parts rife to the same dimensions in an equation, admit the same tangents, &c.

If a rectilinear figure be to be transmuted into another, it is sufficient that the intersections of the lines which compose it be transferred, and lines drawn through the face in the new figure.

If the figure to be transmuted be curvilinear, the points, tangents, and other right lines, by means of which the curved line is to be defined, must be transferred.

Transmutation of Colours. The change of colour of a decoction of the nephritic wood, according to the different lights it was viewed in, long perplexed those who attempted to account for it; but Wolfsius has carried the experiments on this decoction much farther, and found a way of giving it its colours again, after taking them wholly away. If this decoction he held between the eye and the light, it appears of a blue colour; but if the eye be placed between it and the light, it appears then of a yellowish or a red colour. If a few drops of oil of vitriol be dropped into it, it will appear of a gold yellow in whatever light it is viewed; but if too much of this oil be added, the whole becomes foul and offensive; and if a few drops do not produce the effect, it is a sign that the decoction is too strong, and that it must be diluted with water. See Colours.

Oil of vitriol has the same effect upon many other decoctions of the woods, particularly on that of Brazil wood, which is of a fine red, but immediately becomes yellow on dropping a small quantity of this acid into it. And as in the other instance, so in this, it is necessary to the success of the experiment, that the tincture be not over strong. A few drops of oil of tartar added to this yellow liquor turn it red again as at first; and if more oil of tartar be added, the colour becomes blueish, with a tinge of red, much stronger than the colour of the nephritic wood at first, when held between the eye and the light. In all experiments of this kind, the weakness of the tincture produces the greatest beauty; and therefore it is best, instead of making a decoc- tion, to make only a cold infusion, by putting a small quantity of the chips of the wood into water, and letting this stand cold for some time.

A tincture of red roses, made with common water and oil of vitriol, is well known to be of a very beautiful red colour, yet when the water has stood ever so long on the roses alone, it has scarcely any colour; if it be strained off in this colourless state, and the oil of vitriol then added, the red colour is produced as strongly as if this acid had been dropped into the water, while the roses were yet in it. When the liquor is of this fine red colour, a small quantity of oil of tartar makes it immediately green; and if more oil of vitriol be added to this green liquor, it becomes red again, but is muddy, and not so well coloured as before. If a few drops of a solution of corrosive sublimate be added to this, it does not at all change colour; and on adding more water, with salt of tartar dissolved in it, the liquor became red again, but of a very different red from what it was before in its muddy state, being now clear and deeper. When the tincture of roses has scarcely any colour, a small quantity of salt of tartar makes it green, but a large quantity makes it yellow. A few drops of oil of vitriol added to this yellow liquor, turned it to a pale red, and this could never be made green again by oil of tartar. Alum-water, added to a solution of salt of tartar, makes a white and opaque fluid, though they are both separately pellucid.

What is most observable in these experiments on the infusion of woods is, that oil of tartar, and a solution of salt of tartar in water, have a very different effect. Thus an infusion of Brazil wood is red, and on dropping into it a few drops of oil of vitriol, it becomes yellow. If oil of tartar be added to this liquor, it only makes it yet more yellow; but if a solution of salt of tartar in water be added to this, it makes it red again. Aet. Erudit. Ann. 1718. p. 322.

The solution of verdigris, which is green, becomes colours by the action of spirit of nitre or spirit of vitriol, and by the affusion of the oil of tartar it becomes green again. The spirit of sal ammoniac gives it a purple colour, and oil of vitriol makes it pellucid. The solution of gall with vitriol gives black, the affusion of oil of vitriol destroys the blackness, and it becomes pellucid as before.

M. Muschenbroeck thought it to be universally true, that yellow vegetables, dissolved in spirit of wine, gave yellow tinctures, which are either not at all, or very little changed by acid, alkaline, or any other salts; but he thought there were some exceptions, and says, that when oil of vitriol is put to yellow paint, called orzéon, it becomes of a beautiful blue, which is destroyed by water or any salt. A small quantity of an astringent substance, with iron, gives a black colour; a greater quantity of the astringent produces blue, more of it makes a violet, and more still produces purple.

There are some tinctures, the colours of which depend upon the external air: such is the red tincture made of Canarian lichen, called orpédile, and water, a diluted spirit of wine, with lime and an urchin salt. For, if this tincture be put into a glass tube, hermetically sealed, in a few days it becomes colourless; and when the tube is opened the colour returns. The abbé Nollet made a variety of experiments with this tincture. To the same clafs may be referred the sympathetic inks.

Colours may be produced in liquors which originally have no colour: thus, spirit of wine with red roses, upon which, whilst it is yet white, any tincture acid spirit is poured, in to small a quantity that the acid can hardly be perceived, produc-
duces a florid red. Many other red flowers hardly give any colour to spirit of wine in a short time; yet give a red colour by the addition of any of the acids. A solution of mercury and oil of tartar gives orange; a solution of sublimate and lime-water produces yellow. The tincture of red roses with oil of tartar per deliquium, or with spirit of sal ammoniac, gives green. In like manner, the tincture of many red flowers it changes into green by an alkali. The tincture of red roses and spirit of wine gives blue. The solution of copper and spirit of sal ammoniac gives purple. The solution of sublimate and spirit of sal ammoniac gives white. The solution of saccharum saturni and that of vitriol, also the tincture of red roses, or many other red flowers, and the solution of copperas in water, and likewise the solution of galls and copperas, produce black. The following table exhibits the colours arising from different mixtures.

Müchenbrock's Introd. ad Phil. Nat. tom. ii. p. 738, &c. The result of a variety of mixtures to produce colours, was recited before the Royal Society by Dr. Goddard in 1661, and may be seen in Birch's History, vol. i. p. 11.

Mr. Melville has made many observations on the transmutation of colours by means of the light of different burning bodies. Bodies of all the principal colours, viz. red, yellow, green, and blue, are very little altered, he observes, when they are seen by the light of burning spirits; but if salts be continually mixed with them, during the burning, different changes ensue. When sal ammoniac, potash, or alum, are infused, the colour of red bodies appears somewhat faded and dirty. Green and blue appear much the same as in candle-light, both being faint, and hardly distinguishable. White and yellow are hardly at all affected.

When nitre, or sea-feal, is plentifully mixed with the burning spirits, and the whole is fired about briskly, the brightest red bodies, seen by the light then emitted, are reduced to a dirty tawny brown, which seems to have nothing of redness in it. Green is transformed into another sort of brown, only distinguishable from the former by a certain inclination to a livid olive colour. When nitre is mixed with the spirits, one may still see some remains of greenish colour, unless it be poured in very plentifully. Dark blue is hardly to be known from black, except that it appears the deeper black of the two. Light blue is changed into a very light brown, of a peculiar kind. White assumes a livid yellowish cast; and yellow alone appears unaltered, and extremely luminous.

These experiments he made with different sorts of richly coloured bodies, as silks, cloths, and paints. Polished copper, which had contracted from the air a high flaming colour, was reduced, by the flame light, to the appearance of yellow brass. The faces and hands of the speculators appeared like those of a dead corpse; and other mixed colours, which had red or green in their composition, underwent the like changes.

Having placed a plateboard, with a circular hole in it, between his eye and the flame of the spirits, in order to diminish and circumcribe this object, he examined the constitution of those different lights with a prism, holding the refracting angle upwards; and found that, in the first case, viz. when sal ammoniac, alum, or potash fell into the spirits, rays of all kinds were emitted, but not in equal quantities, the yellow being much more copious than all the rest put together, and the red being more faint than the green and blue.

In the light of spirits mixed with nitre, or sea-feal, he could observe some blue, though exceedingly weak and diluted. With the latter the green was equally faint, but with the former pretty copious. But when either of these faults was used, he could hardly perceive any trace of red, especially when they were mixed, in great plenty, and the spirits constantly agitated. At every little intermission, indeed, the red rays would shew themselves very manifestly below the hole, and red bodies seen by that light refumed somewhat of their ordinary colour; and it was entertaining to observe how both would vanish again at once, when the faulting and flaring were renewed.

The proportion in which the bright yellow exceeded the other colours in this light, was still more extraordinary than in the former: insomuch that the hole, seen through the prism, appeared uniformly of that yellow, and as distinctly terminated as through a plane glass; except that there was adjoining to it, on the upper side, a very faint streak of green and blue. White bodies illuminated with it, appeared also through the prism perfectly well defined, both which, he says, are very surprizing phenomena to those who have been accustomed to the use of the prism in heterogeneous lights, where it never fails to throw confusion on the extremities of all visible objects.

Upon examining bubbles of soap and water in the same light, he could only observe luminous streaks, separated by dark ones, the green and blue being too weak to affect his eye. Edinb. Essays, vol. ii. p. 32.

Transmutation of Plants. See Seeds and Degeneration.

Transom, among Builders, the piece that is framed across a double light window.

Transom, among Mathematicians, denotes the vane of a crossett; or a wooden member fixed across it, with a square whereon it slides, &c.

Transoms, in a Ship, are beams and timbers extended across the stern-post of a ship, to fortify her after-part, and give it the figure most suitable to the service for which she is calculated. See Ship-building.

The general figure or curve given to the ship by the disposition of the arms of the transoms, which are gradually closer in proportion to their distance from the wing-transom downwards, in consequence of which it becomes extremely narrow from the counter towards the keel, is called the flight of the transoms. Although these pieces are extremely different in their figures, according to the extent of the angles formed...
TRANSPARENCY, transparence, in Physics, a quality in certain bodies, by which they give passage to the rays of light.

The transparence of natural bodies, as glafs, water, air, &c., have imputed to the great number and size of the pores or orifinces between the particles of those bodies: but this account is exceedingly defective; for the most solid and opaque body in nature, we know, contains a great deal more pores than it does matter; a great deal more, fully, than is necessary for the passage of so infinitely fine and subtle a body as light.

Arifotle, Descartes, &c., place transparence in the rectitude or straightness of the pores; by means of which, say they, the rays are enabled to make their way through without striking against the solid parts, and being refracted back again: but this account, in Isaac Newton's eyes, is imperfect; the quantity of pores, in all bodies, being sufficient to transmit all the rays that fall on them, however those pores be situated with respect to each other.

The cause, then, why all bodies are not transparent, must not be ascribed to their wanting rectilinear pores; but either to the unequal density of the parts, or to the pores being filled with some foreign matters, or to their being quite empty, by means of which the rays, in passing through, undergoing a great variety of reflections and refractions, are perpetually diverted this way and that, till, at length, falling on some of the solid parts of the body, they are extinguished and absorbed.

Thus cork, paper, wood, &c., are opaque; whereas glafs, diamonds, &c., are transparent: the reason is, that in the neighbourhood of parts equal in density, such as those of glafs, water, diamonds, &c., are with respect to each other, the refraction being equal on every side, no refraction or refraction enters; but the rays, which entered the first surface of the bodies, proceed, without interruption, quite through the body, those few only excepted which chance to meet with the solid parts: but in the neighbourhood of parts that differ much in density, such as the parts of wood and paper are, both in respect of themselves, and of the air, or the empty space in their pores; as the attraction will be very unequal, the refractions and refractions must be very great; and therefore the rays will not be able to make their way through such bodies, but will be perfectly deflected, and at last quite stopped. See OPAQUE.

TRANSPARENT, we think, would be as useful a term in music, as in painting. We know that visibility and audibility are objects of two different senses; but clearness, transparent, is a favourite excellence with musicians, in speaking of counterpoint; and in compositions of many different parts carrying on different directions, that clearness in their texture and arrangement, which enables the hearer to disentangle them, and to distinguih the several parts through each other, but particularly in vocal music, and to hear the principal melody through all the accompaniments, we think might with some degree of propriety be termed transparent.

TRANSPARENT Column. See COLUMN.

TRANSPIRATION, in Physiology, an expression derived from the French, for the cutaneous exhalation. See INTESTINES.

TRANSPLANTATION, in Natural Magic, was used for a ridiculous supposed method of curing diseases by transferring them from one subject to another; and was much in vogue among certain chemicals, or rather sympathetic phisicians, some ages ago.

This transplantation was effected, either by the use of a certain medium, called on that account a magnet; or, without that, only by simple contact.

Transplantation, by means of the magnet, was of five kinds, viz., 
imfination, implantation, imposition, irritation, and injection; but the whole practice is now deservedly exploded.

Transplantation, or Transplanting, in Agriculture and Gardening, the operation of removing plants and trees of various kinds from the situations and places in which they were originally sown, set, or raised, and replanting them in others which are more convenient and suitable. It is practised with a great number of each of these different sorts of vegetable productions.

With the former, for field crops, it is had recourse to with many of the cabbage tribe, and some other such sorts of plants, for wheat, and lately for potatoes. The transplanting of all the different sorts of plants of the first of these kinds, should always be performed, as much as possible, when the weather is in rather a moist state, the ground having previously been put into a suitable state of preparation, by proper ploughing and other means. The plants are placed out, in such cafes, at different distances, as from two to three feet or more, as the nature of the land and circumstances may direct.

In transplanting wheat plants, which is sometimes the case, it has been noticed to be a practice which is not likely to become general for whole fields, but that circumstances may not unfrequently occur where it may be attended with much benefit when employed in a partial manner; as in those cafes where some accidental failures may have happened to the parts of fields, which on a careful examination may be found to have wholly misled, or to be thinner than the others. In all such instances, whatever may have been the cause of the deficiency,—whether from the wheat plants having been destroyed by wetness during the winter, or any other cause,—some parts of the same fields will mostly be found, from which plants may be drawn for this purpose, without injury; and if attention be paid to good and neat cultivation, the vacancies may be usefully filled up by transplanting from such spots, where it may sometimes happen that the plants are so thick as to do harm to each other, and, of course, service be done to the crops in such parts, while the vacant land is filling with them in other places, and by such means the whole be rendered more perfect, uniform, and regular, improving the appearance as well as the abundance of the crops.

The practice of transplanting wheat in the early spring months, in these and other cafes, has long been advised by different writers, and lately had recourse to, with great success, in the parish of Bocking in Essex, to some considerable extent. It was there performed with the common dibble at the distance of twelve inches, but nine would have been preferable.
ferred, had it not been apprehended that the plants which could be collected would be insufficient.

It is thought capable of being more generally introduced with great advantage not only in the abundance of the crops and the saving of feed, but in the vast increase of employment which it furnishes for the labouring poor of different descriptions, as well as in some other respects, as may be seen in the first volume of the Corrected Agricultural Survey of the above county.

In regard to the transplanting of potatoes, it has been shewn by the trials of the Rev. Mr. Cartwright, which are described in a paper in the fifth volume of Communications to the Board of Agriculture, that there is no plant which admits of being transplanted with more complete success. It is suggested as a practice which, besides affording hints to the farmer for the improvement of the field-crops of this sort, may throw in the way of the cottager some useful information, as it may teach him, that after he has had crops of spring and early summer vegetables in his garden, he may procure from it, by being provided with a small bed of the nursery kind for potatoe plants, a valuable supply of useful food for his winter consumption and advantage.

The crops in these transplantings were after aces of the winter kind, and only top-dressed for, which is a considerable saving of manure.

In garden culture, transplanting is essentially necessary for a great variety of different plants of the euculent and other kinds, as has been seen under their different heads. And it has lately been found to be a considerable improvement in the culture of the onion, both in the garden and the field. When transplanted in moist weather into small shallow drills, eight or nine inches apart on beds, having the whole roots firmly well dipped in a thick puddle liquid, composed of one part foot, and three parts earth, with a sufficient quantity of water to form the mixture, they are said to succeed perfectly. It is a method too which has the advantage of being less expensive, and of course more profitable, than the common one, as the work can be cheaply done by boys or girls; it admits of clearing the plants of weeds better, which is highly beneficial to their growth; a few small beds thickly sown will furnish plants for as many acres; the ground which is to be planted may be under winter or spring crops, it being sufficient to clear it of them by the end of April, or the beginning of the following month, when the transplanting of the onions is to take place, and those contained in the seed-beds will, in the mean time, afford the necessary supplies for family use or the market. It has besides the benefit of having the onions better in quality and larger in size, and the crops wholly free from worms and the rot. See a paper on this subject in the first volume of the Memoirs of the Caledonian Horticultural Society.

With the latter, or plants of the tree-kind, transplanting is performed both for those of the forest and fruit sorts in a great number of cafes. It is a practice which is much had recourse to in nursery-grounds for raising the different kinds while in their early growths, as the first two or three years. But for providing timber-wood, especially with some sorts of trees, as the oak and a few others, it is probably better not to transplant at all, as the produce is said to be firmer, more durable, and better for many uses, where it is not done. See Timber.

Though the work of transplanting be mostly practised while the trees are in this young state, it is capable of being effected, by proper management and attention, with perfect success, when they are of considerably larger growth. Mr. Amos, in his work on "Agriculture and Planting," has observed that, as in forming various sorts of ornamental undertakings with trees, as those of extensive lawns and fields interplanted with large collections of such as are of the forest kind, and flowering shrubs placed out in the wilderness manner, with serpentine walks and paths running through the whole, the delights often become defective and unsatisfactory, from the want of various sorts of proper large-sized trees: to supply the defect in such cafes, plenty of different proper-sized trees should always be at command, for the purpose of transplanting into bare fields, parks, and about naked new buildings, or into other situations where they may be most capable of imitating that charming tasteful negligence of nature which is so ravishingly pleasing to the senses. And that in order to prepare the young trees for being thus transplanted when large, they should, it is said, be continued in the feed-beds for the space of two years and a half, and then be set out at greater distances, reducing the tap-roots considerably, but those of the lateral kind only sparingly. That as in such young trees the root grows faster than the stem, (as oak-plant a foot and a half in height has sometimes a root four feet in length,) the necessity of mutilating the root, especially the tap one, in such cafes, is clearly shewn, the plants then emitting radicles in every direction, grow faster than if the roots had remained perfect. And that if a plant, or tree, be transplanted in this state, it succeeds with greater certainty the more absorbent radicles are preferred to the root. When such trees have remained two years in the nursery-beds, they should be again removed, dressing their roots as before, and increasing the distance between them, when they may continue three or four years more. After which they may be put out in collections, where they are to remain for good, or until wanted for transplanting. That as in transplanting large trees, some large fibres of the roots are unavoidably broken and mutilated, and consequently the absorption of nutriment in the plant diminished, it is necessary that boughs answerin to the destroyed roots should be cut away, in order to lessen the transpiration in proportion to the quantity of food that may be taken up.

The most proper and desirable sorts of trees for transplanting in this large state, are, it is conceived, the different sorts of elms, of which the English is the best, as it is most aper, and soonest recovers its wounds. The lime, too, will bear to be removed at a great size, as its wounds soon heal, and it may be formed into any shape desired. The oak, the beech, and the ash, will likewise bear to be removed when rather large, but they require more care in the work than the former: on the whole, those trees, the bark of which is the thinnest and smoothest, will be the most proper for this purpose. The hornbeam, the fycamore, the large-leaved maple, the sweet and horse-chestnut, and the laburnum, will all bear transplanting and removing, if they do not exceed fifteen or sixteen years' growth, and from twenty to twenty-five feet in height; if they are older and larger when this is done, they do not recover their wounds so perfectly as to become hand-ome trees. The larch and mountain-ash also bear transplanting and removing when large, but they should not exceed twelve years' growth. The balsam poplar of Canada, too, is a fine plant of the tree-kind, which is raised with much care, is hardy, quick in its growth, and will bear to be transplanted and removed at a great size. And the crab-tree and white-thorn will suffer themselves to be transplanted at a large growth, when in a healthy and growing state; and that as few trees exceed them in beauty or fragrance in the spring feason, or their rich
rich glow of fruit in the autumn, they may be transplanted out singly into lawns, fields, and parks, where, when judi-
ciously interpersed with other trees, they may highly deco-
rate such situations. The elevation of flatly trees in clumps, 
parks, lawns, or fields, is considered, on the whole, as having 
a most agreeable effect, but that in new designs they cannot 
often be had without waiting many years, and incurring 
much labour, difficulty, and expense. However, by means 
of the directions which have been given above, and the use 
of the transplanter for large trees, it is thought the dif-
culty may be greatly removed, and a good flat foot made, 
even in bare fields, parks, and about new-built houses, with-
out suffering such inconveniences, which must be a great 
inducement to such persons as are advanced in life to have 
recourse to the practice. See Transplanter, Tree.

In the work of preparing for the removal and transplan-
ting of large tall forest-trees, it is recommended as proper 
to dig a circular trench all round them two or three feet 
depth, as early as possible in the spring; by which many new 
roots will shoot from those which have their ends cut off, 
and by which the balls of earth will be better held together, 
when the trees are removed in the succeeding autumn; and, 
by their having previously produced so many more fine 
radicles of the absorbent kind, be more certain of growing 
in their new situations. After which, the first step to be 
taken in the following autumn, is to mark out the places 
where the trees are to be removed and transplanted to, and 
there to dig pits three, four, five, or six feet wide, having 
the depth of from twenty-four to thirty-six inches, as the 
size of the roots and balls of earth which hang about them 
may be. The top-soil in these diggings is to be thrown to 
the sides of the pits where the trees are to come, and the 
bottom or poor soil to the other sides. It this state the 
pits are to remain until the trees are nearly ready for re-
moval, which is to be effected in this manner, and is the 
next step in the busines. It is carefully to raise the trees 
which are to be the most healthy, and such as are of the 
pyramidal form, with as many roots, herby fibres, and as 
much earth about them as possible. This is to be accom-
plished by digging trenches round about them, two, three, 
or four feet from the bodies of the trees, as their sizes may 
be, and about three or four feet deep, floppy them on 
the sides where the transplanter is to receive the trees. Then 
to bend the trees so far to one side, by the assistance of ropes, 
that the bottom roots may be easily got at, when they may 
be cut across with a sharp hatchet, and the extremities 
smoothed, which have been scattered, by a sharp hedging-bill, 
when bearing them upright again, bend them to the con-
trary side, and dress the roots in the same way, then raise 
them up a second time, when they will be ready for tran-
spalting. In which cafe, it is directed that one fet of hands, 
as one, two, or three men, should fill the pits half full of 
water, the top-soil and other fresh mould being mixed with 
it to the consistence of a thin puddle. That another set of 
men, as two, four, fix, or eight hands, as the sizes of the 
trees may be, should rear up the transplanter of the trees 
against them by means of the rope for the purpose, balancing 
them properly by the machine, and leaving the fore-carriage 
part of it upon the ground, taking care to surround the 
places well with filth, where they roll upon the bars and 
bolts, in order to prevent the bar from being galled and 
rubbed off, which would greatly injure the trees. The 
whole should then be pulled and brought down together, in 
a gentle manner, by the rope for the purpoap; three or 
four men and a horse being employed in the busines, where 
necessary, leading well the motion downwards, and at the 
fame time a man or two are to guide the bolt of the machine 
into the fore-carriage, into which the horses are then to be 
pulled, and the trees conveyed to the pits, which by this 
time will be ready for their reception. The carriage is then 
to be drawn up along that side of the pits on which the 
top-foil was laid, backing it until it gets into such a position, 
that by rearing the machine and trees upright, as in loading, 
the root parts with the balls of earth about them, may be 
dropped exactly into the centres of the pits, amidst the 
puddles, which will fo run among and into the cavities of 
the balls, hanging to the roots, as to farround and cover 
every fibre. The pits are then to be filled completely up, 
and a mound of earth raised about a foot higher than the 
surface all round each of the trees to two or three feet 
distant from the centres, hollowing it towards the trees, for 
the better reception and retention of moisure. After this, 
it is suppos'd the trees will be able to brave and defy the 
rudel affulats of the winds, without any supports, even at 
the first transplanting out. In this manner, the whole 
busines of transplanting large forest-trees is to be proceeded 
in, and which has been found very successful in a variety of 
trials.

In garden management, too, large old fruit-trees of both 
the wall, espalier, and standard kinds have lately been found 
capable of being transplanted with great success and advan-
tage, when performed somewhat in this simple manner. 
When for large wall-trees, it is to be done by forming a 
half-circle for each in extent equal to the five 
of the 
trees, as feven or eight feet for such as cover a large space, 
measuring from the trunks of them; digging a trench 
round that three feet in width, and five inches below the 
roots, carefully preferring the whole, and working out 
the earth from among them with a blunt tool, and cajling out 
the loose mould by the spade. Proceeding thus until 
got fully under the trees to be raifed. The roots are then 
to be tied loosely together, and the branches freed from 
the walls, and put in parcels to prevent their being injured. 
The trees are now to be conveyed to the places into which 
they are to be transplanted; where proper-sized pits, for 
allowing the roots to be spread out and extended, are to be 
provided, placing them upright in them, using fresh earth 
alone or mixed with dung, and disposing them, so as that 
the surface roots may be equal with the top of the border 
in which they are put, then packing in the well-broken 
earth underneath, and for about a foot round the bottoms of 
the trunks, to fill all vacancies where the roots proceed from. 
After which, the whole of the perfect roots are to be 
attentively spread out at full length, cutting off any dead, 
bruis'd, or knotty parts; the ends of the remaining ones 
being smoothed and preserved at different lengths, keeping 
some at full length, others at five, four, and three feet, and 
a few even at one foot long, taking care to save as many of 
the small fibres attached to the leading roots as possible; 
beginning by laying the whole out in sets or layers from the 
bottom at the wall-side of the half-circle, in the same manner, 
until the top be reached, arranging the small fibres in reg-
ular order, and covering the different layers of roots with 
to or three inches in thicknes of mould, packing it well 
by the hand, and never letting the foot on the roots which 
have been covered. Proceeding in this way with each side 
of the half-circle, until they meet in the middle part of it, 
raising the whole with earth to the height of two inches 
above the level of the border; and above all applying three 
inches thick of good rotten dung. A full watering is then 
to be given, to settle the earth about the roots. Boards are 
to be laid to prevent the roots being trodden upon in narial-
The transplanting of efpalier and flatland trees only differs in this, that a full circle is to be dug round them.

The most proper seasons for transplanting large fruit-trees are either in the beginning of the autumn, or just before the spring, in mild weather.

A great number of such large trees has been transplanted in this manner with complete success, some of which have borne half crops the first year afterwards, and others more, the fruit in most cases being greatly improved, as may be fully seen by consulting different papers on the subject in the volume of Horticultural Transplants already noticed.

For fruit-grounds, the young stocks for apple-tree plants are most likely to transplant out the second or third year of their growth. See Stocks, Apple, &c.

The transplantation of the blossom-buds of fruit and other trees has lately also been tried, by transplanting the abundant buds of this first of the orange trees and taking the branches of others, which is said to be capable of being performed with facility, and perhaps considerable advantage, in some cases. Such buds of pear-trees, when inserted into the strongest young shoots of old ones, may afford abundant crops of very fine pears, and be gained with little trouble. The buds of these pear-trees are the best which have been formed upon the boughs of the abundant branches of blossoms of the preceding year; and, that, instead of taking out the wood of the bud wholly, as is usual, it is most advantageous to let it remain in small quantities, only paring it very thin.

Transplantation of Flower-Plants, among Florists, the means of putting out and managing the different sorts of young plants of this kind. Work of this sort should always be performed according to the particular nature and habits of growth of the several kinds of these plants. In the auricula, the polyanthus, and different other similar kinds, the transplanting is often done early in the spring season by some; while others perform it annually about the beginning of the autumnal season, especially for the first of these sorts; but probably the most suitable period is that about the beginning of the first of the above seasons, when the weather is rather showery, though it may often be performed later with good success. Those plants designed for strong blooming, should, however, never be transplanted, either early in the spring or too late in the summer, as they always require to get well-rooted before the winter season sets in.

But notwithstanding the young offsets and other plants are to be transplanted in the above manner into their small pots, the large strong-blowing roots are not to be transplanted or removed more frequently than once in every two or three years, as the risk of having fine strong flowers is otherwise very great, as plants of this sort never thrive in a right manner, until their roots have reached the depth of the pots, which rarely happens in so short a time as twelve months; but a difference is to be made, in performing this sort of work, between the plants which throw out suckers or offsets in great abundance, and such as do not; as the former require more frequent transplanting, all or most of such parts being carefully pared off and removed at the time; while in the latter it need not be so often. Where plants of strong superior bloom for incafe are wanted, it is of material consequence to keep all such suckers and offsets from growing on the stalks of the old plants without fibres, they being kept constantly well rubbed off while of very small fixes, but those that rise from below the surface of the earth need not be so much regarded.

It is thought by some, that the large healthy strong blooming plants of this sort need not be removed or transplanted, and have the earth shacked wholly from their roots every year, as is the usual practice; as they have been found to do better without, by having occasional fresh earthing up the pots in some late trials. They should not, however, remain longer in this way than the third year. Florists in general have, it is supposed, been too fond of frequently transplanting or removing the large blooming plants of this sort, as once in two, or not more than three years, will be found sufficient, and more beneficial. The plants of this large blooming kind are not by any means to be transplanted or removed in dry hot times, as by shaking the mould cleanly from the roots of the plants, the fibres will not be freely drawn, unless the season be inclined to be showery, and there be what is termed a cool moist state of the air. Fine young maiden plants may, however, sometimes be transplanted into small pots in such dry weather, being slipped out of the pots with the whole balls of earth about them, and then immediately relaid in full-sized blooming pots for the ensuing season.

In short, in transplanting these as well as many other sorts of flower-plants, much more always depend upon the state and condition in which the plants are found.

Where the plants of this kind have not been transplanted for some length of time, as two or three years, the small roots having filled the pots, the large, the tap, or the carrot root, as it is often termed, may have become so long as to stand in need of shortening by taking it out of the pot, shaking the earth away from it, and doing what is necessary, as by remaining too long it either gets rotten at the end, and constantly keeps the plant weak, or becomes too long for a common pot; besides, it wants shifting or transplanting every year, and never produces fine strong flowers. The small roots are to be reduced to about a dozen, those nearest the leaves being left for supporting the plants. Where there is any canker or rottenness in the root, it is to be cut to the quick or quite sound parts, and the wounded part secured by the use of a composition made of beeswax, turpentine, and white rye, and be made to crust over by exposure to the sun. Where large blooming or other plants of this sort to be removed have been in the pots only one year since the last transplanting, they are to be slipped out of the pots, with all the earth about them; and as the roots will be small but little matted, it need not be shaken from them, only cutting it and the fibres of the roots down a to a small ball in each plant, according to their ages and sizes. Some, however, do not like this method, but remove all the earth in transplanting them.

Different other fine flower-plants are to be managed somewhat in the manner which has been thus laid down in transplanting them, as the differences of the nature and habits may direct, only they will, for the most part, seldom require so many transplantations; indeed once or twice will almost always be as many as are necessary for them.

Transplanted or Ground Onion, in Gardening, a new sort of root of this kind lately brought from Egypt, and introduced into the northern parts of this island by Mr. J. Burns, captain in the royal navy, whence it is sometimes called by that name.

The manner of its cultivation, uses, and advantages, are thus described in a paper in the Scotch Horticultural Memoirs. The roots, being separated from the branches in which they grow, should be put out or transplanted into any
any ground that is considered suitable for the common root of this fort, the soil being first well prepared and enriched by the use of horse-dung in a reduced state; the plants or roots are then to be covered with only about one inch in depth of earth. The bell and moat proper time for the putting them out or transplanting them is during the month of April. They should be put about a foot or eighteen inches asunder. They grow and are produced in clusters, somehow in the manner of the bunches of grapes or currants; some growing in a round, others in a conical form or shape; those on the surface being the largest, while those in the centre are usually the soonest ripe. It is necessary that they should be taken up as they ripen, and when they are intended for keeping, they may be taken up rather before they are completely ripe.

It was found that two roots, the tops of which had begun to decay in the beginning of August, and which had been raised from the ground in the beginning of the following month, produced, in one case, nine onions, and in the other twelve. The onions in these cases were of very different sizes, but the whole, when taken together, weighed more than a pound. Twenty-three onions of this fort, when planted out, are however said, in another instance, to have produced upwards of six hundred fine plants at the same time.

The circumstance in which this fort chiefly differs from the common Deepsfort and Straffburgh feed-kinds is, that it is larger, as in tarte the quality is much the same. But it has, it is said, a material advantage over the feed-onion in this particular, that if planted about the middle of April, it will be fully ripe about the same time in the following September. Besides, it is not liable to accidents from any badness, imperfectition, or too moist or too dry seasons, as is often the case in the common feed-onion. Another great advantage the transplanted or ground onion has over the feed fort is, that no inhaustance has yet occurred where it has been injured by vermin or insects, which is frequently the case with the feed-kind. This fort of onion would seem on several accounts to deserve further attention to its cultivation and growth in this very uncertain climate for the common crops of such roots.

Transplanter, Tree, in Agriculture and Gardening, a machine or contrivance constructed for the purpose of afflicting and facilitating the means of transplanting and removing trees of large growths and sizes.

A very simple and useful contrivance or machine of this kind has been given by Mr. Amos in his practical work on "Agriculture and Planting," with a correct representation of the frame. It is simply composed of the two hind and the two fore-wheels and carriage part of a farm-waggon, with a platform, and diagonal frame raised and erected upon them so as to be capable of receiving the tree, and of retaining it in a firm, steady position, until it be conveyed to the place where it is wanted to be replanted, when it can be let down with great ease and readiness into the hole where it is to be set and grow.

Much facility and dispatch are given in replanting large trees by machinery of this kind for ornament or other uses. See Transplantation.

Transport-Ship, is a vessel used to convey provisions, warlike stores, fouders, &c. from one place to another; also convicts over the seas.

Transportation, the act of conveying or carrying a thing from one place or country to another.

In matters of commerce, transportation is of equal import with re-exportation, viz. the taking up of commodities in one foreign state or kingdom, bringing them hither, and paying duties for them; and then conveying them into some other foreign state; by which it is distinguished from importation and exportation; where the commodities are either carried originally out of, or brought finally into, our own kingdom.

Transportation, in Law, is also a kind of punishment, or, more properly, an alleviation or commutation of punishment, for criminals convicted of felony; who, for the first offence, unless it be an extraordinary one, are ordinarily transported to some foreign country for a term of years, or for life; within which, if they return, they are executed without further trial than ascertaining their identity.

This is made felony without benefit of clergy by statutes 4 Geo. I. cap. 11, 6 Geo. I. cap. 23, 16 Geo. II. cap. 15, and 8 Geo. III. cap. 15; as is also the afflicting transports to escape from such as are conveying them to the port of transportation.

Exile and transportation are punishments at present unknown to the common law; and whenever the latter is now inflicted, it is either by the choice of the criminal himself, to escape a capital punishment, or else by the express direction of some modern act of parliament. Accordingly, it was enacted by the statutes 4 Geo. I. cap. 11, and 6 Geo. I. cap. 23, that when any person shall be convicted of any larceny or felony, who by the law shall be entitled to the benefit of clergy, and liable only to the penalties of burning in the hand or whipping, the court in their discretion, instead of such burning in the hand or whipping, may direct such offenders to be transported to America (or, by statute 19 Geo. III. cap. 74, to any other parts beyond the seas) for seven years. And by the subsequent statutes 16 Geo. II. cap. 15, and 8 Geo. III. cap. 15, many wife provisions are made for the more speedy and effectual execution of the laws relating to transportation, and the conviction of such as transgress them. But now, by the statute 19 Geo. III. cap. 74, all offenders liable to transportation may, in lieu thereof, at the discretion of the judges, be employed, if males (except in the case of petty larceny) in hard labour for the benefit of some public navigation; or, whether males or females, may, in all cases, be confined to hard labour in certain penitentiary houses, to be erected by virtue of the said act, for the several terms therein specified, but in no case exceeding seven years; with a power of subsequent mitigation, and even of reward, in case of their good behaviour: but if they escape and are retaken, for the first time an addition of three years is made to the term of their confinement; and a second escape is felony without benefit of clergy.

Transportation is said to have been first inflicted as a punishment by 39 Eliz. cap. 4. Blacklt. Com. vol. iv.

Transportation of Plants, is the removal of them from one country to another; with respect to which great caution is necessary. The plants sent from a hotter country to a colder should be transported in the spring of the year, that the heat of the season may be advancing as they approach the colder climates; and, on the contrary, those which are sent from a colder country to a hotter should be sent in the beginning of winter.

The best way of packing up plants for a voyage, if they be such as will not bear keeping out of the earth, is to have boxes with handles, and holes bored in their bottoms to let out the moisture, filling them with earth, and planting the roots as close together as may be; the plants should be set in these boxes a fortnight or three weeks before they are to be put on board, and in good weather they
they should be set upon the deck, and in bad removed or covered with a tarpaulin.

If they are going from a hotter country to a colder one, they must have very little moisture; if, on the contrary, they are going from a colder to a warmer, they may be allowed water more largely, and being shaded from the heat of the sun, they will come safe.

Very many plants, however, will live out of the earth a great while; as the sedums, euphorbias, ficoides, and other succulent ones. These need no other care than the packing them up with moss in a close box, and then should be a little hay put between them, to prevent them from wounding or bruising one another, and holes bored in the boxes, to keep them from heating and putrefying. In this manner they will come safe from a voyage of two or three, or even four or five months.

Several trees also will come safely in the same manner, taking them up at a season when they have done growing, and packing them up with moss. Of this sort are oranges, olives, capers, jasmines, and pomegranate-trees. These, and many others, are annually brought over from Italy; and though they are three or four months in the passage, seldom miscarry. And the best way of sending over seeds, is in their natural husks, in a bag, or packed up in a gourd-shell, keeping them dry, and out of the way of vermin. Miller. See Seed.

Those who are defirous of particular instructions with regard to the boists means of collecting both seeds and plants in distant countries, and of preserving them during a voyage hither in a vegetating flake, may consult Mr. Ellis's Directions for bringing over Seeds and Plants from the East Indies, and other distant Countries, in a State of Vegetation, &c. 4to. 1770.

TRANSPORTING, in Sea Language, the act of removing a ship from one place to another, by the help of anchors and ropes. See Warp.

TRANPOSITION, in Algebra, the bringing any term of an equation over to the other side. Thus, if \( a + b = c \), and you may make \( a = c - b \); this is said to be transposed. See Reduction of Equations.

TRANPOSITION, in Grammar, a disturbing or dislocating of the words in a discourse; or a changing of their natural order of construction, to please the ear, by rendering the contexture more easy, smooth, and harmonious. A transposition, which renders the sense perplexed, is vicious. The construction of the ancient languages, being much more artful than that of the modern ones, allowed of much greater, and more frequent transpositions. The English, French, &c. fearfully ever allow of them but in oratory and poetry; in which cases, they serve to give a force and energy to the discourse, or the verse, and to prevent their languishing.

TRANPOSITION, in Music. We will venture to say, from long experience, that no musician can transposite at sight, with certainty and firmness, but by a perfect knowledge of all the clefs necessary to change any one of the seven notes in music to any other we please. (See Clefs.) This was Dr. Pepusch's method of teaching transposition, though not very clearly explained in his treatise; and Mr. Galliard's method, which he has made perfectly intelligible by a plate, in his translation of Toh. Cerone, in 1614, seems to have been the inventor of this method. See Cerone.

The transposer, besides changing the notes higher or lower by imaginary clefs, without changing their original places on the staff, must likewise know what sharps and flats belong to every key. If, for instance, we wanted to transpose our national supplication of "God save great George our King!" from G natural to Eb, a major third lower, we have only to imagine a clef that will make the second line E, which is the sopрано, or tenor clef, on the first line. If, again, a finger wished to have this favourite air a third higher than G, which is B b, the bafe clef with two flats will render all the notes, which with the treble clef were in G, a minor third higher.

Now to render G on the fourth space in the base B b, we have only to suppose the treble clef in the accompaniment instead of the base. And to render the fourth space B b, instead of G natural, we have only to imagine the base clef on the third line with two flats, instead of the fourth with one sharp.

TRANSPORTING, in Geography, a town of Algiers, near the coast of the Mediterranean, on a gulf called the Immifia; 30 miles S.W. of Oran.

TRANSTRAND, a town of Sweden, in Dalecarlia; 80 miles N.W. of Falun.

TRANSTRUM, in the Naval Architecture of the Ancients, a term used to express a sort of cors or transverse seats that were placed in the polycrotic galleries of those times, and served for the places of several of the rows of men, who could move and work their oars under the seats of the other or lateral rowsers of the next tire.

Melbonius, who has written expressly on the naval architecture of the ancients, has better understood the places and use of these transttras, than any other author of last times; by a proper arrangement of these seats, and the lateral rows above and below each, he has taken off greatly from the height allowed by Scaliger, and others, to the polycrotic velists.

TRANSMUTATION, in the Roman Theology, the supposed conversion or change of the substance of the bread and wine, in the eucharist, into the body and blood of Jesus Christ.

Transmutation, taken in its general and literal sense, implies any change of one substance into another. Thus, the change of Mofes's rod into a serpent; of the waters of the Nile into blood; of Lot's wife into a pillar of salt; were preternatural transmutations: and the change of the food we eat into the substance of our bodies, is a natural transmutation.

But the word, in its proper and technical sense, is, to return to the miraculous change which the Romish church holds is wrought in the sacrament, by the consecration of the priest.

One of the great articles of that church, rejected by the reformed, is that of transmutation; the latter maintaining the transmutation to be only figurative, and the former affirming it to be real.

The reformed interprete, is, in the text Hor est corpus meum, This is my body, by significat, q. d. This signifies my body.
body: but the council of Trent stand up strenuously for the literal sense of the verb. Thus, in can. i. feil. 13. of that council, it is expressly decreed, that, in transubstantiation, the body and blood of our Lord Jesus Christ are truly, really, and substantially, under the species of bread and wine.

It is added, that by truly, we mean properly; and not only by signification, as if the eucharist were no more than a sign of the body and blood of Jesus Christ: that by really, we mean in fact, and not only in figure, as if the eucharist were only a figure and representation of the body and blood of the Saviour of the world; and that by substantially, we mean in substance, and not only in virtue and energy. Thus is truly opposed to a simple sign, really to a figure, and substantially to energy or virtue.

This doctrine was established in the fourth general Lateran council, under pope Innocent III., in 1215, who is said to have introduced and established the use of the term transubstantiation, which was hitherto absolutely unknown; though some say that Stephen, bishop of Autun, first used this term. Burnet on the Article's, p. 312.

It was principally owing to the authority of Lanfranc, the principal champion of this new doctrine against Berengarius, supported by Rome, that so strong a tenet was established in the eleventh century, both in England and France. At the beginning of this century it was unknown to the church of England, as is incontrovertibly proved by the epistles and canons of 

It seems difficult, at first sight, to account for the zeal of Rome in advancing and propagating a doctrine so full of absurdity as that of transubstantiation. What use, it may be said, could there be in understanding a figurative expression (with which manner of speaking the Scripture so much abounds) according to the letter, which makes it nonsense; when that nonsense does not appear to be productive either of power or profit to the church? The supremacy and infallibility of the bishops of Rome; the doctrine of purgatory, masses, and prayers for the dead; the worship of saints and images; the celibacy of the clergy; the merit of monastic vows; the necessity of confession to; and absolution by a priest, for the remission of sins; the power of the pope to grant indulgences, and apply to the benefit of other men the works of supererogation done by saints, and therefore belonging to the treasury of the church; all these opinions have a clear and evident tendency to raise and support the dominion and wealth of the Roman see and the clergy; whereas the multiplied contradictions and impossibilities contained in the notion of transubstantiation, seem to serve no purpose, but to expose the Christian faith to the ridicule and contempt of the Jews and Mahometans, or other unbelievers. Nevertheless, the solution of this difficulty may be found in the words of Pope Pius VII. viz. "That it was a most execrable thing, that those hands, which had received such eminent power above what had been granted to the angels themselves, as, by their ministrv to create God the creator of all, and offer up the same God, before the face of God the Father, for the redemption and salvation of the whole world, should defend to such ignorance, as to be put, in sign of subjection, in the hands of princes, &c." The same words were also used by pope Urban II. at the council of Bari. And certainly nothing could to raise the idea of the priesthood, or produce such veneration for them in the minds of the people, as their being supped to polish this more than angelical power. Lyttelton's Hist. of King Henry II., vol. i.

**TRANSUBSTANTIATION, Declaration against.** See Declaration.

**TRANSVERSALIS COLLIS, transversa gere, in Anatomy, a small narrow muscle, placed at the lower and lateral part of the neck, and upper part of the back, which it extends from the transverse processes of the five or six lower cervical vertebrae, to the corresponding processes of four or five dorsal vertebrae after the second. The splenius, levator facæula, facralimbus, and longissimus dorfi, cover it behind, where it is inseparably connected to the two latter: it lies upon the transverse-mana-loidous, to which it is also intimately connected, the complexus, and multifidus spine. The front edge of the muscle is attached to the cervical transverse processes already mentioned; it passes over those of the two first dorsal vertebrae, and is then attached to the transverse processes of the four or five following ones. These attachments are effectuated by slender tendons, connected with those of the splenius, levator facæula, and multifidus spine. It will extend the neck on the back; or, if the muscle of one side acts separately, it will incline the neck to its own side.

**TRANSVERSE, something that goes across another from corner to corner.**

Thus bends and bars, in heraldry, are transverse pieces, or bearings: the diagonals of a parallelogram, or a square, are transverse lines.

Lines which make intersections with perpendiculars, are also called oblique or transverse lines.

**Transverse Axis, or Diameter, called also the first or principal axis.** See Axis, Diameter, and Latus-Transversum.

The transverse axis of an ellipse is the longer axis, or that which transversely it lengthwise, in contradistinction from the conjugate one. See Conic Sections, and Ellipse.

For the transverse axis of the hyperbola, see Conic Sections, and Hyperbola.

**TRANSVERSO-SPINALIS, in Anatomy, a name sometimes given to the multifidus spine. See Multifidus.**

**TRANSVERSUS ABDOMINIS, a broad muscle of the abdomen. See Obligus.**

**TRANSVERSUS NAFE, a synonyme of the contrætor narium. See Nare.**

**TRANSVERSUS PEDIS, transversus des orteils, a small muscle lying across the foot, immediately under the heads of the metatarsal bones, and extending from the four lateral these bones to the first phalanx of the great toe. It is thin and feby; covered above by the metatarsal bones and interscalar muscles, and covering below the flexor tendons, arteries and nerves of the toe. It arises from the heads of the four last metatarsal bones, and is inserted, together with the tendon of the adductor pollicis pedis, in the outside of the basis of the first phalanx of the great toe. It will approximate the great toe to the others; and by drawing the toes together, from side to side, will render the foot concave.**

**TRANSVERSUS PERINIS, two muscles of the pedis.**

**TRANSVERSUS PERINIS ALTER, a muscle, of which the former is connected to the end of the large intestine. See Intestine.**

**TRANSUM, in Gunnery, is a piece of wood which goes across the cheeks of a gun-carriage, or of a gun, to keep them fixed together; each tramum in a carriage is strengthened by a bolt of iron. See Carriage.**

**TRANSUMPSTION, Transsumption, in the Schools, a syllagism by concession or agreement, used where a question proposed is transferred to another, with this condition, that the proof of this latter shall be admitted for a proof of the former.**

Thus
Thus Aristotle, in his book De Caelo, undertaking to show, that all the flars are round, transfers the question to the moon, and proves her rotundity from her increasing and waning; supposing it a thing admitted by his opponents, that the flars are all alike.

TRANSYLVANIA, Principality of, in Geography, a country of Europe, bounded on the N. by Hungary, Poland, and Moldavia; on the E. by Moldavia; on the S. by Walachia and the bannat of Temeswar; and on the W. by Hungary. The form is nearly oval, about 400 miles in circumference. It is surrounded on all sides by lofty mountains, and is itself mountainous and woody; the mountains run from N. to S., and branch off likewise E. and W., and terminate at the centre, in hills covered with vineyards, and abundant in minerals. The air is generally warm, but more wholesome than that of Hungary; the soil is fertile, abounding in corn; flax of a very good quality, which is manufactured into linen; wine, cattle, and rich pastures: among the minerals are gold, silver, copper, iron, quicksilver, cinabcr, antimony, sulphur, vitriol, rock-fall, salt-petre, ochre, &c. The principal quadrupeds are buffaloes, hares, wild a=ises, elk, bears, wild boars, lynxes, chamois, mar- tens, ermines, and beavers. The inhabitants are composed of different nations: Hungarians, Sikli or Scythian Huns, Saxons, Walachians, Armenians, Rascians, Bulgarians, and Greeks; to which may be added Jews and Cingars, who live in tents, and lead a vagabond life like gypsies. This country is by the Germans called Siebenbergen, and by the Hungarians Erdely. It was an ancient part of Dacia; and, conquered by Trajan, it became a Roman province. It afterwards fell into the hands of the Goths, Huns, and afterwards the Hungarians. In the year 1004, it was first made a province of Hungary, and continued under the government of a wawode to the year 1526, when two rival princes contended for this principality; one of them was supported by the German emperor, and the other by the Turks; whereupon this country became the seat of war for many years. The princes of the house of Ragotzki were at the head of the Protestant faction, and supported by the Turks, but being at length obliged to quit Transylvania by the Austrians, Ragotzki fled for refuge into Turkey; and at the treaty of Carlowitz in 1699, this country was confirmed to the house of Austria by the Turks. The government of Transylvania is wholly different from that of Hungary; and, by the joint consent of prince and people, formed into an arilocratical government; and, since the year 1722, rendered hereditary to the princes and princes of the house of Austria. Formerly the prince of Transylvania succeeded to the government by free election, but since the year 1722 by inheritance; and though his power is connected with that of the king of Hungary, and archduke of Austria, yet his government and privileges differ from both. The soils of Transylvania, with respect to the number of its nations, are divided into Hungarians, Siculi, and Saxons; with respect to its different religions, into Catholics, Calvinists, and Lutherans; and formerly, also, into Unitarians; but, politically, after the example of Hungary, into prelates, nobility, gentry, and royal towns. The magnates confit of the great officers of state, the counts and barons. The gentry are Hungarians and Siculi, but the royal towns Saxons only. The nobility are generally very proud, and keep their peafantry in a state of flavery; four out of fix days in the week the peafant is obliged to labour for his master, having only the remaining two days for himself. The principality of Transylvania is governed in the name of the prince and nobility, by the diet, the office of fiate, the royal government, the exchequer, the assembly of Hungarian counts, the tribunals of justice, and the magistrates of the Siculi and Saxons. The diets meet by summons from the prince at Hcrmanstadt. The revenue arises from the contributions, customs, metals, minerals, rock-fall, royal demefnes, cfeheits, and confications; and are levied by the treasury. This province pays to the emperor in taxes of all kinds 1,500,000 florins annually, which is chiefly imposed upon the land, for the payment of the citizens is very trifling. Transylvania formerly could bring from 80,000 to 90,000 soldiers into the field; but at present the whole force of that principality consists of fix regiments, under a commander-in-chief, for the defence of the country.

TRANTERY, in some Cufions, denotes the money arising by amerciaments of ale-fellers and victuallers for breaking theaffize of bread and ale; particularly at Luton, and other manors in Herefordshire.

TRAP, in Geography, a town of Maryland; 7 miles S.E. of Oxford.—Allo, a town of Maryland; 7 miles S.W. of Salisbury.

TRAP, in Geology, a class or family of rocks, characterized by the tendency to assume a columnar shape, or to divide into steps forming natural terraces. The name is originally derived from the Swedish word trappa, a step. It was called by Wallerius cornea transeas.

Rocks of the trap family are very extensively spread over the globe, and no question in geology has excited greater attention than that respecting the mode of their formation. The near resemblance which many of these rocks bear to compact lava, the remarkable position in which they frequently occur, the regularity of their structure, and the changes which the rocks in their vicinities have evidendy undergone, induce many geologists to attribute to them an igneous origin; other geologists strenuously contend, that all trap-rocks have been originally formed by deposition from an aqueous fluid. Before detailing the facts in favour of these different hypotheses, it will be proper to describe the rocks which are comprised in the trap-formation. The earlier geologists have frequently applied the term trap indedefinitely to a great variety of rocks, and the distinction made between trap and the rocks which the French mineralogists have denominated cornéens, is extremely vague.

The roche de carné, so frequently mentioned by Saflirius, according to Bronnina is a trap-rock in the Wernerian accep- tion of the term. Werner, according to Mr. Jamfon, reftirms the term trap to rocks principally characterized by the presence of hornblende and black iron-clay; yet the same author informs us, in the following paragraph, that in the oldest or primitive trap, no iron-clay whatever occurs. Jamfon's Mineralogy, vol. ii. p. 129.

The presence of hornblende and fephar, or augite and felpar, would have formed a more accurate and comprehensive definition of the confituents of trap-rocks, or of those rocks which are comprised by Werner in the trap-formation.

M. le Cordier, in an interesting memoir presented to the National Institute in 1815, affirms, that in the trap-rocks which are supposed to be of igneous origin, and in volcanic rocks, hornblende is extremely rare, but its place is supplied by augite, which has been mistaken for hornblende. The constituent parts of these two minerals are the same, and the proportions in which they combine do not greatly vary, so that considerable doubt has existcd whether they should not be classed as the same species, notwith-
The classification of trap-rocks adopted by Werner having been extensively admitted, we shall endeavour to state it as concisely as is consistent with perspicuity. He divides trap-rocks into three formations: primitive trap, transition trap, and the newest felsite trap.

Primitive trap is almost always distinguished by a great predominance of hornblende, so that some of these rocks are entirely composited of this mineral, or nearly so. There are three principal species of primitive trap; common hornblende-rock, hornblende mixed with felspar, and hornblende mixed with mica.

Common hornblende-rock is principally composited of hornblende: it contains two subordinate kinds, granular hornblende-rock and hornblende-flake; the latter differs from the first in having a flaty structure. Hornblende-flake passes sometimes into gneifs, and sometimes into talsum flake. (See Gneiss, and Talcous Slate.) These two kinds of hornblende-rock occur in gneifs and mica-flake, forming beds which are but few in number, and of incon siderable magnitude; but in clay-flake they occur frequently, and in very thick beds.

Hornblende mixed with felspar. This species Werner divides into two subordinate kinds; greenstone and greenstone-flake. The term greenstone (grunfeldian, German) is used by Werner to denote a rock composited of crysftals of felspar and hornblende, and nearly refembling fiente (see Sienite); but in greenstone the hornblende generally predominates, and the felspar is commonly white, whereas in fiente it is red. When the greenstone includes large crystals of felspar, it is denominated porphyritic greenstone. When the granular basal is very fine, it is called greenstone porphyry. According to Mr. Jamefon, this is the black porphyry of the ancients. When the granular nature of the base is no longer visible to the naked eye, it has a blackish green colour, and includes crystals of compact felspar. It is the porphyre vert, or antique green porphyry of sculptors.

Greenstone-flake is composited of hornblende and compact felspar, and has a distinct flaty structure. The felspar is generally more abundant than the hornblende, and it sometimes contains scales of mica. It occurs in great beds and masses in clay-flake.

Hornblende mixed with mica is the third species of primitive trap; it is composited of an intimate mixture of hornblende and felspar, and includes scales of mica. It occurs in beds in gneifs and mica-flake. Jamefon's Mineral. vol. iii.

Transition trap is divided into transition greenstone and transition amygdaloidal; but it does not appear that these rocks have any very distinct character to distinguish them from the greenstone and amygdaloidal of the other trap-formations. According to Mr. Jamefon, transition greenstone is a fine granular mixture of hornblende and felspar; but some of the primitive and flaky greenstones are also denominated by the same geologist as being finely granular. Transition amygdaloidal is stated to have a base of wacke, (see Waaker,) and approaches more or less to the nature of greenstone, sometimes inclining to bafalt, and sometimes to iron-clay.

The vehicles are filled with clay, or with chaledony and agate; it alternates with transition lime-flake.

The newest felsite trap-rocks of Werner comprise green stone, basalt, wacke, porphyry-flake or black-flake porphyry, trap-tuff, greenstone, amygdaloidal, with compact felspar and clay-flake. He also includes pearl-flake, pitch-flake, obsidian, and pumice in this formation of trap. (See the various articles here enumerated.) It is these rocks which Werner calls the newest felsite trap, that pretend the strongest indications of their igneous origin; and some of the substances here enumerated, such as obsidian and pumice, are now generally classed with volcanic products.

Some geologists are of opinion, that there is no foundation in nature for the division of trap-rocks into three distinct formations, introduced by Werner.

There are, however, certain peculiarities of position, which seem to indicate a difference in the mode of formation between the trap-rocks that occur imbedded in other rocks, and those which cover the secondary strata. To form a more distinct idea of this, we must refer to the general structure of the surface of the globe. The beds of rock which form the crust of the globe, are commonly arranged over each other in what is denominated a conformable position, as represented Plate II. Geology, fig. 6, where G is the foundation, or lowest rock, on which the different beds a, b, c, and d are laid, and may be supposed to cover the mountain with a general conformity to the shape of the lower rock. This is more distinctly seen in the same plate (fig. 3.), where the upper beds have the same elevations, depressions, and undulations as those of the lower. The other position in which rocks occur, is called unconformable. "If a thick stream of lava, as frequently happens, were to flow over a range of conformable rocks, filling up the cavities and inequalities of the surface, when it hardens by cooling, it would form a bed of superincumbent unconformable rock. Such infusions are common in volcanic countries. Very extensive ranges of rocks occur in this position in various parts of the world, covering not only the primary, but the secondary rocks. These unconformable rocks, composited of different kinds of trap, porphyry, and felspar, frequently assume the columnar structure, and form vast ranges of natural pillars, as at Staib and many of the Hebrides, on the northern coast of Ireland, and in Iceland, Sicily, and various volcanic countries. Now whatever theory we adopt respecting the formation of unconformable rocks in this position, we must admit that they are of more recent origin than the rocks which they cover; the lower rocks must have been hard and unyielding, when the upper were thrown upon them." Bakewell's Introduction to Geology.

The unconformable position of bafaltic rocks, or rocks of the trap-formation, is represented Plate IV. Geology fig. 2. a, a, a, being a series of regularly stratified rocks, covered by a mass of unconformable bafalt, b. The trap in this position is often divided into different beds, none of which are columnar, as represented at c, and these column beds are frequently separated by beds of compact trap.

Masses of trap also occur, forming perpendicular walls (called dykes in the northern part of England); these intersect the strata and frequently change their position, as represented Plate II. Geology, fig. 8., where a series of strata a, b, c, d, e, f, g, which were once continuous, are broken by a dyke of bafalt. The similar letters on each side of the dyke represent the same stratum, as d, d, c, c, broken by the intervention of the bafalt. In such instances, the strata in the immediate vicinity of the bafalt have undergone a considerable degree of change; and where the stratum c, e is coal, it is frequently found converted into coal.

Vol. XXXVI.
TRAP.

cok, or charred for some distance on each side of the basalt. These walls or dykes of trap are sometimes twenty, thirty, or even a hundred yards or more in thickness, and sometimes range along through very extensive districts; indeed there is reason to believe that many mountains of trap which are arranged in one line along a country, have been originally dykes of enormous magnitude, through which valleys have been excavated by diluvial currents, by partial subidence, and by other agents which have in former ages changed the surface of our present continents. See Veins, Mineral.

Independently of theoretical opinions respecting the formation of trap-rocks, it is obvious that the mafic of unconfomable overlying trap, and also the trap or whin-dyke in dykes, must be of posterior date to the rocks which they cover or interfret; whereas the hornblende-rock or primitive trap which is imbedded in gneifs, mica-flate, or clay-flate, must be coeval with the rocks in which it occurs; and the name is equally obvious with respect to trap-rocks alternating with secondary flata. Trap or basalt sometimes occurs in globular masses composed of concentric spheres, or of prisms of basalt in a radiated diverging form. The spheroidal basalt with concentric layers, frequently includes in its centre a mass of basalt similar to that which envelops it; but sometimes the central mass is of a harder kind, or is a fragment of some other flate, as of shelly lime-flate. Many trap-rocks, in decomposing, present a spheroidal structure which was not before visible in the mafs; and it is observed, that the balls of basalt which fall out or remain when the rock is decomposed, are harder than the main body of the rock. This is the case with the basalt at Rowley in Staffordshire, called Rowley Rag. See Rowley Rag.

The spheroidal structure is however not peculiar to basaltic rocks. Rocks of granite, in decomposing, sometimes present globular masses of harder granite imbedded in the mafs.

In columnar trap we find the columns of all sizes, from a few inches to two hundred and fifty feet in length. The form of the prism or column is also various, and more or less regular, having generally three, four, or five sides; the latter or pentagonal form is the most common. The diameter of the larger columns is frequently four or five feet, or more, and sometimes is nearly equal to the height.

* Rocks of the trap-formation are also frequently observed to form conical mountains, or to occur as detached masses on caps of the summits of other hills, and to occur at nearly the same level as represented Plate IV. Geology, fig. 3. c, d, and e. In such instances, it seems probable that the different caps have originally formed parts of one continuous bed, which has been broken either by the excavation of currents, by subidence of the intermediate parts, or by the elevation of the hills from their primeval position.

The columnar structure and the overlying position so remarkable in trap-rocks, are also common to some kinds of porphyry, and to rhyolite, which are not included by geologists among trap-rocks, but to which they bear a near affinity. To take a jux and enlarged view of this class of rocks, we must leave the minute subdivisions and classifications of cabinet philosophers, and contemplate the natural relations which these rocks have to each other, and the gradations which may be traced between mountain masses possibly great difference in their external appearance. Hornblende or augite forms an essential part of almost all trap-rocks, as well as rocks of undoubted volcanic origin. Now these minerals, though classed by mineralogists as two distinct species, are so nearly alike in their constituent parts, that we may consider them as identical, when they existed in a fluid state in the matter of the rocks of which they form a part. Circumstances of minor import may easily be conceived to have changed the form of their crystals, as we know by experiment the slight causes which occasion varieties of form in the crystalization of the same constituent ingredients in our laboratories. The constituents of hornblende and of augite, are fliex, alumin, lime, magnesia, iron, manganese, and a trace of potash: the proportions of each, which exist in the two minerals, do not vary more than the proportions which exist in substances classed by Hawy with hornblende, or between varieties of the same species in many other minerals.

We may regard then, in a geological view, the constituents of hornblende and augite as forming the same mineral, under whatever crystalline forms they may present themselves in rocks. It is this substance which forms the connecting link between granite, trap-rocks, and lava. Hornblende enters as a constituent part into many rocks of granite. According to Patrin, mafic and veins of granite occur in hornblende-rocks, and mafic and veins of hornblende in granite-rocks, in the Altea mountains. Hornblende is found in some of the granites of the Higher Alps: it exists abundantly in mafs of gneifs, which is only a laminated granite. When the hornblende in granite increases in quantity, the other parts of the mafs remains, the rock is denominated gneifte. When the hornblende gives its colour to the rock, it forms greenstone. When the parts are more intimately mixed, it becomes a compact trap or basalt; and basalt and compact lava bear in many instances a close resemblance as before remarked, to being distinguished. According to the account of Sir George Mackenzie, beds and even columns of basalt frequently occur in Iceland, the lower parts of which are a porous and vitreous lava or flag. The close resemblance between the compact lavas, and the columnar basalt in the vicinity of Etna, and other active volcanoes, so to great, that we believe it is extremely difficult, if not impossible, to distinguish them from each other by any well-defined characters. The currents of lava which have recently flowed, differ indeed from beds of basalt or trap by their porosities; but Cordier has well observed, in the memoir before alluded to, that it is only the superficial part of the upper current of lava that are exposed to our observation; and to judge of their real nature from the external scoria, would be like judging of the contents of a vat of wine, from the froth floating on its surface. The ancient currents of lava are some of them immense size, and have frequently been excavated or broken, by which the internal parts are discovered, and thence, as before remarked, bear a near resemblance to many of the regular rock-formation, and particularly to varieties of trap-rock.

Such being the leading characters in the composition, structure, and position of trap-rocks, we need not be surprised that the earlier geologists were disposed to class them all with volcanic products, and to assert that they had been formed by eruptions from ancient volcanoes, in a manner similar to the formation of modern currents of lava. This hypothesis, advanced before many phenomena attending volcanic eruptions were known, and when the effects of heat combined with pressure had not been investigated, was exposed to many weighty objections. Another theory, which ascribed the formation of trap-rocks to aqueous depositions, was warmly supported by many geologists on the continent, and particularly by M. Werner. He supposes, that after all the primitive and conformable rocks had been deposited, the primeval waters which covered the highest mountains sunk slowly to their present level.

From
TRAP.

From some unknown cause, a sudden rising of the water took place in a turbid and agitated state, and covered the whole globe; it then became calm, and during the period of its settling, deposited the different rocks of overlying trap, and again retired to its former level with considerable rapidity. The broken stratification, so characteristic of this formation, was caused partly by the rapid retiring of the water. The heaps of trees, the beds of clay, sand, and gravel, and their confluent occurrence in the lower part of this formation, are evident proofs (says Mr. Jameson) of the rapid and tumultuous rising of the water. The subjacent calamefs of the water is proved by the finenes of the mechanical and the increasing finenes of the chemical solutions, as we approach the upper part of the formation. Jameson's Mineralogy, vol. iii. p. 85.

According to this theory, the regular ranges of columns so frequent in trap-rocks, were produced by the shrinking in or drying of the mafs. As the inundation was general, the rocks of this family must be spread universally over the globe. Indeed the fame geologist fuppofes there were two inundations, the fift, which depofited the overlying porphory and fennite, the second, which depofited the bafaltic or flets trap-rocks. On this theory, Mr. Bakewell remarks in his Introduction to Geology, "it is fearcely possible for the human mind to invent a fystem more repugnant to existing facts." Were bafaltic rocks, as Werner fuppofes, depofited from an aqueous fluid, that covered the whole globe after the formation of the secondary flarta, every part of the dry land and every valley must have been inundated or filled with bafalt; it would be the prevailing rock of every diftrict: on the contrary, overlying trap or bafalt exifts only in detached mafles, in particular situations, nor do fragments of bafalt occur in any quantity fufficient to warrant the belief that it was ever formed universally over the globe."

Though the mode of aqueous formation, fuppofed by Werner, is utterly inadmissible, we do not think it improbable that many bafaltic rocks may have been formed in the humid way, by eruptions of mud of limited extent, like close which issue at prefent from the volcanoes in South America. The opinion that all bafalt or trap-rocks have originally flowed in the form of lavas, we do not feem authorized, from existing facts, to maintain; and the great altitude given to this mode of formation, has induced other geologists to reject it altogether. But it has been well obferved, that there is a wide difference between afcertaining the agency by which a rock has been formed, and the manner in which that agent has been applied. Numerous observations, which have been recently made on trap-rocks in volcanic countries, have led to the opinion that many of these rocks have been softened, and even fused, in their original position, without ever having flowed as currents of lava.

The principal objections against the agency of fire in the formation of these rocks are enumerated by Brochant. Min. tom. ii. Many of these objections, we think, can be satisfactorily answered.

1. "Bafalts are extremely rare among the products of burning volcanoes, and modern eruptions have not produced any."—This objection is founded on an assumption of facts, which are not admitted by other geologists. The observations of Daubouin in Auvergne, of Sir George Mackenzie in Ireland and the Feroe islands, and of Humboldt in South America, prove that trap-rocks are extensively spread among volcanic products; though, in many instances, they appear to have been formed by the agency of subterraneous fire acting on beds of schilt, which have been melted or softened in their original position, and been subsequently elevated, without ever having flowed as lava. If modern eruptions have produced no bafalts, we may recollect that it is only the external parts or frons that are exposed to our view; and we have no opportunity of examining the currents of subterraneous lavas, formed at great depths under the ocean, in circumstances similar to those which may have attended the formation of bafalts. That many bafaltic rocks were formed under the sea, is evident from their alternating with beds of lime-flone containing marine shells.

2. "Whatever origin may be attributed to the columnar or tabular structure of bafalt, it is not peculiar to trap-rocks: there are gypsums, marls, and sand-flones, which frequently present this structure."—The columnar and globular structure may be formed by the flow refrigeration of a melted mafs of bafalt, as was proved in the experiments of Mr. Gregory Watt. (See Rowley Rag.) The columnar structure has been observed by colonel Imrie in a current of lava which had flowed from a volcano in Feli-cuda, one of the Lipari islands. This current could be traced from the mouth of the volcano to the sea. That the columnar structure may be formed also in rocks of aqueous origin, cannot invalidate the above facts. The particular forms which the columns of bafalt sometimes present, will be subsequently noticed, appear to be the effects of partial fution.

3. "Bafalts often repose immediately on coal, as at Meinfen, near Caife. Now, if this bafalt were volcanic, it muft necessarily have produced the combustion of these beds of coal."—To this objection it will be fufficient to reply, that numerous infinaces may be cited of bafaltic dykes and beds of bafalt having charred the coal in their vicinity, and reduced it to a flate of coke or cinder. (See Veins, Mineral.) And from the experiments of Dr. Maccullock on powdered jet and wood-coal, inclosed in gun-barrels under pressure, it is as certain to confine a considerabe part of the volatile products, it appears that they were converted into true mineral coal by a red heat; and had the confinement, fracture, and every property of pit-coal. Where bafalt in contact with coal has reduced it to a coke, it appears highly probable that the volatile parts have been driven off by heat; and where the coal preserves its true character, the volatile parts have been retained by compression.

4. "The remains of animals and vegetables which are found in some trap-rocks, could not have refided the action of volcanic heat without being destroyed. It is the fame with many very fusible minerals. Some fuch fusible minerals are also found in volcanic rocks; but these infinaces are rare, and cannot serve as a basis for a general rule."—In the experiments of Sir James Hall on lime-flone expofed to heat under comprefion, it was found that chalk, which contained fubflances might be melfed and reduced to a crystalline flate by cooling, without destroying the organic structure of the fhen. Most of the organic remains in bafaltic rocks are in a lofter amygdaloid, or in wacks, which may probably have been formed from eruptions of volcanic mud, like that called pumice, from the South American volcanoes. The fusible fubflances found in bafalt and some volcanic products, there is every reason to believe, affume a distinct crystalline form when the mafs was confolidating.

5. "Cavities filled with water in secondary trap-mountain, oppofe the fuppofition of their igneous origin."—That these cavities have been filled by infiltration is rendered almost certain, from the circumstance that the water may be expelled by a gentle heat; and if the water can find a passage through the flone from the cavity to the surface, it may also find a passage from the surface to the cavity of the mafs.
6. "There are not observed in trap-rocks either that black colour, or those indications of vitrification, that are apparent at least in certain portions of the products of burning volcanoes; real craters have never been observed. All those which have been cited were hollows, chafins filled with water, so common in some mountains."—This is an assumption of facts which recent observations disprove. The basaltic dykes, and beds of basalt contain also in their lower, and sometimes in their upper parts, fiorica; and those indications of vitrification that are apparent in burning volcanoes; and the sides of the basaltic dykes are generally vitrified. That many of the hollows, suppose to have been craters, were hollows formed by depression, is probable; but what other appearance could the crater of an ancient volcano be expected to present, than a hollow or chafin which might be filled with water?

7. "Mandellein (or porous amygdaloid) has certainly some resemblance to porous lava; but there are mandellevins evidently not volcanic. Besides, the cavities in the mandellevins of trap-mountains contain very different minerals, and such as could not have undergone the action of fire, without being changed."—The remarks made previously on very fufible minerals inclosed in basalts, and fome lava, apply equally to this objection. It is also probable that soft and amygdaloidal basalts may have been formed from eruptions of mud, as before flated.

8. "Although from experiments made on basalts and lava, and from observations made on burning volcanoes, it is known that fony substances may, after perfect fusion, refuse their fony character; but when this takes place in burning volcanoes, there are always found in the vicinity lufibilances which are forified or vitrified, and denote some action of fire."—It has been before remarked, that forified and vitrified lufibilances occur in the basalts of Iceland and Ferro; they accompany the basalts in Auvergne, and the vicinity of Etna. In almost all basaltic countries, some of the rocks present fo striking a similarity to volcanic products, that the resemblance has often itrucked the mosl common observer. If other basaltic rocks do not present the fame appearances, it may be owing to their having been formed by submarine eruptions, under circumstances very different from those which take place on land; and it is not contended that all basalts have originally flowed as lava.

9. "In various countries, beds of basalt are observed to alternate with sand-flone and stratified lime-flone."—It is observed in many parts of England and Scotland, and is probably general, that where beds of trap are interposed between sand-flone or lime-flone, they are generally very irregular both with respect to thickness and extent, and have seldom the same uniform arrangement as the stratified rocks with which they alternate. That the lime-flone was formed under the sea, is proved by its containing marine shells; and there is no improbability in the supposition, that currents of submarae lava may have flowed at different periods over beds of shells or sand, and converted the one into lime-flone and the other into sand-flone.

10. "In many basaltic districts, basalt is only found on the summits of hills; and it is evidently perceptible, by the correspondence of the beds, that all these summits were parts of one and the same bed, which passed over all the district. This is not the form of volcanic deposits; they take a certain direction, and no similar indications of such vast volcanic deposits are known."—The frequent occurrence of detached caps of basalt forming the summits of hills, in some basaltic districts, near the same level, constitutes one of the most remarkable peculiarities of the trap or basaltic formation, and deserves particular attention, as marking some of the latest revolutions that have changed the surface of the globe. To form a more distinct idea of the situation of these caps, we refer to Plate IV. Geology, fig. 3, where a mafs of unconfornable trap, a, lies upon the stratified rocks b, and mafs of more recent basalt is formed of other flattened hills at c, d, and e. In some instances, as in the Isle of Skye, as described by Dr. Macculloch (Geological Transactions, vol. iii.), the mafs at a appears to be connected with the lower rock b, and to form a part of it, as if it had broken through the strata, and been thrown over the surface in a flat of fusion. The strata consist of grey lime-flone containing shells; but where the lime-flone is in the vicinity of the trap, it is converted into white crystalline flinty marly. A similar change is produced on chalk, or earthy lime-flone, where subjected to heat under pressure, as was proved in a series of experiments made by Sir James Hall; and as we are unacquainted with any other cause which could produce this change, it appears probable that the lime-flone has been converted into marble by subterraneous heat, and that the trap has flowed over the surface like lava, but under the pressure of the ocean; the existence of marine shells in the lime-flone proving that such must have been its original situation. The caulis which have changed the relative level of the lime-flone, with respect to the sea, may have broken the continuity of the strata, and of the basalt which lies upon them. The basaltic mountains of Auvergne, in the departments of Port-de-Pom and Cantal, in France, have excited much attention from the existence of ancient volcanic craters in their vicinity. According to Dauquillon, the fundamental rock of that district is granite, covered in some places with a marly lime-flone. Nearly all the soil is covered with volcanic or igneous productions; they are of three kinds, and appear to have been formed at three distinct epochs. The most recent are currents of lava, which lead to craters still existing, though dormant. The second formation consists of mafs or tables of basalt, separated by openings or valleys. The third consists of mountains composed of a kind of volcanic porphyry. The currents of lava are observed to have run from the bottom of a number of conical hills, from two hundred to four hundred yards in height. These hills, of which there are about one hundred, are formed of heaps of scoriæ, fragments of lava, and rapilo or tufa. Their summit often presents a hollow in the form of a crater; they rest immediately upon granite. The lava at the bottom is of a basaltic nature; it is of a greyish-black colour, with a fine compact grain; it contains grains of augite, olivine, and felspar. The superfcies is bilttered and fluided with apertures, which sometimes exceed a yard in height. The interior is more compact. The currents are spread in the adjacent plain; they have sometimes reached the bottom of certain valleys, and have followed their course for three or four leagues. In advancing progressively, they always descend to lower elevations; they follow the inequalities of the soil; and separate on meeting with any obstructing eminences in their passage. The history of these currents of lava, says M. Dauquillon, is complete, and there is nothing left for the imagination to supply. We behold the orifice from which they flowed, the course they pursued, and the course they occupy. As for the period when these lakes flowed, though anterior to the history of man, it is none the less recent, compared with those vast changes which the surface of the globe presents, and was posterior to the excavation of the valleys, since it flowed through them, and occupied their bottoms.
The igneous productions of the second kind are basalts, which in the form of beds, tabular masses, or peaks, cover the elevated parts of the ancient surface of the country, or occur on the summits of some mountains and isolated eminences. They are also observed on the skirting round the sides of Mont Dor and Cantal. They are, says M. Daubuisson, evidently only the remains and patches of different currents which have spread over the country: they present the same mineralogical characters as the basalts of Saxony, and other districts; they contain the same fusibles, and have the same tendency to form regular prisms or columns; they cover, without distinction, all kinds of rocks, and are never covered by them. An igneous origin cannot be denied to these basalts; the perfect resemblance between their pseil and that of some of the currents of lava in their vicinity, which can be traced to existing craters, affords a strong presumption of this; but they present other infallible marks of their origin. In following step by step certain masses of basalt, which are near Mont Dor and Cantal, and supplying by imagination what has been taken away, where their continuity is broken, you arrive at the sides of these two enormous volcanic mountains, and we come to masses of fioro re or of blistered rocks, where beyond doubt we are near the current; all the basalts which have been traced upwards made part of that current. A great number of these large basaltic platforms, which cover isolated mountains, display on their surface blisters, fpongy fcorie or droffes, like those which cover the belt preferred lavas; nor can we refute them a similar origin. Some of these platforms repose on volcanic ashes. It is true, some isolated eminences have summits of compact prismatic basalt of a black colour, and definite of those unequivocal signs of the action of fire which are seen elsewhere; but these eminences of compact basalt most frequently stand by the side of those platforms with scoriated surfaces, before described: they once formed with them a continued whole, and have evidently been divided from them by the excavation of the ravines and valleys which now separate them. They cannot have had a different origin. The convulsive action of time and the elements must have destroyed the incised crat: only the compact nucleus remains, deprived of the marks of the action of fire, like the interior parts of most currents of lava, which are equally diffusive of such marks. Thus, says M. Daubuisson, all the basalts of Auvergne present proofs either direct or indirect of an igneous origin; though the disintegration of the surface, and the disarrangement that the currents have suffered, prevent us from retracing them to the crater from whence they flowed, and from seeing the number, form, and extent of the different currents; but we are certain that their existence was anterior to the excavation of the valleys.

The porphyroidal trap is the third kind of igneous rock-formation in Auvergne. It forms eight or ten distinct mountains: the most considerable are Mont Dor, Cantal, and Puy-de-Dôme. The fusibility of these mountains, from the account of Daubuisson, appears to be a kind of felspar or chink-folone porphyry: their pseilage, direct or indirect, into basalt, and, above all, the volcanic fioro imbedded in their mass, prove that they owe their existence to fire. These porphyries are the most ancient of the igneous productions of Auvergne; they are covered with basalt, and contain veins of that fusibility.

In the opinion of some geologists, these mountains and masses of porphyry have never flowed as lava, but have been fused in their native beds, and subsequently elevated. The homogeneity of their palse shows how complete the fusion has been. The crysals of felspar were, in all probability, formed during the igneous fluidity of the mass. However different the currents of lava, the basalt, and the porphyritic trap may be, and however various the periods of their formation, they appear, says M. Daubuisson, to be united in a certain degree. Cantal, Mont Dor, Puy-de-Dôme, and the other porphyry mountains, are ranged in a direct line running nearly from north to south. Almost all the basalts of these regions, that can be, in some manner, retraced to their origin, seem to have taken their direction in the same line. It is also in this direction, and among the ancient products, that the greater part of the craters have been opened whose vestiges are still visible. When, at two leagues to the westward of Clermont, we see near forty volcanic mountains ranged in a straight line, it can scarcely be believed to be the effect of chance. A cause has certainly existed, which has produced this effect. Perhaps, says Daubuisson, there was in this direction a vein of matter that contained the germ of volcanic fire, which burnt forth and was renewed at different periods.

Perhaps this range of mountains may be regarded as an enormous basaltic dyke, which has broken through the crust of the globe along the line where they are now ranged, their continuity having been broken by partial subidence, and by diluvial currents. Daubuisson's account of the trap-rocks or basalt of Auvergne is particularly interesting, as establishing the intimate connection between trap-rocks and those of undoubted igneous origin. It is further remarkable, as M. Daubuisson had previously published an account of the basalts of Saxony, in which he endeavoured to prove the aqueous formation of basaltic rocks.

The most remarkable trap-formation in Europe, and perhaps in the world, extends from the county of Antrim, in Ireland, through part of the Scotch Hebrides, and is probably the same which occurs in the Ferroö islands, and the island of Iceland. An account of the columnar basalt of this formation will be found under the articles Giant's Causeway, and Staffa. The geological relations of the trap-rocks of Antrim with the regular strata in that country, have been recently traced by the Rev. J. Connycare and Dr. Berger. The basalt of this district generally covers chalk, similar to the chalk on the eastern side of England, and like it reposing upon beds of sand, and the grey stratified limestone called ?as. In England we have no instance of basalt occurring above the chalk, or of the strata over the basalt, or in the basalt itself, though it occurs in the coal-formation under the basalt. A fine fection of the beds of basalt with the chalk, sandstone, lias, and coal-strata, may be seen for many miles along the coast, presenting numerous dykes and fractures of the strata, which have sometimes brought the basalt to the same level with the chalk, and in other situations with the coal-strata. The basalt in the interior, and in some parts of the coast, forms isolated caps on the summits of detached conical hills. The existence of these isolated caps has been attributed to diluvial currents, which have cut through the once continuous beds of basalt. Though such currents have doubtless existed in various situations, and have excavated valleys, another agent has obviously been employed in the formation of the valleys of Antrim. We have only to examine the coast to convince ourselves of this fact, where we may see the basalt suddenly thrown down or elevated several hundred feet, by mineral veins or dykes filled with basalt. If we trace in imagination the same displacement into the interior, where it obviously extends, we shall see a sufficient cause for the existence of isolated caps or beds of basalt, separated from each other by valleys, or lower grounds, that have been formed by subidence. Through these veins or dykes the basalt itself was probably
probably thrown up, and spread over the surface in a fluid state. Wherever these dykes pass through the chalk, they have converted it into crystalline lime-flour to a certain distance on each side, and produced various appearances, which tend further to prove that the matter of the basalt has been in a state of igneous fusion. See Veins, Mineral.

That the basalt has been forced through the chalk and the other strata on which it now rests, is rendered almost certain, by the occurrence of broken flints of chalk enveloped in the basalt, and contorted in a manner which proves the violence of the disintegrate, the upheaving of the basalt, and the lateral pressure to which the chalk-strata have been subjected. See Plate IV. Geology, fig. 4.

One remarkable feature in the arrangement of the basaltic columns in Antrim must not be overlooked. The great ranges of columns are nearly vertical, but the columns of basalt in the mineral dykes are arranged horizontally. This difference of poise may admit of a probable solution, if we allow that the basalt, in both instances, had been in a state of igneous fusion. The beds of columnar basalt being thrown over the surface of the ground that formed the bed of the ocean, would begin to refract at the upper and under side in a vertical direction. On the contrary, in mineral dykes intersecting rocks already formed, the basalt would suffer refrigeration more rapidly where it was in contact with them, which would be on the sides, and this refrigeration would gradually extend to the interior, in a horizontal direction: and to this difference in the mode of their condensation, we may ascribe the horizontal or vertical position of the columns in the beds and dykes of basalt. For an account of the experiments of M. G. Watt and Sir James Hall on the fusion of basalt and lava, see Rowley Rag, and Volcano.

Trap-Holes, in Rural Economy, a term applied to a round hole, which is cut out and prepared in the floors of the flowage-rooms, where hops are deposited after being dried, for the purpose and convenience of bagging them. It is formed exactly equal in size to the mouth or opening of the bag, around which a wooden frame is securely placed and fixed, to the edge of which, the border of the mouth of the bag is firmly attached all round. By this means the hops are readily forced into the bags in a close compact manner.

The term is also occasionally applied to other holes cut and formed in the floors of farm-buildings.

Traps, Garden, such as are contrived for the purpose of destroying mice and other vermin; which are often conveyed into such places with the straw, litter, and other matters that are made use of in them; and which are extremely hurtful and troublesome in the spring season, in destroying peas and beans, as well as lettuces, melons, and cucumbers in frames.

Traps for this purpose are contrived in a great many ways; but as field vermin are very shy, and will rarely enter traps which are close, the following simple cheap form has been advised by Mr. Forthly, though it has nothing of novelty in it. These traps may be made by stringing garden-beans on a piece of fine pack-thread, in the manner of beads, and then driving two small flake-like pieces of wood into the ground at the breadth of a brick from each other, and setting up a brick, flat stone, or board with a weight on it, inclining to an angle of about forty-five degrees; tying the string with the beans on it, round the brick or other substances and flakes, to support them in their inclining position, being careful to place all the beans on the under side of the bricks or other matters. The mice in eating the beans, in such cafes, will also destroy the pack-thread, and by such means disengage the brick or other weighty body, which, by falling on them readily destroys them. Mice are always the first to rid of by some sort of simple open traps of this nature.

TRAPA, in Botany, a Linnaean name, whose idea is certainly taken from the warlike instrument called Caltop, the Tribus of the ancients, with confluent of four iron radiating spikes, to placed that one of them might always stand upwards, in order to wound the feet of passengers. Such is the figure of the figurative fruit of this genus, hence named by Tournefort Tribuloides. Calicrappa, an old botanical word of similar meaning to Tribulhus, is compounded perhaps of calceo, to tread, or kick, and Tribulhus, to turn, because the Caltops are continually kicked over if they fail of their intended mischief. Here we have the immediate origin of Tropa.—Linn. Gen. 62. Schreb. 84. Willd. Sp. Pl. v. 1. 681. Mart. MILL. Dict. v. 4. Ait. Hort. Kew. v. 1. 267. Sm. Prodr. Fl. Græc. Sibith. v. 1. 104. Juss. 68. Lamarck Illuir. t. 75. Genr. t. 26. and 95. (Tribuloides ; Tourn. t. 431.)—Clads and order, Tetrandria Monogynia. Nat. Ord. Inundate, Linn.? Hydrocharides, Juff. or rather, as that author himself indicates, his Onagra.

Gen. Ch. Cali. Perianth superior, of four acute, equal, permanent leaves, firmly united to the sides of the germen. Cor. Petals four, obovate, larger than the calyx. Stam. Filaments four, the length of the calyx; anthers simple. Fil. Germen turbinate, crowned by the calyx, of two cells; style simple, as long as the calyx; stigma capitate, emarginate. Peric. None. Seed. Nut turbinate, more or less compressed, of one cell, armed with two or four horn-like protuberances, originating in the permanent calyx, thickened, either spiny or blunted. Kernel solitary.

Eff. Ch. Corolla of four petals. Calyx of four leaves. Nut armed with two or four opposite horns, originating in the leaves of the calyx.

T. natans, European Water-caltops. Linn. Sp. Pl. 175. Suppl. 128. Willd. n. 1. Ait. n. 1. Prodr. Fl. Græc. n. 1. Genr. t. 26. (T. aquaticus; Camer. Epit. 715. Matth. Valgr. v. 2. 324. Ger. Em. 824.)—Nuts with four spiny ascending horns.—Native of ponds and mucky ditches in the south of Europe, flowering in summer. The plant is annual, and has several times been brought into England; but whether its seeds are not perfected here, or from any other cause, it has never yet been naturalized. The ponds at Verailles abound with this Tropa. The foliary fibrous root sends up a long, cylindirical, floating stem, varying in length according to the depth of the water, furnished with numerous, opposite, pectinated tufts of fibrous radicles, gradually diminishing to simple fibres, and at the top of the stem, which is thickened, these fibres are replaced by alternate flaked leaves, which are crowded at the summit into a large spreading flat, floating on the surface of the pool, and often ten or twelve inches in diameter. Each leaf is rhomboid, fusculent, an inch or more in breadth, veiny; strongly toothed in front; entire at the base; the veins rather hairy underneath. Footstalks three or four times as long as the leaves, smooth, swelling beyond the middle into an elliptical cellular body, rendering the plant more buoyant. Flowers small, white, on short, club-shaped, axillary, simple, partly hairy stalks, fearfully half an inch long. Nuts turbinate, about an inch in diameter, angular, smooth, with four, by accident only two or three, prominent ascending pointed horns, becoming lateral by the increase of the summit of the germen, two of them situated at the angles of the nut, two lower down at the sides. The kernel inedible, somewhat like a chestnut. This plant is doublets the τραπάζοι, κόρες of Dioscorides, found by Dr. Shibthorp in countries bordering
TRAPA

on the north of Greece, though not in that country itself, nor the neighbouring islands. The wooden cut of Camerarius, executed, we believe, under Conrad Gesner's inspection, is one of the best representations of any known plant. — Linneus miftook the radicles for submerged foliages, like that of Myriophyllum.

2. T. bicorns.—Chinese Water-caltrops. Linn. Suppl. 128. Willd. n. 2. Ait. n. 2. Gartn. t. 95. Obbeck's Voyage, Eng. ed. v. 1. 356. (Bocephon; Burm. in Plum. l. 56. t. 67, at the bottom. Linkoa, Ling-kann, or Leng-ka, of the Chinese.)—Nuts compressed, with two opposite deflected horns. —Native of ponds in China. Some of its nuts were procured by Sir Joseph Banks, in bottles of water, from China. These beingimmered in mud at the bottom of some tubs of water at Kew, as well as in Mr. Lodiges' floré at Hackney, vegetated, and produced plants hardly distinguishable, in any respect, from the foregoing, of which we obtained specimens, from the ciltersn at Kew, in October 1790. These had the shell of the parent nut at their root, so that no deception could take place. This nut is very different from the former, being twice as large, much compressed, with two large, divericated, recurved, opposite horns, more or less pointed, which could hardly be supposed to have originated from the calyx. We know nothing of the flowers of this species, nor are we perfuaded of its existence at present in the English gardens. Mr. Aiton indeed marks it as a perennial greenhouse plant, but not as having flowered; and we presume, with deference to his well-known accuracy, that it perished as an annual, without flowering; we have never heard of it since the firft feafon. One of our specimens has several flens from a fingle root, which may possibly be the cafe with T. natans occasionally. Gartner's figure is different from Burmann's, and from our Kew specimen, in the bluntnefs of its horns. We have a specimen like it, from China or the East Indies, and are not without a fufpicion that it may belong to a third species, whose herbage is, as yet, unknown to botanists.

TRAPANI, in Geography, a fcap-port town of Sicily, in the valley of Mazara, fixuated on a peninsula, with a good harbour, defended by a fort, which flands on a small island, called Colombara. This town was anciently called Drepanium, from the similitude its haven is thought to have borne to a fickle. It is ancient, and, according to Virgil, existed in the time of Enneas. According to Diodorus, it was fortified in the firft Punic war by Hamilcar, the father of Hannibal. The Carthaginians were always defirous of poifefling this city on account of its harbour. Here is a good pearl-fifhery on the coast, and in the neighbourhood a confiderable falt-work. The number of inhabitants is about 20,000; 43 miles W.S.W. of Palermo. N. lat. 38° 5'. E. long. 12° 30'.

TRAPESO, in Commerces, a weight in Malta, Sicily, and Naples. At Malta, gold and filver are weighed by the libra or pound of 12 ounces. The ounce is divided into 16 parts, or into 32 trapesii, and the trapeso into 18 grains. This pound weighs 4888 English grains: and thus 720 lbs. or ounces of Malta = 611 lbs. or ounces Troy. At Naples, gold and filver are weighed by the libra of 12 ounces, the ounce being fhdivided into 30 trapesii, and the trapeso into 20 acini. The pound of Naples weighs 4950 Troy grains; hence 64 lbs. or ounces = 55 lbs. or ounces Troy weight.

TRAPEZA, in Ancient Geography, a promontory of Afa Minor, in the Troade, at the entrance of the Hellespont, and 18 miles from the small town of Dardanum. Phily.

TRAPEZOIDES, in Anatomy, bones of the carpus. See Extremities.

TRAPEZIUS, in Anatomy, (cucullaris, dorso-fus-acromien,) a broad and flattened muscle, of triangular shape, describing with that of the opposite side the lozenge figure, wherein its name is derived, situated on the posterior surface of the neck and back, and reaching from the head and vertebral column to the scapula and clavicle. Its line of origin is very long. It arises, by a thin aponeurosis, from the occipital tuberclity, and the external transverse ridge of the bone; from the ligamentum nuchae in its whole length; from the spinous process of the last cervical vertebra; from the spines of all the dorsal vertebrae, and the intervening interpinel ligaments, by means of short aponeurotic fibres, except from the sixth cervical to the third dorsal vertebra inclusively, where these fibres are much longer, and form a broad femioval aponeurosis. At the lower part too, the origin of the trapezius presents an aponeurosis of some breadth. The muscular fibres pursue various directions: the superior, which are the thinnest, descend; the middle ones pass horizontally; and the inferior ones ascend: the two latter portions are much thicker than the upper. The middle fibres are the shortest, the upper and lower considerably longer. The fibres converge towards the shoulder, and form a flat aponeurosis, which, having passed over the smooth triangular space at the root of the spine of the scapula, is fixed to the superior margin of that process in its whole length, to the superior margin of the acromion, to the ligaments of the scapulo-clavicular joint, and to one third of the posterior edge of the clavicle. Numerous fleshy fibres are inserted, with aponeurotic ones, in the acromion and clavicle.

The posterior flat surface of the trapezius is every where subcutaneous; the cellular subfubance between it and the skin does not contain much fat, particularly about the neck. Its anterior surface covers the complexus, sphenius, levator scapula, serratus superior pollicus, supraspinatus, rhomboideus, the triangular surface at the root of the scapular spine, the infraspinatus, latissimus dorsi, and a small portion of the long and back muscles are oblire: the former from the occiput to the clavicle, the latter from the last dorsal vertebra to the scapula.

The trapezius carries the shoulder backwards, at the fame time making the scapula rotate, so as to turn its inferior angle forwards, and the superior backwards. In this way the shoulder is elevated, as in supporting a burden. If the levator scapula acts with it, the scapula is moved directly upwards: if the rhomboideus, directly backwards. When the shoulder is fixed, it will extend the head, and incline it, with the trunk, to one side.

TRAPEZOJOID, in Geometry, a plane irregular figure, having four fides, no two of which are parallel to each other.

TRAPEZOPOLIS, in Ancient Geography, a town of Afa Minor, in the interior of Caria. Ptolemy.

TRAPEZUNTINA LABIES, a name used by some botanical authors for the laurel-leaves, or common laurel.

TRAPEZUNTIUS, in Biography. See George of Trebizond.

TRAPEZUS, TREBIZONDES, in Ancient Geography, a populous town of Greece, E. of Pontus, and on the coast of the Euxine sea. It was a colony of Sinope. In the
TRAPPE, Monks of La, in Ecclesiastical History, monks of the Cistercian order, belonging to an abbey beautifully situated on a large valley in the province of Le Perche, on the confines of Normandy, in France. The abbey was founded in 1140 by Rotrou, count of Perche, and dedicated under the name of the Blessed Virgin. That this abbey was subjected to a very rigorous discipline by the Abbé de Rance, in 1664. Encyclop.

TRAPPINGS. Among the ancients, some will have the horsetrappings to have been placed on their breasts; others, on their forehead; and others, again, on their cheeks; that on the breast was a small kind of shield, finely polished.

TRAPRAIN LAW, in Geography, a mountain of Scotland, in the county of Haddington; 4 miles E. of Haddington.

TRAPS, The, a town of Pennsylvania; 26 miles N.W. of Philadelphia.

TRAPSALO, in Zoology, a name given by the Greeks in the Levant to a species or variety of Calamary, or Stella Loligo (which see), called by the Provençals Arugi. It resembles the common calamary, but differs from it by the extraordinary size of its eyes, by a less extent of fins, by its feet having a greater number of smaller bony points to their cartilaginous tubercles, by a less length of the back-bone, by the gills having a smaller quantity of black liquor, and by its becoming very large. The Greeks are of opinion, that their trapalo is only the calamary changed by age. The ariughi approaches the coast more frequently than the calamary; it often comes on the sand in the shore, and there deposits its eggs, whereas the calamary never goes on land. The flesh is better and less difficult of digestion; but their eggs have a slight purgative property, from which no bad effects are felt. It is considered as a presage of a tempest, when the calamaries dart out of the water. Somnini's Greece, p. 128.

TRAPTOWN, in Geography, a town of Maryland; 7 miles S.W. of Fredericktown.

TRAQUAIR, or TRÉ-QUAIR, a parish in the shire of Peebles, Scotland, on the southern bank of the Tweed, is watered by the river Quair, which has its rise and its whole course in the parish to which it communicated its name; Tre-Quair signifying a dwelling on the Quair. The present parish is composed of the old parish of Traquair, with that half of the ancient parish of Kailzie, which lies on the south side of the Tweed, and to which it was annexed in the year 1674. Its greatest length from E. to W. is about nine miles; its greatest breadth, from the Tweed to the source of the Quair, is from four to five miles; the whole contains 17,290 acres, of which about 4000 are arable. The surface is rocky and mountainous. Minnoch, one of the hills, is upwards of 2000 feet above the level of the sea; and Gumfleugh and some other heights are elevated above 200 feet more. The hills, in general, afford excellent pastures for sheep, of which there are above 10,000 in the parish. The soil in the low grounds is shallow and fotty, but tolerably fertile; and the air salubrious. In the population return of the year 1811, the number of inhabitants was stated to be 621, occupying 102 houses. The church was rebuilt in the year 1785. A parochial school is established, with a salary of 300 marks and perquisites, a free house and garden. Traquair House, the residence of that branch of the Stewart family who derive the title of earl from this parish, is seated on the bank of the Tweed; and on the side of a hill, which overlooks the lawn, are the remains of “The Buil aboon Traquair,” celebrated in ancient melodies, and probably in former times a considerable thicket, but now reduced to five solitary thorn-trees. Part of the mansion is of very remote antiquity.
antiquity; and was built in the castellated form. There have been several other tower-houses in the parish, one of which is still almost entire at Cardrona. Several places, denominated chelors, exhibit evident marks of lines of circumvallation, and are more or less circular, and seem rather to have been intended to secure cattle against sudden incursions, than for regular encampments; though tradition dignifies them by the appellation of Roman camps: they are all constructed upon the summits of eminences not easily afforded. At the commencement of the Scoto-Saxon period, the Scottish kings possessed the forest of Traquair, with a castle on the site, which is formed by the junction of the Quair with the Tweed. The first mention of it on record, is in the reign of David I., from whose time, till the death of Alexander III., the castle was occasionally the royal residence. Traquair was then a considerable village, which had arisen under the shelter of the castle, and appears to have been more opulent and populous than Peebles itself; but is now very much reduced.—Carlisle's Topographical Dictionary of Scotland. Beauties of Scotland, vol. ii. Chalmers' Caledonia, 4to. 1810.

TRAQUATUHA, a town of Brablia, on the river of the Amazon, 330 miles W. of Fort Rio Negro.

TRAQUENADE, in the Mange. See ENTREPAS.

TRARA, in Geography, a range of mountains in Algiers; 6 miles E. of Twint.

TRASCALETA, a town of Spain, in the province of Galicia; 16 miles S.E. of Lugo.

TRASCINA, in Ichthyology, a name by which some authors have called the fish more usually known by the names of draco marinus, and aranurus.

TRASSEN, in Geography, a river of Germany, which rises in the Se of Austria, passes by Marktl, Lillenfeld, Wilhelmsburg, St. Polten, &c., and runs to the Danube, 8 miles below Mautern.

TRASIMENUS LACUS, or the Lake of Trajanus, in Ancient Geography, a lake of Italy, towards Etruria, S.E. of Cortona: famous for the battle called after its name, in which Hannibal, in the year of Rome 536, defeated the Romans under Flaminius; 15,000 Romans having been killed, 10,000 put to flight, and 1500 having died of their wounds.

TRASKIRCHEN, or Draskirchen, in Geography, a town of Austria; 3 miles E.N.E. of Baden.

TRASMAUR, a town of Austria, on the Tracen, with a citadel; it belonged to the archiepiscopal of Salzburg; 12 miles W. of Tulln.

TRASOS-MONTES, or TRASOS-MONTEs, a province of Portugal, bounded on the N. and E. by Spain; on the S. by Beira, from which it is separated by the Duero; and on the W. by Entre Duero e Minho. It receives its name from its position, with respect to the province of Entre e Minho, lying on the other side of the mountain of Marao. In extent from N. to S. it is 70 miles, and from E. to W. about 50, being for the most part mountainous. It is wild, barren, and thinly inhabited, though blessed with fertile and delightful vales, which produce rye, wheat, wine, and fruits: besides the Duero, it is watered by the small rivers of Tamega, Corgo, Tuela, and Sobor, which run all into the Duero. It contains two cidades or cities, and 57 villas or towns; according to De Lima's bill, 549 parishes, in which, in the year 1732, were computed 135,864 souls.

TRAVI, a citadel and lordship in the Engadine, on the borders of Tyrol, with a small garrison in it; 27 miles N. of Bormio.

TRAW, TRATOW, a town of the duchy of Holstein; 6 miles S. of Segeborg.

TRATTINICKIA, in Botany, is so called by Willdenow, in honour of a Vienna botanist named Trattinick. The name of Leopold Trattinick occurs in Mr. Dryander's Bibl. Bankf. v. 3. 642, 648, and 654, as the author of some botanical treatises in German. Perfon, it appears from Pursh 519, has a Trattinickia, which is MARSHALLIA of Pursh, after Schreber. (See that article.) We must premuse Willdenow to be most correct in the above orthography. — Willd. Sp. Pl. v. 4. 975. — Clafs and order, Polygamia Monocotyl., Willd.; rather Pentandra Monogynia. Nat. Ord. Terentaceous. Juffi.

Gen. Ch. Cal. Perianth inferior, of one leaf, hairy, bell-shaped, with three teeth. Cor. of one petal, bell-shaped, longer than the calyx, with three flight teeth, somewhat hairy at its outside. Stam. Filaments five, awl-shaped, very short, inserted into the receptacle; anthers oblong, erect. Pist. German ovate, superior; style awl-shaped, the length of the filaments; stigma simplex. Fruit unknown.

Obs. There are some flowers male only, having merely a short style, without any germen. But we cannot for that reason admit the genus into Polygamia, there appearing to be no difference of structure in the other parts of the flowers.

1. T. rhoifolia. Sumach-leaved Trattinickia. Willd. n. 1.—Found in the province of Para, in Brafl, by count Hoffmann-egg, who communicated a dried specimen to professor Willdenow. — A large and very handsome tree, whose ultimate branches are striated and smooth, as thick as the little finger. Leaves alternate, stalked, pinnate, two feet long, composed of seven pair of opposite leaves, with an odd one, which are stalked, four or five inches in length, oblong, pointed, entire, rigid, rough on both sides, veiny; somewhat heart-shaped at the base. The common fruit is semi-cylindrical and striated; partial ones half an inch long, corrugated. Stigmas lacerate, an inch long, rough with hairs, deciduous. Panicle terminal, spreading, compound, flowers white, feathery, in little round tufts. The panicle ends in a pointed bud, expanding into a branch after the flowering is over, so that the branches of the panicle subsequefly become lateral. The habit of this plant most resembles Canarium, though the genus is unquestionably distinct. Will.

TRATUZ, in Geography, a town of European Turkey, in Moldavia; 49 miles S. of Niametz.

TRAU, or Tragan, a town of Dalmatia, pleasantly situated on a piece of land, which was formerly a peninsula, but now separated from the continent by a canal cut through. It is divided into the New and Old; the latter of which has a double, the former only a single wall, and defended by three towers. The harbour, which is formed by a bay, has depth of water enough for the largest ships, which ride there sheltered by two capes. It abounds also in fish, particularly fine fardines. It was an ancient Roman colony of the emperor Claudius; and so early as the year 937, put itself under the protection of Venice; on which it has been continually dependent ever since the year 1425, though without any changes and disfarous revolutions. Vine's, olives, fags, and almonds are cultivated here, and some corn, which however is not the richest produce of these parts. The internal part of the territory of Trau, which
is about 100 miles in circuit, on the continent, produces very little wine, and scarcely any oil. The flocks that feed there, together with those on the island under the same jurisdiction, yield about 400,000 pounds of cheese, and wool in proportion. The number of inhabitants in this territory is about 20,000; 12 miles W. of Spalatro. N. lat. 43° 30'. E. long. 16° 30'.

TRAV, a bay on the S.W. coast of Tries, one of the Western islands of Scotland. N. lat. 56° 31'. W. long. 6° 48'.

TRAVAY, or TRAVENEBURG, a town and castle of Germany, in the circle of Swabia, which gives name to a small county situated to the S.W. of the territory of Kempen; 12 miles E. of Wangen.

TRAVE, a river of Germany, which rises from a lake in the duchy of Holstein, 2 miles W. of Arensbuck, passes by Oldeelhohe, Lubeck, &c. and runs into the Baltic, about 10 miles N.E. of Lubeck. N. lat. 54°. E. long. 10° 55'.

TRAVE, in Agriculture, a term applied, in some districts, as Erica, to a large fort of flould of the wheat kind. In the work of traving, fourteen sheaves are set in a flating position, head to head, across a furrow, and prefixed together as close as may be; a single sheaf being then firmly placed in the furrow against each end of the trave. The traves are by this means made quite secure, solid, and compact, and may defy almost any force and violence of the wind. In some cases, instead of placing sheaves at the ends in this way, they are laid along the top or ridge of the trave; which, without doubt, at once better preserves the trave from the rain and wet, and gives a freer passage to the air between the sheaves, and sooner dries them, in case of their having been thoroughly soaked with rain; but then they are not nearly so strong to withstand powerful storms and blasts of wind as in the other mode of constructing them. See Harvesting.

TRAVE, among Farriers, the name with travece.

TRAVELLER, in a Ship, a fort of thimble, whose diameter is much longer, in proportion to the breadth of its surface, than the common ones. It is furnished with a tail formed of a piece of rope, about three feet in length, one end of which encircles the ring to which it is spliced. These machines are principally intended to facilitate the hoisting or lowering of the top-gallant-yards at sea; for which purpose, two of them are fixed on each back-flay, whereon they slide upwards and downwards, like the ring of a curtain upon its rod; being thus attached to the extremities of the top-gallant-yard, they prevent it from swinging backwards and forwards, by the agitation of the ship, whhilst the yard is hoisting or lowering at sea. Falconer.

TRAVELLER'S JAY, in Botany. See Clemathis.

TRAVEMUNDE, in Geography, a sea-port of the duchy of Holstein, on the Baltic, at the mouth of the Trave, belonging to the city of Lubeck, which appoints a governor or commandant. The harbour is capable of containing 60 vessels, and deep enough for those of 200 tons. Men of war ride at anchor in the road. Travemunde is defended by a small fort, mounting 40 guns, and a garrison of 50 men; 8 miles N.E. of Lubeck. N. lat. 54°. E. long. 10° 51'.

TRAVENDAL, a town of Holstein, on the Trave; 2 miles S.W. of Segeborg.

TRAVERON, a town of France, in the department of the Meuse; 10 miles E. of Gondrecourt.

TRAVERS, John, in Biography, a musician brought up in St. George's chapel at Windsor, and afterwards bound apprentice to Dr. Greene, about the year 1730, was elected organist of St. Paul's Covent-Garden; and in 1737, on the death of Jonathan Martin, was appointed one of the organists of the king's chapel. He afterwards attached himself to Dr. Pepusch, and confined his studies solely to the correct, dry, and facile style of that master. His compositions, however pure the harmony, can only be ranked with pieces of mechanism, which labour alone may produce, without the assistance of genius.
His passion for fugues, reminiscent of an inveterate punster, who never hears a phrase or sentiment uttered in conversation, without considering what quibble or pun it will unfit: to Travers seems never to have been or heard any sort of sounds, without trying to form them into a fugue, and meditating when and where the answer might be brought in.

**Travers**, in Geography, a town of the county of Neufchâtel; 11 miles W. of Neufchâtel.

**Traverse**, or Transverse, something that goes athwart another, i.e. so as to cross or cut it obliquely.

**Traverse** is particularly used for a piece of wood or iron placed transversely, to strengthen and fortify another: such are those used in gates, windows, &c.

To plane a board against the grain, is also called, among joiners, &c. to traverse it.

**Traverse**, in Gunnery, signifies to turn or point a piece of ordnance, which way one pleases, upon her platform.

The laying or removing of a piece of ordnance, or a great gun, in order to bring it to bear, or lie level with the mark, is also called *traversing the piece*. See GUNNERY.

**Traverse**, in Fortification, denotes a trench with a little parapet, sometimes two, one on each side, to serve as a cover from the enemy that might come in flank. See GLACIS, and Plate V. Fortification, fig. 6, in which **w**, **v** represent traverses, constructed at the extremities of the places of arms, which serve to enclose them: these traverses are three toises thick, and as long as the covert-way is broad; and a paffage is cut in the glacis round them of about fix or eight, in order to have a free communication with the rest of the covert-way. There are also traverses of the fame dimensions before every fahiant angle of the battalion and outworks, and they in the fame direction of the faces of those works produced; and the thickness lies at the fame fide as the parapets. The paffages round these falt traverses are from fix to eight feet wide. The fcond covert-way has also traverses every where, in the fame manner as the firl.

Traverses are sometimes covered over-head with planks, and loaded with earth. Each traverse is furnifhcd with a foot-bank, and a row of palisades planted on the foot-bank; and the paffage round its end fhould be furnifhed with klinquets, or doors, to shut them up when neceffary. They are very commodious for ftopping an enemy's way, and to prevent being enfilded; they likewise make a good defence, in a dry fols, in making the parapet on the fide next the opposite flank.

**Traverse**, in a word *fols*, is a fort of gallery, made by throwing faficles, jofts, fafifnes, flones, earth, and other things, into the fols, over-againit the place where the miner is to be put to the foot, or the wall, in order to fill up the ditch, and make a paffage over it.

**Traverse** also denotes a wall of earth, or flone, raised across a work which is commanded, in order to cover the men.

**Traverse** also signifies any inrenchment, or line fortifified with fafifes, barrels, or bags of earth, or gabions.

**Traverse**, in Navigation, is the variation or alteration of a ship's course, occasioned by the shifting of the winds, currents, &c.; or a traverse is a compound course, in which several different courses and distances are known.

Traverse failing is used when a ship, having fet fail from one port towards another, whose course and distance from the port failed from are given or known, is, by reaon of contrary winds, or other accidents, forced to shift and fail on several courses, which are to be brought into one course, to learn, after fo many turnings and windings, the true course and distance made from the place failed from, and the true point or place where the ship is; that is, the wind coming fair, it may be known how, afterwards, to shape a course for the place intended.

This may be performed geometrically two ways; the firft by drawing new meridians, through the extremity of every course, parallel to the firft meridian, or north and south line at firft made, and fetting off every course with a sweep of sixty, as if it were a qunetion in plain failing: you may also let fall perpendiculars to every new meridian, from the point that the ship failed to upon that course; by which you have the course, distance, difference of latitude, and departure, to every course.

To illustrate this by an example: a ship, being bound for a port distant 120 miles N.E. 45° E. falls S.S.E. 30 miles, then N.E. by N. 40°, then E. by N. 25°, then N.N.E. 44°: it is required to find the course and distance made good, and also the course and distance to the port bound for.

Draw the line HK (Plate VI. Navigation, fig. 1.) at pleasure, for a meridian, or north and south line, and therein assume a point, as A, for the port failed from; then, with 60 of the chords, and one foot in A, draw the arc Lm, upon which let off two points (because the course is S.S.E.) from L to m, and draw the line A m, upon which let off the distance 30 from A to B; then is the ship at B: thus letting fall the perpendicular BK, A K 27° 7', is the difference of latitude, and B K 11° 5', the departure of the first course.

For the second course: with the distance KB draw the parallel BN, and thereby with the chord of 60, as before, let off the second course and distance, N.E. by N. 40°, from B to C, and let fall the perpendicular CL; then is the ship at C, the difference of latitude upon the course is B L 33° 3', and departure C L 22° 2'.

Proceed in the same manner for the third course: with the parallel CO, let off E. by N. 25°, from C to D, and draw the line D P, from which let off the laft course, N.N.E. 44°, then is your ship at E.

Since, then, the ship came from A, and is now at E, the line AE, measured on the fame equal parts upon which all the other distances were taken, will be found 91 miles; and the arc RQ, measured on the rhumbs, five points; viz. N.E. by E.; so that the ship is now 91 miles N.E. by E. from the port failed from.

To find her course and distance to the port bound for, let off four half-points upon the arc RQ, from R to S, and from A through S draw the line A SF; upon which let off 120, the distance from the port failed from, to the port bound for, from A to F; then is F the port bound for; now the port bound for being at F, and the ship being but at E, the line EF, measured on the fame equal parts that the refl was taken from, will be found to be 31°; and the arc TV, measured on the rhumbs, is 35° 12', or N.E. by N. somewhat easterly, &c. This method is useful where the courses tend generally one way, without intersecting one another; but if they often crofs, it is helpt to have recourse to the second method, which is without new meridians.

In order to this, observe how many points are between the point next to be laid down, and the point opposite to the course laid down; for that is the point for laying down: then when the chord of 60, and one foot in the point the ship is laft come to, describe an arc; upon which let off the points found by the above faile rule, and through that draw the line for the next course, &c. For an example:

- Draw a north and south line, as in the former, as the line R M (fig. 2.), in which assume a point, as at A, for the
port failed from; then from A set off the first course and distance, viz. N.N.W. 68, from A to B; and for the second course, with the chord of 60, and one foot in B, draw the arc T W, upon which to set off the next course S.S.W. 70: observe the rule above delivered; viz. to take the number of points between the point next to fail, and the point of which rule is this; if from A to B your course be N.N.W., then back from B to A must needs be S.E. the opposite point; and then if you were to fail S. by E. it must be one point to the southward of that S.E. line; if S. it is two points; and consequently the next course being S.S.W., you are to set off four points, upon which set off 70 miles, from B to C, and then is your ship at C: for the third course, if from B to C be S.S.W., then from C to B is N.N.E.; but the next course being E. ½ N. the points between N.N.E. and E. ½ N. are five points and a half; and therefore, with the chord of 60, and one foot in C, draw the arc X Y, upon which set off five points and a half from X to Y; and through Y draw the line C D, upon which set off 90 miles from C D: then is your ship at D.

After the same manner lay down all the rest, as D E, which is W.N.W. ½ N. 70; then E F, S. 25; then F G, E. ½ S. 45; then lastly G H, S. 30, which is the last course.

Thus your ship being at H, and the port failed from at A, the line A H, 28 miles, is the distance made good; and the angle at A is four points, viz. S.E.; but the port intended for being S.W. 55, set it from A to K; and the ship being at H, the line H K, 62 miles, is the distance from the ship to the port bound for; and the course is found by measuring the angle at H 71° 49', or W.S.W. more than a quarter westerly, &c.

To work a Traverse by the Tables of Difference of Latitude and Departure.—This is the principal use those tables are intended for; and the way of working a traverse by them is equal to the bell for exactness, and superior in point of expedition.

Make a little table with six columns, the first for the course, the second for the distance, the third for the northing, the fourth for the southing, the fifth for the easterly, and the sixth for the westerly. Then find the difference of the latitude and the departure to every course, and set them in their proper columns; as, where the course is northerly, set the difference of the latitude under northing; or, in the north column; and where the course is southerly, set the difference of latitude in the south column.

Again, where the course is easterly, set the departure in the east column, and when westerly, set it in the west column: then, adding up each column by itself, subtract the north and south columns, the less from the greater, the remainder is the northing or southing made good. Also subtract the east and west columns, the less from the greater, the remainder is the easterly or westerly made good; then you have the difference of latitude and departure given to find the course and distance.

In the first example above specified, the first course is S.S.E. 50 miles, or two points 30 miles; for which I find the difference of latitude 27° 7. Now the course being between southerly and easterly, I place my difference of latitude in the south column, and my departure, 11 : 5; in the east column, leaving the north and west columns blank.

Then for the second course N.E. by N. or three points 40 miles, my difference of latitude, 33 : 3, is to be placed in the north column, and the departure, 22 : 2, in the east column; because the course is between the north and east.

Then the third course being E. by N. or seven points 25 miles, I place my difference of latitude, 4 : 9, in the north column; and departure, 24 : 5, in the east column.

And so for the fourth course N.N.E. or two points 44 miles, I place my difference of latitude, 40 : 6, in the north column; and my departure, 16 : 8, in the east column; then adding up each column, the sum of the southing column is 78 : 8, and the sum of the southing column is 27 : 7; which subtracted from the northing, 78 : 8, the remainder, 51 : 1, is the difference of latitude made good, which is northing, because the northings was the greater number.

Again, the sum of the easterly column is 75 : 0, which, because there is no weather to subtract from it, is the easterly made good. Thus you have the northing 51 : 1, and the easterly 75 : 0 given, to find course and distance; and though you cannot find in the table the exact number of 51 : 1 and 75 : 0 together, yet find the nearest you can, which is 75 : 41, and 50 : 9, over which, at the top, you find 34 degrees for the course, which is N.E. by N. 6° 15', easterly, and the distance is 91 miles.

To reduce a Traverse by the Scales on Gunter's Scale, improved by Mr. Roberton.—E.g. A ship in 40° N. lat. and 5° 14' W. long. fails the S.E. by S. 68 min. then S.W. by W. 55 min. and then W.N.W. 75 min. What is her difference of latitude and departure in this general run?

The proportions are, for the

| Traversing Table. | | | |
|-------------------|-------------------|-------------------|
| Departure. E. W. | | | |
| S.E. by S. 68 | 57.0 | 38.0 | |
| S.W. by W. 55 | 30.6 | 46.0 | |
| W.N.W. 75 | 28.8 | 69.5 | |
| General diff. Lat. | 58.8 | 77.5 | |

Then is the department made good in this day's run.

To work the above on the Sliding Gunter.—Set five of 8 points on the fixed piece, by the help of the brass index, against 68 num. on the slide; then draw the said index to S. 5 points, you will find 57 num. on the slide for the difference of latitude; and (without any alteration) against S. 3 points, on the fixed piece, you will have 38 num. on the slide for the departure.

With the compasses, take the extent from 8 points on the fine rhumbs to 68 on the numbers; the said extent laid the same way from fine 5 points will reach to 57 on the num.
If a matter be expressly pleaded in the affirmative, which is expressly answered in the negative, no traverse is necessary, there being a sufficient issue joined: also where the defendant or his attorney has given a particular answer in his plea to all the material points contained in the declaration, he need not take a traverse: because when the thing is answered, there needs no farther denial.

**Traverse of an Indictment or Presentment** is the contradicting or denying some chief point of it, and taking issue thereon. See *Indictment*, and *Presentment*.

Thus, in a prentment against a person for a highway overflowed with water, for default of fencing a ditch, &c. he may either traverse the matter, by alleging that there is no highway, or that the ditch is sufficiently fenced; or he may traverse the cause, viz. by alleging that he hath not the land, or that he and they have a lease, &c. have not used to clean the ditch.

It is not customary, nor agreeable to the general course of proceedings, unless by consent of parties, to try persons indicted of smaller misdemeanors at the same court in which they have pleaded not guilty, or traversed the indictment.

But they usually give security to the court, to appear at the next affizes or sessions, and then and there to try the traverse, giving notice to the prosecutor of the same.

**Traverse of an Office** is the proving that an inquisition made of lands or goods is defective, and untruly made. See *Office*.

No person shall traverse an office, unless he can make to himself a good right and title: and if one be admitted to traverse an office, this admission of the party to the traverse supposes the title to be in him, or else he could have no cause to traverse.

**Traverse is sometimes used in Heraldry, for a partition of an escutcheon, which they blazon parti per pale, traverse, argent and gules.**

**Traverse, in the Manager.** A horse is said to traverse, when he cuts his tread crose-wise; throwing his crouse to one side, and his head to another.

**Traverse Tyle.** See *Tyle*.

**Traverse Bay, Grand, in Geography, a bay on the eait side of lake Michigan. N. lat. 44° 35'. W. long. 86°.**

**Traverse Islands, a chain of islands at the east end of Noquet's bay, in lake Michigan: on one of the largest is a town of the Ottoway Indians.**

**Traverse River, a river of Louisiana, which runs into the Mississippi, N. lat. 38° 30'. W. long. 92° 5'.**

**TRAVERSIERE, Flute, commonly called the German-flute, being supposed of German invention. But it has its title of flute traversiere in France, from the different manner of holding it from that of la flute à ber, or common flute.**

Its original compass was from the lowest D in the treble, to a in altissimo.

Such was the extent of the scale in 1752, when Quantz published his "Methode de la Flûte," who was the late Frederic king of Prussia's master on that instrument, and the first who added keys to correct and clear the bad notes.

In the folio Encyclopédie, tom. vi. there is a scale of all the tones, semi-tones, and shades possible on the instrument, with an additional half-note, C or D, below the usual lowest note of its compass, and three notes above A in altissimo, the highest note of Quantz's scale. See *Music Flutes*.

For the history of the flute traversiere, Quantz tells us that in the year 1620 it had no key to make D or E, and was called the Swifs flute. It was the French who added the first key; but it was not known by whom or when,
when. Quantz himself added a second key in the year 1726, and about 1732, a third. Two more keys have since been added by subsequent performers on the instrument; but it has been thought more for parade than use: as the management of five keys in rapid performance, would be as difficult as running divisions on an organ with all the five short keys split into quarter-tones. See Fackler.

TRAVESTY, or Travesty, a term which some late authors have introduced into poetry; it is originally French, being a participle of the word travestir, to disguise one's self, or to appear in masquerade. Hence travesty comes to be applied to the disfiguring of an author, or the translating him into a style and manner different from his own; and is generally applied to pieces of humour.

Travesty, or parody, may be divided into two classes:—that which is intended to ridicule absurdity, and that the purpose of which is to extract gaiety and laughter from compositions in their own nature grave and admirable. The Rehearsal by the duke of Buckingham is the bell specimen of the former. At a period when false taste seems to have prevailed in an eminent degree, which would be most likely to happen when a man of splendid talents like Dryden condescends to sacrifice his better judgment for the puerile amusement of a temporary popularity, an author of wit has the appearance of doing the public a service, who shall call them to sobriety and good sense by the force of ridicule. The second kind of travesty has stillless that can be alleged in its favour. Its direct operation is to pollute our better feelings, and tarnish with a putrefying film of ridicule all the noblest and most exquisite effusions of the human mind. Here unfortunately ridicule most easily takes hold. We cannot laugh at nothing; the prattle of inanity bids defiance to the ludicrous. There must be something of what we have been accustomed to view with honour in the composition we are facetiously invited to contemplate again and again with bursts of laughter against the author. But that which is most easily turned into burlesque, and affords the most permanent hold of an attack of this fort, is the language and sentiments that had before excited in us the deepest and most sacred emotions. The very contrast between the solemn feelings with which these things had been formerly regarded, and the unexpected colour of absurdity which is given them now, makes the temptation to laughter the more violent and irresistible.

G. Battista Lalli has travestied Virgil, or turned him into Italian burlesque verse. Scarron has done the same in French; and Cotton and Philips in English verse.

Cafalio is, by some, charged with having travestied the sacred text, by reason of the difference of air and style between his version and the original.

TRAVICE, in the Manier, is a small inclosure or oblong quadrangle placed before a fr retar's shop, and consisting of four pillars or posts, kept close together by cros poles. This inclosure is designed for holding and keeping in a horse that is apt to be unruly or disorderly in the time of shoeing, or of any operation.

This, in some of the remote parts of England, goes by the name of a break; and is called in French, traveil.

TRAUMATICS, Traumatics, Vulgarities, or medicines good for the healing of wounds. See Vulnerary and Aeglutinant, Healing, and Consolidation.

TRAUMATICUM, Balsamum. See Balsamum Traumaticum.

TRAU, in Geography, a river of Austria, which rises in the Hallstatter See, forms a considerable lake, called Traun See, and runs into the Danube, about three miles below Steyrregg.—Also, a river of Bavaria, which rises from two lakes, Forchensee and Daubensee, and enters the Alza, 4 miles N. of Chiemsee.

TRAVNIKOUVA, a town of Russia, on the Lena; 6 miles S.S.E. of Orelne.

TRUNKIRCHEN, a town of Austria; 12 miles S.E. of Voglabruck.

TRAUNE, a town of Austria; 4 miles S.W. of Zwettl.

TRAUNSTEIN, a town of Bavaria, on the Traun, where are some considerable salt-works; 18 miles W. of Salzburg. N. lat. 47° 21'. E. long. 12° 35'.

TRAUSI, in Ancient Geography, a people of Thrace, in the environs of mount Hæmus, wholly massacred by Herodotus, esteemed thes of the other Thracians.

TRAUTSTEIDT, or Eisenstadt, in Geography, a town of the duchy of Warsaw; 40 miles S.S.W. of Posen.

TRAUN, a town of Bohemia, in the circle of Königgratz; 21 miles N. of Königgratz. N. lat. 50° 27'. E. long. 15° 48'.

TRAUTELENFELS, a town of the duchy of Styria; 7 miles E.N.E. of Groming.

TRAUTMANSDORF, a citadel in the county of Tyrol; 4 miles N.E. of Tyrol.

TRAUTMANSROFF, a town of Austria; 6 miles W.N.W. of Brugg.

TRAVUS, in Ancient Geography, a river of Thrace, which discharges its waters into the lake of Bitonis.

TRAYAGUERA, in Geography, a town of Spain, in Valencia, surrounded by a wall flanked with towers. Here is a manufacture of fine earthenware; 80 miles N.E. of Valencia.

TRAYL-BASTON, or Trail-Baston. Edward I. in his 32d year, sent out a new writ of inquisition, under this denomination, against the intruders on other men's lands, who, to oppress the right owner, would make over their lands to great men; against batterers hired to beat men, breakers of peace, ravifiers, incendiaries, fighters, false affiants, and other malefactors; which inquisition was so strictly executed, and such fines taken, that it brought in much treasure to the king.

Hence, also, justices of trail-baston, a denomination given to the justices appointed to execute this commission, either by reason of their severe and summary way of proceeding, or because a staff was delivered them as the badge of their office, and the offenders were dragged before this jurisdiction.

TRAYTOR, Traitor, Traitor, a betrayer of his king and country, or one guilty of high treason. See Treason.

TRAYTOROUS or Traitorous Person, is particularly underloid of a tenet, which some formerly held, of the legality of taking arms, by the king's authority, against his person, and those commissioned by him; which is condemned by statute 14 Car. II. c. 3.

TRAZA, in Geography, a town of Arabia, in the country of Yemen; 70 miles N. of Loheia.

TREC, in Pharmacy, &c. See Theriac.

The word treacle is also popularly used for mealties; and in this sense it is that Dr. Shaw, in his "Essay on Distillery," has endeavoured to bring into use several sorts of treacles, which might be made at home, and would serve very conveniently for the distillation of spirits, or the making of potable liquors. These are the infilpated juices or decoctions of vegetables; such as the sweet juice of the birch, or yarrow, procured by tapping or piercing the trees in spring, and the common wort made from malt, or from other vegetable substances treated in the same manner. These liquors
TRE

liquors are severally to be boiled down in a copper till they begin to infipitate, and then to be poured into a balneum Maria, when the remainder of the evaporation may be
finifhed without burning the infipitated juices: thus pre-
pared, it may be at any time reduced to the state of wort,
only by adding a fufficient quantity of warm water.
Treacle is employed for the more quickly fattening fome
forts of domestic animals, fuch as sheep and neat cattle,
when properly mixed and united with different forts of
dry materials, fuch as pollard, bruifed grain, cut hay, and
many other matters of the fame nature, as they moftly fon
become very fond of it, and it is well known to be of a
very nutrient quality. Trials have been made with it in this
view, with great success. See Staal-feeding.

TREACLE-Mulnard, or Mitribadice, in Botany. See
Thlaspi.
The feed enters into the composition of the theriaca,
and externally used, cleafes all forts of ulcers, and is also a
tarmic, but not very common. It is reckoned an enemy
to pregnant women, becaufe it kills the fatus. James. See
Thlaspius Semen.

TREACLE-Mulnard, is also a name given to the clypeola.

TREACLE-Water, Aquæ Theriacæ, a compound cor-
dial, or精神文明 water, diffilled with a精神文明 men-
fbruam, from any cordial and fulodic drugs and herbs,
with a mixture of fome of the theriaca Andromachi, or
Venet treacle; whence its name.

TREAD, in the Manage. See Piste.
The tread of a horfe is considered to be good, when
firm, and without the animal refting upon one fide of the
foot more than upon the other, or fetting down the toe or
heel one before the other. Where the heels are firft fet
down to the ground, it is often fuppofed to be a fign that
the animal is unfound in its feet. And where the toes are
firft put to the ground, it is considered as fhewing that
the horfe has been of the draught or diftant kind. Confequently,
in a good going horfe of the faddle fort, the whole foot
should be fet down equally, at the fame time, and
neither turned out nor in, in any perceptible degree.

Tread upon the Coronet, is a term applied to any injury
which is done to it by the treading of the other horfes or
animals on it. See Coronet.

TREADHAVEN CREEK, in Geography, a branch of
the river Choptank.

TREADING in Wheat, in Agriculture, the practice of
making fuch land as is light, fandy, and friable, hard and
firm by fuch means after the feed has been put into it, in
order to fecure its vegetation and growth in a more perfect
manner. It has been fuggelted as ufeful on different kinds
of foy, but it is evidently the moft proper for thofe that are
light and open, either from their particular nature and
quality, or the forts of crops by which they have been occu-
pied, as tho'fe of the potato, turnip, or other fimilar kinds.
In all fuch cafes, it will be found of great utility and ad-
vantage in promoting the elablifhment of the roots of the
plants, by forcing the wheat to strike more strongly into
the foy, and by keeping the frots from injuring and throw-
ing them out while in the early state of their growth. But
in other kinds it may be injurious and hurtful in many in-
fances, and moftly unnecessary.

The bolt mode of effecting it is probably by the ufe of
fweep immediately after the land has been fown and harrowed,
by turning them upon it in fufficient quantities, as they
do it in a very effectual manner. Some have, however, re-
course to other forts of animals, as neat cattle and horfes,
and to rolling; but this is feldom fufficient well, as it is
liable to increafe the friability below in fuch foyals. The
cattle and horfes, when in fufficient number, often produce
much benefit in this way; and in fome places, where the
land is of a foft abraded fotty quality, teams of fix or eight
oxen are used in covering in the fee, in drawing a light
pair of harrows, in this intention. Wherever treading is
necessary in this view, it should confantly be performed in
an effectual manner, with whatfert fort of live-rock it is
done, whether fheep, oxen, or horfes. Sometimes treading
is found beneficial for wheat, on fuch foyals, fo late as
March, even more foon than at the time of putting in the feed,
as tending to deftroy weeds, fuch as the corn-poppy, &c.

The practice of treading in the wheat is, of course,
mootly to be adopted, in all thofe cafes, as tending to fecure
and increafe the quantity of the produce whenever fuch
forts of land are fown with that kind of crop. See Wheat.

TREASON, Treachery, the act or crime of infidelity
to one's lawful sovereign.

Treason is a general appellation made ufe by the law,
to denote not only offences againft the king and government,
but also that accumulation of guilt which arises whenever
a fuperior repofes a confidence in a fubject or inferior, be-
tween whom and himfelf there subsists a natural, civil, or
even fpiritual relation; and the inferior fo abufes that con-
fidence, and fo forgets the obligation of duty, fubjeftion,
and allegiance, as to deftroy the life of any fuch superior or
lord. Whence

Treason, in our laws, is of two forts, high and petty.

Treason, High, or Treafon Paramount, which is equiv-
calent to the crimen lege majeflatis of the Romans, (as Glanvi
denominates it also in our English law,) is an offence com-
mitted againft the fecurity of the king or kingdom, whether
by imagination, word, or deed.

In order to prevent the inconveniences which arose
in England from a multitude of conftructive treasons, the
statute 25 Edw. 111. c. 2. was made; which defines what
offences only for the future should be held to be treason:
and this statute comprehends all kinds of high-treafon
under seven different branches.

1. "When a man doth compafs or imagine the death of
our lord the king, of our lady his queen, or of their eldeft
son and heir." A queen pregnant is alfo within the words
of the act, though it does not extend to the husband of
such a queen. And the king here intended is the king in
possession, without any refpect to his title: confequently,
a king who has refigned his crown, fuch refinement being
admitted and ratified in parliament, is no longer the objec-
t of high-treafon; and the fame reason holds in cafe the king
abdicates the government; or, by actions subverte of the
constitution, virtually renounces the authority which he
claims by that constitution. As the compafing or
imagination, expreffed by this statute, is an act of the mind,
it cannot poftibly fall under any judicial cognizance, unlefs
it be demonftrated by fome open or overt act. The statute
expreffely requires, that the accused "be thereof upon suf-
cient proof attainted of fome open act by men of his own
condition." Thus to provide weapons or ammunition
for the purpofe of killing the king, is held to be a palpable
overt act of treafon in imagining his death: to compofe to
imprison the king by force, and move towards it by attem-
bathing company, is an overt act of compaffing the king's
death: and taking any means to render treafonable pur-
poles effectual, as afsembling and confulting on the means
to kill the king, is a fufficient overt act of high-treafon. It
now seems clearly to be agreed, that, by the common law
and the statute of Edw. 111., words spoken amount only to
a high misdemeanor, and no treafon. If the words be let
down
TREASON.

down in writing, it argues more deliberate intention; and it has been held, that writing is an overt act of treason; for **scribere eft agere.** But even in this case, the bare words are not the treason, but the deliberate act of writing them. It was formerly held, that the publication of a treasonable writing was a sufficient overt act of treason at the common law; though of late even that has been questioned.

2. The second species of treason is, "if a man do violate the king's companion, or the king's eldest daughter unmarried, or the wife of the king's eldest son and heir." By the king's companion is meant his wife, and by violation is understood carnal knowledge, as well without force, as with it; and this is high-treason in both parties, if both be consenting.

3. The third species of treason is, "if a man do levy war against our lord the king in his realm." And this may be done by taking arms, not only to dethrone the king, but under pretence to reform religion, or the laws; or to remove evil counsellors, or their grievances, whether real or pretended; and by intimidation and violence to force the repeal of law.

4. "If a man be adherent to the king's enemies in his realm, giving to them aid and comfort in the realm, or elsewhere," he is also declared guilty of high-treason. This must likewise be proved by some overt act, as by giving them intelligence, by sending them provisions, by selling them arms, by treacherously surrendering a fortress, or the like.

5. "If a man counterfeits the king's great or privy-seal," this is also high-treason.

6. The sixth species of treason under this statute is, "if a man counterfeits the king's money; and if a man bring false money into the realm counterfeit to the money of England, knowing the money to be false, to merchandise and make payment withal." Counterfeiting the king's money is treason, whether the false money be uttered in payment, or not. Also if the king's own minters alter the standard or alloy established by law, it is treason. But gold and silver money only are held to be within this statute. With regard, likewise, to importing foreign counterfeit money, in order to utter it here; it is held that uttering it, without importing it, is not within the statute.

7. The last species of treason ascertained by this statute is, "if a man slay the chancellor, treasurer, or the king's judges of the one branch or the other, judges in eyre, or judges of assize, and all other judges assigned to hear and determine, being in their places doing their offices." This statute extends only to the actual killing of them, and not to a wounding, or bare attempt to kill them. The barons of the exchequer are not within the protection of this act; but the lord keeper or commissary of the great seal now seem to be within it, by virtue of the statute 5 Eliz. c. 18. and 1 W. & M. c. 21.

The new treasons created since the statute 1 M. c. 1. and not comprehended under the description of statute 25 Edw. III. may be comprised under three heads. The first species relates to Papists; the second, to falsifying the coin (see <i>British Coins</i>) or other royal signatures; as falsely forging the sign manual, privy signet or privy seal, which shall be deemed high-treason. (1 M. fl. ii. c. 6.) The third new species of high-treason, is such as was created for the security of the Protestant succession in the house of Hanover. For this purpose, after the Act of Settlement was made, it was enacted by statute 13 & 14 Will. III. c. 3. that the pretended prince of Wales, assuming the title of king James III., should be attainted of high-treason; and it was made high-treason for any of the king's subjects to hold correspondence with him or any person employed by him, or to remit money for his use. And by 17 Geo. II. c. 39. it is enacted, that if any of the sons of the Pretender shall land or attempt to land in this kingdom, or be found in the kingdom or any of its dominions, he shall be adjudged attainted of high-treason; and corresponding with them or remitting money to their use, is made high-treason. By 1 Ann. fl. ii. c. 17. the offence of hindering the next in succession from succeeding to the crown is high-treason; and by 6 Ann. c. 7. if any person shall maliciously, advisedly, and directly, by writing or printing, maintain, that any other person hath any right to the crown of this realm, otherwise than according to the Act of Settlement, or that the kings of this realm, with the authority of parliament, are not able to make laws to bind the crown and its defect; such person shall be guilty of high-treason.

The punishment of high-treason in general is very solemn and terrible. 1. That the offender be drawn to the gallows, and not be carried or walk; though usually (by custom, at length ripened by humanity into law) a pledge or hurdle is allowed, to preserve the offender from the extreme torment of being dragged on the ground or pavement. 2. That he be hanged by the neck, and then cut down alive. 3. That his entrails be taken out, and burned, while he is yet alive. 4. That his head be cut off. 5. That his body be divided into four parts. 6. That his head and quarters be at the king's disposal.

The king may, and often doth, discharge all the punishment, except beheading, especially where any of noble blood are attainted. For beheading being part of the judgment, that may be executed, though all the rest be omitted by the king's command. But where beheading is no part of the judgment, as in murder or other felonies, it hath been said that the king cannot change the judgment, although at the request of the party, from one species of death to another. See Execution.

In the case of coinage, the punishment is milder for male offenders; being only to be drawn, and hanged by the neck till dead. But in treasons of every kind, the punishment of women is the same, and different from that of men: for, as the decency due to the sex forbids the exposing and publicly mangling of their bodies, their sentence is to be drawn to the gallows, and there to be burned alive.

The consequences of the judgment pronounced upon a traitor are attaint, forfeiture, and corruption of blood. See Attainder, &c.

The maxim, that, *in majori prolationis, omnes sunt principales,* there are no accessories in high-treason, all are accounted principals.

Also, that *voluntas non reputabitur pro faato, nisi in camus prolationis,* the will is never taken for the deed in any case, but in that of high-treason. See Indictment.

Treason, Petit or Petit, according to the fl. 25 Edw. III. c. 2. may happen three ways: by a servant killing his master, a wife her husband, or an ecclesiastical perdon (either secular or regular) his superior, to whom he owes faith and obedience. A servant, who kills his master whom he has left, upon a grudge conceived against him during his service, is guilty of petit treason: so if a wife be divorced *a mensa et thoro,* still *vindicat matrimonii subfibs,* and if the king fuch divorced husband, she is a traitor: and if a clergyman is underfoot to owe canonical obedience to the bishop who ordained him, to him in whose diocese he is beneficed, and also to the metropolitan of such suffragan or diocefan bishop; and therefore to kill any of these is petit treason.

A perdon indicted of petit treason may be acquitted thereof, and found guilty of manslaughter or murder; and in such case, it

Treasure, Appeal of High. It was anciently permitted, that any subject might appeal another subject of high-treafon, either in the courts of common law, or in parliament, or (for treafons committed beyond the seas) in the court of the high-treafurer, the two grand-treafurers, and the magistrates. The cognizance of appeals in the latter still continues in force; and to late as 1651, there was a trial by battle awarded in the court of chivalry, on such an appeal of treafon; but that in the first was virtually abolished by the first flat. 5 Edw. III. c. 9, and 25 Edw. III. c. 24, and in the second expressly by flat. 1 Hen. IV. c. 14. So that the only appeals now in force, for things done within the realm, are appeals of felony and mayhem. Blackliff. Comm. vol. iv.

Treasure, Confriptive, an offence raised, by forced and arbitrary conftuction, into the crime and punishment of treafon, which never was confecrated to be fuch: a multitude of thefe existed before the inconvenience was remedied by 25 Edw. III. c. 2. Confriptive treafons were also numerous in the reign of Richard II. and afterwards in the reign of Henry IV. and queen Mary, and particularly in the bloody reign of Henry VIII., all which were abrogated by the flat. 1 Mary, c. 1, which once more reduced all treafons to the flandard of the flat. 25 Edw. III.

Treasure, Misprifon of. See Misprifion.

TREASURE, Thesaurus, Sexagesim, a flore, or flock of money, in reserve.

Treasure-crowe, q. d. treafure found, thefaurus inventus, in lavo, is when money, gold, fiver, plate, or buckoon, is found in the ground, in any place, and none knows to whom it belongs.

This should naturally fall to the finder, to whom it formerly belonged, as was the rule of the civil law: but particular nations have made particular provisions for it. The Jews give it to the proprie:tor of the place where it was found: the Roman jurisprudence was various with regard to it; sometimes it was given to the master of the grounds, sometimes to the finder, and sometimes it was adjudged to the public treasury and marhal.

In England, and also in Germany, France, Spain, and Denmark, the general ufage is, to have such treafure confecrated to the king, unless where the benefit of it is expressly granted or made over by the king to some other, as the lord of the manor: and that the prince shall be intitled to this hidden treafure, is now become, according to Grotius, jus commune & genius. If, indeed, he hid it he known, or afterwards found out, the owner, and not the king, is intitled to it. Also, if it be found in the sea, or upon the earth, it doth not belong to the king, but the finder, if no owner appears. So that it feems it is the hiding, not the abandon-

In some places in France it is divided into three parts, one for the king, one for the proprietor of the land, and one for the finder.

Briton fays, it is every fubjeet's part, as soon as he hath found any treafure in the earth, to make it known to the lord of the county, &c.

The punishment for hidding treafure found in England, was formerly no les than death; but now it is only imprisonement and fine: but if any mine of metal be found in any ground, it always appertain to the lord of the foil, except it be a mine of gold or siver, which ancietly always belonged to the king, in whose ground it was found; but, by an act of parliament, the king hath now only the pre-emption.

TREASURER, an officer to whom the treafure of the prince, or corporation, is committed to be kept, and duly disposed of, in payment of officers, and other expences. See TREASURY.

Of these there is a great variety. His majesty of Great Britain, in quality of elector of Brunfwick, was formerly arch-treafurer of the Roman empire. In the fates of Poland are two grand-treafurers; that of the kingdom of Poland, and that of the duchy of Lithuanua.

In England, the principal officers under this denomination are, the lord high-treafurer, the treafurer of the household, treafurer of the navy, of the king's chamber, &c. Anciently, we had likewise a treafurer of the exchequer, treafurer of war, &c. In the Romish countries, the title of treafurer is also given, somewhat abusively, to an ecclesiastic, who has the keeping of the relics, and of the charters and archives of a church or monaftery. This dignity succeeds, in forme measure, to that of the ancient deacons, who had the like charge in the primitive church.

TREASURER of England, Lord High, is the principal officer of the crown; under whose charge and government is all the king's revenue kept in the exchequer.

He receives the office by delivery of a white staff to him from the king, and holds it during the king's pleasure: anciently he received it by delivery of the golden keys of the treafury.

He has the cheque of all the officers any way employed in collecting imposts, customs, tributes, or other revenues of the crown. He has the gift of all the customers, comptrollers, and searchers' places, in all the ports of London; and the nomination of the efcheatours in every county.

He alone (or others in commiffion with him) lets leaves of all the crown-lands, gives warrants to certain perfons of quality to have their wine custom-free, &c.

Killing the lord-treafurer in the execution of his office, is high-treafon.

The office of lord-treafurer is now in commiffion.

The number of lords-commiffioners is five.

TREASURER of England, Under. See Under-Treafurer. TRESERER of the Household, is an officer who, in the absence of the lord-treafurer, has power, with the comptroller and other officers of the Green-cloth, and the steward of the Marshallens, to hear and determine treafures, felonies, and other crimes committed within the king's palace. See HOUSEHOLD.

There is also a treafurer belonging to the eftabli{hment of her majesty's household, &c.

TREASURER of the Navy, is an officer who receives money out of the exchequer, by warrant from the lord high-treafurer, or the lords-commiffioners executing that place; and pays all charges of the navy, by warrant from the principal officers of the navy. See NAVY.
TREASURER of the County, he that keeps the county flock.

There are two of them in each county, chosen by the major part of the juries of the peace, &c. at their general quarter-seccion; under previous security given for the money entrusted with them, and the faithful execution of the trusts reposest in them.

The juries may continue or remove these treasurers at pleasure, and allow each of them a salary of 20l. a year.

The county flock, of which this officer hath the keeping, is raised by rating every parri. yearly; and is dispofed of to charitable uses, for the relief of maimed soldiers and mariners, prisoners in the county-gaols, paying the salaries of governors of houses of correction, and relieving poor almshouses, &c. And the duty of these treasurers, with that of raising the flock, and how it shall be dispofed of, is set forth particularly in the statutes of 43 Eliz. cap. 2. 

TREASURER, in Cathedral Churches, an officer whose business was to take charge of the vestments, plate, jewels, reliques, and other treasures belonging to the said churches. At the time of the Reformation, the office was extinguisht, but needes in most cathedral churches; but it is still remaining in those of Salisbury, London, &c.

TREASURY, the place in which the revenues of a prince are receiv'd, preferv'd, and disbursed.

In England, the treasury is a part of the exchequer; by some called the lower exchequer.

The officers of his majesty's treasury, or the lower exchequer, are the lords-commisioners, one of whom is chancellor, two joint secretaries, private secretary to the first lord, two chamberlains, an auditor, four tellers, a clerk of the files, rulers of the receipt, a tally-cutter, &c. See each officer under his proper article, CHANCELLOR, TELLER, TALLY, &c.

At Rome, under the emperors, there were two kinds of treasuries, the one called ararium, wherein the monies deended to support the charges of the government were kept; and the other fiscus, wherein were preferv'd those intended for the particular intollance of the emperor and his court. In effect, the ararium belonged to the people, and the fiscus to the prince. See ARA R A R I U M and F I S C U S.

We have still a resemblance of this difference among us; but it is confounded in France, &c. where the king dispofes absolutely of the public treasurers, &c.

The Athenian treasury was sacred to Jupiter Σωτήρ, or the Saviour, and to Plutus the god of riches. Besides the public monies, there were always a thousand talents kept in it, which it was capital to touch, unleas on the most pressing occasions. See ΟΙΣΙΟΝΟΙΟΣ.

The funds among the Athenians, which supplied their treasury, were four; viz. the telar, τελαρ; the phoris, φόροι; the eisphora, έισφορά; and the timenata, τιμενατά.

The public treasury was divided into three parts, according to the use it was applied to: as, 1. The χρήσια της δεκατείας, or that expended in civil uses. 2. The χρήσια της γειτονίας, or money design'd to defray the charges of war. 3. The ιταλισμοι, or money intended for pious uses, in which they included the expences at plays, public shows, and festivals, &c. Potter Archizol. Græc. tom. i. p. 82.

To each of these branches of the public revenue there was a treasurer appointed, as χρησια της δεκατείας, των γειτονίας, and των ιταλισμων, and so των ιταλισμων.

TREASURY, LORDS OF. In lieu of one single director and administrator of his majesty's revenues, under the title of lord high-treasury, it is frequently thought proper to put that office in commissiion, i.e. to appoint several persons to discharge it, with equal authority, under the title of lords-commissioners of the treasury. See Lord-high-Treasurer.

TREASURY ISLANDS, in Geography, a cluster of islands among Solomon's islands. S. lat. 6° 38' to 7° 30'. E. long. 155° 34' to 156°.

TREAT, in our old Law-Books, signifies as much as taken out, or withdrawn. Thus a jury was challenged, because he could not dispend 40s. and therefore was treated by the flate, or discharged.

TREATISE, Tractus, a fet discourse in writing; on any subject.

A treatise is supposed more express, formal, and methodical, than an essay; but less so than a system.

TREATY, Lat. Fédus, a covenant between several nations; or the several articles or conditions stipulated and agreed upon between sovereign powers.

Sovereigns treat with each other by their proxies, who are invested with sufficient power, and who are commonly called plenipotentiaries. The rights of the proxy are expressed in the instructions that are given him; but every thing he promises within the terms of his commissiion, and the extent of his powers, bind his confiant. At present, in order to avoid all danger and difficulty, princes refer to themselves the ratification of what has been concluded upon in their name by their minimiers. A treaty is valid, if there be no fault in the manner in which it was concluded; and for this purpose nothing more can be required than a sufficient power in the contracting parties, and their mutual confiant, sufficiently decla red.

If, however, a treaty has been honestly concluded by a sovereign without his perceiving any iniquity in it, and turns at length to the detriment of an ally, nothing can be more amiable, more laudable, more conformable to the reciprocal duties of nations, than to yield as much as possible, without being wanting to himself, without putting himself in danger, or without suffering a considerable los. Since every treaty ought to be made with a sufficient power, a treaty pernicious to the flate is null, and not at all obligatory; no conductor of the nation having the power to enter into engagements to do such things as are capable of destroying the flate, for the safety of which the empire is entrusted to him. Moreover, a treaty made for an unjuft and dionenl intention is absolutely null; nobody having a right to engage to do things contrary to the law of nature. Nations and their conductors ought to keep their promises and their treaties inviolable. This great truth, though too often neglected in practice, is generally acknowledged by all nations: the reproof of perfidy is esteemed by sovereigns a most atrocious injury; and he who does not obeye a treaty is certainly perfidious, since he violates his faith. On the contrary, nothing adds so great a glory to a prince, and the nation he governs, as the reputation of an inviolable fidelity to his promise. To violate a treaty, is to violate the perfect right of him with whom we have contrafted, and this is to do him an injury. No subsequent treaty can be made contrary to those that actually subsist. Nothing hinders a sovereign from entering into engagements of the same nature with two or more nations, if he is at the same time able to fulfill them with respect to all his allies. But in cases of competition or difference, the most ancient ally ought to be preferred; and besides, the justice of the caufe is another reaon of preference between two allies; nor ought we to affilt him whose caufe is unjuft, whether he be at war with one of our allies, or with another flate.

Grotius (De Jurc Belli et Prin. l. ii. c. 15. § 5.) divides treaties into two general classes: viz. 1. Those which turn merely
merely on things to which we were already bound by the law of nature; and 2. Tho' by which we engage something more. Of the first clafs are all the simple treaties of peace and friendship, when the engagements contracted in them add nothing to what men owe each other as brethren, and as members of the human society; as tho' that permit commerce, passage, &c. Treaties of the second clafs, in which sovereigns engage to do which they are not obliged to perform by the law of nature, are either equal or unequal. Equal treaties are those in which the contracting parties promise the same things, or things that are equivalent, or, in short, that are equitably proportioned, so that their condition is equal; such, e.g., is a defensive alliance, in which they reciprocally stipulate for the same succours: such is an offensive alliance, in which it is agreed that each of the allies shall furnish the same number of vessels, the same number of troops, of cavalry and infantry, or an equivalent in vessels, in troops, in artillery, or in money. Such is also a league, in which the contingent of each of the allies is regulated in proportion to the interest he takes or may have in the design of the league. Equal treaties may be subdivided into as many kinds as the sovereigns have different transactions between them. Thus they treat of the conditions of commerce, of their mutual defence, of associations in war, of the passage they shall reciprocally grant to each other, or refuse to the enemies of their ally, &c.

Nations ought as much as possible to preserve equality in their treaties. Equal treaties are distinguished from equal alliances. The former are those where equality is kept in promises; and the latter are those where equal treaties with equal, forming no difference in the contracting parties, or, at least, admitting no superiority too plainly pointed out; but only some pre-eminence of honours and rank. Unequal treaties are those in which the allies do not promise the same things; and the alliance is unequal when it makes a difference in the dignity of the contracting parties. Tho' unequal treaties that are at the same time unequal alliances, are divided into two kinds; the first, where the inequality is found on the side of the most considerable power, and the second comprehending treaties where the inequality is on the side of the inferior power. Unequal alliances are subdivided into two kinds, such as degrade the sovereignty, and such as do not.

By another general division of treaties or alliances, they are distinguished into personal and real; the former are those that relate to the person of the contracting parties, and are restrained and in a manner attached to them. Real alliances relate only to the things of which they treat, without any dependence on the person of the contracting parties. The personal alliance expires with him who contracted it; but the real alliance is affixed to the body of the state, and subsists as long as the state, if the time of its duration is not limited. The alliance terminates as soon as the term of it is expired; but a treaty made for a time may be renewed by the common consent of the allies, and the renewal is manifested either expressly or tacitly.

Treaties between nations are facred; and he who violates his treaties, violates at the same time the law of nations; for he deprives the faith of treaties, that faith which the law of nations declares facred, and he does all in his power to render it vain. But unhappy experience having too fully convinced mankind, that the faith of treaties is not always a sufficient warrant for their being observed, securities have been sought for against perjury; and hence is derived the origin of a guarantee, and hostages, which fee. The interpretation of treaties is subject to certain rules or maxims, of which writers on this subject have enumerated the following. It is not allowable to interpret what has no need of interpretation: if he who can and ought to explain himself has not done it, it is to his own damage: neither of the contracting parties has a right to interpret the treaty at his pleasure: what a person has sufficiently declared, ought to be taken for true against him: the interpretation ought to be made according to certain rules previously understood and allowed. For these and other particulars, we refer to Vattel's Law of Nations, b. ii.

For the solemn manner in which the Romans used to conclude treaties, see Livy, lib. i. cap. 24. The ceremonies observed by the Greeks in making treaties may be seen in Potter, Archaeol. Græc. lib. ii. cap. 6, tom. i. p. 252, seq.

In general, it appears that the ancients were very religious, grave and solemn in making treaties; which were always confirmed by sacrifices and mutual oaths, with horrid imprecaions on the party that should break the terms of agreement.

There are treaties of war, of peace, of marriage, of confederacy, of neutrality, of capitulation, and of commerce and navigation.

Treaties relating to war are of several kinds. Some of these are connected with alliances, defensive and offensive. In judging of the morality of the several treaties or alliances, or of the lawfulness of them, according to the law of nations, the following is an incontestable principle: It is lawful and commendable to succour and afford, in any way, a nation making a just war; and this assistance is the duty of every nation, which can give it without being wanting to itself. But he who makes an unjust war is not to be afflicted in any manner. Other treaties relating to war include those of neutrality. Sometimes necessity renders a treaty of this fort justifiable; at other times this kind of treaty is the best method of securing peace, and preventing altercation. Some treaties relate to the passage of troops through a neutral country; and others to the search of neutral ships, &c. When the powers at war have agreed to lay down their arms, the agreement or contract in which they stipulate the conditions of peace, with the manner in which it is to be restored and supported, is called the "treaty of peace." The effect of this treaty is to put an end to the war, and to abolish the subject of it. It leaves the contracting parties without any rights of committing hostility, either for the very subject which kindled the war, or for what has passed in the course of it: it is therefore no longer permitted to take up arms. Accordingly, in these treaties, the parties reciprocally obliged themselves to a perpetual peace, which is not to be understood as if the contracting parties promised never to make war on each other for any cause whatever. Peace relates to the war which it terminates; and as it forbids the revival of the same war by taking arms for the cause which at first kindled it, is in reality perpetual. As it is the end of peace to extinguish all subjects of discord, amity, or a perfect oblivion of what is past, should be the leading article of the treaty; and though the treaty should be silent on this head, it is necessarily understood. This treaty binds the contracting parties from the moment of its conclusion, as soon as it has passed through all its forms. From this time all hostilities cease, unless a day is specified when the peace shall take place; but this treaty becomes obligatory on subjects only from the time of its being notified to them. When no term is assigned for the accomplishment of the treaty, and the execution of the several articles, common sense dictates that every point should be executed as soon as possible. The faith of treaties equally excludes from the execution of them all neglect, all dilatoriness, and deliberate delays. A treaty of peace is a public
treaty, obligatory upon the whole nation; it is also a real
treaty, obliging successors as well as the prince who signed it,
since it obliges the state itself.

Treaties of commerce are the compacts or agreements by
which different states secure to themselves and to one another
something constant in their mutual trading intercourse; and
they are usually followed by various tariffs, to adjust the
duties of exportation and importation of merchandise into
the respective dominions of the contracting powers.

A nation having a full right to regulate itself in com-
mercial affairs by what is useful or advantageous, it may
make such commercial treaties as it shall think proper; and
no other has a right to take offence, provided these treaties
do not affect the perfect rights of another. Every such
treaty is allowable among nations, and the execution of it
ought not to be opposed; but that alone is in itself just and
commendable, which, as far as is possible and reasonable in
the particular case, is transacted with a tendereness for the
general interest. Nations may accordingly, in their treaties,
infest such clauses and conditions as they think proper; and
they are at liberty to make them perpetual or temporary,
or dependent on certain events. But when once a nation
has entered into engagements by treaty, it is no longer at
liberty to do, in favour of others, contrary to the tenor of
the treaty, what it might otherwise have granted to them,
agreeably to the duties of humanity, or the general obliga-
tion of reciprocal commerce; being to do for others no
more than what is in its power. Having deprived itself of
the liberty of disposing of a thing, that thing is no longer
in its power. Therefore, when a nation has engaged to
another that it will sell only to them certain goods or pro-
visions, as, e. g. corn; it can no longer carry them for
sale to another market. The cafe is the same in a contract
to purchase certain goods only of that nation. The natural
liberty of trade is not hurt by treaties of this nature; for
this liberty confines only in every nation being unmolested
in the right of trading with those with whom it is disposed to
trade with it; every one remaining free to clothe with or decline a
particular commodity, as it shall judge most advantageous.

The celebrated treaties are those of Ninegum, of Mun-
fier, of the Pyrenees, of Weftphalia, of Rywick, of
Utrecht, of Hanover, Vienna, &c.

The great treaty of peace, commerce, navigation, &c.
between England and France, was signed at Utrecht, the
1st of April, 1713, and consists of 39 articles.

For other treaties, see the general titles.

It is the king's prerogative to make treaties, leagues, and
alliances, with foreign princes and states; and yet, left this
plentitude of authority should be abused to the detriment of the
public, the constitution has interposed a check, by the
means of parliamentary impeachments, for the punishment of
such ministers as, from criminal motives, advise or con-
sider any treaty, which shall afterwards be judged to derogate
from the honour and interest of the nation.

TREATY, Guarantee of. See GUARANTY.
TREBIA, or TREBE Augula, in Ancient Geography, a
town of Italy, in the interior of Latium. Ptol.
TREBA, in Geography, a town of Saxony, in Thuringia;
2 miles S.W. of Salza.
TREBAU, or Mahrisch Trebau, a town of Moravia,
in the circle of Olmütz; 10 miles W. of Müghitz.
TREBBIN, a town of the Middle Mark of Branden-
burg; 20 miles S.S.W. of Berlin. N. lat. 52° 10'. E.
long. 13° 6'.
TREBBIO ANTICO, a town of the Podedom, in the
duchy of Urbino; 17 miles E.N.E. of Urbino.

TREBEJO, a town of Spain, in the province of Leon;
46 miles S. of Ciudad Rodrigo.
TREBELLIANICA, or TREBELLIAN Fourth, in the
Roman Jurisprudence, a right belonging to an heir inluted-
ated by testament. If the testator, after appointing a full and
general heir, spent and disposed of all his effects in legacies;
or if he went ultra deductam, beyond three-fourths thereof;
in that case, the heir was allowed to retrench and detain one
fourth part of the legacies to his own use. This was called the
trebellianica.

In like manner, if the testator charges his heir with a
footment of fruit, and to restore the inheritance to another;
in that case, the heir might likewise retain a fourth of the
whole succession, that the quality of heir might not be ren-
dered wholly vain and fruitless.
TREBELLUS-POLLIO, in Biography, a Latin his-
torian, flourished about the year 298 of the vulgar era.
According to Vopiscus, he wrote the lives of the Roman
emperors from the two Philip's to Claudius; but we have
extant only the latter part of the reign of the elder Valerian,
that of his son, the lives of the two Gallicini, those of the
thirty tyrants, and that of Claudius. He is reckoned one
of the "Historie Augurale Scriptores," and praised by
Vopiscus for his exactness, which applies only to some
dates, as in other points he is very incorrect. His style
is somewhat superior to that of the other historians.
Vollius.
TREBENDA, in Ancient Geography, a town of Asia
Minor, in the interior of Lycia. Ptol.
TREBENITZ, in Geography, a town of Bohemia, in
the circle of Leitmeritz; 70 miles S.W. of Leitmeritz.
N. lat. 50° 27'. E. long. 14° 5'.
TREINESSCHIKOV, a fortress of Russia, in the
government of Caucasus, on the Ural; 64 miles N. of
Guriev.
TREBERK, a town of Germany, in the duchy of
Anhalt-Cothen; 4 miles N. of Cothen.
TREBES, a town of France, in the department of the
Aude; 6 miles E. of Carcassonne.

TREBIA, in Ancient Geography, a river which ran from
south to north, commencing in Liguria, south of the valley
inhabited by the Frimites, and passing into Gallia Cip-
dana, across the territory of the Anamani, watered the
town of Placentia, and discharged itself into the Padus.
The Trebia was famous for the victory obtained by Han-
ibal, near its mouth, over the preeminent and imprudent
Sempronius, in the year of Rome 435; on which occasion
the Romans lost 26,000 men.

TREBIA, in Geography, a river of Italy, which runs into
the Po, 2 miles W. of Piacenza.
TREBIGNO, a town of European Turkey, in Dal-
matia; the site of a bishop; 60 miles S. of Mollar.

TREBINA, a town of Naples, in Basilicata; 5 miles
S.S.W. of Turfi.
TREBIASACCIA, a town of Naples, in the province
of Calabria Cúra, on the coast; 10 miles N.E. of Cúßano.
TREBISOND, or TARABOS, a city of Asiatic
Turkey, with a harbour, on the Black Sea, in the country
of the Colchians: founded by a Greek colony of Sinope,
descended from the Miletians. It derives its historical fame
more from the circumstance of its hospitable reception of the
10,000 Greeks after their celebrated retreat, than for
having been the capital of that portion of the Lower empire.
From the Romans it was taken by the Scythians, or Tur-
tars, in the time of Valerian. The Greek emperors became
afterwards masters of Trebizon, and erected it into a prin-
cipality; Alexis Comnenes took possession of it in the year
1204. When the French and Venetians made themselves
masters
matters of Constantinople, this principality, or, as it is sometimes called, empire, continued till the year 1462, when it was taken by Mahomet II, who carried David Comnenes and all his family prisoners to Constantinople, where they were moitly put to death. The town of Trebifond is built on the seu-flide, at the foot of a little hill, pretty steep; its walls are almost square, high embattled, and, though they are not of the firft ages, yet it is very probable they fland upon the foundations of the ancient inftifiite, which got this town the name of "Trapeziunm," or "Trapezus." The pretent walls are built of the ruins of the ancient edifices, as appears by old pieces of marble let in several parts, and whose infcriptions are not legible, because they are too high. The town is large, and not well peopled; there are more woods and gardens in it than houses; and those houses that are there, though well built, are but one story high. The castle, which is pretty large, but very much neglected, is situated upon a flat rock, and its ditches are cut in the rock. The infcription that is on the gate of this castle, the arch whereof is a semi-circle, shows that the emperor Justinian repaired the edifices of the town. The port of Trebifond, called "Platanus," is to the eaf of the town. The emperor Adrian caufed it to be repaired, as we are informed by Arrian. This port is now proper for nothing but faques. The mole which the Genoese are said to have built there is almost destroyed, and the Turks give themselves very little trouble about repairing such works; 150 miles N.E. of Sivas. N. lat. 41° 15', E. long. 37° 40'.

TREBITSCH, or TREBITZ, a town of Moravia, in the circle of Iglau, on the Iglawa, with considerable manufactures of cloth, iron, glafs, &c.; 20 miles S.E. of Iglau. N. lat. 40° 14', E. long. 15° 50'.

TREBITZ, a town of Saxony; 3 miles N.N.W. of Schmiedeberg.

TREBIUS, in Ichthyology, a name given by Joannes Cuba, and some other writers, to the fish called Plexis by Aristotle, Ælian, and Pliny.

TREBLE, in Music, the highest or acutetl of the four parts in symphony, or that which is heard the clearest and shrillest in a concert.

In the like fense we say, a treble violon, treble hautboy, &c. In vocal music, the treble is usually committed to boys and girls. Their part is the treble.

The treble is divided into first or highest treble, and second or base treble. The half treble is the fame with the counter-tenor.

TREBLIZ, in Geography, a town of Bohemia, in the circle of Leitmeritz; 10 miles S.W. of Leitmeritz.

TREBZITZ, a town of Silefia, in the principality of Olens; 12 miles N. of Breslaw. N. lat. 51° 18', E. long. 17° 2'.

TREBNIZ, a town of Bohemia, in the circle of Leitmeritz; 6 miles S.W. of Leitmeritz.

TREBOWE. See TRIAU.

TREBSCHEN, a town of Brandenburg, in the New Mark; 6 miles S.E. of Zulichan.

TREBSEN, a town of Saxony, in the circle of Leipzic, on the Mulda; 26 miles W. of Meißen. N. lat. 51° 10', E. long. 13° 40'.

TREBUCHET, TREBUCHET, or Trebucbctum, a tumbler, ducking, or cucking-fool. See CUCKING-STOOL and SCOLPS.

The trebuchet, in Artillery, a machine for throwing flones, for which purpose a fling was sometimes fixed to it: it acted by means of a great weight fallened to the short arm of a lever, which being let fall, raised the end of the long arm with a great velocity.

TREBULATA MUTUSCA, in Ancient Geography, a town placed by Strabo and Pliny among the Sabines, the existence of which is testified by many infcriptions. Virgil recognizes it for its olives, which perhaps might have occasioned its being called "Oliveto."

TREBULATA SUFFENATA, a town of Italy, in the Sabine territory. It is suppos'd to have been situated in the valley of Turano, probably at the place called Rocca Simbaldia.

TREBURG, in Geography, a town of Erfte-Darmstadt; 10 miles W. of Darmstadt.

TREBUXENA, a town of Spain, in the kingdom of Seville; 12 miles from Xeres de la Frontera.

TRECASE, a town of Naples, in the province of Otranto; 5 miles E.N.E. of Alelano.

TRECASSOS, or TRICAS, in Ancient Geography, a people of Celtic or Lyonefse Gaul, according to Pliny and Ptolomey; subject, in the time of Cæsar, to the city of Sens (civitas Senonum), which was very powerful.

TRECATE, in Geography, a town of Italy, in the department of the Olona; 3 miles E. of Novara.

TRECCHINA, a town of Naples, in Baflica; 36 miles S. of Potenza.

TRECENTA, a town of Italy, in the department of the Mincio; 25 miles E.S.E. of Mantua.—Also, a town of Italy, in the department of the Lower Po; 12 miles N.W. of Ferrara.

TRECHEIPNA, TECHEIPNA, or TECHEIPNA, a town of Italy, in the department of the Mincio; 25 miles E.S.E. of Mantua. N. lat. 48° 11', E. long. 13° 22'.

TRECHEADIPNA, TECHEADIPNA, or TECHEADIPNA, a town of Italy, in the department of the Mincio; 25 miles E.S.E. of Mantua. N. lat. 48° 11', E. long. 13° 22'.

TRECHEINIA, in Geometry, a town of Bohemia, in the circle of Leitmeritz; 6 miles S.W. of Leitmeritz.

TRECHIS. See TRACHIS.

TRECHON, one of the many names by which the classical writers have called quicksilver.

TRECHTIC, in Geography, a township of New Hampshire; 65 miles N.W. of Portland.

TREDDLE, or TREADEL, CHALAZA, in Natural History, a part of an egg. See CHALAZA.

TREDAGILE. See ASPECT.

TRE, Armor, the firt and largest of the vegetable kind, confiding of a single trunk, out of which spring forth branches and leaves.

Mr. Ray distinguishes the trees and thrubs of our native growth of England into, 1. Such as have their fower disjoined and remote from the fruit: which are,

1. The nufciferous trees, or fuch as bear nuts: as the walnut-tree, the hazle-nut-tree, the beechn, the chestnut, and the common oak.

2. Coniferous trees, or fuch as bear a fquamous or fcaly fruit, of a conical figure, and a woody or hard fubfance, in which are many seeds, which, when they are ripe, the cone opens or gaps in all its feveral cells or parifions, and lets drop out: of this kind are the Scotch fir, male and female; the pine, which, in our gardens, is called the Scotch fir; the common alder-tree, and the birch-tree.

These trees are alfo called reiniferous, by reafon that coniferous trees are generally covered with a bark that abounds in resin.

3. Bacciferous
3. **Bacciferous** trees, are such as bear berries, as the juniper and yew-tree.

4. **Langetous** trees, or such as bear a woolly, downy substance; as the black, white, and trembling poplar, willows and osiers of all kinds.

5. Trees which bear their seeds (having an imperfect flower) in leafy membranes and cases; as the hornbeam, or hard-beam, called, in some places, the horn-beech.

II. Such as bear their fruits and flowers contiguous; which are either with the flower placed on the top of the fruit, or adhering to the base or bottom of the fruit. Of the former kind, some are pinnatifol, as apples and pears; and some bacciferous, as the forb, or service-tree, the white-thorn, or hawthorn, the wild rose, sweet-briar, currants, the great bilberry-bush, honey-suckle, ivy, &c.

The latter kinds are either such as have their fruit moist and soft when ripe: as, 1. **Pinnatifol** ones, whose fruit is pretty large and soft, with a stone in the middle; as the black-thorn, or sloe-tree, the black and white bullace-tree, the common wild cherry, the black cherry, &c.

2. **Bacciferous**, trees as the strawberry-tree common in the west of Ireland, mifletoe, waterelder, the dwarf or spurge-laurel, the viburnum, or wayfaring-tree, the dogberry-tree, the sea black-thorn, the berry-bearing elder, the privet, barberry, common elder, the holly, the buck-thorn, the berry-bearing heath, the bramble, and the spindle-tree or prickwood.

Or such as have their fruit dry when ripe: as the bladder-nut-tree, the box-tree, the common elm and ash, the maple, the gaule, or sweet willow, common heath-broom, dyer’s-weed, furze or gorse, and the lime-tree.

**Trees in full Air.** or Standards, are such as naturally rise a great height, and are not topped. See Standards, Standard-Trees, and Timber.

Trees, **Dwarf** are such as are kept low, and never suffered to have above half a foot of stem. These are used to be kept vacant, or hollow in the middle, that the branches, spreading round about the sides, may form a kind of round bowl, or bush. See Dwarf-Trees.

**Trees, Forst.** See Forest-Trees and Planting.

**Trees, Wall.** are those whose branches are stretched out, and nailed against walls.

For dwarf and wall-trees, such as to be chosen out of the nursery for transplantation as are straight, and consist of a single stem, and a single graft, rather than two or three grafts in several branches: their thickness at bottom, when removed, should be two or three inches.

**Trees, Fruit.** are such as bear fruit. See Fruit-Trees.

**Trees, Timber.** are those whose trunks are tall and straight, of which beams, masts, &c. are used to be made.

Trees that are nine inches girt about a yard from the ground, are commonly reckoned timber-trees, but none under this size. See Timber and Planting.

The growth of trees is a curious and interesting subject; but few experiments have been made in order satisfactorily to ascertain the annual accensions that are made to the bulk of trees at different periods of their age. Mr. Barker has furnished a table exhibiting the increase of three kinds of trees, viz. the oak, ash, and elm, in the Phil. Trans. for 1788. He states the result as follows:

"I find (says he) the growth of oak and ash to be nearly the same. I have some of both sorts planted at the same time, and in the same hedges, of which the oaks are the largest; but there is no certain rule as to that. The common growth of an oak or an ash is about an inch in girth in a year; some thriving ones will grow an inch and a half; the unthriving ones not so much. Great trees grow more timber in a year than small ones; for if the annual growth be an inch, a coat of one-sixth of an inch is laid on all round, and the timber added to the body every year is its length multiplied into the thickness of the coat and into the girth, and therefore the thicker the tree is, the more timber is added."

We will present our readers with a table, shewing the growth of 17 kinds of trees for two years. The trees grow at Cavenham in Suffolk.

Heat is so essential to the growth of trees, that we see them grow larger and smaller in a fort of gradation as the climates in which they stand are more or less hot. The hottest countries yield, in general, the largest and tallest trees, and those also in much greater beauty and variety than the colder do; and even those plants which are common to both, arrive at a much greater bulk in the southern than in the northern climates; nay, there are some regions so bleak and chill, that they raise no vegetables at all to any considerable height. Greenland, Iceland, and the like places, afford no trees at all; and what shrubs grow in them are always little and low.

In the warmer climates, where trees grow to a moderate size, any accidental diminution of the common heat is found very greatly to impede vegetation; and even in England, the cold summers we sometimes have, give us an evident proof of this; for though the corn and low plants have succeeded well enough, and gooseberries, currants, raspberries, or other low shrubs, have brought forth fruit in sufficient plenty, yet the production of taller trees has been found very much hurt; and walnuts, apples, and pears, have been very scarce among us.

Heat, whatever be the producing cause, acts as well upon vegetation one way as another. Thus the heat of dung, and the artificial heat of coal-fires in flues, is found to supply the place of the sun.

Great numbers of the Indian trees, in their native soil, flower twice in a year, and some flower and bear ripe fruit all the year round; and it is observed of these last, that they are at once the most frequent and the most useful to the inhabitants; their fruits, which always hang on them in readiness, containing cool juices, which are good in fevers, and other of the common diseases of hot countries.

Plantations of useful trees might be made to very great advantage in many places in every country, and the country greatly
greatly enriched by it, while the public would be also benefited by it, since it would raise a continual supply of timber used in ship-building, and on other public as well as private occasions.

We have in many places heaths, and other barren and uncultivated lands, of very great extent; and how great an advantage would it be to the public to bring these to be truly valuable. Many, if not all of these heaths, would be found on trial capable of producing trees; and some of them are truly the remains of destroyed forests; and though the profit to be reaped from the planting of them would come late, yet the expense of doing it would be very trifling in comparison of that profit, and the means easy. See Timber and Plantation.

The authors who have given rules for planting, having employed themselves only about small spots of ground, the establishing of orchards or parks, are by no means to be supposed proper guides in attempts of this kind; and Monf. de Buffon, who had a great opinion of the knowledge of our Evelyn and Miller, who seem to speak of every thing from their own experience, found, when he let about large plantations, that their opinions and rules were erroneous; and was obliged to have recourse to experience only, which he varied a thousand ways; and though many of them proved unsuccessful, yet they all gave hints towards others, by which the attempt might afterwards be brought to succeed.

This frugal enquirer into the operations of nature in the growth of vegetables, having let apart a considerable quantity of land for the trial, and procured a number of young trees, first divided the whole quantity into a number of small squares, and having made a plan of it, examined the nature, depth, and other circumstances of the soil in each, and minuted the whole down on a proper part of the plan; that himself, or whoever succeeded him, might judge from the different growths of a number of trees planted in the same flat in these different soils, the different advantages and disadvantages of every circumstance in the depth and nature of the ground, in regard to the growth of useful trees. Different numbers of labourers were employed upon different spots of this ground, and the acorns for the young growth planted at different seasons: but the result in general was, that what should seem the best methods succeeded the worst; and those pieces where many labourers had been employed, and the acorns planted before winter, were much thinner of young oaks than those where the least labour had been bestowed upon the ground, and where the acorns had been planted in the spring; but those places which succeeded in the fowing, were those which had the acorns planted in holes made by a pick-axe, without any preceding cultive of the ground. And those where the acorns had only been laid upon the earth, under the grass, afforded a great number of vigorous young trees, though the greater part had been carried away by birds and other devouring animals. Those spots of ground where the acorns were let at six inches depth were much more nourished with young shoots, than those where they had been buried but at an inch deep; and in some places where they were buried at a foot deep not one shoot appeared, though in others, where they had been buried at nine inches, there were many.

Those acorns which had been steeped for eight or nine days in wine leaves, and in the water of the common levers, appeared out of the ground much earlier than those which were put in without this previous management.

But of the most successful of all the trials, was that of planting in the spring such acorns as had been found together in another place, and had time to shoot there; of these scarcely any one failed, and the plantation was perfectly flourishing, though the growth of these young shoots was not so quick or vigorous as those of the acorns which had remained when first sown; which was probably owing to the injury the tender radicles received in transplanting.

Thus succeeded the experiments by fowing, while of those made by planting young trees, such as had been brought out of woods and places under covert, succeeded much worse than those which had grown in more exposed places.

The young trees of the several parts of the plantation kept on their growth in the manner they had begun to shoot, those of the more labourous parts continuing more weak, and lower than those of the less labourous.

Thus were a number of necellary experiments carefully tried, and the refult of the whole was, that to make a plantation of oaks, on a soil of the common clayey or loamy kind, the most successful method is this: the acorns must be prefered during the winter in the earth in this manner: let there be made a bed of earth of six inches deep; on this place a layer of acorns, two inches deep; over these lay a bed of another half foot of earth, over that another layer of acorns, and so on successively, till as many are employed as there will be occasion for: the whole is then to be covered with a foot depth of earth to preserve all from the frost. In the beginning of March these beds are to be opened, and the acorns, which will by that time have shot out, and are then in reality fo many young oaks, are to be planted out a foot distance each, and the succese of a plantation of this kind need not be feared. This is a manner of planting that is done at a small expense, and even that might be in a great measure spared, were it not for the birds and other devouring animals; since, could the acorns be defended from these, they might be only laid on the surface of the ground under the grass in autumn, and they would infallibly shew themselves in so many young oaks the succeeding spring.

It is easy to continue the carrying of the acorns, when taken out of their winter's bed, to the place where they are to be planted, without doing them much injury; and the small stop the transplanting puts to their growth is in reality rather an advantage than an injury, since it only retards the young shoots for about three weeks, or less than that; and by that means secures them from the few cold mornings that may be expected about the time of their natural appearance. Mem. Acad. Scienc. Paris, 1759. See Timber.

An experiment to determine the comparative durability of different kinds of timber, when exposed to the weather, was made by a nobleman in Norfolk; of which an account is given by Sir Thomas Beevor. This nobleman, in the year 1741, ordered three polls, forming two sides of a quadrangle, to be fixed in the earth on a rising ground in his park. Into these polls were mortised planks, an inch and a half thick, cut out of trees from 30 to 45 years' growth. These, after standing ten years, were examined, and found in the following rate and condition:

The cedar was perfectly found; larch, the heart found, but the sap quite decayed; spruce fir, found; silver fir, in decay; Scotch fir, much decayed; pinaster, quite rotten; chestnut, perfectly found; akele, found; beech, found; walnut, in decay; fymare, much decayed; birch, quite rotten. Sir Thomas Beevor justly remarks, that the trees ought to have been of the same age; and Mr. Arthur Young adds, they ought to have been cut out of the same plantation.

The
The immense quantity of timber consumed of late years in ship-building and other purposes, has diminished in a very great degree the quantity produced in this country. On this account, many gentlemen who with their country, alarmed with the fear of a scarcity, have strongly recommended it to government to pay some attention to the cultivation and preservation of timber.

It appears, on the authority of Mr. Irving, inspector-general of imports and exports, that the shipping of England in 1760 amounted to 6167 in number, the tonnage being 433,912; and the shipping in Scotland amounted to 976 in number, the tonnage being 52,818. In 1788, the whole shipping of Britain and Ireland and their colonies amounted to 13,800, being 1,359,752 tons burden, and employing 107,025 men. The tonnage of the royal navy in the same year was 413,667. It also appears, from the report of the commissioners of the land revenue, that the quantity of oak-timber of English growth, delivered into the dock-yards from 1760 to 1788, was no less than 768,676 loads, and that the quantity used in the merchant's yards in the same time was 516,650 loads; in all 1,285,326 loads.

The foreign oak used in the fleet period was only 137,766 loads. So that after deducting the quantity remaining in the dock-yards in 1760 and 1788, and the foreign oak, there will remain about 1,054,284 loads of English oak, consumed in 28 years, which is at an average 37,653 loads per annum, besides from 8,300 to 10,000 loads expended annually by the East India Company within the same period.

Mr. Pitt, in the Bath Transactions, cited in the Encyclopedia Britannica, article Trees, says, that the aggregate of oaks felled in England and Wales for 30 years past, has amounted to 320,000 loads in a year; and as this statement seems to differ from that above given, under the authority of the commissioners of land revenue, we think it necessary to point out the reason of this difference. This we are enabled to do, by the liberal communication of the ingenious Samuel Purkis, esq. whose diligence of research and accuracy in making the necessary calculations, and fidelity in reporting the result of his inquiries, must be admitted by all who knew him without hesitation. He informs us, that the calculation was made by himself and a friend at the request of Mr. Pitt, then prime-minister, in order to ascertain whether there was a sufficient quantity of oak-timber in this country to supply the probable demand for many years.

The calculations were made from documents furnished by government, and upon principles which could not fail to afford an accurate result. This result was communicated by Mr. Purkis to Mr. South, a man of fortune and respectability in Hampshire, and was published by him in the Bath Transactions. The discrepancy above-mentioned is merely apparent, and not real. For the commissioners of the land revenue only stated the annual consumption in the royal navy, and by the East India Company; whereas Mr. Purkis's statement comprehended the annual consumption of the whole kingdom; nor had they the means which he possessed of making the latter estimate.

The building of a 20-gun ship, it is said, would take 40 acres of timber; and though this may seem to be an exaggerated estimate, it should be considered, that, according to the prevailing opinion of experienced surveyors, it will require a good soil and good management to produce 40 trees on an acre, which, in 100 years, may, at an average, be computed at two loads each.reckoning, therefore, two loads at 8l. 16s., one acre will be worth 350l. and consequently 40 acres will be only worth 14,200l. The building of a 70-gun ship is generally supposed to cost 70,000l.; and at ships do not last many years, the navy continually requires new ships, so that the forests must be fritted in a century or two, unless young trees are planted to supply their place.

As the consumption of oak-timber is so considerable, methods should be devised and diligently practiced for procuring a fresh supply.

Trees are liable to a variety of diseases and injuries, for the prevention or cure of which various means have been proposed.

The chevalier de Bienenberg of Prague, we are told, has discovered a method of effectually preserving trees in blossom from the fatal effects of those frosts which sometimes in the spring destroy the most promising hopes of a plentiful crop of fruit. His method is extremely simple. He surrounds the trunk of the tree in blossom with a wape of straw or hemp. The end of this he spins, by means of a flone tied to it, in a vessel of spring-water, at a little distance from the tree. One vessel will conveniently serve two trees; or the cord may be lengthened so as to surround several, before its end is plunged into the water. It is necessary that the vessel be placed in an open situation, and by no means shaded by the branches of the neighbouring trees, that the frost may produce all its effects on the water, by means of the cord communicating with it. This precaution is particularly necessary for those trees, the flowers of which appear nearly at the same time as the leaves; which trees are peculiarly exposed to the ravages of the frost. The proofs of its efficacy, which he had an opportunity of observing in the spring of 1787, were remarkably striking. Seven apricot cypresses, in his garden, began to blossom in the month of March. Fearing that they would suffer from the late frosts, he surrounded them with cords as above directed. In effect, pretty sharp frosts took place fix or eight nights: the appicot-trees in the neighbouring gardens were all frozen, and none of them produced any fruit, whilst each of the chevalier's produced fruit in abundance, which came to the greatest perfection. See Fröst.

For Mr. Forth's remedy, we refer to the article Composition for Trees. See also Grafting.

Mr. Ray, and other authors, speak of several trees of prodigious bulk.

The jesuit d'Acofia, in his History of the Indies, lib. iv. cap. 3, mentions a hollow tree at Tlacocharaya, three leagues from Guaxa, in New Spain, nine fathoms within side near the ground, and fifteen without side. He adds, that it is under this tree the barbarians assembled to perform their religious ceremonies, dance round their idols, &c. Herrera mentions another, which fifteen men, joining hands, could not fathom. And F. Kircher, in his Latinum, p. 50, affirms that he has seen a tree, near Gonzano, which would lodge a whole family of twenty-five persons in its cavity. The common people had a tradition, that this was planted by Augustus.

There are forests of very large chestnut-trees, growing out of the lava of mount Etna, in Sicily. One of these, called the Caltagno di Cento Cavalli, is much the most celebrated. It measures 204 feet round, and though said to be united below in one trunk, it is a bush of five large trees growing together. The hollow of one of these chestnut-trees is said to contain a hundred sheep, and it is also related, that thirty people have been in it on horseback. Brydson's Letters, vol. i. p. 109, &c. See Etna.

In the Indies there are very large forests formed from a single tree, whose branches bending to the ground, take root, and put forth new trees: the Indian fig-tree and parrotier are of this kind.

M. Lonvillers mentions trees in Peru, one part of whose branches produce fruit one half the year, and the other part
part the other half. In China there is a tree which bears tallow, of which that nation make their candles. See Sibera and Tallow.

Mr. Marsham saw spruce and silver firs in the dock-yard at Venice above forty yards long, and one of thirty-nine yards was eighteen inches in diameter at the smallest end. It was found that they were brought from Switzerland. Some yews have been found in Britain sixty feet round. Palms in Jamaica attain the height of 200 feet, and some of the pines in Norfolk island are 280 feet high.

At Tortworth, in Gloucestershire, it is said by the writer of the report on agriculture for that district, that a chesnut-tree was measured in 1791, which was found to be forty-four feet and four inches in circumference.

The great Boddington oak, belonging to the manor-farm of the name in the same district, before it was burnt down in 1790, either by accident or design, was not less remarkable. It grew in an old orchard-ground, and the following account was given of it by Marshall, in his work on planting, as it appeared in 1783. The stem was remarkably collected and snug at the root; the fides of its trunk more upright than those of large trees in general; its circumference at the ground somewhat more than eighteen yards, and at its smallest dimensions twelve. The greatest extent of arm, eight yards from the stem; and the greatest height of the branches, forty-five feet. The stem quite hollow, forming a capacious well-fixed room, measuring on the floor, one way, more than sixteen feet in diameter. At that time it was perfectly alive and fruitful, with a large fine crop of acorns upon it. Part of the trunk, it is said, escaped the fire, and still remains.

In Needwood forest, the oak-tree called the Swilcar lawn oak contains, as Mr. Pitt supposes, in his account of the agriculture of Staffordshire, at least a thousand feet of timber. The Rev. Mr. Snow says, this oak, the father of the forest, girt at five feet high twenty-one feet; the lower stem is ten feet clear; the whole height about sixty-five; the extent of the arms about forty-five feet. It is of great antiquity, but still fruitful in acorns.

In the first volume of the Agricultural Survey for the County of Elles, it is stated, that in Hatfield forest Sir John Barrington has a very beautiful oak, for which a timber-dealer offered one hundred guineas. And that near it is the ruin of a most venerable tree of the fame kind, which gave the name of Broad-Oak to Hatfield.

There is a Lombardy poplar in this district which is a very fine and beautiful tree, guelled to be above seventy feet high, and which at five feet from the ground measures seven feet three inches in circumference. It is one of the three original trees of this kind which were brought by lord Rochfort from Italy, and planted at St. Olyth above forty years ago, and from which much the greater part of those which are now scattered through the kingdom originated.

Very near it is the largest and most beautiful laurel of the Portugal kind that is almost any where to be seen; it is nearly of a semi-globular form; feathered all round to the lawn it grows in, and is fifty-two yards in circumference. At a small distance from these prodigies of vegetation is, it is said, another at least equally interrelling, an arb uterus, which would make no inconsiderable figure at Killarny. They are in the grounds of Mr. Naffau, in which the soil is a fine rich loam. See the Report.

There are now growing about Townley Hall, in Lancashire, besides many laxe fine oak timber-trees, an alder tree, called the wain-hoofe ash, which measures fourteen feet in circumference; a hazel-tree, which is three feet in girth; a yew-tree, which has fix feet two inches of girth; and a white-thorn, in New Copy field, which measures seven feet in circumference.

There are two or three very remarkable phenomena in the growth of trees, which have escaped the observation of the naturalists of all ages, except those of our own: these are the perpendicularity of their trunks or stems to the horizon, and the parallelism of their tufts to the spot of earth they grow on. See Parallelism and Perpendicularity.

For the planting, transplanting, fermentation, pruning, felling, grafting, throwing, &c. of trees. See Plantation, Planting, &c.

On felling of trees, letters have sometimes been found in the midst of them. We have instances of this kind mentioned in the Philos. Trans. No. 454, sect. 16, where the trunk of a beech being fawed, discovered several letters in the wood, about an inch and a half from the bark, and near the fame distance from the centre of the trunk. It seems these letters had been formerly cut into the bark, and in procès of time these might be covered.

In the same Transactions, we have an account of the horn of a deer found in the heart of an oak. Cruciferous plants have also been found in trees, and were of course flown as miraculous to the ignorant. See p. 236 of the said Transactions in the Remarks.

Trees are often found buried in the earth. See Morass, Fossil Wood, and Bog Wood.

For the punishment of stealing trees, see Larceny.

By flat. 1 Geo. I. c. 48. maliciously to set on fire any underwood, wood, or coppice, is made sngle felony. By the Black-aæ, to cut down or delivry any trees planted in an avenue, or growing in a garden, orchard, or plantation for ornament, shelter, or profit, is felony without benefit of clergy; and the hundred shall be chargeable for the damages, unless the offender be convicted. By 6 Geo. III. cap. 36. and cap. 48. wilfully to spoil or destroy any timber or other trees, roots, shrubs, or plants, is, for the two first offences, liable to pecuniary penalties; and for the third, if in the day-time, and even for the first, if at night, the offender shall be guilty of felony, and liable to transportation for seven years.

Trees, Discomposition of. See the preceding article, and Composition, &c.

Trees, Hollowness of. See Hollowness.

Trees, Juices of. See Juice and Sap.

Trees, Felling of. See Felling and Timber.

Trees, Parallelism of Rows of. See Parallelism.

Trees, Fruit, Barking of. See Rural Economy, the injury of their having the bark eaten off by hares and rabbits in the winter season. It is particularly the case with young apple and pear trees, and occasionally with forest-trees and shrubs. Several different methods of preventing it, and of protecting the trees, have been proposed at different times; such as twisting straw-ropes round the trees; driving in small flat flakes all about them; and the use of fume-scented oils. But better and nearer modes of effecting the business have lately been fuggelled in the Transactions of the Scotch Horticultural Society; as with hog's-lard, and as much whole-soil as will work it up into a thin paste or paint, with which the flums of the trees are to be gently rubbed upwards, at the time of the fall of the leaf. It may be done once in two years, and will, it is said, efficaciously prevent such animals from approaching them.

Another and still nearer method, is to take three pints of melted tallow to one pint of tar, mixing them well together over a gentle fire. Then, in the month of November, to take a small brush, and go over the rind or bark of the trees with the composition, in a milk-warm state, as this

Vol. XXXVI.
as it can be laid on with the brush. It is found that such a coating does not hinder the juices or sap from expanding in the smallest degree; and the efficacy of the plan is proved, in preventing the attacks of the animals, by applying the liquid composition to one tree and missing another, when it was found that the former was left, while the latter was attacked. Its efficacy has been shown by the experience of five years. The trees that were gone over the first two years have not been touched since; and none of them have been injured by the hares.

It is a mode particularly well adapted for nurseries, where the ground is not well secured with a fence to protect the young fruit-trees and tender shrubs from hares.

The above is the proportion of the materials, whatever may be the extent of trees.

Trees, Misting of, their becoming much affected and covered with the mols-plant or mossy fulblance. It is found to prevail in fruit-grounds of the apple kind, and in other situations, when they are in low, cloft, confined places, where the damp or moisture of the trees is not readily removed. It is thought to be an indication of weaknesses in the growth, or of a diseased state of the trees, and to require nice attention in preventing or eradicating it. The modes of removing it have usually been those of scraping, rubbing, and washing, but they are obviously calculated for trees only on a small scale. How far the use of powdery matters, such as lime, chalk, and others, which are capable of readily absorbing and taking up the wetness that may hang about the branches and other parts of the trees, by being well dusted over them, may be beneficial, is not known, but they would seem to promise success by the taking away the nourishment and support of the mols, when employed at proper seasons. And they are known to answer in destroying mos in some other cafes, when laid about the limbs of the plants, as in thorn-hedges, &c.

In the fruit-grounds of Gloucefsshire it is recommended, the writer of the account of the agriculture of that district says, to wash with soap-foads, and rub off the mos with a brush, in wet weather when it is soft, and easily separable from the different parts of the trees. This work should be begun at an early period of the growth of the trees, when the branches are few and open, and be repeated every season; otherwise the labour would be too great to undertake on a large extent, when the trees are full-headed, and entangled with shoots. The fruit-farmer should not, however, be too easily discouraged, since it has been discovered, that the eggs of caterpillars are often lodged between the mos and the rind of the trees, and probably the insects Issue forth from these depositaries in the spring, to the destruction of leaf and blossom.

In this district, the mousing of the trees is attributed to the plantations being made on grafs-lands, which is the common practice in a great part of the county; as, it is said, that in the neighboring counties, where the fruit-trees are planted in hop-grounds and arable fields, the trees, though not free, are less affected by it. This may, it is supposed, be owing to the frequent manuring and flirring of the mould near the roots, by which means the sun and rain have power to exert their influence, and by invigorating the fibres, promote a general kindliness in the growth of the trees.

The mousing in all sorts of trees is injurious to their growth by depriving them of a portion of their nourishment, but more particularly hurtful to those of the fruit-tree kind, as preventing them from bearing full good crops of fruit by rendering them in a weak and unhealthy state.

Trees, Espalier, Coff-iron Rails for, a new mode of forming this sort of rails. It is noticed in a Paper in the first volume of the Memoirs of the Caledonian Horticultural Society, that the advantages attending rails of this kind in gardens, in respect to utility as well as ornament, are well known and acknowledged. The greater chance they afford to the fruit in setting and ripening, by the branches being laid in at regular and equal distances, the neatness of appearance which the trees exhibit, and the elegant viftas produced by the rail and trees when bordering the sides of well-kept walks, are all matters with which the admirers of horticulture have long been acquainted. It does not appear, however, whatever may have been the cause, that this, by no means uninteresting branch of the art, has hitherto in any considerable degree engaged the attention of the improver.

The rails for trees of this kind have, for the most part, been made of wood, though not without objections; the principal of which is, want of durability in the fulblance; the difficulty of keeping them in a perfectly rectilinear position; and the elusiveness of appearance which they constantly, in some degree, exhibit, when made of the dimensions necessary for the proper extension of the trees.

The most usual modes of constructing such rails are two: first, the having upright splits of dried timber funk into the ground, and mortised into a horizontal top-rail. This is greatly objectionable on account of the speedy decay, and from the splits always foorn giving way where funk into the ground, as well as from its being fearlessly practicable to keep them straight. The second, or that which is the most generally practised, is to sink upright polts into ftones, to mortise two crofs-bars into them, and to nail upright fplits to the bars. The great defect in this mode is, that by the bulk of the polts, rails, and splits, so great a strain is thrown upon the ftones during high winds, that they cannot long resit it; and the consequence is, that the rail foon begins to twist, while the part funk into the ftones, in spite of every precaution, will at no great length of time decay, in conquence of moisture getting in between the wood and the ftones.

In order to obviate these objections, the substituition of espalier rails formed of call-iron instead of wood, has been proposed and tried with success by a gentleman in Dunbarfnshire, Scotland.

Each portion of rail is formed of two rails intersected at the different ends into handsome upright columns or polts, having erect arrows or pieces fixed into them, somewhat in the manner of common iron paling, the whole fheet or portion refing upon three supports at the bottom, in the way direcd below. The supports on which it stands are thus contrived: the centre one is a piece of seafoned oak, driven firmly into the ground, and sunk a little below its surface. It receives the upright middle arrow-piece, which keeps up the centre of the bottom rail, and through which the different upright arrow-pieces to each side of it are put. It is supported below the rail by two pieces of the same metal in a triangular manner. Those at the ends are ftones of two feet in length, having their tops hewn into an hemispherical shape, and perforated in the middle by a hole of four inches in depth, and two in diameter, which receives the bottom ends of the columns or polts. The upright arrow-pieces are each furnished with a raff at the places where they meet the top and bottom rail.

The columns or polts have the length of six feet, their bottoms being funk, as above, into the ftones: the diameter of them at the bottom rail is an inch and a half, and at the top, one inch and one-eighth: the upright arrow-pieces are five feet in length, and their diameter half an inch: the bottom rails are three-eighths of an inch in thicknes, and in breadth...
breadth one inch and five-eighths; the top ones three-fourths by one-fourth of an inch. The columns, at the parts where the rails enter them, have a flank projecting at right angles to them, with a hole, through which, and through a hole in the end of the rail, a leaden rivet is put, for fastening the rail to the column or post. See Treillage.

Tree, Onion, in Gardening, that fort of onion-plant which rives somewhat in the tree-like form, and which affords its produce or bulbs at the top of the stem or flalk. At what period this valuable and useful bulb-rooted plant was first introduced into this country, seems now to be quite uncertain; and it has never yet perhaps been grown or cultivated to any extent in any part, being mostly had in growth merely for the sake of curiosity. From a Paper inserted in the first volume of the Memoirs of the Caledonian Horticultural Society, it would appear, however, to be capable of being raised with advantage as a substitute, in part, for onions of the keeping kind, as might have been supposed from the foregoing nature of the climate from which it originally came.

In addition to the little which has been said of the nature of its culture for the purposes of ornament and variety under the head Allium, (which see,) the following observations on its culinary use may be given in this place.

It is stated, on the experience of some years, in the Paper alluded to above, that the root-bulbs, when two years old, put up each a stem from thirty inches to three feet in height, on which good-sized bulbs are formed at top: that there from these, others push out of a second size; and that sometimes a third set is produced, which are still smaller; but that the first and second fixes are the only ones which are fit for planting. Towards the end of summer, the top-bulbs are in a proper state for gathering, and should be collected and carefully dried in a shady place, then put in a dry airy situation, until the season for planting them out. At this time the old floor-bulbs should be lifted, which have mostly one or two onions to each of them, which are of good quality, and keep well until late in the following spring season.

About the last week in the month of April is the most proper time for planting out the young top-bulbs for the purpose of a crop, as if sooner planted, they are apt to puff that feallon, and better produce good floor-bulbs nor top-bulbs. The old roots should be planted out any time in the month of February, or the following one, as early planting has the power of making them produce good bulbs at top. The young bulbs of the first size should be separated and planted out in rows in any good garden ground, which is in an open situation, six inches by four: the second size in rows fix inches by three, in shallow drills of very little depth, as the swelling and ripening of the roots are spoiled when they are deep.

The whole of these will, it is said, produce onions of a good size, which will keep, when well taken care of, until the middle of May. The old floor-bulbs, when not all wanted for planting, will likewise keep equaly well; and after a sufficient flock of them has been provided, the rest may be used with the other principal sorts.

It is noticed that the old roots are the best for replanting for a crop of top-bulbs, as they are the most certain of running to items.

The writer has never known these crops to be infested with vermin in any flage of their growth; the reason of which is, it is thought, their quick growth and coming to maturity before the feallon at which vermin commonly attack the usual spring-fown roots, as it has been found that the late or autumn-sown crops of the common kind, when allowed to stand for an over-year produce, are seldom or ever affected in this way, even on light dry ground.

This sort of onion, besides its property of long keeping, is a strong well-flavoured kind, equal, if not superior, to most of the common sorts.

It is, however, perhaps the best calculated for private gardens, as requiring a good deal of attention, as in such, when once provided with a certain quantity of floor-bulbs, the proprietor would be rendered independent of the failure of the crops of common onions; and it is confidently afferted, that if the cultivation of it were generally well understood, it would be capable of being grown with both pleasure and profit in a great many cattle.

Tree, Cork. See Cork and Oak.

Tree, Chief. See Agnus Cauilus.

Tree of Life, Arbor vitae, in Botany. See Thuja.

The occidenta], which grows naturally in Canada and other northern countries, is used, according to professor Kalm, for many medicinal purposes. It is much extolled for rheumatic pains; with this intention the fresh leaves are pounded in a mortar, and mixed with hog's grease, or any other grease; this is boiled together, till it becomes a false, which is spread on linen, and applied to the part where the pain is. This false gives certain relief in a short time.

Against violent pains which move up and down in the thighs, and sometimes spread all over the body, they recommend four-fifths of the leaves of polypody (polypodium fernae pinnata, &c.) and one-fifth of the cones of the thuja, reduced separately to a coarse powder, and afterwards mixed. With this powder, and milk-warm water, they make a poultice, which they spread on linen, and wrap round the body; but they commonly lay a cloth between it and the body, otherwise it would burn and fcorch the skin.

The decoction of thuja leaves is used as a remedy for the cough; and they use this at Saratoga for the intermitting fever.

Tree-Fold, in Sheep-farming, a term applied to that fort of sheep-fold which is formed or surrounded by trees in the growing flate, and which is well suited for protecting them in certain exposed situations, as well as affording them other advantages. See Sheep.

Trees, in a Ship, arc of several forts, as chef's-trees, crown-trees, roof-trees, wattle-trees, trussel-trees. See Chess-trees, &c.

Tree Island, in Geography, a small island in the Indian sea, near the coast of Africa. N. lat. 17° 16'.—Alto, a small island in the East Indian sea, near the E. coast of Sumatra. S. lat. 13° 50'. E. long. 103° 51'.—Alto, a small island near the W. coast of Sumatra. S. lat. 12° 58'. E. long. 100° 15'.—Alto, an island in the bay of Bengal, near the coast of Ava. N. lat. 18° 12'. E. long. 94° 15'.

TREE-A-TOP ISLAND, one of the Chusan islands, which undoubtedly deferred the appellation given to it, when it was first described by the Europeans above half a century ago, at which time they were permitted to trade to Chusan.
but the tree is gone, and this island, which is as bare as the
thick surrounding it, is only known by its relative position
in the chart. To the southward of this island, about three
or four miles, there is excellent anchorage in five or six
fathoms water, where the ships are sheltered from every wind.

**TREE-NOILS,** or **TRENLGELS,** in a Ship, are long cy-
nindrical wooden pins, employed to connect the planks of a
ship's side and bottom to the corresponding timbers, and to
fasten the anchor-flock.

The tree-nails are justly esteemed superior to spike-nails
or bolts, which are liable to rust and loosen, as well as to
rot the timber: but it is necessary that the oak of which
they are formed should be solid, close, and reptile with gum,
to prevent them from breaking and rotting in the ship's
frame. They ought also to be well dried, so as to fill their
holes when swelled with moisture. They have usually one
inch in thickness to 100 feet in the vessel's length: so that
the tree-nails of a ship that is 100 feet long, are one inch in
diameter, and one inch and a half for a ship of 150 feet.

**TREET,** **TUFTICUM,** in our **Statutes,** is used for fine
wheat. See flat. 51 Hen. III. Hence **treet-bred.** See
**BREAD.**

**TREFALLO, To,** in **Husbandry,** is to plough land
the third time before sowing.

**TREFEN,** in **Geography,** a river of Carinthia, which
runs into the Drave, 6 miles below Villach.

**TREFORT,** a town of France, in the department of
the Ain; 7 miles N.E. of Bourg-en-Bresse. N. lat. 46° 10'.
E. long. 5° 27'.

**TREFURT,** a town of Weilphalia, in the territory
of Eichsfeld; 10 miles W.S.W. of Muhlhausen.—Also,
a town of Germany, in the principality of Hefte-Rhinefs,
situated on a hill near the Werra; 36 miles E.S.E. of Caffel.
N. lat. 51° 8'. E. long. 10° 18'.

**TREFOIL,** in **Architecture,** the usual mode of orna-
menting an arch in the pointed style by the insertion of a
suf or point on eaeh side of it. Other trefoils are infebrbed
within a circle, and resemble a head of clover-grafs more
perfectly.

**TREFOIL,** in **Botany.** See **TRIFOLIUM.**

Trefoil is a plant of the clover kind, which is not unfre-
quently sown or met with in grafs-lands. It is always a
valuable plant in such grounds as are kept under a permanen-
ltate of grafs; and not much lefs useful, when sown and
cultivated in theohe of the arable kind. See **CLOVER**
and **MEDICAGO LUPALINA.**

It succeeds well on folks of different descriptions, as on
thohe of the dry, loamy, and the calcareous kinds and qua-
Ities. It was found to succeed perfectly on the lime-brash
kinds, by Mr. Davis, in Oxfordshire; and it has been
greatly advised for the chalky and some other dry forts, by
Mr. Boys of Kent. It is constantly known to answer well
in all the lefs moist loams. It is a plant, however, which
has been objected to by some farmers, as being only a bien-
nial; but as it yields its feeds annually in great abundance,
this is probably a matter of little consequence; and it is well
known to seldom wear out of lands, in which it has been
once well established. Its feed is readily procured, and
with little expense or trouble.

The plant is of much lefs growth than that of common
clover, being considerably slenderer in the stem or flalk part;
yet notwithstanding this, it is not unfrequently sown with
crops of the grain kinds, in the manner of that grafs-feed.
The proportion of feed, which is made use of in such cafes,
is usually about three pottles, or two gallons, when per-
fectly cleared of the hulks; but when in the contrary state,
two busheels are mostly the quantity that is sufficient for the
purpose. These quantities should, however, be constantly
varied, according to the nature, circumstances, and condi-
tions of the lands.

By some it is supposed to be a beneficial practice to sow
it in these ways, especially where large flocks of animals are
kept; as with the oats or wheats in the spring feaon, when
they are to be followed with grain in the next; as, by this
means, good feed is provided in the fluffles for the flock,
in the latter part of the summer and in the autumnal months,
while, at the same time, the land is left free for the pur-
oposes of tillage in the spring. When it is employed in the
way of laying down land for pasture, as it is always of much
importance to the farmer to have such land to produce a
full crop the first year, this is proper; and as there are
some grafs-plants which require two or more years to etab-
lish themselves, and acquire their full growth, while others
arrive at their extreme and perfect size and expansion the
first year after being sown; some of the latter sort should
constantly be had recourse to, among which this should
never be neglected, as it is found, in most cafes, to be
highly valuable and useful in such circumstances. Hence,
too, the advantage of mixing it with other fown grafs-feeds
is shown in different instances. Some farmers consider
the quantity of four pounds of trefoil-feed to the acre as to
small a proportion; and think it an improvement to either
double the quantity, or to add as much red clover-feed,
which is probably the preferable method. In this quantity,
it is supposed, they will not injure the other grafs-feeds
which may be sown at the same time, but furnish a copious
vegetation, until the other may come to perfection; at
which period, both the trefoil and clover have a natural ten-
dency to disappear and be worn out of the land.

Trefoil is said to produce excellent pasturage for cattle-
flock, but to be more particularly calculated for sheep,
when either in mixture with clover or alone, as it is found
not to be so liable to hurt them by dwelling oroving them
as clover. It is of great importance in the feeding and sup-
port of sheep, in consequence of its being more early than
clover, and its coming in well after the consummation of the
rye and turnip crops, before the clovers become ready in the
spring feaon.

The writer of the "**Experienced Farmer**" states, that this,
by some, is supposed a better plant, and that sheep are
not fond of it, but that he must own that nothing within the
comps of his experience has led him to form such an
opinion. It vegetates about a month earlier than white
clover, and long before the rye-grafs is exhausted. But it
is thought improper for being sown alone, except for the
express purpofe of raising feed. There are no folks, it is
thought, proper for trefoil but what are capable of pro-
ducing rye-grafs and white clover. Hay made from
this plant alone, is a pretty hay, but seldom abundant in
produce. It is conceived that more trefoil is capable of
being raised on any fort of land, in any quantity, by fowing
rye-grafs among it, than without; as it has been observed
that trefoil, like the vine and pea, wants support from some
stronger material to which it may cling. For this reason it
propers well with red clover, round which its tendrils twine
as woodbines in a thorn-hedge. It is believed, too, that the
crop of clover will be very little lefs in quantity or weight
from the trefoil growing in a fate of mixture with it.
The after-grafs of trefoil is considered as not worth much,
on which account some recommend it to be followed with
wheat, but it can be declared on the grounds of constant
experience, that land intended for wheat, cannot possibly
be
be too much smothered with crops of every fort of the close-growing shady kinds.

It has been flated by a late writer, that upon light and poor sandy soils, or lands on which clover does not succeed well, it is common handbury to trefoil with a portion of white clover and rye-grafts, with the intention of leaving it two years. If this cafe, six pounds of trefoil, four of white clover, and half a bushel of rye-grafts feeds are the common quantities. These are with the intention of providing sheep-feed.

Where trefoil is left for hay, it does not afford a large produce, but a fort which is highly useful and advantageous as a sheep-fodder in the winter season, and lefs wasteful than most other kinds, when used in that way. At the same time, it is suppoed to be lefs troublesome in the process of making into hay. However, it is afderted by Mr. Kent that it readily runs together, and becomes mouldy by wet.

The feed is to be collected from the second floot, in the same manner as in common clover, the produce being in general from fix to eight buflhels of clear feed from three acres. In districts where it is grown for the feed, the crops are mown in the beginning of July; the heads or husks being often threshed off the straw in the field on a cloth, and then fold by the quarter to those who have mills and collect them, who grind the feed out of the husks, and then dispose of it to others, in different places, for the use of the farmers in those districts where it is rarely faved. The acre mostly produces from about four or five to ten quarters in the hulk, each of which affords about two bushels of clean feed when grown boldly in this intention.

This plant has often the names of black-grafts, nonsuch, yellow clover, and others, given it by writers on husbandry.

There are other different sorts or varieties of this plant occasionally cultivated by the farmer, such as the trefoil termed bird's-foot, which has been found useful when cultivated in meadows that are inclined to be moif, as growing to a great height, and affording an excellent hay. In some places too it is raised as pasturage for sheep. Also the trefoil called by the name of hop, which is often confounded with the real trefoil, as being nearly of the same duration, but which is more grateful to animals. The trefoils seem, on the whole, not to be fo much diereribated by agricultural writers, as their importance as artificial grafts would appear to demand. Besides, much confusion is introduced in confluence of the diversity of their provincial titles. It has been remarked, that as fome are annual, fome biennial, and others perennial, where the two former sorts are fown where it is intended to have a permanent paffure, disappointment muif of necefly be the confluence.

Trefoil of Canthius, Thorny. See Fagonia.

Trefoil, Bajie Tree. See Cyftisus.

The ancient botanifts feem to have been acquainted with two very different shrubs under the name cyftisus; and there have been no small errors about the true meaning of several paffages in Dioscorides and Theophratus, on occasion of the miftaking one of these things for another. Dioscorides describes the cyftisus, as being a shrub with leaves white and hoary, both on the upper and under fide; and of no ufe, or value, to mankind; as to its wood, Pliny tranflates this account, and adds to it from Hyginus, that it was a very hardy and ftrong shrub, not being affected by heat or cold, snow or hail, or any other injuries of the weather, nor of its enemies, as Pliny expresses it (boflum). It is not very easy to conceive what enemies these should be; but the moft probable conjecture, as to this odd paffage, is, that Pliny had tranfcribed it in his usual carelefs way, and that what is called boflum, should be the word noftrum.

The fenfe then is clear enough; the author had juft before faid that the wood was good for no ufe to mankind; and, therefore, when he was fpaking of the trees flanding a long time, and fearing the injuries of no weather, he might very well add, nor of us; for the wood being good for nothing, men would not be at the trouble of cutting it up. It is plain, however, that Theophratus means quite a different shrub by this name cyftisus; for, as Dioscorides fays, that the wood of his was white throughout, and very light. Theophratus obferves, that it was black at the heart, and as heavy and folid as ebony; and, in many places, where he speaks of the hard and elegant woods used for inlaying, he mentions the cyftisus wood, coupling it with the ebony, heart of oak, and other the hardefl and moft elegant woods known in his time.

Pliny mentions no other cyftisus than that of Dioscorides, which was the common kind cultivated by the Greeks and Romans, as a food for cattle; he fays it was raised by feed, and came to its perfection in three years, and that it was gathered in the spring juft after the time of its flowering; he adds, that this was usually the office of children, or old women, unfit for other work, and was the cheapest of all the offices of husbandry. It is easy to conceive, that such a shrub as the cyftisus of Theophratus, with a wood as firm as the heart of oak, and hard as ebony, did not come to perfection in three years from the fowing; nor could any more be cut up by boys and old women, than eaten by cattle when taken up. There were, therefore, two kinds of cyftisus among the ancients, the one fown and cultivated as food for cattle, the other a wild tree, or shrub, growing in woods, and being larger than the fown kind. Dioscorides and Pliny defcribe the firit, and Theophratus alone the latter, except that Pliny has now and then taken a fentence from Theophratus, when he mentions the cyftisus occasionally among other hard woods, and placed it to the account of his manured cyftisus.

Ovid, indeed, where he mentions the cyftisus as a wild wood shrub, certainly means this kind mentioned by Theophratus:

"Nec teneris cyftisus curvate tineas abierit."

And Columells acknowledges both kinds. It may feem a natural objection, that culture could never make such a difference in this plant, as that it should be hard and black in the wood in its wild state, and soft and white in the cultivated kind. But we are not to fuppofe that the cultivated and wild cyftisus were the fame fpecies of shrub, only altered by these two rates. The ancients were not fo accurate in their names as later botanical writers have been; and if a wood-shrub, in some respects, resembled their manured cyftisus, they would call it by that name, though it
had not all the generical characters to make it fame. COLUMella, de R. R. lib. ix. cap. 4.

TREFUMEL, in Geography, a town of France, in the department of the North Coasts; 6 miles S. of Dinan.

TREGARON, or TREV GARN, or Garon, a small market-town in the hundred of Pen-Arth, and county of Cardigan, South Wales, is situated in a valley watered by the river Berwyn, a contributory stream to the Teifi; 18 miles S. by E. from Aberystwyth, and 170 miles W. from London. It was formerly a corporate town, but for some improper conduct at the election of a member to serve in parliament in the year 1742, the house of commons voted that the corporation had forfeited their charter. A weekly market is held on Tuesday, and an annual fair of three days' continuance in March. The church, which is a spacious structure of very rude masonry, consists of a nave and chancel: it stands on a rocky eminence, regularly circular, and forming an elevated centre to the town. In the churchyard are the remains of a Druidical circle, with the spaces filled up with stone-walling. The parish of Tregaron, which extends nine miles in length, and four miles in breadth, comprehends eight parishes or townships, and, according to the population return of the year 1811, contains 2121 houses, and 1732 inhabitants. At a place called Cauffell Flemys, in this parish, is a very large interment of a semi-circular form, well defended on three sides by a moat. On a hill called Penbhwfour are three heaps of stones, called Carneddau, sepulchral monuments of Druidical origin; and a bank of raised earth runs in a straight line for several miles, in this parish as well as that of Gwynws, and is said to lead into the sea, called "the furrow of Bannow's oxen," the same as were said to be employed in building the church of Llandewi Brefi. But it is probably the remains of an old British road. Thomas Jones, an eminent antiquary and poet, who lived at the end of the sixteenth century, was a native of Tregaron.

Malkins's Scenery, &c. of South Wales, 2 vols. 8vo. 1807.

TREGIANO, a town of Naples, in the province of Bari; 6 miles E.S.E. of Bittetto.

TREGONY, a market-town and borough in the western division of the hundred of Powder, and county of Cornwall, England; is situated on the river Fal, 8 miles E. from Truro, 40 miles S.W. from Launceston, and 250 miles S.W. by W. from London. This town was formerly a place of some consequence, but fell to decay when Truro began to flourish, and attract its trade and population. Tregony lent two members to parliament in the reign of Edward I.; and after a long dispute, recovered its ancient privilege in the year 1559: the right of election is vested in the.houfekeepers: the number of voters who polled in the year 1812 was 183, the exact number of houfes returned under the population act of 1811; the number of inhabitants were therein flated to be 923. The town confifts principally of one long street. It was ancienfly governed by a portreeve, or mayor; but in the year 1620, king James I. granted it a charter of incorporation. The market, which is on Saturday, is held by prescription: Henry de Pomeroy certified his right to it in the reign of Edward I. Henry III. granted a fair to the said Henry in the year 1266. Here are now five fairs. Both the fairs and market have for many years been in a declining state; till the middle of the last century, they were very confiderable; and particularly noted for the sale of woollen cloth, of which there was an extensive manufactory in the town. Tregony castle, of which there are now no remains, is said to have been built by Henry de Pomeroy at the time king Richard I. was in the Holy Land; it was fanding, and was the seat of the Pomeroids, in the reign of Edward VI. In the year 1566, Hugh Bofcawen found an hospital for decayed houfekeepers, and endowed it with lands, now let at 50/- per annum, but capable of being foon raised to three times that value. On the north side of the town flood, what is called, Old Tregony, where was a church dedicated to St. James, the walls of which were standing till about the middle of the last century.

On the opposite bank of the Fal, is Trewarthicken, the seat of Francis Gregor, esq. The house is fted on an elevated piece of ground, abounding with fine groves, and commanding a variety of interefting prospects.

About two miles south-west of Tregony, is Ruan Lanhorne, a village feated on the banks of the Fal, of which the Rev. John Whitaker, the learned historian of Manchester, was nearly forty years the refident rector. He died Nov. 4, 1808, in the 73d year of his age, and lies buried within the rails of the communion-table.—Lylons's Magna Britannia, vol. iii. Cornwall, 1814. Beauties of England and Wales, vol. ii. Cornwall; by J. Britton and E. W. Brayley, 1802.

TREGULIER, a fee-port town of France, in the department of the North Coasts, on a peninsula, near the English Channel; before the revolution the fee of a bishop; 9 miles N.E. of Lannion. N. lat. 48° 47'. W. long. 3° 8'.—Alfo, a river of France, which runs into the English Channel, 6 miles N. of Treguer. N. lat. 48° 51'. W. long. 3° 8'.

TREIA, in Ancient Geography, a town of Italy, in Picenum, S.E. of Cingulum.

TREIJA, in Geography, a town of the Popedom, in the marquisate of Ancona; 6 miles W. of Macerata.

TREGIGNAC, a town of France, in the department of the Correze; 16 miles N. of Tulle.

TREIGNY, a town of France, in the department of the Yonne; 9 miles S.E. of St. Fargeau.

TREILLAGE, in Gardening, a sort of rail-work consisting of ranges of light posts and railings, for the purpose of training espalier trees to, and occasionally for wall-trees, where the walls do not admit of nailing the branches immediately against them; likewise for training wall-trees in forcing-frames, &c. They are made in different ways for use and ornament, as well as of different dimensions, from four or five to fix or seven feet high.

For common espalier fruit-trees in the open ground they are absolutely necessary, and may either be formed of common stakes and rails nailed together, or of regular joinery work.

The cheapest and the eafeft, and soonest made treillage for common espalier trees, is that formed with any kind of straight poles or stakes of under-wood, as cut in the coppices, being then cut into proper lengths, and driven into the ground in a range at distances of a foot each, all of an equal height, and then nailed along the top with the fame kind of poles, to preface the whole flat and firm in a regular position. See Espalier.

And to render these firll stronger, two or three horizontal ranges of rods may be nailed along the back part of the uprights, a foot or eighteen inches asunder. The more elegant and ornamental treillages are formed with regularly squared posts and rails of hard timber, neatly planed and framed together; having for this purpose deal or oak posts, uniformly worked two or three inches square; but if the main posts are of oak, it will be of advantage
TRELAZE, in Geography, a town of Jamaica; 60 miles N.W. of Kingston. N. lat. 18° 21'. W. long. 77° 42'.
TRELAZE, a town of France, in the department of the Mayne and Loire; 3 miles E.S.E. of Angers.
TRELECH, a town of England, in the county of Monmouth; 5 miles S. of Monmouth.
TRELLIS, or TRELLIS, in Gardening, a term sometimes employed to signify the frame as treillage, or a lighter and less strong sort of wooden frame-work of this nature, which is sometimes used in particular situations and circumstances. See TRELLAGE.
TRELOIN, in Geography, a town of France, in the department of the North; 9 miles S.E. of Avefnes.
TRELOOBING, in Mining, denotes a stirring and working the loods or flimsy earth of tin, &c. in a flume-pit, that the mud may be partly washed off with the water, and the ore settle at bottom.
TRELOU, in Geography, a town of France, in the department of the Aisne, on the Marne; 9 miles E. of Chateau Thierry.
Female, on the same plant, above the male, Cal. as in the male, permanent. Cor. none. Pét. Germin superior, roundish, depressed; style none; stigma two, short, villos. Peric. Drupa roundish, somewhat depredded, single-seeded. Sec. Nut minute, pierced with several holes.
1. T. cannabina. Cay Rach chico of the Cochinchinefe. —Native of the woods of Cochinchina. A tree of middling size, with a filamentous bark, and ascending branches. Leaves alternate, ovato-lanceolate with a long point, ferrated, downy. Flowers on axillary branched flanks. Drupa yellow.—We know nothing of this plant but from the above description.
TREMANDREAE, a new natural order of plants, pointed out by Mr. Brown in his truly excellent and instructive "Remarks on the Botany of Terra Australis," published at the end of captain Flinders's Voyage. This order is founded on the genus TETRATHEA, (see that article,) and another from the same country, named by Mr. Brown Tremandra, apparently from τρέμανος, a perforation, and σως, a man, because of the pores of the anthers. The characters of the order are thus given.

Calyx
Calyx of four or five equal leaves, overlapping each other in the bud. Petals four or five, equal, involute, and enfoldig the flaminig, before expansion. Stamens eight or ten, below the germen, distinct; anthers attached by their base, of two or four cells, burling by either a tube or pore at the summit. Germen (superior) of two cells, with from one to three pendulous seeds in each; style one; stigma one or two. Calyptra of two cells, and two valves, with partitions from their centres. Seeds albuminous, with a naked face, and an appendage at the opposite extremity; embryo in the axis of the flasky albumen, and half as long again, radicle directed towards the face. The plants are humble herbs, resembling Erics, with either flattened or whorled leaves, destitute of stipulae. Their flowers axillary, and single-flowered.

Mr. Brown prefers the name he has chosen for this order to one derived, as it ought in right of priority to be, from Tetralbea; because it better describes the structure of the flaminig in both genera: the four distinct cells not existing in the ripe state of the anthers of Tremendra, nor even of all the species of Tetralbea. We are well aware of the truth of his attention, that bilocular anthers in general have each cell divided by the inflexed valves, till they burst, being while young truly quadrilocular. We were however of opinion, in founding the genus Tetralbea, that the four cells being permanent, afforded an excellent name, as well as character. If this character does not exist in every species, it may be less important; but that it is not found in Tremandra, surely renders it the more descriptive of Tetralbea.

Mr. Brown proceeds to remark, that the writer of this, Labillardiere, has mistaken the fongous appendage to the apex of the seed for an umbilical caruncula, or appendage to the face; hence one end of the seed was taken for the other, and they were supposed erect, not pendulous; Labillardiere moreover was thus led to conceive that the radicle pointed towards the face.

The Tremandra, as Mr. Brown observes, are nearly related to Polygalae, but he objects them sufficiently distinct from the latter, not only in the regularity of the flower, and structure of the anther, but in the inflexion, or manner of folding, of both calyx and corolla; in the appendage of the seed being at its apex; and, it may be added, in the tendency to produce an indefinite number of seeds in each cell. We would rather contend than dilate the number of natural orders, as well as genera, and with respect to the first reason of our learned friend, we would recall a remark of the famous Corea, that every natural order contains some regular and some irregular-flowered genera. The different inflexion is perhaps a necessary consequence of the last-mentioned difference. The other characters are freely of small account in this cafe.

"The greater number of Tremendra are found in the principal parallel of New Holland. They extend also to the south end of Van Diemen's island, but none have been observed within the tropic."
TREMELLA.

Fructification scarcely perceptible, in a membranous, gelatinous, expanded, undulated subfance.

Nothing is more uncertain than the generic character, and even the natural order, of Tremella. The genus feems made up of various gelatinous productions, in which no traces of fructification have been detected. Having no fhiels, tubercles or warts, they could not be referred to Lichen or its allies; neither have they feeds imbedded throughout their subfance, to make them Uloce; much lefs any aggregated feeds with or without a perceptible pericarp, as in Fucus. They moreover differ from both the latter genera, in not being fubmerfed Alge; for the aquatic fpecies are, as Roth and Perfoon obferve, much better excluded. The able cryptogamifl laft named refers Tremella to the order of Fungi; but without any attempt to fhow that they produce powdery feeds from the surface of a hymeinum, or superficial memfbrane; a moft material character of fuch fungi (see that article) as have not a real pericarp with numerouf enclosed feeds. Their habit indeed is effentially dif- ferent. They are repeatedly revivefcent by means of moisture, thriving in a wet atmofphere only, though not living immerfed in water. In thefes particulars they agree exactly with the Lichenes, not with genuine fungi; which lafc, though they generally flourifh in humidity, are fcarcely revivefcent after having been dried up. The various fpecies, of which Perfoon defines twenty-four, are generally parafitical, on the bark or branches of living trees, or on dead wood. We doubt the reality of feveral, which appear to us mere gummy excudations of the plants on which they are found. This will prefently form a fubjeft of enquiry. We propofe to detail all the British fpecies, real or fuppofed, along with any exotic ones that feem particularly worthy of notice.

We are not much fatisfied with Perfoon's fections of this genus, nor do we think it advisable to adopt them here, on account of the uncertainities above-menlioned. Our determina- tion does not arise from any difrepref for that excellent author, one of the moft methodical and accurate in this obfcrve and much neglected lepth.

T. mefenterica. Plaited Yellow Tremella. Retz. Prodri. 294. Perf. n. 1. Dickf. Crypt. falc. 1. 14. Engl. Bot. t. 709. (T. mefenteriformis; Jacq. Mif. Altr. v. 1. t. 142. t. 13. T. juniperina; Hudf. n. 1. Nolte Luteum, menef- teri form.; Vaill. Parif. t. 14. f. 4.)—Seffile, cluftered, plaited, lobed, waved, orange-coloured.—Found in rainy weather in the autumn and spring, on dead branches of oak and other trees, or on decayed clumps of brown or fufce; never on living wood or bark. This very flaking and con- fpicuous fpecies forms clumps of various dimensions, from one to four inches broad, of a rich orange hue, more or lefs deep; when young pale or whift. The fubfance is soft and flexible, neither vifcid, nor very tender. In dry weather, or after being gathered, it thins, becomes hard, and assumes a dirty brown colour; but revifes in moisture. Little faltie or fmall is perceptible in any part, nor has any fign of fructification been discoverd. Yet the plant appears to be annual, and confequently must be propagated by feed.

T. lutefgens. Soft Yellowifh Tremella. Perf. n. 2. Ic. et Derf. Fung. 43. t. 8. f. 9.—"Convolute, extremely soft, deliquefcent, pale yellow."—Obferved by Perfoon on Vol. XXXVI. the branches of beech in autumn, but rarely. Half an inch broad, and of a fotfer subfance than the foregoing. We are unaquainted with this fpecies.

T. perfetfens. Perennial Purplifh Tremella. Bulliard Fung. v. 1. 223. t. 304.—Horizontal, leafy, somewhat coriaceus, smooth, undulated, pale violet.—Found on the ftems of the Savine, Juniperus Sabina, according to Bulliard, laffing for a number of fuccufive years. When the conduc- tive is hardly diftinguifhable from the black fcales of the bark; but in very moist or rainy weather it appears in the form of horizontal leaves, half an inch or more in length, bluntly rounded and lobed, of a pale vinous purple. Bulliard.

T. ferruginea. Plaited Ruftie Tremella. Engl. Bot. t. 1452.—Seffile, cluftered, lobed, waved, of a rufty-brown; the surface finely pubefcent.—Obferved by the late Mr. Crowe, at Lakenham, near Norwich, growing on dead wood, in wet weather in winter, compofing plaited con- vuluted tufts, three or four inches broad, pliable and tender, thrived and fhapeleafes when dry, reving imperfectly with moisture. The fegments are rounded and waved, not lobed or notifed; their colour a rich brown, white within the surface finely downy, or rather covered with pale veined undulated granulations, interfeted with brown irregular fpecks, more like fructification than any thing elfe that has fallen under ouf notice in this genus, except perhaps that Bulliard defcribes in the following fpecies.

T. verticallis. Upright Dark-purple Tremella. Bulliard Fung. v. 1. t. 272. (T. mefenteriformis violacea; Ibid. v. 1. 230. t. 499. f. 6, X, Y.)—Cluftered, erect, lobed, finu- ated and plaited, smooth.—Found on decayed clumps of trees in autumn. Of a vinous violet-colour when young; afterwards of a blackifh red-brown. It always grows erect, from one to four inches high, gelatinous and elastic, crack- ling between the teeth. Laid when fresh on glafs or white paper, it difcharges from every point of its surface a very fine powder, fuppofed to be the feeds. This answers to the nature of fungi, and high microfopic examinations are re- quisite to determine how these feeds are produced; whether in feries of eight together, from cells of the upper furface, as in Peziza, see that article; or in a lefs regular manner, from pores of the hymenium involving the under furface. Bulliard has finally reduced the prefent fpecies to a variety of his mefenteriformis; but it is very diftinct in many effential points from our mefenterica, and we cannot but fuppofe him to have here confused feveral fthings together. His original verticallis is faid to be valuable for its colouring principle. When boiled in water for many hours, by which the form and colour of the plant are not altered, it yields a deep brown, likely to be ufeful in dyeing. For liming, Bulliard obtained by infufion of this Tremella in fimple water, a fine reddifh fibile-colour, very durable, and pre- ferable to any that he could buy in the shops.

T. intumescens. Brown Tumid Tremella. Engl. Bot. t. 1870.—Seffile, cluftered, twifted, tumid, brown, fhining and gelatinous; when dry thin and membraneous.—Gathere- red by Mr. W. Borrer, in January 1807, on a beech in St. Leo- nard's foreft, Suffolk. This confifts of roundifh soft pulpy maifes, two or three inches broad, convolute and inflated, like the intumeftes of fome animal, of a darkith, dull, not red, brown; but with a fhining vifcid furface, obscurely doted. When cut, brown verteal freaks are obfervable a little way into the fubfance, which may contain the feeds, though none have as yet been detected.

T. moriformis. Mulberry Tremella. Engl. Bot. t. 2446. —Seffile, cluftered, twifted, black, opaque; internally fhely, deep purple.—Found by Mr. C. E. Sowerby, on pales and rails in Surry, early in June. This grows fettle, on ex- polled
posed wrought wood, in roundish or oblong, tumid, fuscous masses, various in length from a quarter to an inch, not unlike mulberries, but coal-black; their infide only is of a rich deep purple, and the centre is attached by a strong root. The plant communicates a violet stain to whatever it touches in drying.

T. farcioides. Fleasy Tremella. With v. 4. 78. Engl. Bot. t. 2450. (T. amethyften; Bulliard Fung. v. 1. 229. t. 499. f. 5. With. v. 4. 82. Helvela farcioides; Dickf. Crypt. v. 1. 21. Bolt. Fung. v. 3. 101. f. 101. f. 2. Lichen farcioides; Jacq. Misc. v. 2. 378. t. 22. Elvella purpurea; Schaff. Fung. v. 4. 114. t. 323. f. 242.)—Seville, gelatinous, roundish, undulated, blackish, beft with mammillary white-headed procifiees on the upper fide.—Common in autumn and winter on the decaying trunks of trees, and dead ficks, ofpecially the Alder. The Englih name, according to Dillenius, arofe from the plant being fuppofed efficacious againijf witches, when thrown into the fire. It confifts of roundish, unequal, lobed, indeter-

T. vorcinis. Bladder Tremella. (Bulliard Fung. v. 1. 224. t. 427. f. 3. Engl. Bot. t. 2451.)—Membranous, somewhat rigid, brownish-white, pouch-like, filled with fivicid evanefcent jelly.—Found by the late Mr. Jacob Raycr, near Maidftone, Kent. Bulliard fpeaks of it as very rare. It always grows on the ground, solitary or in tufts, attached by fibrous radicles. When young, the plant is a turgid, firm, but elafic, bag, full of fivicid jelly, and nearly upright, from one to three inches high. The jelly in time efapes, by a rupture in the bag, which collapses, and looks like a fresh bladder, juft emptied. From its or-

T. flaccida. Pendulous Black Tremella. Engl. Bot. t. 2452.—Membranous, thin, fivice and pendulous, very black; externally opaque and roughfih; internally corrugated.—Found by Mr. Sowerby on the perpendicular trunk of a living oak in Peterham park. Several fimcimens, two or three inches long, grew one above another, pendulous, in a bell-shaped manner, fo that the outer surface, naturally inferior, became uppermost, and when fresh refembled black crape in colour and roughnefs; the coneace part being paler, smooth and shining, marked with coarse reticulated veins. This fpecies, except its polition, feems moft akin to Bulliard's fuppofed variety of his Peziza nigra, v. 1. 238. t. 116, which we cannot conceive to belong to his t. 462. f. 1.

T. Auricula. Jew's-car Tremella. Linn. Sp. Pl. 1625. Perf. n. 9. Bulliard Fung. t. 427. f. 2. Engl. Bot. t. 2447. (Peziza Auricula; Bulliard Fung. v. 1. 241. Agaricum auricula fforme; Mich. Gen. 123. t. 66. f. 1.)—Seville, leathey, reddish-brown; rough beneath; rugged and plafted above, refembling an ear.—Not rare upon roten elder-trees. Perfoon fays he never found this fpecies in any other fitation. It forms large tufts of irruguaylarly plafted and convo- luted fleathy cups, of a femi-transparent reddifh-brown; the inner or upper surface palett, smooth and thinning; the outer darkfet, opaque and roughpifh. The plats branch from the middle, fo as to convey an idea of the human ear; whether Jewifh, Pagan, or Christian, depends on the compofition or elegantnes of the prototype. Bulliard afferts the feeds to be difcharged from the upper surface entirely. If this be correct, he is fuppofed in transferring the plant to Peziza.

T. beatoftorm. Brown Rough-backed Tremella. Engl. Bot. t. 1819.—Nearly fivice, fcattered, roundifh, defpuffed, brown; smooth and thinning above; rough and dotted be-
tion by Paracelsus, or any other chemist, as Geoffroy, cited by Dillenius, nits; from which those fapist philosophers hoped to extract an universal solvent, or medicine; we feel little courage or curiosity to enquire. The subject is as unprofitable as Geoffroy's own analyses of various plants, the only advantage of which is to prevent any similar mode of investigation in future.

tered, membranous, containing a fluid. — Frequent on the mud of ditches and ponds, partly dried up, in autumn, in various places round London. Innumerable crowded, somewhat flakled, globules, each about the size of mustard-

...
TRE

and rough to the touch, and scratch glass when rubbed upon it under water. By this property it may always be distinguished from asbestos, to which it bears a considerable resemblance.

_Afternoon tremolite_ (amphibole blanc and foysolé of Haiiy) is of various shades of white. It occurs massive in wedge-shaped or foliaceous concretions. The structure is fibrous and radiated; it is translucent on the edges, and somewhat brittle and feathery. The specific gravity is 2.683. It melts before the blowpipe into an opaque white mass. When rubbed or struck in the dark, it emits a pale reddish-coloured light; when thrown on hot coals, it gives out a greenish-coloured light.

_Tremolite_ occurs most frequently in granular foliated lime-stone, or in dolomite. It is sometimes found in chlorite, and more rarely in trap-rocks. It occurs at Gleneg in Inverness-shire, in Aberdeneshire, and Incolmhill, and in basalt at the castle-rock of Edinburgh. It is found also in various parts of Europe, and in granular lime-stone with augite on mount Vevuis.

_Common tremolite_ (grammatite, Haiiy) occurs of various shades of white, and sometimes dark smoke-grey. It occurs massive and crystallized. The primitive form of the crystal, according to Haiiy, is an oblique prism, with a rhomboidal base, the planes of which are inclined at an angle of 127° and 53°. The more common form of the crystals is a very acute rhomboidal prism, with the edges more or less truncated, and the lateral planes longitudinally streaked.

This mineral splits easily, not only in the direction of the planes of the crystal, but also in that of its diagonals. When one of the prisms is broken across, we may observe a line strongly marked in the direction of the principal diagonal; hence it may at first sight be considered as a twin crystal, but this is not the fact.

_Common tremolite_ is translucent or semi-transparent; it scratches glass, is brittle, and is fusible, but with great difficulty, by the blowpipe. According to Brongniart, the crystals of tremolite are rarely found pure, but generally contain a portion of the accompanying rock in the interior. The constituent parts are stated as under:

It occurs in the same situations as asbestos, tremolite, and also in metalliferous beds, and sometimes in serpentine and granite.

_Glaff tremolite._—Its colours are the same as those of common tremolite. It occurs massive, and in acicular crystals. The luster is shining, but in a less degree than that of common tremolite. It is translucent and rather brittle. The constituent parts of this mineral vary in different specimens. According to Langier, the tremolite from St. Gothard varies as under:

Though tremolite is arranged under a distinct species from hornblende and actinolite by professor Jameson, it is classed under the same family. In a general view he observes, that tremolite is characterized by its white colours, actinolite by its light green colours, and hornblende by its dark green colours. The Count de Bourbon states, that the phosphorescence of tremolite is owing to an intermixture with dolomite, and when the latter mineral is separated from it by acids, the property is destroyed.

_TREMONT_, in Geography, a town of France, in the department of the Maine and Loire; 3 miles E.N.E. of Vihiers.

_TREMOR_, in Medicine. See PALSY.

_Tremor of the Heart._ See PALPITATION.

_Tremorel_, in Geography, a town of France, in the department of the North Coasts; 8 miles S. of Broons.

_Tremouille, la_, a town of France, in the department of the Vienne; 6 miles E. of Montmorillon. N. lat. 46° 28'. E. long. 1° 7'.

_Treme_, a town of Spain, in Catalonia, on the Noguera Palaire; 20 miles N. of Balaguer.

_Trembuttel_, a town of the duchy of Holstein; 20 miles E. of Hamburg.

_Tremula_, in Ancient Geography, a town of Africa, in Mauritania Tingitana, upon the route from Ptolemais to Tingis. Ant. Itin.—Also, a town of Hulfania, belonging to the Baftian.

_Trench_, in Agriculture, a narrow opening or furrow cut in land by the plough or plough, for the purpose of draining or watering, and some other uses. Also, a small opening made in digging and working land over in different cales, and in laying it up both in ploughing and gardening. See SPRING and SURFACE DRAIN, WATERING LAND, RIDGES, and RIDING-up.

The cutting should be very exact for the two first purposes, the different sorts of materials raised being laid to the different sides of the trenches, which, in the latter case, are now mostly made in the wedge form.

Many of the bogs in Ireland have been drained, and made good ground, by only digging trenches round them.

_Trench Filled-Drain_, that fort of surface-drain which is laid with some kind of material for affording a proper passage to the water in its lower part, the upper being covered in with loose earth. See SURFACE DRAIN.

_Trench-Planting_, in Agriculture and Gardening, the practice of setting and putting out plants and other productive matters in trenches. It is a method which is had recourse to for many different sorts of crops in each of these departments of cultivation. In the former for potatoes and some others, and in the latter for a very great number of plants and roots, as is seen under their different heads.

It has lately too been practised for asparagus, and some other crops, with very great success. In planting this valuable vegetable in this way, it was done in the early spring, the ground being first dug to the depth of eighteen inches, and well incorporated with rotten dung quite to the surface; a trench four or five inches deep was then formed, in which the plants, at the time twelve inches in height, were planted at three inches apart, keeping the tops perfectly upright, and breaking or hurting the roots as little as possible, covering them in with the plaud, and treading them gently with the foot; after which the work was finished by a good watering. The plants fearfully flagged at all, though no care had been taken to preserve the mould about their roots, and not one of them died, but they far surpassed in the course of the summer those in the seed-bed rows, and some of them were capable of being cut the following year, in consequence of their great progress. The soil had a large proportion of peat-earth in it.
Sea-kale has likewise been raised in trenches with great advantage. They were made the same depth as above, eight inches of loose foil being left in the bottom, with which, six inches depth of river-land were then intimately blended. The trench was now a foot deep, and being filled with fix inches more of very light sandy loam, and the whole mixed together, was sown in a line along the middle; and as the plants grew they were earthed up. The plants became, in this mode, so stout in the second year, as to be made use of by being blanched by means of straw skimmed loosely over them, removing it as it became wet and heavy.

There are probably many other plants, feeds, and roots, that have notyet been tried, which may be raised in this method of planting with great success and advantage.

Trench-Plough, in Agriculture, that sort of tool of this kind, which is contrived for the purpose of opening and working land to a much greater depth than the common kind, so as to allow tap-rooted plants to strike them deeper, and form them better. See Plough and Tat-Root.

Trench-Ploughing, the practice of opening and loofening the foil of lands to a great depth by means of such ploughs, which is a method that is essentially necessary where the roots of crops are to shoot and strike down to great depths, as without it such roots are incapable of being grown in the best and most profitable manner. The work is sometimes performed at one operation, but in other cafes the tool does it by going twice in the same track, rendering the earth loofe, and capable of being penetrated to a still greater depth. This mode of preparing land is much too little had recourse to by farmers in many cafes.

Trenches, in Fortification, are ditches which the besiegers cut, to approach more securely to the place attacked; whence they are also called lines of approach. See Parallels.

They say, mount the trenches, that is, go upon duty in them. To relieve the trenches, is to relieve such as have been upon duty there.

The enemy is said to have cleared the trenches, when they have driven away, or killed, the soldiers who guarded them.

Trench, Tail of the, is the place where it was begun: and the head, to which it was carried.

Trenches are of several sorts, according to the nature of the soil: if the adjacent territory be rocky, the trench is only an elevation of basins, gabions, wool-packs, or earthenments of earth, cast round about the place; but where the ground may be easily opened, the trench is dug in it, and bordered with a parapet on the side of the besieged.

The breadth of the trenches is from eight to ten feet, and the depth from fix to seven: they are cut in talus, oraffle.

The trenches are to be carried on with winding-lines, in some manner parallel to the works of the fortrefs; fo as not to be in view of the enemy, nor to expose their length to the enemy's shot; for then they will be in danger of being embalmed, or covered by the enemy's cannon: this carrying of the trenches obliquely, they call carrying them by sideches, or returns. See Parallels.

Trenches, Opening of the, is when the besiegers begin to work upon the line of approaches; which is usually done in the night; sometimes within musket-shot, and sometimes within half, or only whole cannon-shot of the place, if there be no rising ground about it, the garrison strong, and their cannon well served.

The workmen that open the trenches, are always supported by bodies of men against the falls of the besieged; and sometimes those bodies lie between them and the place, as also on their right and left.

The pioneers sometimes work on their knees; and the men that are to support them, lie flat on their faces, in order to avoid the enemy's shot; and the pioneers are likewise usually covered with mantlets, or faucions.

Trench-Guard. See Guard.

Trench the Ballast, To, is a sea-phrase, signifying to divide the ballast into several trenches in a ship's hold.

TRENCHARD, John, in Biography, a political writer, was the son of Sir John Trenchard, secretary of state under king William, and born in 1669. Liberally educated, he was placed in one of the inns of court, with a view to the study of law. He was called to the bar, but as he preferred a political life, he abandoned the profession, and obtained the place of the commissioner of the forfeited estates in Ireland. Having acquired considerable wealth by marriage, by the death of an uncle, and by the decease of his father in 1695, he came into parliament for the borough of Taunton, and appeared as a patriotic member and writer. He was a zealous opponent of a standing army; and soon after the peace of Ryeck in 1697, which rendered needlefs such a force, he published a pamphlet, entitled "An Argument shewing that a Standing Army is inconsistent with a free Government, and absolutely destructive to the Constitution of the English Monarchy." This was followed, in 1698, by "A Short History of Standing Armies in England." These pamphlets are supposed to have occasioned the king's giving away his Dutch guards, and the army's being reduced to a very low establishment. In many subsequent years, Mr. Trenchard continued to write occasionally in favour of liberty; and having taken Thomas Gordon, a person of similar sentiments, into his house, they began in 1720 to publish periodically a series of papers, entitled "Cato's Letters," for the professed purpose of promoting civil and religious liberty. Trenchard died in 1723, at the age of fifty-four; and Gordon published his eulogy in the "Independent Whig," Biog. Brit.

TRENCHES, in Heraldry. See Trenché.

Trenches's Island, in Geography, an island near the coast of South Carolina; 25 miles in circumference. N. lat. 32° 13'. W. long. 89° 58'.

TRENCING, in Agriculture, the operation and practice of working over land in trenches by the spade. It is had recourse to in bringing some kinds of waste lands into cultivation, in some cafes and particular situations, as in the northern parts of the island, where labour is cheap; but in others it is mostly too expensive.

It, however, answers sometimes in cafes where it could hardly have been expected, on account of its being so very complete, as scarcely to require anything being done afterwards to the ground.

The term also signifies the laying up land in the ridge form, either by the spade or plough.

TRENCHMORE, the name of an old English dance; of which nothing certain is now known, but that it was a lively movement.

TRENC, Frederic, Baron von, in Biography, an adventurer, was descended from a noble Prussian family, and born at Konigfberg in 1726. Having been too much indulged in his youth, and losing his father when he was twelve years of age, he became ungovernable, and the sport of his own impetuous passions. In 1742, at the age of sixteen years, he entered into the Prussian guards, then quartered at Potsdam. In 1744, at the commencement of the second Silesian war, he entered the king as an aide-de-camp; but being suspected of a traitorous correspondence, he was arrested, and confined in the prison of Glattz, and failing in his first attempt to make his escape from prison, he at length succeeded.
ceded by bribery, and got safe to Bohemia, and afterwards to Elbing, in Polish Prussia, in March 1747. After various adventures he arrived at Moscow, where he informed himself into the good graces of the lady of the grand- chancellor Beflouch, the favourite of Elizabeth. From Moscow he made a circuitous tour to Vienna, with a view of recovering some contended property; and dissatisfied with the reception he found at the Austrian court, he determined to return again to Russia; but in passing through Dantzie, he was arrested at the request of the Prussian republic, and committed to prison at Magdeburg, where he remained ten years. Here he amused himself, during a tedious and rigorous imprisonment, in writing verses. which, long after his release in 1763, he published at Frankfort on the Main, in 1769. He published some other works at Aix-la-Chapelle, where he became editor of a gazette, and married a lady of respectable character and connections. Finding the occupation of a gazette-writer tiresome and not lucrative, he began business as a wine-merchant: but the wine-trade not answering his expectations, he disappeared about the year 1783. In 1792 he edited a journal at Hamburg and Altona, and from the latter place he removed to France, where he left his life by the guillotine in the month of July 1794. The Memoirs of his own Life appeared at Berlin in 1787, in two parts, 8vo. Of the authenticity of the facts related in these memoirs, great doubts have been entertained. His life, translated into French by himself, was published at Paris in 1789, 3 vols. 8vo. A new edition of his "Macedonian Hero" was printed in 1788, Franckfort and Leipfick, 8vo. Gen. Biog.

TRENCSIN, in Geography, a town and castle of Hungary, near the river Waag, situate on a rock, and defended by a very strong castle. Near it are some hot baths; 20 miles N.N.W. of Topoltzan.

TREND, that part of the flock of an anchor from which the fize is taken.

TRENDING, in Rural Economy, the operation or practice of freeing wool from filth of different kinds. It is usually done by persons who are called tenders, and who are appointed and sworn for the purpose. In most sheep-districts, the bell wool is always understood to have gone through this process, and then to be worth two or three fullings the tod more than other untreated wool. The fleeces in such cafes are neatly rolled together, and bound with oyer or with bands in some places. It is sometimes termed tendering. See Sheep and Wool.

TRENDLE, a term signifying the wheel of a barrow, or any thing which turns round in that manner when the low wheel kind.

TRENNO, in Geography, a town of Italy, in the department of the Olona; 4 miles N.W. of Milan.

TRENSDorf, a town of Bavaria, in the bishopric of Bamberg; 4 miles S. of Bamberg.

TRENT, a city of the county of Tyrol; in Latin Tridentum, called by the Italians Trento, and by the Germans Trient; and situated upon the Adige or Etch, in a very fruitful valley, surrounded with high hills. It was built by the Cenomani Gaus, who were dispossessed by the Romans. The Goths became masters of it when they came into Italy, and after them the Lombards. Afterwards it was possessed by the German emperors, until 1337, when Wencelhaus, son to Charles IV., gave it to the church of Rome. Afterwards its bishops, being made princes of the empire, became temporal as well as spiritual lords of the city. Some authors affirm that the name Tridentum is derived from Neptune's sceptre, or trident, to whom they say the city was once consecrated. This opinion took its rise from an ancient marble being found there, on which was a Neptune holding his trident. Others derive the name from three rivers and torrents that fall into the Adige, a little above and below the city. Others say it owes its name to three high rocks in the neighbourhood, which appear like three teeth, tres dentes. The bishop was a prince of the empire, and temporal as well as spiritual lord of his diocese, which is of very considerable extent; but notwithstanding the sovereignty of the bishop, the city of Trent has its own distinct privileges, and magistrate to prefer them: these consist of two burgo-males, who preside by turns, and twelve counsellors. Trent contains no streets exactly regular, but the antique style. Besides the cathedral, there are three parish churches, a college, and some convents: 55 miles N. of Maestri. N. lat. 46°. E. long. 11° 5'.

TRENT, a princely bishopric of Germany, situated in the Tyrol, in which this ancient bishopric was gradually increased by the liberality of the ancient Roman emperors. Though the bishop of Trent, after the revolution ratified in the reeves of the empire, at Augsburg, in the year 1548, held of the archducal house of Austria, as a land fief, yet he enjoyed, as an immediate prince of the empire, both a seat and voice at the diet, in the college of princes of the empire, and likewise actually sent deputies to the diet of the empire. This privilege was also a flate of the circle of Austria. Among the indemnities agreed to at Ratibon, in 1802, the bishopric was given to the grand duke of Tuscany, as archduke of Austria. It was afterwards ceded to Bavaria.

TRENTO, a town of the island of Rugen; 11 miles N.W. of Bergen.

TRENT, a river of England, which rises in the north-west part of Staffordshire, on the borders of Cheshire, about six miles south-west from Leek; taking a south-east direction, it crosses the county to the borders of Leicestershire and Derbyshire; it then takes a north-east direction, and crosses the county of Derby and Nottingham to Newark, from whence its direction becomes nearly due south, till after passing a small part in the north of Lincolnshire, it joins the Ouse, and the two streams form the Humber. Canals are made or making, to open a communication between this river and various parts of the kingdom, e.g. from the mouth of the Idle, below Gainborough, to Redford and Chelferfield; to Lincoln, and from thence to Tatterfall, Horncastle, Seaford, Boston, and the sea; from near Nottingham, to Cromford and Winfler; from the mouth of the Derwent, one branch through the counties of Derby, Stafford, and Chester, to the Mersey, which is joined with another branch to Coventry and Birmingham, where it meets with the canal from Brentford: other branches join the Thames at Lechlade, the Avon at Warwick, the Severn at Worcester, and many others. The Trent is of itself navigable from Burton in Staffordshire.

TRENT, a river of Canada, which runs from Rice lake to Lake Ontario.—Alfo, a river of North Carolina, which runs into the Neufce, at Newbern.

TRENT, Council of, in Ecclesiastical History, denotes the council assembled by Paul III. in 1545, and continued by 35 lefions till the year 1563, under Julius III. and Pius IV., in order to correct, illustrate, and fix with perplicity, the doctrine of the church, to restore the vigour of its discipline, and to reform the lives of its ministers. But it has been a matter of complaint by many, both in and out of the communion of the church of Rome, that this assembly, instead of reforming ancient abuses, rather gave rise to new enormities. It is alleged, that opinions of the scholastic doctors on intricate
intricate points, which had been left undecided, were by this
enactment, and the new laws, that had been the church, more intricate and
perplexed, and which really multiplies and propagates, in
stead of diminishing and suppressing them: that matters were
decided in this assembly, according to the despotic will of
the Roman pontiff, without regard to the dictates of truth,
or the authority of Scripture; and that the few wise and
pious regulations that were made in this council, were never
supported by the authority of the church, but suffered to
degenerate into a mere lifeless form or shadow of law, which
was treated with indifference, and transgressed with impunity.
It will not, therefore, appear surprising, that there are
certain doctors in the Romish church, who, instead of
submitting to the decisions of the council of Trent, as an
ultimate rule of faith, maintain that these decisions are to be
explained by the dictates of Scripture and the language of
tradition: nor can we wonder that this council has not
every where the fame degree of credit and authority, even in
those countries that profess the Roman Catholic religion.
Some countries, indeed, such as Germany, Poland, and
Italy, have adopted implicitly and absolutely the decrees of
this council, without the least restriction. But in other
places it has been received and acknowledged on certain
conditions, which modify, not a little, its pretended author-
ity. Among these latter we may reckon the Spanish do-
minions, which, during many years, disputed the authority
of this council, and at length acknowledged it only so far as
it could be adopted without any prejudice to the rights
and prerogatives of the king of Spain. In other countries,
such as France and Hungary, it has never been solemnly
received or publicly acknowledged. Indeed in the former of
these kingdoms, those decrees of Trent that relate to points
of religious doctrine, tacitly and imperceptibly through the
power of custom, acquired the force and authority of a rule
of faith; but those which regard external discipline, spiri-
tual power, and ecclesiastical government, have been con-
stantly rejected, both in a public and private manner, as in-
consistent with the authority and prerogatives of the throne,
and prejudicial to the rights and liberties of the Gallican
church.

Notwithstanding the preceding remarks, the decrees of the council of Trent, together with the creed of pope
Pius IV., contain a summary of the principal heads of the
Roman Catholic religion. See POPERY.

However, in these decrees and confession of faith, many
things are expressed in a vague and ambiguous manner, with
a view to the intellelive divisions then prevalent in the church:
and several tenets are omitted in both, which no Roman Ca-
tholic is allowed to deny, or even to question. But it must
be acknowledged, that in these decrees, and in this confession,
several doctrines and rules of worship particularly pertaining
to the doctrine of purgatory, the invocation of saints, and the
worship of images and relics, are inculcated in a much more
rational and decent manner than that in which they appear
in the daily service of the church, and in the public practice
of its members: and it is to be observed, that in deducing a
just notion of the doctrine of Rome from the decrees of the
council of Trent, regard ought to be had, not so much to
the terms made ufe of in these decrees, as to the real signifi-
cation of these terms, which must be drawn from the cus-
toms, institutions, and observances, that are, everywhere,
Eng. ed. 8vo.

Trent, Council of, congregation for interpreting the decrees
of the, is a congregation, the plan of which was formed by
Pius IV. and afterwards instituted and confirmed by
Sixtus V. It was authorized to examine and decide, in
the name of the pope, all matters of small moment relating
to ecclesiastical discipline; while every debate of any con-
sequence, and particularly all disquisitions concerning points
of faith and doctrine, were left to the decision of the pontiff
alone, as the great oracle of the church. Hence it was,
that the approbation of Innocent XI. was refused to the
artful and insidious work of Boffuet, bishop of Meaux,
entitled "An Exposition of the Doctrine of the Catholic
Church," until the author had suppressed entirely the first
edition of that work; and made corrections and alterations
in the second. See POPERY.

But though the court of Rome, and all those who favour
the despotic pretensions of its pontiff, maintain, that he
alone who governs the church as Christ's viceregent, is
entitled to explain and determine the fcnse of scripture and
tradition in matters pertaining to salvation, and that a devout and unlimited obedience is due to his decisions; yet
it has been impossible to persuade the wiser part of the
Roman Catholic body to acknowledge this exclusive author-
ity in their head. And consequently, the greater part of the
Gallican church, and a considerable number of learned
men of the popifh religion in other countries, think very
differently from the court of Rome on this subject. They
maintain, that all bishops and doctors have a right to con-
Sult the sacred fountains of scripture and tradition, and to
draw from thence the rules of faith and manners for them-
selves and their flock; and that all difficult points and
debates of consequence are to be referred to the cognizance
See INFALLIBLE.

Trental, Triennial, or Tricennial, a Romish
office for the dead, confituting of thirty masses, rehearsed for
thirty days successively after the party's death.

The trental is thus called from the Italian, trenta, tri-
ginta, thirty. It is mentioned anno primo Edw. VI.

Trenton, in Geography, a town of New Jer-
y, in the county of Hunterdon, on the E. side of the Delaw-
re. Here the legislature flately met, the supreme court fit,
and most of the public offices are kept. The court-house is
a handsome building. There is a flourishing academy, and
the number of inhabitants is about 3000; 24 miles N.N.E.
of Philadelphia. N. lat. 4° 13'. W. long. 74° 48'.—
Also, a poll-town of the province of Maine, in the county
of Hancock, containing 501 inhabitants; 31 miles N.E.
of Penobscot.—Also, a town of North Carolina, on the
river Trent; 20 miles S.S.W. of Newbern.—Also, a poll-
township of New York, in Oneida county, 12 miles N.
of Utica; bounded northwvrd by Steuben and Remsen, easterly by West Canada creek or Herkimer county, S. by Deer-
field, and W. by Floyd. The town is well watered by small
streams, and by springs. The soil is good: the forest
woods are elm, linden or bals-wood, butternut, beech, map-
y, &c. The inhabitants are principally of New Eng-
land decent, though some are of the ancient Dutch from
Holland, and their industry is well rewarded by the pro-
ducts of agriculture. There are some very remarkable
falls in West Canada creek, on the eastern border of this
town. This stream affords numerous feites for mills in
Trenton. The population is 1548; the senatorial electors are
127. The largest compact settlement in this township
contains from 70 to 80 buildings, and is distant 13 miles
from Utica and 107 from Albany.

Treo, a town on the E. coast of the island of Paros.
TREOGAN, a town of France, in the department of the North Coasts; 9 miles W.S.W. of Roskiren.

TREOGAT, a town of France, in the department of the Finisterre; 9 miles S.W. of Quimper.

TREPAN, in Surgery, a circular saw, by means of which the skull is perforated in the operation called trepanning. It bears a considerable resemblance to the well-known instrument named a wimble, and is worked in the same manner.

A representation of it is given in Plate VIII., fig. 6. of the surgical plates. Formerly, the saw was sometimes made of a conical shape (see fig. 5.); but this construction rendered the action of the instrument difficult; and as the fear of a cylindrical saw penetrating too suddenly, so as to injure the brain, was found by experience to be an insufficient reason for the conical shape of the saw, the cylindrical trepan at length came into general use. In this country, the trepan is now imperfectly by the instrument called a trephine, which has a different kind of handle from that of the trepan, and is not worked in the same way. (See Trephine.) On the continent, however, the trepan still has the preference. Mr. Rodman's trepan (fig. 4.) is objectionable, because with it you cannot increase and diminish the pressure on any particular point of the circular groove in the bone, as occasion requires. You must continue to saw every part of the circle. Hence, if the bone be sawn through in one place, and not in another, as generally happens before the operation is finished, the further action of Mr. Rodman's saw will inevitably do mischief to the dura mater, and is not well calculated for completing the division of the bone. See the following article.

TREPANNING, or Trephining. From what has been said in some preceding articles of this work, (see particularly Head, Injuries of, Extravasation, &c.) the operation of trepanning or trephining, or that of sawing out a portion of the skull, is, in several affections of the brain from compression or irritation, the only means of preserving life, and of all other remedies the most urgent and effectual. It should be performed in good time, and the repetition made according to the exigency of the case. In the records of surgery, innumerable facts may be consulted, where the prudent and judicious employment of the trepan has effected wonderful cures, and been the only thing by which the patients' lives could possibly have been saved. The benefit which the operation brings about, is also sometimes so sudden and alonning, that in no instance does the interpolation of the surgical art display itself to greater advantage. The immediate restoration of sight by the depression or extraction of an opaque effusion from the eye, is not more beautiful and striking, than the instantaneous communication of the intellectual faculties, and of the powers of speech, of feeling, &c. together with voluntary motion, to a victim lying in an apparently lifeless state from an injury of the head. The utility of the trepan is occasionally manifested even in this degree. In the valuable essay of Mr. Abercromby on injuries of the head, a case may be seen, in which the patient, who had been in a condition almost devoid of animation, rose up and spoke the instant the extravasated blood was removed from the surface of the brain. And among the wounded at the battle of Waterloo, there was a folder of the 44th regiment, whose case is of equal interest. He had been struck with a musket-ball on the right parietal bone, which was exposed, and had no appearance of being fractured.

As, however, the symptoms of compression were urgent, and the patient was in nearly a lifeless state, the writer of the present article conceived it right to apply the trephine to the part on which the violence had acted. He had not sown long before the external table came away in the hollow of the trephine, leaving the inner table behind, which was not only splintered, but driven at one point more than half an inch into the membranes and substance of the brain. No sooner were the fragments taken out with a pair of forceps, than the man instantly sat up in his bed, looked round, and began to speak with the utmost rationality. It is a most extraordinary fact, that this patient got up and dressed himself the same day without leave from the medical officers, and never had a bad symptom afterwards. Immediately the operation was finished, the temporal arteries were opened, and some purgative medicines exhibited.

Let not the young surgeon, however, draw from these dazzling cases of success an immoderate solicitude to perform the operation; for it should never be undertaken but in the most preluding circumstances, and when the symptoms unequivocally shew, that a dangerous degree of pressure on the brain exists. We recollect an unfortunate example, in which an hospital surgeon of this metropolis ventured to saw out a portion of the frontal bone for a mere long-continued pain in the part: the patient was attacked with inflammation of the dura mater, and perished in three or four days. We may therefore conclude, that the operation is not itself exempt from danger; and it is certain that it ought never to be resorted on without deep consideration.

The trepan or trephine is never necessary in injuries of the head, except for the purpose of relieving the brain from pressure. Such pressure may be caused by a depressed portion of the cranium, or it may be produced by an extravasation of blood, or the lodgment of matter, betwixt the skull and the dura mater. The chief danger of concussion, when the accident is not directly or soon fatal from the disorganization and mischief done to the brain, depends upon the consequent inflammation of this organ, and therefore can be little likely to be benefited by the use of the trepan. If the operation becomes proper in such a case, it is when an abscess has formed under the cranium, and when the confined matter itself creates bad symptoms by its pressure on the brain. This state of things, however, cannot come on till after the inflammation of the brain and its membranes has prevailed a certain time, and it is always accompanied with a detachment of the pericranium and a puffy tumour of the scalp; or, if there be a wound of the latter part immediately over the abscesses, the lips of the injury acquire suddenly an unfavourable appearance, and lose their vermilion colour. The patient has also had much preceding febrile disorder, pain and tension over the whole head, redness and turgence of the eyes, and generally more or less delirium. When the matter is forming, there are usually some rigors, and as soon as it is formed, the patient falls into a comatose state, and paralytic symptoms frown themselves. Here the urgency for the prompt application of the trephine is very great, and the patient's chance of living is almost essentially connected with the immediate performance of the operation. This important case has been particularly dwelt upon in the writings of Mr. Pott.

In the articles Head, Injuries of, Extravasation, &c. we have laid down the most remarkable symptoms of concussion and compression of the brain, a subject which every surgeon should study with earnest attention, before he ever presumes to employ the trepan. For sometimes these accidents are extremely difficult to be discriminated; sometimes they exist together in the same individual, a complication which is peculiarly embarrassing; and in every instance where the symptoms are those of concussion, the
TREPPANNING.

operation, so far from being indicated, would be a step of all others the most likely to do harm, by increasing the irritation and inflammation of the brain and its membranes. A fall upon the back, or upon the head, occasions a direct concussion of the brain, and the shock, not being wholly neutralized by the intervention of any yielding elastic structure, is the more dangerous. When a person has fallen from a certain height, and pitched upon his head, his back, the buttocks, the knees, or even the soles of the feet; when he has been instantly deprived of his senses, and then by degrees recovered them and come to himself again; the fact of his having suffered concussion of the brain is clear and indubitable. Concussion has likewise taken place, though in a flighter degree, when the patient has been only stunned by the fall, and experienced a benunciation of sparks. But a multitude of degrees separate this feeble concussion from that, in which the substance of the brain is instantaneously disorganized, so that the patient has not the possibility of recovery.

The symptoms of concussion of the brain are attended with coma, and the compresion of this organ by an extravasation is also accompanied with lethargic heaviness. How, then, is the surgeon to ascertain, whether the comatose disorder arises from one or the other of these affecting?

Here, in order to avoid repetitions, we beg leave to refer to the observations already made in the articles quoted above. But there is one criterion of such first-rate importance, that it may prevent innumerable fatal mistakes, and, indeed, without the continual recollection of it, no man ought to be rash enough to interfere with this dark and abrufe part of surgery. On this account we shall mention it here, notwithstanding we have already noticed it elsewhere. If the patient is knocked down and stunned directly by the blow, and remains in a state of insensibility, these primary symptoms are aafeivable to the concussion. On the contrary, when the coma and loss of sense do not take place till an hour or two after the blow, they are to be imputed to an extravasation.

The shock given to the brain by concussion, must, like every other impulsive communication, continue to diminish until it ceases altogether. If, at the very time of the blow, the shock has not been forcible enough to produce alarming symptoms, such symptoms will not afterwards come on when their cause is weakened. Hence the reason may be discerned, why concussion may be distinguished from concussion of the brain, when there has been an interval of sense between the receipt of the blow, and the occurrence of the bad symptoms. But the distinction of the symptoms into primary and consequent, cannot be made when concussion and extravasation exist together.

Having made these few remarks on concussion and concussiocon of the brain, remarks which seemed necessary before we entered into a description of the operation of the trepan, we shall next premise some observations relative to contusions and fractures of the skull, cases on which the most erroneous opinions have been entertained. It is true, that we have in another place (see Head, Injuries of,) considered the subject; but we think it better to recapitulate certain points here, because they have such immediate connection with the application of the trephine.

Contusions of the head not unfrequently occasion a small kind of tumour, which is soft in the centre, but hard and refilling at the circumference, especially when the violence has been considerable. Now the case with which the centre or feat of the extravasated fluid admits of being depressed, while the circumference remains hard and elevated, is extremely apt to give rise to the belief, that a fracture with depression has happened. The true nature of this accident was first clearly explained by the eminent M. J. L. Petit, and since his time the proper cautions, not to fall into a mistake concerning it, have been laid down by the generals of surgical writers.

Often nothing is more obscure than the diagosis of fractures of the cranium: their existence indeed can only be made out with certainty, when they can be felt or seen. Thus a fracture of the skull, attended with a wound of the scalp, and exposure of the bone, shews itself in the form of a fissure more or less wide and extensive, and taking various directions. The accident may also be known by the touch, even when the soft parts continue entire, particularly if the fracture is accompanied with splinters, or the edges of the fissure are materially separated. When there are many splinters, entirely detached, a crepitus will likewise serve to explain the nature of the accident; but, unaided by these symptoms, imparted to him by the sight, the hearing, or the touch, the practitioner cannot at once offer a decided opinion as to whether a fracture exists or not.

In order to procure more positive information, would it be right and judicious to make several incisions and uncover the bone? But here the surgeon would be embarrased in the very commencement of his proceedings; for how would he be able to judge where the knife should be applied? Why also should he refer to an useless and painful operation, which (to say the best of it) could only render the patient's cure more distant.

The symptoms indicating compression of the brain, can alone justify an examination of the fracture. These symptoms also must be urgent and alarming; for when they prevail in a flight degree, bleeding and evacuations promise more benefit than any operation on the skull, and consequently all examination of the part supposed to be broken must be unnecessary. The precept, too commonly given, to cut through the scalp for the purpose of bringing the fracture into view, will no longer be matter of suprême, when it is known that, with some surgeons, the operation of the trepan is a thing of course in all fractures of the cranium.

Even when the cranium has been denuded, so that the sight can convey the information respecting the solution of continuity in the bone, care must be taken not to be deceived by a future, or by the groove of a vessel. In cases of doubt, a modern surgical author advises us to scrape the outside of the bone; and he tells us, that if, after the removal of the external table, the fissure yet appear, and a thread of blood be seen at its outer part, no doubt exists of its being a real fissure. As, however, making this examination can answer no purpose, except with a view to determining the place where the trepan should be applied, we cannot recommend the plan, except where the symptoms are such as to render this information desirable. On the contrary, it appears to us, that all examinations of the bone, made seemingly from mere curiosity, and without any true surgical object, should be deprecated as rash and hurtful.

The danger of fractures of the skull does not depend upon the simple solution of continuity: it bears altogether a relation to the concussion and compression of the brain, with which the injury of the bone may be complicated. The fissure, which is caused by depressed splinters of bone, is less alarming, inasmuch as the cause of the compression is easy of removal. The fissure arising from extravasated fluid is far more serious, in consequence of the difficulty of ascertaining positively the existence and precise situation of such extravasation.
The seat of the extravasation is sometimes between the skull and the dura mater, which has been detached from the bone. More frequently it occurs either between the dura mater and tunica arachnoidea, in the substance of the brain, or else in the ventricles. The quantity of extravasated fluid is generally less in those extravasations which are situated between the dura mater and the skull. The extravasations, which are formed in the substance of the brain itself, are not only more considerable, but also, as they mostly depend upon concussion, are more alarming, than effusions on the surface of the dura mater. It is indeed extremely difficult, if not impossible, to ascertain the situation of the extravasated fluid. In such cases, the trepan is likewise of no use; while concussion, when so violent as to produce internal extravasation, is invariably fatal. In extravasations between the dura mater and the skull, which are almost the only cases of the kind to which surgery can administer relief, when the effused fluid lies under a part of the skull accessible to the trepan, the extravasated fluid is almost always small in quantity. The danger, however, is not the less: ten or twelve drops of fluid are sometimes enough to produce a fatal compression. When the extravasation has happened in the substance of the brain, the compression is far more perilous; in short, it may be said to prove, with very few exceptions, certainly mortal. The danger is not fo great, when the extravasation is situated between the skull and dura mater.

The lethargy, the degrees of which increase from mere drowsiness unto the most perfect coma, and the paralysis of the opposite side of the body to the seat of the extravasation, are the characteristic symptoms of this accident, in cases of injury to the head. Having explained elsewhere (see Head, Injuries of, Concussion, Extravasation, &c.) some other symptoms, such as floridous respiration, dilated pupils, &c. which usually indicate-pressure on the brain, we need not here dwell upon them. The frequent incafe of the coma and paralytic affections, and the gradual augmentation of their intensity, serve to render these symptoms distinguishable from others, which are suddenly brought on by concussion. But there are instances, as every man of experience knows, in which the concussion ruptures the blood-vessels, and produces an extravasation of blood. In this circumstance, it is obvious that the symptoms of compresion are blended with those of concussion. The symptoms, proceeding from the latter cause, always diminish in proportion to the time which has elapsed from the moment of the injury; while those of compression succeed, and, on the contrary, increase in intensity, in proportion as the quantity of extravasated fluid becomes more considerable. Notwithstanding these distinctions, however, it must be acknowledged that there are many cases in which the surgeon is obliged to remain in doubt with regard to the particular cause of the symptoms. This indecision is the more embarrassing, because the operation of the trepan is necessary in cases of extravasation, but useless in those of concussion. Even when extravasation is known to exist, the practitioner requires more information; for he ought to know the precise situation of the effused fluid. It is true, indeed, that paralysis of one side of the body indicates the pressure to be upon the opposite hemisphere of the brain. But what surgeon would venture to follow the practice advised by Van Swieten, and apply to the suspected side of the head three crowns of the trepan? Possibly not one of them might fail in the situation of the extravasated fluid. When the skull is broken, the extravasation exists on the same side as the fracture. When it is the effect of concussion, or when the breach of continuity in the skull is what is termed a counter-blow, the effusion is generally on the side of the head most remote from the blow. If the pressure is caused by a detachment of the internal table of the skull, the nature of the case cannot be ascertained, before the operation of the trepan has been performed on the part of the skull upon which the violence has acted. When there are two extravasations, one depending upon a fracture, and situated immediately under it, between the dura mater and the skull; the other arising from concussion, and situated at some point directly opposite, either between the dura mater and tunica arachnoidea, or within the substance of the brain itself; paralysis may occur on the same side as the fracture; and hence it may be inferred, that the palsy does not always take place on the side opposite to the extravasation. But an examination of the body quickly proves, that the case does not deviate from the common rule. The extravasation produced by concussion, being almost invariably more considerable than that caused by a fracture, accounts for the extension of the palsy to the same side of the body. Sometimes the side which is not paralyzed is affected with convulsions, the pulse is full and hard, and the respiration floridous; in short, the symptoms are analogous to those caused by apoplexy.

The evacuating plan, recommended for the treatment of concussion (see Concussion, and Head, Injuries of,) is all that can be done, when every thing is uncertain relative to the situation of the extravasation. It is all that can be done in those frequent instances, where the effusion has taken place in the substance of the brain, so that it cannot possibly be voided. The trepan then is indicated only when there is an extravasation between the dura mater and the bone, the fracture being situated in a part of the skull accessible to instruments, and not at the bafe. We will not here dwell upon the doubtful example, where the fluid lies between the dura mater and the arachnoidea. But are the cases, which we have just been describing, as frequent as they are supposed to be? Cannot the effused blood be generally discharged through the interstices of the broken pieces of bone? Is the trepan usually necessary for the relief of injuries of the head, as Quefnay, Pott, and the French Academy of Surgery maintained?—We think not. The operation is often useles, and sometimes dangerous. We believe that it should be limited to a small number of cases. The exact determination of the cases in which it is absolutely indispensible, is one of the greatest desiderata in modern surgery.

Richerand contends, that extravasations between the skull and the dura mater, if considerable as to produce compression of the brain, and render the trepan necessary, are much less common than many surgeons think. Even when they do occur, the dura mater is always detached to a certain extent; and, according to this writer, if the bone is much broken, the interstices of the fragments are quite sufficient for the evacuation of the effused fluid. The following case is quoted in proof of this observation. A woman injured her head, by falling from a height of fifteen feet. The fracture reached the whole breadth of the skull, so that when the os frontitis was taken hold of with one hand, and the os occipitis with the other, the two halves of the cranium admitted of being manifely moved and separated. Blood issued from the fissure, the edges of which were kept apart by a small wedge of wood, in such a manner that the pulsations of the brain were visible. On the sixth day, as nothing was discharfed from the fissure, the bit of wood was removed; and on the fifty-second, the wound had completely healed without any exfoliation. On the seventy-second, the patient was discharged from the Hôtel-Dieu, perfectly.
TREPANNING.

Thus we see that the trepan is often unnecessary in injuries of the head, with fractures of the skull, notwithstanding the co-existence of an extravasation between the bone and the dura mater. This doctrine is very different from what is taught in the memoirs of M. Quefnav, in the first volume of those of the French Academy of Surgery. Default, in the last years of his practice, abandoned the operation of the trepan altogether. It has been remarked for many years, that in the Hôtel-Dieu this operation has had very little success; a circumstance which has excited a suspicion, that the soul air of the wards of that establishment may have had a share in bringing on the unfavourable event. We shall not here expatiate on the bad effect of the atmospheric air on the membranes of the brain; a thing of which B. Bell seems to have convinced M. Richerand.

When the skull is fractured by a blow or fall, and the cafe is a simple fiffure, the trepan ought to be applied upon the solution of continuity, if the symptoms indicate a dangerous degree of pressure on the brain, and the edges of the fracture are not sufficiently separated to let the extravasated fluids escape.

When the detached portions of bone are depressed, fo as to comprefs the brain, the operation is still requisite, if they cannot be elevated by other means. But Richerand maintains, that a positive indication for trepanning is not frequent, either because it is difficult to judge of the existence and situation of extravasations, or because extravasated fluids readily escape through the interpaces of the fragments, when there is a splintered fracture. Such facility is allo increafed, when one of the portions of broken bone is totally detached, fo that it can be removed, leaving an aperture equivalent to what would be produced by the application of the trepan.

When the indications render it neceflary, there is no point of the external surface of the cranium to which the trepan, or trephine, may not be applied. The region of the frontal spine and fninnes, however, and the situation of the fphenes and inequalities of the occiput, the lower part of the squamos portion of the temporal bone, and the track of the meningeal artery running under the anterior inferior angle of the parietal bone, are places to which the instrument ought never to be applied without urgent necessity. The surgeon may trepan upon the futures, and over the sinusses of the dura mater, with perfect safety. A wound of the longitudinal fissus has not only been found to be free from danger, but actually beneficial, by the evacuation of blood that has followed. The experience of Pott, Callifen, &c. confirms this fact; and they have even purposely opened the vessell with a lanceet. Callifen, Syllf. Chir. Hodierne, tom.i. p. 659. edit. 1708.

The manner in which the two tables of the skull recede from each other at the frontal sinusses, would make the operation difficult. Defides, here the spine of the os frontis projects inward, fo that the whole of the bone could not be faown through, without the dura mater being lacerated. In an urgent cafe, however, the surgeon might trepan exactly on the frontal spine, by removing the outer table of that cavity with a large trephine, and applying a finall one to the inner table. Perhaps alo, in these prefling examples, it would be proper to trepan on the centre of the os frontis, and ufe a chifel for breaking the inner spine of that part of the bone. In the fame way, although a surgeon would al- ways prefer avoiding the meningeal artery, he ought not, in urgent cafes, to be afraid of it. The bel flmoforns, well know that the hemorrhage from that vessell is capable of being easily suppressed, by the introduction of a small plug into its orifice.

The practionier can never be too careful not to place the trepan on a loose part of the fractured bone, as it would be apt to be prefixed inward, fo as to do mischief to the brain.

When the cranium has been perforated with the trepan, and nothing is found between the skull and the membrane which underlies it, the situation where an extravasation may be suspected to exist, additional perforations should be made elsewhere, if the symptoms should indicate fuch practice. The repetition of the trepan is particularly requisite in cafes where the fiffure runs across a future. The intime adhesion of the dura mater to the future, explains why this membrane often continues undetached in that situation, while on each side it is separated from the bone, and blood effused upon it. There are then two diftinct extravasations, and two perforations of the bone are absolutely neceffary for the discharge of the blood.

Foreign surgeons invariably prefer, for the accomplish- ment of the operation, an instrument called the trepan, which much resembles a wimble, a tool extensively employed by cooper's, and, like it, confists of a handle, to which is adapted a circular faw, or, as it is termed, the crown of the trepan. The diameter of the crowns varies from fix to ten lines, and they are about one inch in height.

In England, the trepan (Plate VIII. Surgery) has gone into difufe, the trephine being generally preferred, though perhaps without great reafon. The trephine differs from the trepan in having its crown fixed upon and worked with a common transfere handle, instead of being turned with a handle like that of a wimble. On the continent it is objecuted, that the trephine which the English surgeons make use of, requires a ftronger hand and greater preffure than the trepan; fo that at the moment of finifhing the division of the bone, one runs a risk of forcing the instrument too deeply, and lacerating the brain and its membranes. We must confeft, however, that we have never seen this accident occur, and the trephine is now made in fo excellent a manner, that it will cut the bone fufficient enough without any oceafion for immoderate preffure. If some badly made trephines cut with too much difliculty, the trepan may be acucced of dividing the bone with too much celerity. A man of ordinary ilkill may ufe either instrument, and an awkward practionier will be apt to do mischief let him employ which he will. See TREPINE.

The firf object in the performance of trepanning, is to expofe the exact part of the bone on which it is intended to apply the instrument. In some cafes, the scalp is fo torn and injured, that a fufficient extent of the skull is already uncovered, and it is neceffary to employ a Scapul. But in the majority of inftances, the ufe of the knife must precede that of the faw. Incisions of a crucial form, or shaped like the letter T or V, are found to be the moft eligible, because they allow their edges to be brought together again with cafe, and they enable the surgeon to denude a larger surface of bone than could be managed with an incision of a different figure, but of equal fize. The old surgeons ignorantly made circular wounds, and without confeferation cut large portions of the scalp away before they applied the trepan. The confequence was, that the patient was fully of being permanently disfigured, and the edges of the perforation, remaining for a long while uncovered, frequently exfoliated.

The generality of furgical authors next advise us to be careful to afcape away the pericranium from the part to which the trepan, or trephine, is to be applied, fo as to let the faw act with more facility. We have never found this proceeding
proceeding necessary, and conceive that, as more of the pericranium must always be removed than what is absolutely intended, it may sometimes be the cause of exfoliations. We advise it, therefore, to be rejected, as well as the old plan of scraping the pericranium off the bone, which must be fawn in amputations. The ruginum, which is kept in most cases of trephining, instruments for the purpose of scraping off the pericranium, would be no real loss if omitted.

Now, on first beginning to work either with the trephine or trepan, the practitioner would find that it would flip about and not readily divide the bone, were it not for a particular contrivance. This is the centre-pin, which admits of being pulled down a little below the level of the teeth, and being very sharply pointed, immediately fixes itself in the mid-point of the circle of bone which is to be removed. As soon, however, as the teeth of the trephine have made a sufficient furrow, the centre-pin should be withdrawn, as it would otherwise wound the dura mater before the sawing of the bone were completed.

In making the incision through the scalp, when there is a fracture, the knife must be used with some degree of caution, lest it should depress the fragments of bone against the cerebrum, or be carried too deeply, so as to injure the dura mater. In certain instances, it will be advisable to make the requisite incision with a director and curved billory.

The trephine is worked by being rotated backward and forward; the trepan is turned round continually in one direction. In trepanning upon a simple fracture, or fissure, the crown of the instrument should be so placed as to include an equal portion of the bone on each side. But when there are portions of bone depressed and moveable, it is customary to apply the trepan upon an adjacent solid part of the cranium, which will serve after the operation as a fulcrum for the elevation or extraction of the depressed fragments. We must observe, however, that this method, if practised indiscriminately, will often lead to an unnecessary removal of bone; a circumstance which it is always desirable to avoid. Loose depressed pieces of bone should constantly be taken away with a pair of forceps, whenever it can be done; and then no trepanning will be needed. Also, when the fracture is shaped somewhat like the letter V, or when it is of an oblong form, the depressed piece of bone may frequently be entirely removed by sawing through the part which connects it with the rest of the cranium, and no circle of bone will stand in need of being fawn out. For the performance of such operation, Mr. Hey's saws (represented in the surgical plates) will be found exceedingly advantageous.

The surgeon should not press too heavily with the trephine, or trepan, when he is in the act of fowing the bone; but execute the burrs with as light a hand as possible. As soon as a sufficient groove is formed for the teeth of the crown, the centre-pin is to be taken out. The first part of the faying may be done briskly. Afterwards, the operation is to proceed slowly and cautiously. With a bit of quill, the surgeon must examine the depth of the circular groove, in order to be sure that he has not fawn through at any particular point. When one side seems to be more cut than another, the faw must not be allowed to act upon it so much; and if there be any part of the circle which is completely fawn through, the instrument must not be applied to that point any longer. While the surgeon examines the depth of the groove with a piece of quill, an affiant takes care to clean the teeth of the faw with a small brush made for the purpose, by which means the action of the instrument will not be obstructed by the particles of bone.

When these become tinged with blood, the teeth of the faw are known to have reached the diploe; but the practitioner must remember, that the diploe is not a criterion which will be met with in every instance, as for fear the instrument is fo fiere, that it does not gain a tinge of blood to the bone-dust. It is of importance to be aware of this fact; for were a surgeon to faw boldly on in all cases until he sees marks of his having arrived at the diploe, he would frequently be apt to injure the dura mater and brain. When he knows that he is sawing the internal table, he is to proceed with great slowness and circumpection, making repeated examinations of the groove with the pointed quill. When the portion of bone to be taken out appears to be connected with the rest of the skull principally on one side of the groove, the trephine is to be inclined to that side. Immediately the circle is loose enough, it is to be taken out with a pair of forceps constructed for this object, or with the elevator. (See surgical plates.) But rather than run a hazard of sawing too deeply with the trephine, we would always recommend the surgeon to prefer breaking the few light fibres of bone which impede the circle from being taken out.

When there are any inequalities round the margin of the perforation, they must be carefully removed by means of the lenticular knife. (See plates.) In doing this part of the operation, care must be taken not to let the lenticular knife make improper pressure upon the dura mater, a thing which might have the worst consequences.

The circle of bone having been fawn out, the surgeon is to keep in mind the grand object of the operation; viz.: that of relieving the brain from the pressure, which is the cause of the alarming symptoms. All depressed fragments of bone are to be raised, and, if quite detached, they ought to be entirely removed. All pieces of bone, penetrating the dura mater and substance of the brain, are to be extracted without delay. If there be blood or matter upon the surface of the dura mater, it now escapes, being expelled by the pulsatory movement of the cerebrum.

When the extravasation is under the dura mater, a puncture may be cautiously made through this membrane with the point of a bilivery, or lancet. There must be, however, a manifest elevation and tension of the dura mater, arising from the lodgment of a fluid below it, to justify the preceding practice. If blood should be found in the suspected situation, the puncture may be enlarged into a crucial incision.

According to surgical writers, if, after dividing the dura mater, the surface of the brain appears smooth and flabby, with a fluctuation, there is an abscess in its substance. They then select the method of carrying the point of the billivery to the depth of an inch, if circumstances render fo deep a puncture necessary. But, says Richerand, prudence forbids us to go further. Cutting the surface of the brain causes no pain, and it produces less danger than one could presume to expect; but experience and observation have proved, that the essential parts of this organ are situated near its base, and that its surface may be removed without danger or pain. Nosogr. Chir. T. 2. p. 301. edit. 3.

After the operation of trephining, the divided scalp is to be placed as nearly as possible in its natural situation, and lightly dressed with a simple pledge of any common unirritating ointment. In applying the dressings, the surgeon should invariably keep in view these objects; namely, to let whatever is put on the wound be as light as possible; not apt to make pressure on the brain, and of a nature which cannot excite irritation. All stimulants are to be strictly avoided; nor will any bagadage be better than an ordinary
ordinary night-cap of sufficient size to be put on with
facility. It may be secured with bits of tape, which are to
be tied under the jaw.

The aperture in the skull usually becomes closed with
soft granulations, which flowly acquire a hard confluence.
These almost continually grow from the edge of the per-
formation, and form from the surface of the dura mater.
While the cicatrix is soft, it should be protected from ex-
ternal injury with a thin piece of horn or metal. Ex-
foliations from the margin of the perforation sometimes re-
tard the healing of the wound; but now that the practice
of dressing with drying spirituous applications has been ex-
ploded, and the removal of any part of the scalp is con-
demned by all the best surgeons, these unpleasant con-
sequences are rendered much less frequent than in former days.

TREPHINE, in Surgery. The operation of trepanning is
now frequently called the operation of trephining, from
its being generally performed in this country with a trephine,
which is a more modern instrument than the trepan. The
trephine consists of a simplex cylindrical saw, with a handle
placed transversely, like that of a gimlet; and from the
centre of the circle, which the teeth of the saw describe,
a sharp little perforator projects, named the centre-pin.
The upper part of the centre-pin is made to screw in a
corresponding hole at the inside of the top of the saw, and is
capable of being taken out or put in at the surgeon's option,
by means of a little key for the purpose. Its use is to fix
and steady the trephine, when the instrument first begins
to work, that is, before the teeth of the saw have made a
sufficient circular groove, in which they can securely move.
But as soon as an adequate groove is formed, the centre-pin
must always be taken out; because it is now unnecessary,
and, if not removed, it would not only retard the progress
of the operation, but inevitably penetrate the dura mater
and brain, when the teeth of the saw had cut to a certain
depth through the cranium. Some trephines contain centre-
pins, which are contrived to slide up or down, and to admit
of being fixed in either situation, by turning a little screw.
This method seems to us both ingenious and convenient.

The cylindrical part of the trephine is often termed the
crown of the instrument. The surgeon should always have
at least two or three cylindrical saws of various sizes; for it
is a commendable rule never to saw away any more of the
cranium, or indeed of any other bone, than is absolutely
required for the accomplishment of some afflicting object.
There is no occasion, however, for having more than one
handle, which may be made to fit any of the saws.

The trepan is worked in the manner of a wimble, the
instrument turning round and round upon its own axis; but
the trephine only performs semicircular movements, which
the surgeon imparts to it by the prongation and supination
of his hand. As its teeth are arranged perpendicularly, they
cut whether the instrument is turned from the left to the
right, or from the right to the left.

Certainly cæles do frequently present themselves, in which
trephining is absolutely necessary; and yet there is no occa-
sion for removing a complete circular portion of the cranium;
the taking away of a piece of smaller size, and
different shape, would sometimes be much more advan-
tageous. A very good instrument for effecting this pur-
pose is a common trephine, terminating only in a semicir-
cular saw, instead of a circular one. With this the surgeon
can cut across the base of certain depressed portions of
bone, and take them away, without any occasion for re-
moving also a circle of the cranium.

The saws, however, which Mr. Hey has described, should
consequently be kept in every case of trephining instruments.
This practical writer remarks, that "the purposes for
which any portion of the cranium is removed, are, to enable
the surgeon to extract broken fragments of bone, to elevate
what is depressed, and to afford a proper suffusion to blood
or matter that is, or may be confined, &c.

"When a broken fragment of bone is driven beneath the
found part of the cranium, it frequently happens that the
extraction cannot be executed without removing some of the
unbroken part under which the fragment is depressed. This
might generally be effected with very little loss of found bone, if
a narrow portion of that which lies over the broken fragment could be withdrawn.
But such a fragment cannot be removed by the trephine. This instru-
ment can only cut out a circular piece. And as, in executing
this, the central pin of the saw must be placed upon the
uninjured bone, it is evident that a portion of the found bone,
greater than half the area of the trephine, must be removed at every operation.
When the broken and de-
pressed fragment is large, a repeated application of the
saw is often necessary, and a great derruction of found
bone must be the consequent.

"When the injury consists merely of a fissure with de-
pression, a small enlargement of the fissure would enable
the surgeon to introduce the point of the elevator, so as to raise
the depressed bone. But a small enlargement of the fissure
cannot be made with the trephine. When it is necessary to
apply the elevator to different parts of the depressed bone,
a great deal of the found cranium must be removed, where
a very narrow aperture would have been sufficient.

"The same reasoning will apply to the case of openings
made for the purpose of giving a discharge to extravasated
blood or matter.

"If a saw could be contrived, which might be worked
with safety in a straight, or gently curvilinear direction, it
would be a great acquisition to the practical surgeon.
Such a saw I can now with confidence recommend, after a
trial of twenty years, during which time I have rarely used the
trephine in fractures of the skull. Its use has been
adopted by my colleagues at the General Infirmary in Leeds;
and will be adopted, I hope, by every surgeon who has
once made trial of it." Mr. Hey next informs us, that the
instrument was first shewn to him by Dr. Cockell of Pott's
fracture; but that there is a saw, formed on the same principle,
in Seelenius's Armamentarium Chirurgicum. The saw
alluded to are very short ones, fixed at the end of a length
straight handle; their edges are made either straight, or
semicircular. The latter construction qualifies the instru-
ment for cutting in a curvilinear direction, which is often
proper. The edge of the saw should always be made a
little thicker than the rest of the blade, by which means it
will work in the groove, which is cut, with more facility.
Saws made on the principle just described, are also of
infinite use in cutting away depressed portions of other bones,
besides the skull, cartilages, &c. In cases of necrosis, when
a dead part of a bone is quite wedged in the substance of the
surrounding new bony matter, Mr. Hey's saws may
often be advantageously employed for cutting away the
depth which mechanically prevent the detachment of the
dead.
TRE

TREPICHNIEN, in Geography, a town of Italy, in the department of the Aude; 3 miles from Pont-sur-Seine. — Also, a town of France, in the department of the Sarthe; 7 miles W. of St. Calais.

TRESPASS, in Law, signifies any transgression of the law, under treason, felony, or mifprision of either.

TRESPASS, however, is most commonly used either for that wrong or damage which is done to the king in his forest, or by one private man to another.

In this sense, it is of two sorts: trespass general, otherwise called trespass on the high road, or upon the road, or any other road or thoroughfare; and trespass special, otherwise called trespass upon the house; which should be that done without force, or where the injury is only consequential.

But the two species are sometimes confounded.

TRESPS on lands denotes an outcry on another man's ground without lawful authority, and doing some damage, however inconsiderable, to his real property. Every such unwarrantable entry on another's soil, the law entitles a trespasser by breaking his peace. But in order to be able to maintain an action of trespass, a man must have property in the soil, and actual possession by entry; or at least it is requisite that the party have a lease and possession of the vesture and herbage of the land. But before entry and actual possession, one cannot maintain an action of trespass, though he hath the freehold in law. However, by 4 Geo. II. c. 28, and 11 Geo. II. c. 19, in case after the determination of any term of life, lives, or years, any person shall willfully hold over the same, the lessor is entitled to recover by action of debt, either a rent of double the annual value of the premises, in case he himself hath demanded and given notice in writing to deliver the possession; or else double the usual rent, in case the notice of quitting proceeds from any tenant having power to determine his lease, and he afterwards neglects to carry it into due execution.

A man is answerable not only for his own trespass, but that of his cattle also. See Damage vol. 3.

In some cases trespass is justifiable; or, rather, entry on another's land and house shall not in those cases be accounted trespass; as if a man comes there to demand or pay money, there payable; or to execute, in a legal manner, the process of the law. A man may also justify entering into an inn or public-house, without the leave of the owner: a landlord may justify entering to dispossess for rent: a commoner to attend his cattle, commoning on another's land; and a reverend father to see if any waste be committed on the estate. It hath also been said, that by the common law and customs of England, the poor are allowed to enter and glean upon another's ground after the harvest, without being guilty of trespass; which humane provison seems borrowed from the Moscaic law, Lev. chap. xiv. ver. 9. chap. xxii. ver. 22. Deut. chap. xxiv. ver. 19. In like manner, the common law warrants the hunting of venison beasts of prey, as badgers and foxes, in another man's land. But in cases where a man makes an ill use of the authority with which the law confers him, he shall be accounted a trespasser ab initio; as if one comes into a tavern and will not go out in reasonable
TRESSON, a town of France, in the department of the Sarthe; 13 miles S.E. of Le Mans.

TRESSURE, in Heraldry, a diminutive of an orle, usualliy supposed to be half the breadth of it.

It is usualliy borne florly and counter-florly; sometimes double, and sometimes triple.

TRESTIANA, in Geography, a town of European Turkey, in Moldavia; 24 miles S.E. of Jaffy.

TRESTLE, Tressel, or Trussel, is explained by Minshieu, to be a three-footed floor; or, more particularly, a wooden frame or stand to bear up tables, scaffolds, or the like.

TRESPASS, a cause for ejectment, and is either by voluntary entry of the trespassor, or, in case of his refusal, by force and violence. It is thus defined by Sir N. Bacon, 1 Inst. 164:—

"A trespass is an action to recover land, and is either by voluntary entry, or by force and violence. It is the action of the owner of the land against the useEffect trespassor, by whom he is deprived of the use and enjoyment of his estate, or of the occupier of the land for his benefit and use. It is an action in which the plaintiff avails himself of the assistance of the law, by procuring a jury to give the value of the land and the damages sustained by the plaintiff, and to agree the time when the defendant shall quit the land, and to order the defendant to pay the damages so agreed upon, and to quit the land, and to deliver up to the plaintiff the possession of the land."

TRESPASS, in Law, is the wrongful entry into another's land or premises, with the intention of taking possession or obtaining exclusive occupation thereof. It is a civil wrong, and is actionable in the hands of the plaintiff and the plaintiff's assignee, and the defendant, if he is not the assignee, is liable for the damages sustained by the plaintiff, and the land is to be restored to the plaintiff.

TRESPASS, 1. As to the defendant's own land.

2. As to the land of another.

TRESPASS, 1. As to the defendant's own land.

a. Trespass to landlord.

b. Trespass to a tenant.

c. Trespass to a mortgagee.

TRESPASS, 2. As to the land of another.

a. Trespass to a neighbour.

b. Trespass to a landlord.

TRESUND, in Geography, a small island in the gulf of Bothnia. N. lat. 69° 13'.

TRET, or Trett, in Commerce, an allowance made for the waft, or the dust, that may be mixed with any commodity, which is always four pounds in every 104 pounds weight. See Tare.

This allowance, which is said to be for dust or sand, for the waft or wear of the commodity, was formerly made on all foreign articles sold by the pound avoidingos but it is now nearly discontinued by merchants, or allowed in the price. It is wholly abolished at the East India warehouses in London; and neither trett nor draft is allowed at the Custom-house. The weight which trett is allowed is called the "fittle weight."

TRETA, in Ancient Geography, a town of the island of Cyprus, in the S.W. part of the island, very near Paphos, to the S. Strabo places it between Boofara and the promontory from which those who were precipitated who had touched the altar of Apollo.

TRETE, an island of the Red Sea, upon the coast of Arabia. Ptolemy.

TRETS, in Geography, a town of France, in the department of the Mouths of the Rhone; 12 miles E.S.E. of Aix.

TRETUM, in Ancient Geography, a small town of the Argolid, nearly N. of Argos. In the mountains near this town was a cavern, which was the abode of a very fierce lion, which is said to have been slain by Hercules, and which formed among the poets one of his labours. It was called the lion of the forest of Nemata, situated near the town, to the W. of it.

TREUTUM, or Tritum, a promontory of Africa propria, on the coast of the gulf of Numidia.

TRETUR, in Geography, a small village of South Wales, in the county of Brecknock; 3 miles N.W. of Crickhowel.

TREVA, in Ancient Geography, a town in the northern part of Germany. Ptolemy.—Alfo, a town of Italy, in Flaminia, watered by the river Clytumnus.

TREVANNION'S ISLAND, in Geography, an island in the South Pacific ocean, and one of the cluster called Queen Charlotte's islands, discovered by captain Carteret in 1767, near the coast of Egmont island, or New Guernsey, in a bay called Trevannion's Lagoon. S. lat. 10° 43'. E. long. 161° 47'.

TREUCHTLINGEN, a town of Germany, in the margrave of Anspach, on the Altmühl; 28 miles S.S.E. of Anspach.

TREUEN, or DREVEN, a town of Saxony, in the Vogtland; 9 miles E.N.E. of Plauen.

TREWENBRIETZEN, a town of the Middle Mark of Brandenburg. This town was surrounded with walls in the year 1296. It was at first simply called Brietzen, but for its fidelity to the margrave Louis the Roman, was honoured...
noured with the epithet of Treves, or faithful. In the year 1641, this town was laid waste by the Swedes; 20 miles S. of Brandenburg. N. lat. 52° 8'. E. long. 12° 47'.

TREVENEN'S ISLAND, or Reetouen, a small island in the Pacific ocean, discovered by lieutenant Hergeth, in the Dredalus fleet-chip, in 1792. S. lat. 9° 4'. E. long. 220° 21'.

TREVIRI, or Trevis, in Ancient Geography, a people who occupied an extensive territory of Germany, from the Meuse to the Rhine. Of Treveri Caesar says, 'hace civitas Rheum magis tangit'; and the bridge constructed over the Rhine secures the bank on which this city was situated. The present Treves answers to the ancient position of Treveri. See TREVES.

TREVES, in Geography, lately an archiepiscopal and electorate of Germany, bounded on the N. by the electorate of Cologne; on the E. by the estates of the elector palatine, and of the house of Nassau; on the S. by France; and on the W. by the duchy of Luxembourg: about eighty miles in length, but of very uncertain breadth. The country is in general mountainous and woody, containing, indeed, good pasturage for cattle, and in many places also fruitful arable land, but yet it stands in need of the importation of corn. On the contrary, the growth of wine on the Mosel is very considerable, with plenty of game. There are likewise mineral springs, and mines of coal, salamby, iron, copper, lead, tin, silver, and gold. The electoral subjects are Roman Catholics, but in some other places where the elector of Treves is possessed of in common with other houses, there are like-wise Protestants. The ancient Tervi, from whom the principal town here, and the country also, had its name, were, till the fourth century, subject to the Romans, and afterwards to the Franks. In the divisions which the fons and potesty of the emperor Louis I. had made, this country was added, in the year 855, to the kingdom of Lorraine, and in 870, fell to the share of Louis, the German king, ever since which time it has continued annexed to Germany. The church of Treves, however, is held to be the most ancient in Germany. An archbishop of Treves was elected by the chapter there, and swore to a capitulation propounded by them. The pope confirmed such election in the usual manner, empowering one of the new elected bishops, allotted for that purpose, to consecrate him. The archbishop of Treves was in rank the second spiritual elector. At the election of an emperor, he delivered the formula of the election-oth to the elector of Mentz, to be sworn to by him; and he had also the first voice. As elector, the archbishop of Treves enjoyed both feast and voice in the electoral council at the diets of the empire. The suffragans of the archbishop of Treves were the bishops of Metz, Toul, and Verdun. The chapter of Treves consisted of forty canons, among whom were fifteen capitulars, and twenty-four domicilii. The archbishop had regular troops, and a land militia. The former of these consisted, in times of peace and ordinarily, only of the circle troops, which the elector of Treves was bound to maintain, and which amounted to between 1000 and 1200 men. The elector also kept up a life-guard of forty person. By the treaty of Luxemburg, the archbishopric and the electorate are no more: and that part of the territories which lay on the left bank of the Rhine is annexed to France, composing chiefly the department of the Sarre. The principal part of the electorate lying on the right side of the Rhine was, in 1802, given as an indemnity to the prince of Nagau-Weilburg.

Treves, or Trier, a city of France, and capital of the department of the Sarre: late capital of an electoral principality, and archiepiscopal of the circle of the Lower Rhine, lying between two mountains on the Moselle, over which it has a stone bridge. This town is very old. Long before the birth of Chrift, Treves was a town of note of the Treviri. Afterwards the ancient Roman emperors had a refidence here; and it is also the head town of the first Bel-gium, and so early as the days of Constantine the Great, was the capital of all Gaul. About the year 458, from the Romans it fell under the power of the Franks. Under the Austrasian monarchs, a royal court had its seat here; in which, as well under the Frankish kings as for a long time after, refeved palaces. The archiepiscopal court, or palace near the cathedral church, was built by the elector Francis George. The cathedral church of St. Peter here stands on a hill, being a large building. Exclusive of this church, there are likewise here three collegiate and five parochial churches, together with three colleges, and thirteen monasteries and nunneries, as also a hofe of the Teutonic order, and a manion belonging to that of St. John. For the establishment of the university here, papal privileges were bestowed early as the year 1434, but these were bought only to bear only in 1472, in 1535 renewed, and in 1722 improved. This town, according to the common opinion, was formerly imperial, and had a particular matrical evaluation of its own: but by a frantice of the electors pitched upon for the decision of this matter, in conjunction with the imperial aulic counselors, nominated by the emperor, it was declared to be subject to the superiority of the elector of Treves, which was also immediately after effectually exercised by him over it. In the beginning of August 1794, the French republicans entered the city, which had been halfly evacuated by the German troops. The magistrates met them in their robes at the gates with the keys, congratulated them on their successes, and declared they were glad to receive them. The good conduct of this army deserves commendation; and an English writer, speaking of it, observes, "they had no sooner entered Treves than they established a municipality; they broke in upon no property whatever, and left the different corporations, and all civil and religious institutions, as they found them;" 68 miles S.S.W. of Cologne. N. lat. 49° 48'. E. long. 6° 48'.—Allo, a town of France, in the department of the Gard; 12 miles E. of Le Vigan.

TREVISO, a town of Italy, in the duchy of Spoleto, anciently called Matusev and afterwards Trebula; 6 miles N. of Spoleto.—Allo, a town of the Popedom, in the Campagna di Roma; anciently the fee of a bishop, erected about the year 1000, but in the year 1260 united to Anagni; 32 miles E. of Rome.

TREVICO, a town of Naples, in Principato Ultra; the fee of a bishop, suffragan of Benevento; 14 miles N. of Conza. N. lat. 41° 6'. E. long. 15° 14'.

TREVIERES, a town of France, in the department of the Calvados; 12 miles E. of Caretan.

TREVIGIO, or Trevixo, a city of Italy, capital of the Trevisan, situated at the confluence of the Sile and the Pia-vefella; the fee of a bishop, suffragan of Udine. An university was founded here, and afterwards removed to Padua. The town is three miles in circumference, and contains 2500 houses and 22,000 inhabitants; whom the culture of filk, the filk and woollen manufactures, and particularly the annual fair in the month of October, supply with abundant means of subsistence. Befides the cathedral, the town contains 16 pa-rocchial churches, 11 monasteries, 10 nunneries, 4 hospitals, and a pawn-bank. The streets and public squares are in general
TREW, CHRISTOPHER JAMES, in Biography, a physician and naturalist, was born at Lauffen, in Franconia, in 1695, and settled at Nuremberg, where he gained medical and literary reputation, so as to be made director of the academy "Natura Curioforum." He also contributed much towards establishing a society under the title of "Commerium Literarum Noricum ad Rei Medice et Scientiae Naturalis Incrementum institutum," which published its memoirs. To these societies he communicated several papers, and he also published several splendid works in anatomy and botany. Among others, we may enumerate the following: "De Differentiis quibusdam inter Hominem naturam et saeculum intercedentibus," 1736, 4to; "Epitola ad Alb. Hallerum de Vasia Linguze Salivalibus et Funguis," 1734, 4to; "Tabulae Oecologicae Corporis Humani," fol. max. with coloured plates, 1767. In 1750 he commenced his publication of one of the most splendid of the imitations of Flora, under the title of "Planta feclete, quaram Imagines pinxit G. Dionyfius Ehret." To the incompressable defigns of Ehret, Trew added descriptions and remarks; and the work appeared in decades, seven of which were completed. In the same year he began a similar publication of garden flowers, intitled "Amenciifinae Florum Imagines," which was carried on to fix decades. He also published an improved edition of Blackwell's Herbal, in English and German, with an addition of some plants. In possession of Gelfner's wooden plates, he gave an impression of 216 figures of plants from them, intitled "Icones solignum Gelfnerianae," 1748. Trew died in 1769. Haller, Eloy.

TREWARDRETH BAY, in Geography, a bay in the English Channel, on the south coast of Cornwall, 3 miles W. of Fowey. N. lat. 50° 18'. W. long. 4° 42'.

TREWIA, in Botany, was so named by Linnaeus, at the end of his Genera Plantarum, in honour of Christopher James Trew, an opulent physician at Nuremberg, who has distinguished himself as the editor of some of Ehret's figures, in the most splendid style, with learned descriptions and explanations of his own, under the title of Plantae Scholle. Of a similar character are his Flora Imagines, in six decades. His improved edition of Mrs. Blackwell's Herbal, in German, with valuable additions, has proved acceptable to his countrymen; as have his numerous botanical and physiological essays, published chiefly in the Commerium Literarum at Nuremberg, between the years 1730 and 1746, to the advantage of the scientific world. He is charged by Ludwig, in a letter to Haller, with undertaking more than he could accomplish; nor does he stand in the highest rank of correct and philosophical botanists. He died in 1769, aged 74. (See Trew.)—Linn. Gen. 580. Schreb. 534. Willd. Sp. Pl. v. 4. 834. Mart. Mill. Diet. v. 4. Ait. Hort. Kew. v. 5. 426. Jull. 442. Lamarck Illusr. t. 466. (Tetragastris; Garin. t. 109. Rottler; Willd. in the Goettingen Journal of Nat. Hist. v. 1. 8. Mullotus; Loureir. Cochin. v. 2. 653.)—Clafa and order, Dioccia Polyandria. Nat. Ord. Tricocce, Linn. Euphorbias, Jull.

Gen. Ch. Male, Cal. Periandri of three ovate, reflexed, coloured, equal leaves. Cor. none. Stam. Filaments numerous, capillary, about the length of the calyx, inserted into the receptacle; anthers roundish, of two distinct lobes.

Female, Cal. Periandri inferior, of one leaf in three or four segments. Cor. none. Pyi. Germin superior, roundish, style short; stigma three, very long, feathery on the upper side. Peric. Capsule turbinata, somewhat globular, of three or four lobes and as many cells, with twice as many valves. Seeds solitary, pendulous, angular on one side, convex on the other.

Obi. We believe the several genera cited above, are here very properly united; see MALLOTUS and TETRAGASTRIS. The natural number in every part of the female fructification is probably three, though varying to four in the original species. Linnaeus was but ill acquainted with this genus, nor does it appear that he ever examined a specimen.

1. T. mufflora. Smooth-leaved Trevia. Linna, Sp. Pl. 1661. Willd. n. 1. — Att. n. 1. (Rotella indica; Willd. as above t. 5. Canfchi; Rhede Hort. Malab. t. 76. t. 42.).—Leaves ovate, undivided, entire, smooth on both sides. Native of the East Indies, in sandy ground. It has been introduced into the flowers at Kew, but has never yet flowered. This is a tall tree, whose trunk is two or three feet in diameter; its branches numerous, round, smooth, with a filamentous bark. Leaves alternate, on long smooth stalks, broadly ovate, taper-pointed, three or four inches long, with three principal nerves, and many smaller ones, connected by fine transverse parallel veins, and numerous minute reticulations. Male flowers numerous, in axillary aggregate clusters, three or four inches long, greenish-white; sometimes, according to Rheed, four-cleft. Calyx externally downy, about two lines long. Female flowers on a separate tree, likewise axillary, but rarely more than two together, on a long stalk. Their calyx is either very small, or soon deciduous. Germen not so large as a pepper-corn, hoary. Style about as long as the germen, thick, hoary. Stigmas three or four, spreading, an inch long, densely covered along their upper side with feathery glands. Capsule rather depressed, slightly lobed, smoothish, of three or four cells.

2. T. trianae. Three-pointed Trevia. Willd. n. 2. (Malottus cochinchinensis; Loureir. Cochinch. 635.). —Leaves ovate, downy and toothed; generally three-pointed. For the history of this species we refer the reader to MALLOTUS.

3. T. pubescens. Downy Trevia. —Leaves ovate, undivided, entire, downy on both sides. Female flowers somewhat capitate, with ovate pointed bracteae. —A female specimine of this was sent us by the late Dr. Roxburgh, as an unknown tree from Amboyna. The shape and reticulations of the leaves, with the general habit of the plant, are so like the frill species, that we feel confident of their being of the same genus. The branches and footstalks, however, and the under side of the leaves, are densely clothed with soft velvet-like pubescence; the upper side of the latter is less downy. Near the base of each footstalk is a pair of awl-shaped, very downy, deciduous stipules. Female flowers on simple, axillary, solitary, downy stalks, rather longer than the footstalks, composing small roundish heads, accompanied by four or five somewhat alternate, ovate, pointed, slightly toothed, downy bracteae, an inch long. Each flower appears to have a short partial stalk, which is very hairy, and the germen is no less bristly; insomuch that we can but imperfectly develope the structure of the flower. The stigmas however are large and conspicuous, exactly those of a Trevia; but there is some appearance of their being solitary. Possibly some may have fallen off. We are unacquainted with the male of this species.

4. T. diflor. White-leaved Trevia. —Leaves ovate, entire; densely downy and white beneath. —Communicated by Lamark to the younger Linnaeus, along with several other plants from the East Indies, but without any name, or indication of its native country. We premise it to be the male of a nondefert species of Trevia. The form and veins of the leaves strongly indicate this; but their under side differs from that of the rest, in being covered with the finest deprefed, mealy or fleshy, snow-white pubescence; while the upper is very smooth to the touch, appearing minutely granulated under a magnifier only. The branches and all the footstalks are finely hoary, and, in the dried specimen at least, have a rufy hue. Panicle terminal, composed of numerous, alternate, racemose, many-flowered branches. Unexpanded male flowers about the size of a mulberry feed, downy, on short partial footstalks. —It is evident we can have no certainty at present of the genus of this plant, but there is the greatest probability of its being rightly placed here.

TREYA, in Geography, a town of Denmark, in the duchy of Sleswick; 9 miles W. of Sleswick.

TREYSA, a town of Weftphalia, in the principality of Heffe. In the year 1646, this town was burned down by the Imperialists; 26 miles S. of Cassel. N. lat. 50° 54'. E. long. 9° 16'.

TRIA Prima, among Chemifs, the three hypotaphial principles, viz. sall, sulphur, and mercury; of which they hold all bodies to be primarily made, and into which they are all held resolvable by fire.

TRIAD, TRIAS, τριάς. See TERNARY, TRIAS, and TRINITY.

TRIADICA, in Botany, from τριάς, τριάς, ternary, alluding to the prevalence of the number three in the fructification; which however is not very remarkable. —Loureir. Cochinch. 610.—Clafs and order, Diocca Diandria. Nat. Ord. Amentacee, Linn. Juss.

1. T. cochinchinensis. Cay Soi ti, or Cay Cha dam, of the Cochinchine. —Leaves ovate, obtuse. —Found in the woods of Cochinchina. A large tree, with spreading branches. Leaves alternate, ovate, entire, smooth, on long red footstalks. Flowers nearly terminal. Berries small, of a brownish green.

2. T. sennfr. U Khu mō of the Chinee. —Leaves roundish, pointed. —Wild about Canton in China. A large tree, with spreading branches. Leaves alternate, flaked, smooth, entire. Calyx, of the male as well as female flowers, four-cleft. Seeds tunicated. Of this last circumstance nothing is said in the generic character. —We are not acquainted with any plants answering to the above description. ANTIDESMA perhaps (see that article and STILAGOS) comes the nearest, especially when we contemplate the Stilago danandra of Roxburgh. If allowance be made for some occasional abortion in the cells of the fruit, or if we ourselves have misconceived Loureir's ambiguous description, "baccas trilobularis, monopera," TRIADICA may be no other than Antidesma.

Gen. Ch. Cal. a glume of two unequal, lanceolate, keeled,
TRI

keeled, pointed, membranous valves, containing one floret; the outer valve full half the size of the inner, with a rough dorsoval awn, about its own length, united to it half way up. Cor. of two unequal, lanceolate, keeled, pointed, membranous valves; the outermost largest, three-ribbed, awnless, innermost narrower, with two keels, and a rough dorsoval awn, twice its own length, of three equal points, and a common stalk the length of the glume, slightly confluent therewith at the base only. Stem. Flattens three, capillary, shorter than the glumes; anthers hanging out of the flower, linear, notched at each end. Fruit. German superior, ovate; styles two, thread-shaped, short; stigma oblong, feathery. Peric. none, except the unconnected corolla. Seed one.

Eff. Ch. Calyx simple-flowered, of two valves, with a dorsoval awn. Corolla of two valves, unconnected with the seed, and a dorsoval awn of three points.

1. T. racemosa. Clufter-flowered Trident-grafs. Kunth as above, 179. t. 61.—Gathered by Humboldt and Bonpland, in dry cultivated ground in Mexico, between Guanaxuato and Villalpando, flowering in September. This is an annual, upright, branching gras, about eighteen inches high, with a round, smooth, slender, jointed stem. Leaves linear, narrow, sheathing, flat, striated, rough on both sides, and somewhat hairy on the inner; their sheaths striated, smooth. Stipula very short, fringed. Clusters terminal, solitary, simple, erect, from one and a half to four inches long. Flowers alternate, two-ranked, on short, slender stalks.—We have prefixed to alter the original description, chiefly with respect to the three-pointed awn, which Mr. Kunth considers an abortive floret. The analogy of Triathhra (see that article) will surely authorize this alteration.

TRIAL, in Law, the examination of any cause, civil or criminal, according to the laws of the realm, before a proper judge.

Of this there are divers kinds: both in civil and in criminal cases. In civil cases there are seven species of trial; viz. by record: by inspection or examination, when, for the greater expedition of a cause, in some point or issue being either the principal question, or arising collaterally out of it, but being evidently the object of a judge, the judges of the court, upon the testimony of their own senses, shall decide the point in dispute; as in case of a suit to reverse a fine for non-age of the cognizor, or to set aside a statute or re
cognition entered into by an infant, the king's justices de
termine, by view of the age of the party; also if a defendant pleads in abatement of the suit that the plaintiff is dead, and a peron, calling himself the plaintiff, appears, the judges shall determine by inspection whether he be the plaintiff or not; likewise in the case of an idiot; in the appeal of mayhem; and in determining circumstances relative to a day past by inspection of an almanac: by certificate, as for matters without the realm, and also within the realm: the customs of the city of London are tried by the certificate of the mayor and aldermen, certified by the mouth of their recorder: marriage, baillardy, excommunication and orders, and other such matters, are tried by the bishop's certificate: ability of a clerk presented, admission, instituting and deprivation of a clerk, shall be tried by certificate from the ordinary or metropolitan; and the customs of courts by certificate from the proper officers, &c.: by witnesses: by wager of battle: by wager of law: and by jury. In criminal matters, there was formerly the trial by ordeal and by curfewed: these two methods of trial were chiefly in use among our Saxon ancestors, and are now antiquated; the next, which still remains in force, though very rarely in use,

was introduced among us by the princes of the Norman line, and is the trial by battle, duel, or single combat: the fourth method of trial used in criminal cases is that by the peers of Great Britain, in the court of parliament, or the court of the lord high steward, when a peer is capitaly in
dicted: but that which most commonly occurs is the trial by jury, or the country, secured to every Englishman, as the great buttwork of his liberties, by the Great Charter. Blacklt. Comm. vol. iii. &c. vol. iv. &c.

Before trial, in a criminal case, it is usual to ask the criminal how he will be tried? which was anciently a very per
tinent question, though not so now; in regard there were formerly several ways of trial; viz. by battle, eredal, and jury.

When the criminal answered, By God and his country, it shewed he made choice to be tried by a jury. But there is now no other way of trial. This is also called trying per
pains, or per patriam.

TRIAL, New, is a re-hearing of the cause before another jury, with as little prejudice to either party, as if it had never been heard before. The cause of granting a new trial are such as these: want of notice of trial; or any flagrant misbehaviour of the party prevailing towards the jury, which may have influenced their verdict; or any gross misbehaviour of the jury among themselves: also if it appears by the judge's report, certified to the court, that the jury have brought in a verdict without or contrary to evidence, so that he is reasonably dissatisfied therewith; or if they have given exorbitant damages; and if the judge himself has misdirected the jury, so that they found an unjustifiable verdict: for these, and other reasons of the like kind, it is the practice of the court to award a new, or second trial. But if two juries agree in the fame or a similar verdict, a third trial is seldom awarded; for the law will not readily suppose, that the verdict of any one subsequent jury can counterbalance the oaths of two preceding ones. There are instances of new trials in the year-books of the reign of Edward III., Henry IV., and Henry VII., &c. Blacklt. Comm. vol. iii. &c.

TRIAL, Jean Claude, in Biography, director of the royal academy of music at Paris, and master of the prince of Conti's band, was born in 1734, in the Contat, that country so agreeable and fertile in excellent artists. The fine arts are generally inhabitants of beautiful nature.

At twelve years old, Trial quitted Avignon, in order to acquire knowledge from different masters whom he intended to visit. His talents were so extraordinary for his age, that at fifteen he was appointed director of the concert and opera of Montpellier. The passion which he had for the arts drove him to Paris, where he no sooner arrived, than he was placed at the head of the orchestra at what was then called the Italian theatre, or comic opera. From this orchestra he passed to that of the prince of Conti, of which he was appointed director; and his conduct and manners were such in that office, that on his death the prince deigned to say that he had lost a friend.

The protection with which he was honoured, procured him the important place of director of the Academie Royale. Permit us here to define the office of director of the academy of music, or serious opera. The management of the opera is a painful and embarrassing administration. It is necessary for the director of this complicated machine to attend to all the springs, to dissipate all impediments to their action, flatter the taille and sometimes the caprice of the inconstant public, unite to a point of concord very rarely attainable, a crowd of various and often rival talents, excite emulation without awakening jealousy, distribute rewards with justice.

Wherefore;,


Triangles.

Wherefore, if in two triangles $A\hat{C}B$ and $a\hat{c}b$ (Plate XV. Geometry, fig. 9.) $A\hat{C}B::a\hat{c}b$; $A\hat{C}B::a\hat{c}b$: $C\hat{d}$; the triangles are determined in the same manner, and consequently are similar, and therefore mutually equiangular.

3. A right line, as $A\hat{B}$, and two adjacent angles $A$ and $B$, which, taken together, are less than two right ones, being given; to describe the triangle $A\hat{B}C$. On the given line $A\hat{B}$, make the two given angles $A$ and $B$: continue the sides $A\hat{C}$ and $B\hat{C}$, till they meet in $C$. Then will $A\hat{B}C$ be the triangle required.

Hence, one side and two angles being given, the whole triangle is determined. Wherefore, if in two triangles $A = a$ and $B = b$, the triangles are determined after the same manner, and therefore are similar.

Triangles, Measurement of. To find the area of a triangle, multiply the base $A\hat{B}$ (fig. 10.) by the altitude $C\hat{d}$; half the product is the area of the triangle $A\hat{B}C$.

Or thus; multiply half the base $A\hat{B}$ by the altitude $C\hat{d}$; or the whole base by half the altitude; the product is the area of the triangle.

E. gr. $A\hat{B} = 342$ $A\hat{B} = 342$ $A\hat{B} = 171$
$C\hat{d} = 234$ $\frac{1}{2} C\hat{d} = 117$ $C\hat{d} = 234$
$1368$ $2394$ $684$
$1026$ $342$ $513$
$684$ $342$ $342$

\[2)80028 \quad 40014 \quad 40014\text{ area}\]

See Quadrature.

Or, the area of any triangle is had by adding all the three sides together, and taking half the sum; and from that half sum subtracting each side severally, and multiplying that half sum and the remainder continually into one another, and extracting the square root of the product.

Hence, 1. If between the base and half the altitude, or between the altitude and half the base, be found a mean proportion; it will be the side of a square equal to the triangle. 2. If the area of a triangle be divided by half the base, the quotient is the altitude.

Triangles, Properties of Plane. 1. If in two triangles $A\hat{B}C$ and $a\hat{c}b$ (fig. 9.) the angles $A = a$; and the sides $A\hat{B} = a\hat{B}$ and $A\hat{C} = a\hat{C}$; then will the side $B\hat{C} = b\hat{C}$, and the angles $C = c$, and $B = b$; and therefore the whole triangles will be equal and similar.

2. If one side of a triangle $A\hat{B}C$ (fig. 11.) be continued to $D$, the external angle $A\hat{B}D$ will be greater than either of the internal opposite ones $B$ or $C$.

3. In every triangle, the greatest side is opposed to the greatest angle, and the least to the least.

4. In every triangle, any two sides taken together are greater than the third.

5. In two triangles, if the several sides of the one be respectively equal to the sides of the other, the angles will likewise be respectively equal; and consequently the whole triangles will be equal and similar.

6. If any side, as $BC$ (fig. 12.) of a triangle $A\hat{C}B$ be continued to $D$, the external angle $DOA$ will be equal to the two internal opposite ones $y$ and $z$ taken together.

7. In every triangle, as $A\hat{B}C$, the three angles $A$, $B$, $C$, taken together, are equal to two right ones, or $180^\circ$.

Hence, 1. If the triangle be rectangular, as $MKL$ (fig. 7.) the two oblique angles $M$ and $L$, taken together, make a right angle, or $90^\circ$; and therefore are half right.
with double of the square of the semi-base, is equal to the squares of both the sides taken together.

19. A whole triangle is to a triangle cut off by a right line, as the rectangle under the sides cut off is to the rectangle of the other two sides.

20. In a right-angled plane triangle $\triangle ADE$ (Plate X. Geometry, fig. 17.), a line $DB$ drawn from the right angle or the vertex, perpendicular to the hypotenuse, divides the triangle into two other right-angled triangles, $\triangle ADB$, $\triangle DBE$, which are similar to the first triangle, and also to one another.

Hence it follows: 1. That $EB : BD :: BD : BA$; and $AE : ED :: ED : EB$; and $AE : AD :: AD : AB$. (See Proportionals.) Whence, 2. As the angle in a semicircle is a right angle, it follows that, if from any point $D$ in the periphery of a semicircle $\triangle ADE$, a perpendicular $DB$ be let fall upon the diameter $AE$, and from the same point $D$, to the extremities of that diameter, two chords $DA$, $DE$, be drawn; the square of that perpendicular will be equal to a rectangle under the two segments of the diameter; and the square of each chord equal to a rectangle under the whole diameter and its adjacent segment: i.e. $BD' = EB \times BA$; $ED' = EB \times EA$; and $AD' = AB \times EA$.

21. In every right-angled triangle, the square of the hypotenuse is equal to the sum of the squares of the other two sides. See Hypotenuse and Sine.

22. If any angle of a triangle be bisected, the bisecting line will divide the opposite side, in the same proportion as the legs of the angle are to one another.

23. If the vertical angle of any triangle be bisected, the difference of the rectangles, made by the sides and the segments of the base, is equal to the square of the line that bisects the angle. Thus, if a right line $BE$ (Plate XV. Geometry, fig. 15.) bisects an angle $\angle ABC$ of a triangle, the square of the said line $BE = AB \times BC - AE \times EC$.

24. To divide a triangle into any given number of equal parts; divide the base $CD$ (fig. 16.) into as many equal parts as the figure is to be divided into; and draw the lines $A_1, A_2, \&c.$

25. If in similar triangles from any two equal angles to the opposite sides two right lines be drawn, making equal angles with the homologous sides; those right lines will have the same ratio as the sides on which they fall, and also divide those sides proportionally.

26. If in two triangles having one side common to both, from any point in that side, two lines respectively parallel to two contiguous sides be drawn, terminating in the two remaining sides, those lines will have the same ratio as the sides to which they are parallel. Hence, if those sides are equal, those lines will be also equal.

27. If through any point within a triangle three right lines be drawn, from the angular points to cut the opposite sides, the segments of any one side will be to each other, as the rectangles under the segments of the other sides taken alternately. Hence if the former segments be equal, the aforementioned rectangles will be equal, and therefore the sides of the triangle cut proportionally, and a line connecting the points of division will be parallel to the base.

28. Triangles having one angle in the one equal to one angle in the other, are in the ratio of the rectangles contained under the sides, including the equal angles. Hence, if the rectangles be equal, or the sides reciprocally proportional, the triangles will be equal.

Triangels. Solution of. See Trigonometry.

Triangels, an iron musical instrument with three sides, which serves as an accompaniment to other instruments in a military band, and in the streets: the performer supports it by a ring at the top with his left hand, and beats it with a small iron rod in his right hand. At the lowest angle iron rings are placed, which by their vibration augment the sound.

Triangels, Island, in Geography, an island of South America, in the mouth of the Orinoco, where the French settled a factory in the year 1765. Alto, one of the smaller Bahama islands, so called. N. lat. $20^\circ.51'$. W. long. $69^\circ.53'$.

Triangels, a dangerous Providence in the East Indian sea, near the N. coast of the Percei, or Prail.

Triangels, Southern, a reef of rocks and islands in the bay of Honduras. N. lat. $19^\circ.43'$. W. long. $89^\circ.40'$.

Triangular Apple-Ladder, in Rural Economy, a ladder of this sort for gathering apples from the trees with ease and without bruising them. It is about eighteen feet in height, and has two other branches, which are each of the same length, fattened by iron hoops or rings at its top part. These parts all diverge from each other when the ladder is in use, and appear somewhat in the manner of the corner rafters of a triangular roof, forming a sort of triangle. At about four feet from the ground, each branch and the ladder part has a hook fixed to it, for the purpose of stretching out a triangular cloth by; in the middle of which is formed a circular funnel of the same material. The cloth has at each corner a leather strap, pierced with a number of holes, in order that an equal degree of tension may constantly be given, whether the ladder and its branches to be much extended or not.

In collecting the apples, the gatherer, ascending the ladder, throws the fruit as he strips it from the boughs of the trees into the cloth, whence it rolls down the funnel part into the basket which is placed to receive it below.

So much injury and mischief are done to apple-trees at all periods of their growth, by letting ladders against the boughs of them, and the fruit is so greatly bruised and depreciated, as well as subjected to decay, by gathering it in the usual modes, that both practices should be discontinued, and better ones, such as the above, had recourse to in such cases.

Triangular Battalion, in the Military Art. See Battalions.

Triangular Canon. See Canon and Sine.

Triangular Compasses, are such as have three legs or feet, by which to take off any triangle at once; these are much used in the construction of maps, globes, &c. See Compasses of three legs.

Triangular Fort. See Fort.

Triangular Leaf, in Botany. See Leaf.

Triangular Numbers, are a kind of polygonal numbers; being the sums of arithmetic progressions, the difference of whose terms is 1.

Thus, Of arithmetical progress. $1 \quad 2 \quad 3 \quad 4 \quad 5 \quad 6$

are formed triang. numb. $1 \quad 3 \quad 6 \quad 10 \quad 15 \quad 21$

For the rationale and management of these numbers, see Malcolm's Arith. book v. ch. 2.

Triangular Quadrant, is a sector furnished with a loofe piece, by which to make it an equilateral triangle.

The calendar is graduated on it, with the sun's place, declination, and other useful lines; and by the help of a string and a plumbet, and the divisons graduated on the loofe piece, it may be made to serve for a quadrant.

Triangular Winding-flairs. See Stair.
TRIANGULARIS STERNI, in Anatomy, a muscle of the ribs. See INTERCOASTAL.

TRIANGULARIS GENAE, the depressor anguli oris, a muscle of the mouth. See DEGLUTITION.

TRIANGULARIS PIFIS, in Ichthyology, the name of a fish of a very remarkable figure, called in English the coney-fish, of which there are two species, the one having two horns, the other wanting that character.

The horned kind is usually fix or even fingers breadth long; and about three fingers broad; the tail ends in a long thin fin; the mouth is small, having twelve strong serrated teeth in the upper jaw, and eight larger ones in the lower; the head ribs gibbously from the mouth to the horns, and the back is humped in the middle; it has only one small fin near the tail; its eyes are large and placed near the horns; before the fin near the tail, it has four others; the tail being one, and one more being situated on the back, and two on the belly; it has two horns like cocks' spurs, growing straight out of its forehead, and two others in a contrary direction, out of its belly near the tail; it has no scales, but it has a hard skin, white on the belly, and brown every where else, and wonderfully marked with trigonal, tetragonal, pentagonal, and hexagonal figures.

The species which has no horns has a broader belly, a longer tail, and is marked all over its body only with hexagonal figures, and innumerable small tubercles: its belly is yellowish, and the rest of its body of a greyish or brownish yellow; the mouth is narrow, and the teeth small, five in the lower and eleven in the upper jaw; the eyes are large and round; it is hollow, and has very little flesh.

Both the species, which belong to the genus of the American, are caught among the rocks, on the shores of the island of Java, and are sometimes eaten by the inhabitants, being first skinned. Clus. Exot. lib. ii. cap. 27.

Willughby's Hist. Pisc. p. 150.

Gen. Ch. Cal. Perianth half-inferior, of five oblong leaves, internally coloured, pointed below the summit, permanent. Cor. none, except the calyx, which partakes of the nature of both parts, be considered as fuch. Stam. Filaments about ten, (from five to twelve) capillary, the length of the calyx; anthers roundish. Pdl. Germin almost entirely superior, oblong, abrupt; styles one or two, thread-shaped, the length of the germin, bifid on one side; figites simple. Peric. Capsule oblong, abrupt, burting all round, of two, transfierely intersected cells. Seeds one or two in each cavity, nearly ovate.

Obf. The number of figites, as well as of styles, differs in different species.

1. T. mauungua. Purflane Triantehma. Linne. Mant. 63. Willd. n. 1. Ait. n. 1. "Decand. Pl. Graffes t. 109." (T. Portulacafum; Linne. Sp. Pl. 325. Portulaca curafavica procumbens, capparida folio, flore mucroco, capsula bifurcata; Herrm. Parad. 213. t. 213. Kali curafavicum procumbens, folis fubrotundis; Pluk. Phyt. t. 95. f. 4.)—Stamens more than five. Style one. Leaves elliptico-oblong. Stem with a hairy line along the upper side.—Native of the West Indies and South America. Sometimes raised, for curiosity's fake, in our flowers, where it flowers in Summer. The root is annual. Stems a foot long, much branched, leafy, spreading on the ground in every direction, smooth, except a dense, slender, hairy line along their upper side. Leaves opposite, unequal, flaked, oval or roundish, obtuse with a small point, entire, smooth, red at the edge, from one to two inches long. Stipulas membranous, acute, half the length of the footstalk, to which they are united. Flowers axillary, few, about three together, pale and membranous, with a pair of bracteas to each. Stamens from two to ten. Germs with two ditant horns. Style, according to Linneus, solitary, rough at one side, with a simple stigma.

2. T. cryfyllina. Cryfylline Triantehma. Sm. Spicil. 24. t. 26, unpublished. Vahl. Symb. v. 1. 32. Willd. n. 2. (Papularia cryfyllina; Forsk. Egypt.-Arab. 69. Gymnophyllum cryfyllinum; Linne. MSS.)—Stamens five. Style one. Leaves elliptic-lanceolate. Stem papillary all over.—Native of the East Indies and of Arabia. We received it from Madras, by the favour of Dr. Roxburgh. Linneus cultivated it at Upfal, and has left in his herbarium specimens, with a coloured drawing, and a description. He made this plant a new genus by the name of Gymnophyllum, judging it akin to Herniaria. It would have appeared in the third number of our Spicilegium, had that work been continued; but the page, though printed, was never published. The root is perennial. Stems herbaceous (not thorny), procumbent, a span long, reddish, branched, leafy, clothed with bell-shaped papillar granulations, which in the dried specimen become hairy hairs. Leaves opposite, flaked, like Polygonum mediae in size and figure, with united membranous figites, as in the foregoing. Flowers axillary, few, one, two or three together, small, whitish with a red germin. BRACTEAS of two opposite scales under each flower. Stamens five, very short. Style one, with a divided stigma. Ripe capsule of one cell, embraced by the base of the calyx. Seeds two, one above the other, black, orbicular, depressed, rough, with concentric furrows. This species surely approaches in many points to Salsola, so far at least as to indicate a great affinity between the two genera.

3. T. pentandra. Smooth Triantehma. Linne. Mant. 70. Willd. n. 3. (Rocama; Forsk. Egypt.-Arab. 71. Portulaca affinis polygonoides, bliti folio et face despecta; Pluk. Phyt. t. 120. f. 3.)—Stamens five. Styles two. Leaves obovate. Stipulas pointes. Stem nearly smooth.—Native of Arabia. Annual, cultivated by Linneus at Upfal, but unknown in our gardens. The size and habit of the plant answer to the first species, but the stem has no hairy line, nor more than a flight papillary roughness, on the young branches only. Leaves nearly uniform, obovate rather than elliptical, on long filaks, to which the membranous figites are entirely united, without any separate points. Flowers purplish. Styles recurved. Willdenow copies Richard's error of Ractorna, for Rocama.

4. T. ficcafofa. Shrubby Triantehma. Vahl.Symb. v. 1. 32. Willd. n. 4. (Gymnocarpus decandrum; Forsk. Egypt.-Arab. 65. 1. t. 10. Desfont. Atlant. v. 1. 203.)—Stamens ten; five alternate ones imperfect. Style one. Leaves cylindrical, pointed. Stem thorny, round, smooth.—Native of the sandy deserts east of Cairo, as well as about Tunis. A rigid spreading shrub, about a foot high; its bark grey and weather-beaten. Leaves shiny, glaucous, smooth, obliquely triangular, about half an inch long in little tufts. Flowers three to five, in tufts at the ends of the branches, feoffle, violet-coloured, a third of an inch broad,
broad, hairy at their base and at their points. Seed solitary, according to professor Desfontaines, to whom we are obliged for a specimen. Vahl fuppsects there may be two seeds.

5. T. humifusa. Prostrate Cape Trianthema. Thunb. Prodr. 80. Willd. n. 5—"Style one. Leaves lanceolate. Stem shrubby, round."—Gathered by Thunberg at the Cape of Good Hope, as well as the next. We have seen no specimen of either.

7. T. decandra. Trailing Indian Trianthema. Linn. Mant. 70. Willd. n. 4. Zaleya decandra; Burnin. Ind. r. 11. t. 31. f. 3.—Stamens about ten. Styles two. Leaves obovate. Stipules pointless. Stem nearly smooth.—Native of the East Indies. The herbage of this species bears a great affinity to T. pentandra, but the flower-flasks are rather shorter. Their flowers indeed are very different, those of the present being much larger, on longish flasks, with a feby, scarcely membranous, calyx.

TRIARATHIA, in Ancient Geography, a town of Asia, in the Leifer Armenia, upon the route from Schafie to Cuscum, between Tonofa and Coduzuala. Anton. Itin.

TRIARII, in the Roman Militia, a kind of infantry, armed with a pike, shield, a helmet, and a cuirafs: they were thus called, because they made the third line of battle.

The triarii were also called poffyghani, because ranged behind the principes who bore the Rubard in a legion.

Polybius distinguishes four kinds of forces in the Roman army: the first, called pilati, or velites, he says, were a raw loddary, lightly armed. The haffati, or spear-men, were a degree older, and more experienced. The third, called principes, princes, were still older, and better soldiers than the second. The fourth were the oldest, the most experienced, and the bravest; these were always dispersed in the third line, as a corps de reserve, to sustain the other two, and to retore the battle, when the others were broken or defeated. See Legion.

Hence their name of triarii: and hence the proverb, Ad triarios ventum ex, to shew that one is at the last and hardest struggle.

TRIAS Harmonica, Lat.; Triade Harmonique, Fr.; Harmonical Triad, Eng.; in Music. This term has two different senses. In calculation, it is the harmonic proportion; in prattices, it is the perfect major chord resulting from the same proportion, and which is composed of the fundamental found, its major or sharp 3d, and its 5th. It is called a triad, because composed of three sounds; and harmonic, because in harmonic proportion; and is the sence of all harmony.

Eff. Ch. Calyx single-flowered, of two valves. Corolla of two valves; the outermost with three briskly teeth; inner with a triple dorsal awn.

1. T. junca of De Faux is given as the only species, without any account of its native country. By the figure it appears to be a slender grafs, with linear leaves, and a simple, upright, unilateral cluster, rather above an inch long; the flowers not a quarter of an inch in length. Nothing is known of the flaments, pistil, or seed. The awn, conflating of three rough equal bristles, more than twice the length of the florest, and united by a short simple base, is considered by the above author as the rudiment of an abortive florest, which idea is adopted in a familiar care by Kunth. (See TRIJENA.) We do not wish that such an awn may take place of a florest, by one of those metamorphoses so common in grafs, whose awn are known to be among the least permanent of their distinctions; but it is offering too great violence to language to use one term for the other.

TRIACOURT, in Geography, a town of France, in the department of the Meule; 7 miles S. of Clermont en Argonne.

TRIAZELA, a town of Russia, in the government of Upha; 88 miles N.N.W. of Upha.

TRIAGNOUCHA, a town of Russia, in the government of Upha, on the Ural; 140 miles E. of Orenburg.

TRIBALE, La, a town of France, in the department of the Tarn; 6 miles W.N.W. of La Caune.

TRIBALLI, in Ancient Geography, a people of Lower Media, upon the banks of the Danube, called also Servians.

TRIBAU, or TRIBOWE, in Geography, a town of Moravia, in the circle of Olmutz; 28 miles N.W. of Olmutz. N. lat. 49° 45'. E. long. 16° 29'.

TRIBE, TRIBUS, in Antiquity, a certain quantity or number of perfons; when a division is made of a city or people into quarters or districts.

The city of Athens was divided into ten tribes: the Jewish nation into twelve; or, if we separate the family of Joseph, thirteen tribes, the descendants of the twelve sons of Jacob, viz. the tribes of Judah, of Reuben, Gad, Asher, Dan, Naphtali, Ephraim, Manasfeh, Simeon, Levi, Issachar, Zebulun, and Benjamin; the poffers of Joseph being divided into two tribes, that of Manafiah, and that of Ephraim.

There were ten of these tribes that revolted, and followed Jeroboam. The other two, viz. thefe of Judah and Benjamin, adhered to the house of David, and to the worship of the true God, whilst the other tribes clave for idolatry.

This fchism, which lasted above 200 years, ended at last in the captivity of the ten tribes, which were carried away by Shalmanefer into Assyria and Media; nor does it appear from his story, that they ever returned into their own country, at least all of them, though we find it affered by some modern Jews and ancient fathers of the church.

Mention indeed is often made in the New Testament of the twelve tribes (see Matt. xix. 28. Luke, xxii. 30. Acts, xxvi. 7. James, i. 15.); and St. James directs his epistle to them; but from these passages we cannot conclude, that they were then gathered together; but we may infer, that they were fih in being. Perhaps the whole body of the Jewish nation retained the name of the twelve tribes, according to the ancient division, as we find the disciples called the Twelve, after the death of Judas, and before the election of St. Matthias. (John, xx. 24.) Moreover, there were Jews in a fufficient number of the ten tribes mixed with that of Judah, or diperfed into several parts of the world, to afford occasion for speaking of the twelve tribes, as making but one body with the Jewish nation. Of their diperfion into various parts of the Eaf, we have accounts that cannot be questioned. Whether or not we admit for W. Jones’s opinion, that the Afgans (which fea) were defended from them, Dr. Buchanan has recently confirmed the opinion, that the Pefians were carried several thousands of Jews into Babylon, from whence it is natural to conclude, that a confiderable number returned home with the others, when they were fet at liberty by Cyrus. See 2 Chron. xxxiv. 9. 1 Chron. ix. 3. Jer. i. 4. Luke, ii. 36.

The tribe of Judah did not continue more faithful to God
God than Samaria, the metropolis of the kingdom of Israel, had done. On this account they were often delivered into the hands of their enemies, and at last all carried away captive by Nebuchadnezzar in the 15th year of his reign. See Captivity and Jews.

The Roman people were at first only divided into three tribes; and from this number three, tree, it was that the word tribes, tribus, took its rise. Livy says (l. vi. c. 5.) that the appellation was derived a tributo. This division was accompanied by Romulus to the several nations he had united; the first confided of the Alban, the second of the Sabines, and the third of a mixture of fugitives, who came to seek an asylum at Rome.

Servius Tullius, fearing this partition might occasion seditions, divided the inhabitants of Rome by cantons, not by nations: accordingly, he distributed the city into four quarters, or tribes; and by reafon a great number of citizens had retired into the country about, of those he composed twenty-six other tribes; so that from this time the Roman people confided of thirty tribes.

Writers are not agreed concerning the precise number. With this from the city tribes, and the eighteen rustic tribes of Servius, as some have arranged and denominated them, the Roman people made up the number of thirty-five tribes. However this be, in after-times the number of tribes amounted to thirty-five; but they then ceased to be ranged according to the quarters of the city. The distribution depended on the censors, who formed their list at discretion, frequently confounding the country tribes with those of the city.

A man was never absolutely a Roman citizen, unless he had the jus tribus, i.e. till he was intituled to the honours of the magistrature, as also a right of voting in assembles of the people; and this is what they called jus quiritum. Hence the inhabitants of the municipal cities were only imperfect citizens, as being of no tribe.

The freed-men were obliged to purchase this right of tribus, which did not otherwise belong to them, though they were citizens of Rome.

TRIBES OF PLANTS, in Gardening, the particular kinds or sorts of cultivated garden vegetables of these descriptions, which are arranged and brought together under peculiar heads or names, according to their similar resembiances or appearances; the names of their habits of growth; and the general affinities which they bear, in some way or other, to each other. By these means, and in these several ways, a great number of different tribes of these sorts of plants are formed and constituted. Thus the time or duration of the growth of some afford several of these classes or tribes, such as the following: viz. the

Annual Tribe; that which contains all sorts of annual plants, or those only of one year's growth or duration, being often simply, on that account, termed annuals.

Biennial Tribe; that which comprehends all sorts of plants which are of perennial or many years' growth or duration, and which is applicable to trees as well as herbs, though somewhat more frequently and generally used to herbaceous perennial plants. These are occasionally called perennials merely. See ANNUAL; BIENNIAL, and PERENNIAL PLANTS.

The nature and form of the root have also some influence in the formation of these tribes, as is evident in the following:

Bulbous-rooted Tribe: that which comprehends all kinds of plants which have thick or bulbous roots; such as those of the onion, turnip, lily, crocus, narcissus, and several other kinds.

Tuberous-rooted Tribe: that which contains all sorts of plants which have thick, knobby, fleshy roots, such as those of the amonone, potatoe, Jerusalem artichoke, and many other kinds.

Fibrous-rooted Tribe: that which comprehends all sorts of plants which have small string-like fibrous roots, such as that of endive, and many other kinds. See Root.

The ligneous or woody nature of plants likewise caufes differences in this description, such as these:

Lignous or Woody Tribe: that which includes all sorts of plants of the tree or shrub kind which have woody or solid durable stalks or stems, such as those of the oak, ash, beech, and other similar kinds, as well as such shrubs as the holly, alaternus, althaea, and many other sorts. See TREE and SHRUB.

Arboeous Tribe: that which contains all sorts of plants of the tree kind, which rise with an upright main stem or stalk to a considerable height, as in the alh, beech, &c. See TREE.

Fruticoso or Shrubby Tribe: that which takes in all sorts of plants of the shrubby kind, or which have any thing of shrub-like growth, and which rise only to a moderate height, having a divided, low, flemmy, and branching bushes appearance about the bottom and other parts, as in the althea frutex, lycias, &c. See SHRUB

The habits of different sorts of plants, in regard to the loss or the retention of their leaves during particular seasons of the year, are a further source of the distinction of them in these modes.

Deciduous Tribe: that which comprehends all sorts of both trees, shrubs, and plants, which cast their leaves during the winter season, or before it commences; such as the althea-tree, the lybinga shrub, and the fennel, golden-rod, and mthn plants.

Sempervirens or Evergreen Tribe: that which comprehends all the various sorts of trees and shrubs, as well as other kinds of plants, which have the property of retaining their green leaves the whole of the year round, such as the holly, yew, box, laurel, and many others. See DECIDuous and EVERGREEN TREES.

Herbaceous Tribe: that which contains all the different sorts of the herbaceous or herb kind of plants, which moit commonly rise furnished with leaves immediately from the roots, and with soft herbaceous stems or stalks, without any sort of woodiness; but which, for the most part, decay and die about the close of the same year in which they were produced, such as the pea, bean, lettuce, mulford, celery, and numerous others. See HERBACEOUS PLANTS.
There are others which are arranged in this manner from their juicy or succulent properties, as the following tribes.

**Succulent Tribe:** this is that which includes all the sorts of plants which have fleshy, moity, juicy leaves, which are sometimes of considerable thickness, but in other cases not, such as the fenum or house-leak, the calocont or meon-thistle, creeping cerasus, &c., the aloe, the agave, and several others. See Succulent.

The manner of feeding, and the economical uses to which plants are put, are further causes of their arrangement and distinction in this way.

**Leguminous Tribe:** that in which all the different plants that it embraces have the sort of feed-veffel which is usually denominated a legume, or pod, as in all the pea, bean, kidney-bean, and other papilionaceous-flowered plants.

**Oleaceous Tribe:** that in which the various plants that it contains are of the efficient or edible kind for the table, or for being preserved and made use of for other culinary or domestic intentions. See Leguminous and Esculent Plants.

The forms of the leaves and plants, the manners of their flowering, the shapes of their flowers, the methods of feeding or fruiting, and the particular natures, qualities, and properties of plants, all have a further tendency to the introduction of more tribes of these kinds.

**Pinnated Tribe:** that in which all the sorts of the trees and plants which it contains have pinnated leaves, or those which are in the shape of wings, as is the case in a great number of different kinds, as in the acacia, the fumich, and many others.

**Enfataceous or Sword-leaved Tribe:** that which comprises plants which have fiddle-shaped leaves, as is the case in many sorts, such as the iris or flowering rufh, the gladiolus or sword-lily, &c.

**Spathaceous Tribe:** that which contains all such plants as produce and produce their flowers out of a fpahta or sheath, and which are many in number, fuch, for instance, as the nareiflans or daffodil and jonquil, the galanthus or snowdrop, and the amaryllis or lily-daffodil, Guernsey lily and the belladonna and jacobsa lily.

**Lilaceous Tribe:** that which comprehends all the sorts of plants which have papilionaceous or butterfly-flowered flowers, such as those of the pea, bean, and all the leguminous kinds of plants. See Papilionaceous Flowers.

**Campanaceous Tribe:** that which contains all the various kinds of plants which have campanulate or bell-shaped flowers, as those, for instance, of the campanula or bellflower, the convolvulus or bind-weed, and bean-kind, and others of the same sort.

**Rotaceous Tribe:** that which includes all sorts of plants which have rotated or wheel-shaped flowers, such as those of the llysichia or lefe-trife, the anagallis or pimprenel, and some others.

**Umbelliferous Tribe:** that which contains all such plants as produce their flowers in somehow the form of an umbel, as in those of the angelica, the anethum or fenel, the pallinaca or parsnip, and some others. See Umbellated Plants.

**Verticillate Tribe:** that which comprises those sorts of plants which have their flowers produced in something of the form of a verticillus or whorl, as in those of the thymus or common thyme, the hyfipus or hyfip, the melissa or balm, the origanum or marjoram, the mentha or mint, and several others. See Verticillated Plants.

**Aggregate Tribe:** that which comprehends such plants as produce their flowers in an aggregate form, consisting of numerous florets or small flowers, each having its own proper calyx or cup, but the whole of which are collected into one close aggregate, or head, as in those of the ceafias or seafius, the iatice, thrift, or sea-pink, the glubariua or globular blue daisy, and some others. See Aggregate, in Botany.

**Composit or Compound Tribe:** that which comprises those sorts of plants which have compound flowers, consisting of a great number of florets contained in one common calyx, or cup, as in those of the sun-flower, the marigold, the alfer or starwort, and many others. See Compound in Botany.

**Amentaceous Tribe:** that which contains those plants which produce their flowers in amaments of catkins, as in those of the popolus or poplar-tree, the corylus or hazel, the fagus or beech, the betulua or birch, and some others. See Amentaceous.

**Baccaceous Tribe:** that which comprehends all those sorts of plants which bear and produce any kind of berry, as the ribes or gooseberry and current, the raspberrua, the yeua, and many others.

**Coniferous Tribe:** that which contains all such sorts of trees and plants as bear the kind of fruit or seed which is denominated a cone, as the various sorts of firs, &c. See Cone, in Botany.

**Fungal Tribe:** that which takes in all vegetables of the mushroom and other similar kinds, as the common mushroom or agaricus, &c.

**Gruminous Tribe:** that which comprehends all such sorts of plants as are of the graps or grain kinds, such as the different field grasses, and those of the wheat, rye, barley, oat, and other similar kinds.

**Lutrid Tribe:** that which includes all the sorts of plants which have any thing of a lumnous appearance or hurtful or noxious quality about them, as those of the atropaga or deadly nightshade, the dara, thorn-apple or phrumonium, the nicotiana or tobacco-plant, the pelonan or love-apple, &c. the capricum or guinea-pepper, the digitals or foxglove, and several others.

**Nuisiferous Tribe:** that which comprehends all the sorts of the nut-bearing kinds of plants, as the hazle-nut-tree, the walnut-tree, &c.

**Pomaceous Tribe:** that which comprehends all such sorts of plants as bear or produce a fruit of the apple kind, as that of the pyrus malus or apple kind, the pyrus communis or pear kind, the pyrus cydonia or quince kind, the amygdalus or almond kind, the prunus or plum kind, the metiplus or medlar kind, the pruncia or pomegranate kind, and some others.

This sort of classification or arrangement of the different sorts of plants which are cultivated in the garden or pleasure-ground for the sake of their culinary uses, or the ornament which is afforded by their flowers, is often of very great utility and convenience, as supplying the means of throwing together those sorts of plants which have many circumstances and practices in their general culture and growth which have much similarity to each other, by which the common gardener has a far greater facility of raising and managing them, as well as of securing their produce in fruit or other ways. He is thereby also better enabled to make use of those of the ornamental kinds in the borders, clumps, and other parts of the grounds in which they are to be let out and placed.

**TRIBENSEE, in Geography, a town of Austria; 3 miles N. of Tulln.**

**TRIBERL, a town of the Brisau; 15 miles N.E. of Fribourg. N. lat. 48° 9'. E. long. 8° 17'.**
of the moderns, was so called from the likeness of its fruit to the instrument of war denounced in English a caltrop. (See TRAPA.) Whether the name arose from τράπη, to tear, or to injure; or as some think from τραπεζ, three, and σκότος, a calf, or a wound, may admit of controversy. The caltrop has four, not exactly three, points; and the feed-velvets of our plant has a much greater number, though the appearance of the whole very much resembles the above war-like, or rather treacherous, instrument.—Linn. Gen. 213. Schreb. 289. Willd. Sp. Pl. v. 2. 566. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 3. 41. Sm. Prodr. Fl. Grec. Sibth. v. 1. 273. Juff. 296. Tourn. t. 141. Lamarck Illustr. t. 346. Gertn. t. 69. — Clasr and order, Decandria Monogynia. Nat. Ord. Gruninales, Linn. Rutaceae, Juff. but not correctly.

Gen. Ch. Cal. Perianth inferior, of one leaf, in five deep acute segments, rather shorter than the petals. Cor. Petals five, oblong, obtuse, spreading. Stam. Filaments ten, small, awl-shaped; anthers incumbent, simple. Pist. Germen roundish, brightly, the length of the filaments; style short and thick; stigma capitate, with five rays. Peric. roundish, thorny, of either five or ten capsules, which are gibbous externally, and armed with three or four sharp thorns; angular on the inner edge and crowded together; their cells several, transverse. Seeds solitary in each cell, oblong.

Obf. T. maximus, Linneus by mistake says cifoletus, has ten rugose capsules, almost defitute of lateral fpines.

Eff. Ch. Calyx in five deep segments. Petals five, spreading. Style conical. Capsules five or ten, gibbous, spiny, with several seeds.

1. T. maximus. Great Caltrops. Linn. Sp. Pl. 553. Willd. n. 1. Ait. n. 1. Jacq. Coll. v. 4. 110. L. v. 1. 462. (T. d. 2.) Browne Jam. 222. t. 21. f. 3. T. terresfris major, flore maximod omoato; Sloane Jam. v. 1. 209. t. 132. f. i. — the figure at leaf, and part of the description. T. terresfris, fructu turbinato, folius lanuginosus; Plum. L. 252. t. 254. f. 1.) — Leaflets about four pair; the outer ones largest. Fruit turbinate, wrinkled, slightly spiny, with ten furrows. Style permanent. — Native of dry waste places, or rocky gravelly ground, in most parts of Jamaica. Sloane. The root is annual, rather deep. Stem several, about two feet long, spreading flat on the ground, branched, round, leafy, frayed, rather hairy. Leaves opposite, abruptly pinnae, leaflet hairy, an inch and a half long, of six pair of half-ovate, entire, acute leaflets; the first pair small, the third largest; on a flat flake. Stipulas awl-shaped, pale, hairy. Flowers axillary, solitary, inodorous, on simple stalks rather than the leaves, hairy, and swelling upward. Calyx permanent. Petals obvate, half an inch long, dirty white, ribbed with dull purple. Germin roundish, hairy, crowned with a conical permanent style, exceeding its own length; stigma obute, marked with five rays. Fruit hairy, composed of ten corugated tumid capsules, knobbed rather than spiny, and beaked with the thick style. Linneus certainly alludes to this species, in the observation under his characters of the genus, and not to T. cifoletus, which has the proper thorny fruit of the rest. It seems to us, that Sloane's definition and description of the flower belong, on the other hand, to cifoletus, and that hence Linneus, nevertheless, took his specific name of maximus, which is nowise suitable to the plant before us.

D d 2
Fruit with ten horizontal awl-shaped thorns. Style deciduous.—Native of Ceylon. The flens seem woody, and probably perennial. Whole plant, excepting that circumstance, much like T. terrestris hereafter described, but the leaves are more hairy, or silky. Each of the five combined wrinkled cappules is armed with a pair of sharp, tapering, prominent thorns, twice the length of the cappule; but the base is nearly, or quite, deliquit of spines. The flowers seem to be yellow, the size of the leaf, with a short, thick, deciduous style.

Leaves six pair, rather hairy, nearly equal. Fruit with ten horizontal awl-shaped thorns, and as many deflexed smaller ones. Style deciduous.—Native of the south of Europe, by way fides, as well as in cultivated ground. Dr. Sibthorp observed this species everywhere in Greece, retaining its ancient name a little altered, τριπλον. This is doublets of the τροφοδος κενταρον, or Land Caltrop, of Diofcorides. The Turks call it Demio Dikimi. We have an East Indian specimen from the late Dr. Roxburgh. The annual root produces many long, reddish, hairy, leafy, slightly branched, prostrate flens. Leaves smaller, and more numerous, than in our first species; leafy than in the second; all nearly of equal lice, the outer, or terminal, ones being, if any thing, rather the smallest. Flowers yellow, on shortish, simple, solitary, axillary flarks. Style three, hardly fo thin as the germ, deciduous. Sperma of five prominent rays. Cappules tuberculated, each with four awl-shaped thorns, of which the larger are scarcely half as big as those of T. lanuginosus. Thole at the base are still smaller, pointing directly downwards, and serve chiefly to distinguish the present species from the last. The herb has been reputed cooling and emollient, ever since the time of Diofcorides. He says the Thracians, who inhabited the banks of the Strumon, fed their horses with the green plant, and made bread for themselves of its feeds.

4. T. ciliolus. Cilus-flowered Caltrops. Linn. Sp. Pl. 554. Willd. n. 4. Ait. n. 3. Jacq. Hort. Schoenbr. v. 1. 54. t. 103. (T. terrestris major corallificius; Herm. Parad. 236. t. 236. T. terrestris americanus, argemones flore flavo; Pluk. Phyto. t. 67. f. 4.)—Leaves about eight pair, silky beneath, nearly equal. Petals twice as long as the calyx.—Native of meadows in the West Indies. A close-plant with us, flowering in June and July, but not in general culture. The root is perennial, thick and woody, though Hermann fays annual. Stem many, herbas, diffuse, clothed with handfome leaves, whose upper leaflets are smaller. Flowers yellow, large and handfome, two inches wide, their stalks longer than the correspondig leaves. Cappules, according to Jacquin, each armed with four thorns of nearly equal lice.

TRIBULUS Marinus, the caltrop-fluell, in Natural History, the name of a peculiar species of the purpura. It is of a whitish colour, and has three rows of spines.

TRIBUNAL, Judgment-Seat, the seat of a judge. The tribunal, in a court of justice, is properly the seat or bench on which the judge, and his associates, are placed, for the administration of justice, &c.

The word is Latin, and takes its origin from a seat raised from the ground, on which the tribune of the Roman people was placed to administer justice.

TRIBUNAL, among the Ancients, was also a place from whence the people were harangued.

Among the Romans, it was an eminence in a temple, or a forum, as that called pro rostris, where the people were harangued in tribes.

The French architects likewise use the word tribunal for a gallery or eminence in a church, or any other place, in which the music is placed for a symphony or concert. Tribunal, or tribunal, is also used for a room or hall in which justice is administered; such, e.g. as the courts at Wiltminter.

TRIBUNE of the People, Tribunus Plebis, in Antiquity, a Roman magistrate, chose out of the commons, to protect them against the oppressions of the great, and to defend the liberty of the people against the attempts of the senate and confuls.

The tribunes of the people were first established in the year of Rome 260. The first design of the creation was to shelter the people from the cruelties of usurers, and to engage them to quit the Aventine mount, whither they had retired in defpaleasure.

Their number, at first, was but two; and the next year, under the confultation of A. Polthamus Arucius and Callius Zicellimus, there were three more added; and this number of five was afterwards increased by L. Trebonius to ten.

The appellation tribune was given them, because they were at first chosen out of the tribunes of the army. See the article following.

The tribunes were, as it were, the heads and guardians of the people. They called assemblies of the people when they pleased; and in those assemblies they frequently annulled the decrees of the senate. Nothing could be concluded without their consent, which they expressed by subfcribing the letter T at the bottom of the decree. They had it also in their power to prevent the execution of any decree, without giving any reason for it, and merely by subfcribing Veto. This interposition was called intercessio. They sometimes even called the confuls and dictator to account for their conduct before the people. The tribunes of the people, by virtue of their office, claimed and exercised a power of mumoning the senate at any time, whenever the affairs of the people required it, though the confuls themselves were in the city. It has been taken for granted, on the authority of Valerius Maximus, that the tribunes of the people, on their first creation, were not admitted into the senate, but had seats placed for them before the door in the vellubb. But we may reaonably conclude, that a magistrate so ambitious and powerful, who could control, by his single negative, whatever passed within doors, would not long be content to fit without. Dionyf. Halie. x. 31. Middlet. of Rom. Senat. p. 129. Val. Max. Lib. ii. cap. 27.

A. Cellius says that they were not made senators before the law of Atinibus, who is supposed to be C. Atinius Labeo, tribune of the people, A.U. 623; but that cannot possibly be true, since it is evident from the authority of Dionysius, that near four centuries before, the tribunes, by the mere weight and great power of their office, had gained an actual admittance into the senate, within two years after their first creation; in which we find them debating and enforcing, with great warmth, the demands of the commons, for a liberty of intermarriages with the nobles, and the choice of a plebeian confus. So that the intent of this Atinian law could not be, as it is commonly understood, that the tribunes should be senators in virtue of their office, for that they had been from the beginning; but that for the future they should always be chosen out of the body of the senate, or, which is the same thing, out of those who had already borne the office of quaeflor. A. Cell. xiv. 8. Vide Pighil.
TRI

Sylla, the dictator, was the first who professed to put a stop to the encroachments of the tribunes, A. U. 672; but under Cotta, the confid, they recovered part of their power. A.D. 672, and in 683, Pompey the Great re-established them in the possession of their ancient privileges. Their power subsisted till the time of Julius Cæsar. And in the year of Rome 731, the senate by a decree transferred the whole authority of tribunes of the people to Augustus and his successors, so that they had little more than the name and form of magistrates; whence the emperors were said to be tribunuti potestate donati. Accordingly, Augustus himself was tribune for thirty-seven years; Tiberius affumed the fame quality; as likewise did his successor; signifying the year of their tribunate on their medals and coins; but their design in it was only to pollute themselves of all the authority, that there might be nobody to oppose them.

In the time of the emperors Nerva and Trajan, the dignity of tribune of the people was a mere title, without office and honour; and thus it continued till the reign of Constantine the Great, after which there occurs no mention of this magistrate.

TRIBUNE of the Soldiers, Tribunus Militum, or Military, an officer in the Roman army, who commanded in chief over a body of forces, particularly a division of a legion; and was much the fame with our colonel, or the French major de camp.

There is a distinction of the tribunes into latriclavi and anguliclavi: those born of noble families were allowed, after they were made tribunes of a legion, to take the latriclavi. The rest were only to wear the anguliclavi; whence Suetonius takes care to inform us, that his father was tribunus latriclavi of the thirteenth legion. Over these tribunes of legions and cohorts, there were other tribunes who commanded in the absence of the consuls, and who were invested with a confular authority. Budæus will have thebe to be much the fame as the marshals of France, or, at least, as our lieutenants-general.

Romulus likewise established a tribune of the cavalry, tribunus equitum, who was the fame with the magister equitum under the dictators, the first officer after the kings.

The tribunes of the foedery were of an elder standing than thofe of the people: thofe latter being elected out of the former. Varro will have it they were called tribunes, becaufe, at first, they were only three in number in each legion, when the legion confifted of three thousand men, taken out of the three tribes then on foot. In proportion as the legion was increafed, the number of tribunes was likewise increafed to the number of five.

At first, the nomination lay in the general of the army; but in the year of Rome 391, it was appointed, that the people should nominate one part, and the general another; the latter were called Rufuli, from Rutius Rufus, who passed that law.

Thofe chosen by the people in the comitia, were called comitiati; they were indifferently either patricians or plebeians; and they had the fame marks of honour as the confuls themselves. The tribune of the pretorian cohorts was the captain of the guards.

TRIBUNE was also an appellation given to various other officers; as the tribuni erarit, tribunes of the treasury. Tribune of the elecors, or Roman light-horse, the officer who commanded them. Tribuni fabricarum, those who had the direction of the making of arms. Tribuni marinorum, tribuni nelanorum, and tribuni vestitum, mentioned in the Theofban Code, as intendents of the public shows, and other diversions.

The title of tribunus, tribunus, was also given to the chief of each tribe.

TRIBUNITIAN, TRIBUNITIUS, a term among antiquaries and medallists. The tribunitian power was the dignity, office, or authority of a tribune of the people.

This power was assumed by the emperors, and makes one of the chief titles they bear on their medals: the quality was first introduced by Augustus, to keep the sovereign authority over the other magistrates without either taking that of dictator or king. Indeed, it was offered to Julius Cæsar, but he defpised it. Augustus is the first who used it, and his successors followed his example. They reckoned the years of their empire on their medals by those of their tribunitian power.

This power was sometimes given them for a certain number of years, and sometimes for ever. Sometimes the emperors would communicate the power to such as they associated, or as they intended to succeed them, and Tiberius held it fifteen years with Augustus. But this practice only obtained till the time of Valerian and Gallienus. After them we only find T. P. II. in Claudius; T. P. V. in Aurelian; and T. P. in Probus. This, however, is only to be understood of medals; for in inscriptions we find it after that time.

Cardinal Noris and F. Pagi have disputed about this tribunitian power, in which it consisted. The first maintains, that it did not at all differ from that of the ordinary tribunes, which consisted in three things: 1. In the right of opposing all the acts and resolutions of the other magistrates. 2. In that it rendered their persons facred and inviolable. 3. In a power of making edicts and laws.

F. Pagi afferts, that it made an addition to the power of the tribunes; that the privilege it conferred of making edicts, was more ample than that of the ordinary tribunes; besides, that it carried with it a power of convening the senate at pleasure.

M. Spanheim is of F. Pagi's opinion; he believes that the tribunitian power had much the advantage of the tribunes: 1. In that it was peculiar to the patricians, and did not reduce the person who held it to the degree of a plebeian.

2. In that it was not confined to the city of Rome alone, like the other; but that it extended throughout the empire, as well as the proconfular power, which was usually annexed to it.

3. That the dignity of the tribunes was inferior to that of the pretors; whereas the tribunitian power of the Cæsars conferred, according to Tacitus, a sovereign authority over all magistrates, and rendered such as it was communicated to, equal to the emperors, and even made them their colleagues in the empire; besides the power of opposing the enterprises of all the other magistrates; and that it rendered their persons sacred, and gave them a right to assemble and dismiss the senate; which were privileges the tribunitian power had in common with the tribunes.

F. Hardouin thinks we should distinguish two tribunitian powers: the one civil, the other military; but the proof he brings of them is very weak. M. Spanheim says, his distinction is only founded on vain conjectures, none of which deserve notice.

The learned are greatly divided as to the month and day on which the tribunitian power commenced: Sigerius and Petavius will have it begin on the 1st of January; others, as Perizonius, on the 5th of the calends of July; M. Toirmard, on the fourth of the ides of December: Onuphrius, cardinal Noris, F. Pagi, &c. on the day of the emperor's accension.
acclimation to the empire; with this difference, that F. Pagii takes it to be on the fifth of the calends of the month in which the emperor was proclaimed; and that this day was, for this reason, held sacred among the Romans.

F. Hardouin thinks, that on medals the tribunitian power, interposed on the anniversary of the building of Rome, viz. the eleventh of the calends of May, excepting on the Greek medals, where it begins in September, in regard this month, which began the Greek year, was near the time when the tribunitian power was first conferred.

Of all these sentiments, the most probable is that of Onuphrius, &c. setting aside the restriction of F. Pagii. See M. Spanheim, Differt. xii. tom. ii. p. 429.

TRIBUTA COMITIA. See COMITIA.

TRIBUTARY, TRIBUTUS, one who pays tribute to another, in order to live in peace with him, or to share in his protection.

The republic of Ragusa is tributary to the grand Turk; so also is the chain of Little Tartary, &c.

TRIBUTE, TRIBUTUM, a tax, or impost, which one prince or state is obliged to pay to another, as a token of dependence; or in virtue of a treaty, and as a purchase of peace.

The Romans made all the nations they subdued pay them tribute. Mahomet laid it down as a fundamental of his law, that all the world should pay him tribute.

In the states of the grand signor, Christian children are taken, by way of tribute, to make agemoglians, janizaries, &c.

Tribute is sometimes also used for a personal contribution, which princes levy on their subjects by way of capital, or poll-money.

In this it differs from an impost, which is properly what is laid on merchandises.

TRICADIBA, in Ancient Geography, an island of India, upon the coast, on this side of the Ganges, in pawning from the gulf of Canticopel to the Colchic gulf, and to the S. of the island of Heptanea. Ptolemy.

TRICE, in Botany, so called from τρίς, τρία, a hair, because they seem composed of a horn-hair rolled, or partly folded, into a little round black head, are the peculiar fructification of the genus of Lichens named Gyrophora. See that article; as well as Lichenes, their eighth kind of reception.

TRICALA, in Geography, a town of European Turkey, in Macedonia, on the Strimon; 30 miles E.N.E. of Saloniki.—Alfo, a town of European Turkey, in Thessaly; 21 miles S.W. of Larissa.

TRICALORE, a town of Hindoostan, in the Carnatic; 38 miles W. of Pondicherry. N. lat. 11° 58'. E. long. 79° 21'.—Alfo, a town of Hindoostan, in the Carnatic; 17 miles S. of Tanjore.

TRICARICO, a town of Naples, in Basilicate, the fee of a bishop, suffragan of Accenza; 13 miles S.E. of Accenza. N. lat. 45° 43'. E. long. 16° 8'.

TRICARIUM, in Botany, a genus of Lourcerio's, the name of which alludes to the three nuts of the fruit, being derived from τρίς, three, and καρυς, a nut.—Lourcer. Cochin. 557.—Claf and order, Monocot. Tetrandra. Nat. Ord. Ramian, or possibly Eleagni, of Jufficue.

Female, interspersed with the male. Cal. Perianth inferior, minute, in four deep ovate divisions. Cor. none. Pflg. Germen superior, roundish; style none; stigma laciniate.

Peric. Drupa roundish, flabby, of three cells. Seed. Nuts solitary in each cell, roundish, with three furrows.

Female, Calyx in four deep segments. Corolla none. Stigma laciniate. Drupa with three nuts.

1. T. cochichinence.—Found in the woods of Cochinchina, where it is known by the name of Cyst Trim. un. A tree of a middling stature, with ascending branches. Leaves alternate, small, ovate, entire, smooth. Flowers red, in long, fimple, slender, aggregate, nearly terminal spikes or clusters. Drupa of a moderate size, yellow, smooth, eatable.—We cannot refer this plant to any described genus, nor are we certain whether it belongs to either of the above natural orders, or to the Euphorbiaceae, or perhaps the Terebinthaceae, of Juffieu. Difficulties attend each supposition.

TRICASSES, in Ancient Geography. See TRECCASSES.

TRICASTINI, or TRICASTI, a people of Gallia Narbonnensis. Hannibal passed through this country in his way to the Alps. Mention is made of these people at the time of the march of the Gauls into Italy, under the conduct of Bellofexis; and Pliny as well as Ptolemy take notice of them, the former specifying Aquae as their capital. It is most certain that they inhabited the left bank of the Rhone, in a small country called Tricalina.

TRICCA, a town of Greece, in Thessaly, in the Ellymite territory. A modern place, named "Tricala," gives its just position, and answers to Strabo's account of the situation of this town. Venus was worshipped in this city, and the inhabitants offered to her sacrifices of fowle.

TRICCINA, a town of Pannonia, on the route from Sirmium to Carnuntum, between Pons Manueltianus and Cimbrianae. Anton. Itin.

TRICE, in Geography, one of the Nicobar islands. N. lat. 7° 30'. E. long. 94° 5'.

TRICENNIAL. See TRENAL.

TRICEPS, in Anatomy, a name given to a large muscle of the arm, and to one of the thigh, from the circumstance of their arising by three distinct portions.

Triceps adductor cruris, (triceps femoris; foss-pubis, foss-pubi, and ischi femoris; adductor longus, adductor brevis, and adductor magnus; long, short, and great heads of the triceps). This muscle is placed at the upper and inner part of the thigh, consisting of three flattened portions, distinct from each other, making up the large mass of muscle on the inside of the limb, and extending from the pelvis to the linea aspera of the thigh-bone.

The long head of the triceps, adductor longus or primus, the fourth in order of the three portions towards the front, is elongated and flattened, narrow above, and considerably wider below, and extends from the front of the pubes to the middle of the linea aspera. It arises by a narrow but strong tendon from the pubes, close to the lymphysis; the muscle descends, passing at the same time obliquely forwards and backwards, and increasing greatly in breadth: it terminates below in a broad and flat aponeurosis, fixed to the middle of the linea aspera, in an extent of about three inches. Some fibres join the tendon of the adductor magnus, while others unite with the vastus externus. The facia lata, the fartorius, and the crural artery, cover it in front: it covers behind the two other adductors. Its outer edge is parallel to the inner margin of the pectinisus, and connected to it by a cellular line: its inner margin is much longer, and covered, in nearly its whole extent, by the gracilis.

The short head, adductor brevis or secundus, is also of a flattened figure, placed at the upper and inner part of the thigh, and extending from the pubis to the upper part of the
linea afera. It arises, principally by feby fibres, from the anterior surface of the body and ramus of the pubes; it paffes obliquely downwards and outwards, with a little obliquity backwards, becoming broader and thinner, and having an attachment of about three inches to the linea afera, from the little trochanter downwards. Here it is closely connected to the two other adductors and to the aponeuros. The perforating arteries go through its fibres. The pectinals and adductor longus cover it in front; the adductor magnus behind. The inner edge is partly covered by the gracilis, partly concealed between the firt and third adductors: the outer corresponds to the obturator externus and the tendon of the psoas magnus.

The adductor magnus or tertius, or the great head, is a broad and thick mass, flattened, nearly triangular, placed at the infide of the thigh, where it reaches from the ilium to the whole length of the linea afera, and to the tubercle of the internal condyle. It arises, by a strong aponeuros and by feby fibres, from the external surface, and from the margin of the ramus and tuberosity of the ilium. From this point the muscular fibres spread out into a great breadth, and take very different directions; the superior fibres going nearly transversely, the middle obliquely, and the inferior almost perpendicularly downwards. The general direction of the muslce is from above downwards, and from within outswards. Its attachment begins at the upper end of the linea afera, just below that of the quadratus: it is fixed to the whole length of that line, being connected to the two preceding muscles. When the linea afera bifurcates at its termination, the adductor magnus divides into two portions; an external or posterior, which ends in a point between the vatus internus and the short head of the biceps; and an internal or anterior, which is connected to the edge of the vatus, and defends with it to the internal condyle. These two portions have between them an interval, occupied by the femoral artery and vein: this interval is covered in front by an aponeuros, extended from the adductor to the triceps, and passing over the femoral artery. There are other openings in the aponeuros for the passage of the perforating arteries. The adductor magnus is fixed to the linea afera by short aponeuros; and to the tubercle of the internal condyle by a strong tendon, which is expanded above into a broad aponeuros. The muscular fibres pass between the tendon and aponeuros, which fix the muscle to the ilium, and those which are connected to the femur. The internal fibres are very long, and directed obliquely downwards and outwards: the middle ones are shorter, and directed more outwards, and the external or upper are the shortest, and nearly transverse.

The frist and second adductors, the fartorius, and the crural artery, cover it in front: the femi-tendinous, femi-membranous, biceps, gluteus magnus, and femoral nerve, cover it behind. The inner edge is covered by the gracilis, fartorius, and faciua; the outer edge is the infexiton in the linea afera. The upper margin, or the bafe of the triangle, is parallel and close to the under edge of the quadratus; the lower extremity, or apex, is the tendinous attachment to the condyle.

The triceps will move the thigh in the direction of adduction, or towards the opposite limb: it will carry one thigh across the other, as in fitting crosf-kned; it will prefs the thighs against any thing between them, as the fides of the horse in riding. The frist and second heads will bend the hip: the third will extend it, when it has been previously bent. All three will rotate the thigh outwards. By draw-ing the thighs inwards, the triceps musfles keep them perpendicularly under the pelvis, so that they support it, and through it the whole upper parts of the body. When we stand on one leg, the triceps will regulate the degree of inclination of the pelvis over the thigh, and prevent it from falling over on that fide.

Triceps extenfor cubiti. (triceps brachialis; anconeus longus, externus, and internus. Winflow: fcapulo-humero-olecranon,) a large thick musle, of an elongated figure, covering the back of the arm, and extending from the fcapula and humerus to the olecranon. Its long head arises from the inferior edge of the fcapula, juft below the glenoid cavity, by a flat tendon, about three-quarters of an inch broad: the second or external head commences, in a pointed form, from the back of the humerus, a little below its head; and the third, internal, or shortfet head, begins on the inner and posterior part of the humerus, an inch below the second. The two latter are seperated from each other by an interval, in which the profunda humeri major artery runs, accompanied by the radial or muscular spiral nerve: this veefel and nerve continue their course, from the inner to the outer fides of the limb, between the muslce and the bone. Below the points mentioned already, as the origins of the second and third heads, these portions arife by feby fibres from the whole posterior surface of the humerus, except where the radial nerve and the profunda humeri fads, and from the inter-muscular aponeuros fixed to the lateral ridges of the bone. The long or middle head continues distinct from the others for fome distance, paffes behind the shoulder-joint, between the teres major and minor muscules, and in front of the latiflimus dori; it then foon joins the two others. It is first thin and flattened; then increafes in fize. The two other heads are pointed and thin above, and increafes gradually: they all then join about the middle of the humerus, which is the thickest part of the musle; for below it again decreafes. From the aponeuros of the middle head, and from the back of the humerus, the feres are continued obliquely downwards and backwards into a broad and flat tendon, which covers the lower and posterior part of the musle, becomes narrower and thicker as it defends, paffes behind the elbow-joint, clofely adhering to its fynovial membrane, and is inserted into the upper and posterior rough extremity of the olecranon. Several feres are detached from it to the fefia of the fore-arm, and particularly to that part of the fefia which covers the anconeus.

The posterlur surface of this muscle is convex; covered above by the teres minor and deltoid, and in the reit of its extent, merely by the fefia and skin. The anterior surface is in contact above with the subficallaris, teres major, and latiflimus dori; with the whole back of the humerus; and with the fynovial membrane at the back of the elbow. The outer edge is fixed to the external ridge of the bone, and to the external intermuscular aponeuros, the attachment being interrupted only at the paffage of the radial nerve. The internal edge is fixed to the corresponding parts on the inside; the ulnar nerve lies on it. The upper extremity is divided into three portions, forming the three heads already described: the lower extremity is fingle.

The triceps extends the elbow-joint, by moving either the bones of the fore-arm on the arm, or vice verfa. Its long head may carry the arm backwards.

Triceps, in Mythology, a surname given to Mercury, becaufe he exercises his functions in heaven, on earth, and in the infernal regions, and is exhibited under three different forms, according to the three different places in which he is employed.

Tricer,a, in Botany, from τρίς, three, and κερα, a horn, becaufe of the three horns, originating in the permanent
TRI

nent styles, which crown the feed-veil. Dr. Swartz had originally called this genus Crantzia, but another having been so named by Schreber, he adopted the above, which is very expressive.—Swartz Ind. Occ. 333. t. 7. Schreb. Gen. 630. Willd. Sp. Pl. v. 4. 338. Mart. Mill. Dict. v. 4. (Crantzia; Swartz Prodr. 38.)—Clafs and order, Monocot Tetrandria. Nat. Ord. Tricoce, Linn. Euphorbes. Jiff.

Gen. Ch. Male. Cal. Perianth of one leaf, deeply divided into four lanceolate, acute, erect, coloured segments. Cor. none. Stam. Filaments four, fleshy, cylindrical, inclining to ovate, erect, longer than the calyx; anthers terminal, ovato-lanceolate, acute, erect, furrowed along one side, recurved after flowering.

Female, in the same tuft, or cluster, Cal. Perianth of five ovate, acute, erect, coloured, permanent leaves. Cor. none. Pil. Genus superior, somewhat triangular; filies three, short, somewhat conical, separable at length into two parts; filaments linear, longer than the filaments, spreading, recurved, channelled, permanent. Peric. Capsule turbinate, triangular, with three cells, three valves, and three recurved horns, each horn splitting, by the opening of the elatic capsule, into two parts. Seeds two in each cell, oblong, triangular, polished, each enveloped in a whitish membranous lax tunic.

Female, Calyx of five leaves, inferior. Corolla none. Styles three. Capsule with three cells, three elatic valves, and three horns. Seeds in pairs, with a membranous tunic.

1. T. leviugata. Smooth Tricera. Swartz Ind. Occ. 333. Willd. n. 1. (Crantzia leviugata; Sw. Prod. 38. Vahl Symb. v. 2. 99.)—Leaves ovato-lanceolate, triple-ribbed; veinslets beneath. Umbels axillary.—Native of boshy hills, in the western part of Jamaica, flowering in spring. Swartz. Vahl received it from Santa Cruz.—A branching flurb, two or three feet high; its branches long and spreading, smooth, leafy, obscurely quadrangular. Leaves fleshy, opposite, two-ranked, an inch long, acute, convex, entire, very smooth, rather rigid. Footstalks short, round. Flowers white, in small, axillary, opposite, fleshy umbels; the males from four to eight, with little white opposite bracteas on their partial flanks; female solitary in the centre, rather larger, fleshy, conspicuous for its long spreading filaments. Capsule the size of a large pea, with three taper horns, exceeding its own length. Seeds black, and shining, in a loose white tunic. Dr. Swartz justly indicates the affinity of this plant to Buruss, from which it is principally distinguished by the want of a corolla, the form of the filaments and filigmas, and the tunic of its seeds.

2. T. citrifolia. Lemon-leaved Tricera. Willd. n. 3. —"Leaves ovato-oblong, pointed, triple-ribbed, veiny on both sides, Clusters axillary."—Gathered by M. Brdemeyer in the Caraccas. A furb fifteen feet high, resembling the Coffee-tree, branched, with a pale-grey bark, and hard yellow wood. Leaves rigid and shining, four inches long, and two broad, on short stalks. Clusters about an inch in length, of about ten white male flowers, on short, alternate partial flanks, with minute, acute bracteas, and one solitary, fleshy, terminal female flower. Filaments a little compressed, most tumid in the upper part. Fruit much as in the foregoing.

3. T. cordifolia. Heart-leaved Tricera. Willd. n. 5. —"Leaves elliptical, obtuse, veiny; somewhat heart-shaped at the base. Flowers in lateral tufts."—Native of the West Indies.—A furb, with round grey branches; the young ones somewhat quadrangular, smooth. Leaves opposite, fleshy, half an inch long, coriaceous, entire, finely veined on both sides, sometimes emarginate; shining above; paler beneath. Flowers small, on the last year's branches. Wilderow.

TRICEROS, a genus of Lourieiro's, has precisely the same derivation as Tricera. (See that article.) The latter being a clear and well-established genus, we cannot allow one whole history to be obscure, and which may possibly be already known to systematic botanists, under some other denomination, to "exalt its horns" against its brother. As to priority of date, there is little to consider, they having been published within a year of each other, the author of each thinking his the original name. We shall, notwithstanding, here give the characters of the Triceros, for the information of those who may wish to inquire what it is.—Lourieiro. Cochinn. 184.—Clails and order, Pentandria Tricynia. Nat. Ord. . . .

Gen. Ch. Cal. Perianth inferior, of five acute, spreading, permanent leaves. Cor. Petals five, oblone, spreading, longer than the calyx. Stam. Filaments five, capillary, about the length of the petals; anthers ovate, of two cells. Pil. Genus superior, roundish, unequal; fililies three, short, distant from each other at the base; filaments simple. Peric. Berry coriaceous, round at the base, with three horns at the top, of three cells. Seeds roundish, pointed, two in each cell.

Obi. Lourieiro says "haca diperma," by which, according to his frequent mode of expression, he means there are two seeds in each of the three cells; at least, fo we feel ourselves obliged here to understand him.

1. T. cochinchinens. Cay au rong of the natives of Cochinchina, where this plant grows wild on the hills. It is a tree of a middling stature, with spreading branches. Leaves bipinnate, with two pair of ovate, pointed, serrated, rigid leaflets, besides a terminal one, in each subdivide. Flowers white, in loose, nearly terminal, clusters. Berries small, ufeles.

TRICETO, in Geography, a town of Naples, in Calabria Citra; 14 miles E.S.E. of Scalea.

TRICHECHUS, in Zoology, a genus of the order of Bruta, and class of Mammalia, in the Linnaean system; the characters of which are, that it has no fore-teeth in the fully grown animal, either above or below; that it has foliary tusks in the upper jaw; that the grinders on both sides are formed of a rugged bony substance; that the lips are geminated or doubled; and the hinder feet, at the extremity of the body, united into a fin.

This genus is altogether marine, comprehending few species. Geeluin, in his edition of the Linnaean system, enumerates the three following:

Species and Varieties.

Rosmarus, the Rosmarus of Johnston, the Moris of Buffon, the Sea-boos of Rays and Ellis, and the Artie Wallis of Pennant and Cook's last voyage. It is characterized by its diatant, exserted tusks. It inhabits the Northern seas, and chiefly within the artic circle. It grows to a large size, having been found 18 feet long, and 12 feet in girth round the body. Its form is inelegant; having a small head, short neck, thick body, and short legs; the lips thick, and the upper one cleft into two large rounded lobes, the surface having numerous semi-transparent bristles of a yellowish tinge, and about the size of a fraw in diameter, and three inches long, pointed at their extremities; the
eyes small; round orifices instead of ears; the skin thick and wrinkled, and scattered over with short brownish hairs; with five toes on each foot, connected by webs; the hind-feet broader than the fore-feet, and the tail very short. In the upper jaw are two long tusks, sometimes two feet but generally about one foot in length, without cutting teeth, and with four rounded grinders. These animals are found about the northern parts of America, in the gulf of St. Lawrence between 45° and 46° lat., in Davis's straits, and within Hudson's bay in lat. 62°; in great numbers about Spitzbergen, also on the coast of Greenland and of Nova Zembla, and on the headlands extending towards the north pole. They are gregarious, produce their young, one at a time, early in the spring, and feed on sea-plants, shell-fish, &c.

Unprovoked the walrus is harmless, otherwise furious and vindictive. The female, when surprised on the ice, flings its young into the sea, plunges after it, and, having carried it to a safe distance, returns with great rage to revenge the injury. They sometimes pull their teeth in the boats, to sink them, or crawl under them, to overtop them, indicating, by gnashing their teeth and roaring frightfully, great tokens of rage. Their attachment to one another is very strong; for a wounded walrus plunges to the bottom, and rises again cuddled up to the others. The walrus suffers no injury which they receive infall. They are said to lie on the ice in herds of many hundreds, loudly roaring, and giving notice of ice in the night or in a fog, when it could not be seen; some of the herd are always on the watch, who, on the approach of danger, awake the rest. They are soon frightened by a flash in the muktan-net, and plunge into the deep; but the female will defend the young to the last, on the ice or in the water; nor will the young one quit the dam, though he be dead. In the gulf of St. Lawrence, this animal is called a Sea-cow, and it is said to resemble a cow much more than a horse, which name may probably be a corruption of the Russian name Morfe. The teeth of the walrus are used for ivory: the animals are killed chiefly for the sake of the oil; and it is said that a very strong and elastic leather may be prepared from the skin.

DUGONG, the Dagon of Buffon, and the Indian Walrus of Pennant, with approximate, exerted tusks. This animal inhabits the reefs about the Cape of Good Hope and the Philippine islands.

MANATUS, the Manati or Sea-cow of Ray, and Lamatin of Buffon; without tusks, or slightly hairy; and with a horizontal tail in place of hind-feet. Found in the larger rivers as well as seas of Guiana, and growing to the length of 16 or 18 feet; the skin being dark-brown, with feathered hairs upon it; the feet with five toes; the body nearly of the same thickness to the tail, when it suddenly narrows; the tail flat, of the shape of a spatula, thicker in the middle, and thinner towards the edges. The T. Chifuis, or Clibusus's Manati, is supposed to be a variety: it grows to an enormous size in the South American rivers. As an article of food, it is said to be superior to any other animal of this genus, particularly the young. It is taken by means of harpoons. The Indians take great numbers, by making clamps across the mouths of the shallow lakes formed by the floods. Dr. Shaw mentions a manati, called by the inhabitants of the country, on account of its gentle nature, "Matum," which, at the time of the arrival of the Spaniards, was kept by a prince of Hapaniola in a lake adjoining to his residence: it hated the Spaniards, but would offer itself to its Indian favourites, and carry over the lake ten at a time, singling and playing on its back. The T. Hydrophibucus, or Sea-ape Manati of Pennant, is only known from the description of Steller, who, near the coast of America, saw a singular animal which he named a sea-ape, and which Pennant supposes to belong to this genus. It was an animal that delighted in frolic, and sported like a monkey.

T. Asyrralis, the variety of T. Manatus, according to Gmelin's Linnaeus, but a distinct species in Shaw's Zoology; hairy, with four-toed unguiculated feet, or with a horizontal tail in place of hind-feet; the round-tailed Manati of Pennant; growing to the length of 14 or 15 feet, and found in the rivers of Africa, particularly in the Senegal. The specimen in the Leverian Museum was about six feet and a half long, and three feet eight inches in circumference in the thickest part of the body, and in the thinnest part near the tail about two feet two inches. The flesh of this animal is said to resemble veal; but it is chiefly killed by the Negroes for the sake of its blubber or fat.

T. Borotalis, a variety of T. Manatus in Gmelin's edition of Linnaeus, but a distinct species in Shaw's Zoology; hairless, with feet furnished neither with toes nor nails; or with a horizontal tail in place of hind-feet; the whale-tailed Manati of Pennant. It approaches nearly to the whale tribe; it never goes ashore, nor attempts to climb the rocks, like the walrus and the seal. It brings forth in the water, and, like the whale, suckles its young in that element. It is the last of the seas about the Aleutian islands, but never appears off Kamtchatka, unless blown thither by a tempest. It is the same species that inhabits near Rodriguez, or Diego Reys, an island eait of the Mauritius, and probably extending to New Holland. These animals live perpetually in the water, but in calm weather frequent the mouths of rivers in great numbers, and approach in time of flood so near the land, that they will suffer themselves to be fished with the hand; but if hurt, swim out to the sea, preferentially returning again. They live in families, one near another; each constituting of a male, a female, a half-grown young one, and a very small one. The affection between the male and female is so great, that if the latter is attacked, the former will defend her to the utmost; and if she is killed, will follow her carcass to the shore, and for some days swim near the place where it was landed. They are very voracious, and when full of the food that grew in the sea, fall asleep on their backs. The back and sides are generally above water, and gulls are found perching on their backs, in order to pick up the infects which they find upon them. They are taken by harpoons fixed to a strong cord; but when struck, it requires the force of thirty men to draw them on shore. When a manati is struck, its companions swim to its assistance, and make many efforts to overturn the boat, or break the rope of the harpoon, and others will strike at the harpoon with their tails. They make a noise, by loud breathing, like the snorting of a horse. Their size is enormous, being 28 feet long, and 8000 lbs. in weight. The circumference of the body near the shoulders is 12 feet, about the belly 26, near the tail 4 feet 8 inches, the head 31 inches, the neck near seven feet; and hence we may infer the deformity of the animal. Near the shoulders are two feet, or rather fins, two feet two inches long, without fingers or nails; beneath they are concave, and covered with hard bristles; the tail is thick, strong, and horizontal, terminating in a thick black fin, and resembling the substance of whale-bone; the skin is thick, hard, and black, unequal on its surface, like the bark of oak, so hard as fearfully to be cut with an axe, and without hair; beneath the skin is a thick blubber, tainting like oil of almonds. The flesh is coarser than beef, and will not soon putrefy; that of the young ones has the taste of veal. The skin

TRICCHERIÆ, in Natural History, the name of a genus of fossils, of the clafs of libraria; the characters of which are, that they are not elastic, and are composed of straight and continuous filaments.

The word is derived from the Greek τικτος, capillaments or fibres. The bodies of this genus are divided into those which have narrower filaments; and there are fixed known species of it, all which turn very readily to a fine platter, like the gyphys; and some of them are found in particular places in such great abundance, that it would be very advantageous to collect and burn them. Hill.

TRIChestrUM, the name of a genus of fossils, of the clafs of the felonites, but differing extremely in figure and finiture from the common kinds.

The word is derived from the Greek τικτος, hair or filaments, and σειρια, a star, and expresses a set of bodies, composed of filaments arranged into the form of a star. The felonites of this genus are composed of filaments, scarcely any where visibly arranged into plates or scales, but disposed in form of a radiated star, made up of a number of disjunct filiae.

Of this genus there is only one known species, which is of a pale brown, and is composed of extremely fine and slender filaments. It is formed like the lepaftrum in the accidentally open cracks in the septaria, or ludus Helmontii, and is no other way different from the bodies of that genus, than as in all the felonites the plates they are composed of are made up of filaments nicely arranged: in this, as in some other of those bodies, the filaments have never arranged themselves into plates at all, but are disposed into the form of a star composed of single threads. This body very readily and regularly splits according to the arrangements of the fibres; and is in some pieces tolerably pellucid.

It is found only in one place, so far as is yet known, which is under the cliffs of Sheppey island, in Kent; where it is very plentiful, and makes a very elegant figure on the broken masses of septaria, which are in immense numbers strewn upon the shore. Hill.

TRICHA, in Botany, first, we believe, received its name from Haller, though he admitted some things into this genus of Fungi, which other botanists have rejected, or referred to other places. The above name is formed from τικτος, σειρια, a hair, or bristle, in allusion to the internal mafs of elastic fibres, gradually expanding after the head bursts.- Hall. Hist. v. 3. 114. Perf. Syn. Fung. 176. Lamarck t. 890.—Clads and order, Cryptogamia Fungi. Nat. Ord. Fungi.

Eff. Ch. Head at length burrying irregularly, permanent. Internal fibres compact, attached to the base of the head, expanding elastically, and discharging the powdery feeds.

To shew the limits of this genus, as defined by the most eminent botanists in this department, we shall give a comprehendious view of Perfoon's eleven species.

Sect. 1. Head tuberibus, or ear-shaped.

1. T. Betoniti. "Perf. Difp. Meth. 9. and 54." ("T. pyriformis; Hofm. Veg. Crypt. v. 2. t. 1. f. 1.")—Stalked, cluftered, opaque, dark red; flarks longer than the heads, combined, somewhat racemose.—Pou discontinued trunks of trees in autumn. Several specimens, coherence together, form a fort of tuft. Perfoon mentions a small and simple—flaked variety, with a solitary head, which he supfuces may be T. ferotina of Schrader's Journal, v. 2. 67. t. 3. f. 1, (not f. 2, as erroneously cited by the author, and by Perfoon; that being Stilbum tomentosum, p. 65.) The figure having been so widely mistaken, may account for the doubt expressed; but we are left in great uncertainty as to what Perfoon intended by his variety.

2. T. rubiformis. "Perf. Difp. Meth. 54. t. 4. f. 3 and t. 1. f. 3." (T. n. 2167; Hall. Hist. v. 3. 115. t. 48. f. 5.)—Stalked, cluftered, of a shining blue; flarks combined, spreading at the base, shorter than the heads.—Not rare on the rotten barks of trees in autumn. There is a smaller variety, of a red or rufi affeet. Perfoon is remarkably incorrect in his citation of Haller, (n. 2162. t. 40. f. 2.)

3. T. falkias. Perf. Obs. Mycol. falc. t. 59. t. 3. f. 4. 5. ("Clathrus falcatus, reticulato deciduo; Schmid. ic. t. 33. f. 1.—18." Spharocarpus fcooides; Bull. Fung. v. 1. 130. t. 147. f. 33; excluding the synonomies. Mucor minutus; Jacq. Aurif. t. 295.)—Simple, stalked; at firft red; then of a dull grey. Base of the head, and top of the flalk, plafted.—Found in autumn, upon soft rotten wood. The head when young is bright red, and roundifh; by age it beomes pear-shaped, on a flalk about its own length, and altogether of a dirty flate-colour, cracking and expanding at the top into a kind of cup. Jacquin's figure reprefents the young, Bulliard's the old, plant.

4. T. elevata. Perf. Obs. Mycol. falc. 2. 34. "Simple, yellow and shining. Stalk rugged, elongated, tapering downwards."—Found on the trunks of trees, either folitary, or compoſing dense tufts. It is among the larger species. The flalk is slender, of a reddih-yellow. We have seen no specimen nor figure.

5. T. nigripes. Perf. n. 5. (T. pyriformis; Perf. Obs. Mycol. falc. 2. 33. Bull. Fung. v. 1. 129. t. 417. f. 2.)—Rather fatterted. Head pear-shaped, yellowifh, longer than the blackifh flalk.—On the trunks of trees, but rare. The head is obovate and obtufe. Stalk half a line long, black, flanding on a manifest membranous base common to many individuals. Perfoon remarks, that the flalk in Bulliard's plate is thicker than his, besides being of the fame colour as the head. He mentions also a smaller more common variety, verging towards an olive hue, and more brittle than the above-difcribed. The following, originally thought diftinft, are now reduced by Perfoon to the fpecies before us.

8. T. vulgaris. Ibid. 32. (T. turbinata; Sowerb. Fung. t. 83?)—Sattered. Head roundifh, somewhat turbinate. Stalk blackifh, extremely short; sometimes entirely wanting.—Frequent after heavy rains in autumn, upon roten beech-trees; appearing when young in the form of white granulations, turning afterwards of the colour of yellow ochre, and more opaque. The flalk in an early flate is hardly difcernible. Mr. Sowerby's synonym seems to us to belong to the following, as he himself suppozed.

in autumn, in woods, upon rotten wood, mosses, &c.—It forms dense tufts, each plant the size of garden poppy-feed, and burbling in an irregularly circular manner, near the top. This is one of our most frequent species.

7. T. alvacea. *Perf. Obf. Mycol. fæc. 1. 62.* —Scattered, sccfelle, roundish, or obovate, abrupt at the bafe, olive-coloured. Internal hairs compaçt, yellowish. —Found rarely on the stems of trees. Heads globular, or hemispherical, becoming by mutual preflure, when crowded, oblong, or somewhat cylindrical. Perfo/on is doubtfull whether this be a distinct species. We have seen no specimeen.

Sect. 2. Head round, or kidney-floated.

perdon favogineum ; Batfch Elench. Fung. 257. t. 173.”) —Crowded, sccfelle, globular, of a shining yellow or cinnamon-colour. —Found in autumn, about the decaying trunks of fir-trees, as well as on beeches. In the former case it is more opaque; in the latter more bright and shining. The head is occasionally a little turbinate.

9. T. varia. *Perf. Obf. Mycol. fæc. 2. 32.* (Lyco-
gala luteum, omnium minimum, reniforme; Mich. Nov. Gen. 216. t. 65. f. 4.) —Rather crowded, yellowish, partly deflexed. Head kidney-shaped, roundish, or somewhat ob-
glong. —Grows on rotten trees in autumn. Found by MichieL in the celebrated gardens of Boboli, behind the palace Patti, at Florence. He represents it as forming globular masses, the size of a large pea, each plant smaller than poppy-feed. The lateral ones appear to be deflexed, or forced outward, by those in the middle.

Sect. 3. Receptacle elongated, thread-shaped, creeping, simple, or interbranching like veins.

Seripula ; Scop. Carn. 493. t. 65.) —Thread-shaped, unbranched, very long, somewhat zigzag, yellow.—On the trunks of trees in Camiolâ, near the roots. *Scopoli.* This is represented as a smooth yellowish thread, creeping like a *Serpula*, or Worm-shell, and resembling a small animal in its tinefline. It bursts and discharges, from every part, tufts of fine hairs beprinkled with yellow powder. *Scopoli.* T. fœn-
доровides, Villars Dauph. v. 3. 1661, is thought by Perfoon to be a variety of this. But the author's description of "from three to five little oblong, cylindrical, worm-like bodies, whose yellowish internal woolly substance soon confounds them in one woolly mass," indicates rather some of the former lections, or perhaps an *Albinus.*

12. f. 1.* (Lycoperdon lumbriæcale ; Bafch Elench.
Fung. 259. t. 30. f. 174.) —Threaded, branched, reticulated, yellow.—Found in autumn on the trunks and mossy bark of trees, but very rare. We have never heard of this or the preceding in Britain. The present species is described as spreading to the extent of an inch, confliving of a yellow net-work, burbling here and there, and protruding tufts of yellow hairs, enveloping a powder, or seeds, of the same colour.

It will readily be perceived that the species of this genus, however curious, can, as yet, be imperfectly defined; nor are we certain how far the *Acrinia, Stemonitis, Crip-
erias,* &c. of Perfoon are entitled to rank as genereally distinct.

TRICHIASIS, (derived from τρίχη, the hair,) in Surgery, sometimes also named *entreponum,* denotes a faulty inclination of the eye-lashes inwards against the globe of the eye. According to Scarpa, the disease presents itself under two distinct forms: the first is, where the cilia are turned inwards, without the natural position and direction of the tarsus being at all changed; the second consists in a morbid inclination of the tarsus, and consequently of the eye-lid towards the half of the eye.

The first form of this disease is very rare, nor has it come under the observation of the experienced Scarpa more than once; and in this instance, only some of the hairs had changed their direction. The second species or form of trichiasis, or that which consists in a folding inwards of the tarsus and cilia at the same time, is that which is commonly met with in practice. This may be either complete, affecting the whole of the tarsus; or incomplete, occupying only a certain portion of the edge of the eye-lid, and most frequently near the external angle of the eye. Sometimes the disease is confined to one eye-lid; at other times it affects both; and occasionally the patient is afflicted with it in both eyes.

To these two species of trichiasis, some writers have added a third, which they call *dystichiasis,* and which they suppose to be produced by a double and unusual row of hairs. But this third species, as Scarpa observes, is only imaginary, and the reason of such subdvision seems to have arisen from not recollecting what was long ago remarked by Winlow and Albinus, that although the roots of the cilia appear to be diphosed in one line only, they nevertheless form two, three, and in the upper eye-lid even four rows of hairs, unequally situated, and as it were confused. Whenever, therefore, in consequence of diphase, a certain number of hairs are separated from each other in a contrary direction and disorderly manner, the eye-lid will appear to be composed of a new and unusual row of them, while, in fact, there has been nothing, either with respect to their number or natural implantation.

It is not an easy matter to determine precisely, says Scarpa, what are the causes which sometimes make a few of the hairs deviate from their natural direction, while the tarsus continues in its right position. They are commonly referred to cicatrices in consequence of previous ulceration, whereby the cilia fall off, and those which are growing are hindered from taking their proper direction. There must, however, be other causes sometimes concerned; for in the case seen by professor Scarpa, two or three hairs were turned inwards against the eye-ball, although there had been no preceding ulceration, nor cicatrices of any part of the tarsus. Indeed Scarpa is inclined to believe, that the small ulcers and fears which are sometimes formed upon the internal margin of the tarsus, are more likely to produce the second form of the disease, or the inversion of the edge of the eye-
lid, and consequently of the cilia towards the globe of the eye. As these ulcers, when neglected, destroy the internal membrane of the eye-lid, and near the tarsus, it necessarily follows, that in proportion as they heal and diminish, they draw along with them and turn inwards the tarsus, and hairs inserted into it. And since these little ulcerations do not always occupy the whole extent of the internal margin of the eye-lid, but are sometimes confined to a few lines, in the middle or extremity, near the external angle of the eye-lid; so after the cicatrices are formed, the whole of the hairs are not invariably turned inwards, but only a certain number of them, which correspond to the extent of the ulcers previously situated along the internal edge of the tarsus. Indeed, in every case of imperfect trichiasis from a cicatrix of the inner margin of the eye-lid, the tarsus and cilia are every where in their natural situation, except opposite the part where the ulcers formerly existed. Also, if the eye-lid be reverted, its internal membrane, near that part of the margin corre-
responding to the seat of the trichiasis, will be found pale, rigid, and hardened, the inversion of its cartilagineous border and of the cilia being plainly a consequence of the contraction of the cicatizert point.
TRICHIASIS.

Besides these causes, there are others which may produce the complaint. Chronic ophthalmies of long continuance sometimes have this injurious effect, in consequence of the skin of the eye-lid being kept for a long time in a state of irritation and adhesion, terminating with the formation of trichiasis. The cartilaginous margin of the eye-lid then loses the proper support of the integuments, inclining towards the eye-ball, and afterwards turns inwards, drawing the eye-lashes along with it in the same improper direction. Long-continued puriform discharges from the ciliary glands, likewise spoil the shape and coherence of the cartilage of the eye-lid, and therefore not unfrequently occasion trichiasis. Scarpia doubts, whether a papilomatous contraction of the orbicularis palpebrarum muscle can ever be a cause of the disease, notwithstanding what Mr. B. Bell has asserted upon the subject.

The annoyance which must necessarily result from the hairs perpetually pressing upon the cornea and white of the eye, may be easily imagined, even by those who have little acquaintance with surgery. The evil is rendered still greater, by the hairs which are turned inwards becoming much longer and thicker than those which retain their natural direction. And although the trichiasis be confined to one eye, both the eyes usually suffer from the effects of the disease. Indeed, generally the eye on the sound side cannot be moved without occasioning pain in that which is exposed to the irritation and friction of the injected hairs. In almost all instances, both the eyes are very irritable, and incapable of bearing the light. As, in cases of incomplete trichiasis, the patient retains some little power of opening the eye-lids for the purpose of seeing, and that most frequently towards the internal angle of the eye, the head and neck are often inclined in an awkward manner, so that in children a distortion of the neck and shoulders is at last produced, which cannot be rectified without difficulty, even after the trichiasis is cured. Unfortunately, also, children are impatient of the uneasiness arising from the injected hairs, and, therefore, are continually rubbing the eye-lids, which act very much increases all the ill effects of the complaint, such as the varicose chronic ophthalmalmy, opacity, and ulceration of the cornea.

The cure of the second species of trichiasis, or that which is commonly met with in practice, is accomplished by artificially everting the eyelids, and fixing it permanently in its natural position, together with the relaxation of the conjunctiva, which do grievously irritate and press against the globe of the eye. According to professor Scarpia, this indication is perfectly fulfilled by the excision of a piece of the skin close to the edge of the eye-lid, of such a breadth and extent, that when the cicatrix is formed, the tarsus and margin of the eye-lid may be turned outwards, and sufficiently separated from the eye-ball, the cicatrix of the integuments affording a point of support fully adequate to keeping the parts in their natural position and direction. Scarpia believes that there are now very few modern surgeons, who, with a view to the radical cure of this disease, place any confidence either in plucking out the inverted eye-lashes, bending them outwards, and retaining them so by means of adhesive plaster, or in plucking them out and destroying their roots with cautick: much less in extirpating the edge of the eye-lid along with the hairs, or dividing the orbicularis muscle on the internal surface of the eye-lid, under an idea that the disease is sometimes produced by a papilomatous contraction of it.

The following is the mode of proceeding recommended by Scarpia, the patient being seated in a chair, if an adult, or, if a child, laid upon a table, with the head raised, and firmly held by an assistant, who must stand behind the patient, the surgeon is to pull outward, with the end of a probe, the hairs which irritate the eye. Then, with a pair of deflecting forceps, or the ends of his fore-finger and thumb, (which answer equally well, and, in many cases, much better than forceps,) the operator should lift up a fold of the skin of the affected eye-lid, taking great care that the piece which is taken hold of, corresponds exactly to the middle of the whole extent of the trichiasis; for, as we have already explained, sometimes the whole, sometimes a half, and, in other instances, only a third of the extent of the tarsus is inverted. The surgeon, with his left-hand, must raise the fold of the skin, more or less, according as the relaxation of the integuments, and the inversion of the tarsus, are more or less confiderable. The reason of this is exceedingly evident, viz., that the greater the quantity of skin which is raised, the greater is the quantity which will be cut away. Supposing the patient to be an adult, as soon as the fold of skin has been raised in a certain degree, the surgeon must request him to open his eye, and, if, in this act, the tarsus and eye-lashes refuse their natural place and direction, the portion of skin already raised will be sufficient for the purpose. We must trust to our own judgment with regard to children, as they seldom let us have recourse to the mode of discrimination just related.

When the integuments are elevated by means of a pair of deflecting forceps, and care is taken to lay hold of the skin precisely at the middle point of the whole extent of the trichiasis, it necessarily follows, that the confluent pile of the skin will form an oval, and that the greatest width of the wound will correspond exactly, or nearly so, to the middle of the eye-lid, and its narrowest parts to the angles, or commissures of the same. This contributes very materially to make the cicatrix correspond to the natural fold of the eye-lid, and hinder the origin of a diseased or any opposite nature to the one about to be remedied, towards the angles of the eye, viz., an eversion of the commissures of the eye-lids. See ECTROPION.

Besides this caution relative to the situation and figure of the fold of the integuments to be cut off, the surgeon must be careful that the division of the skin be made very near the inverted tarsus. Were this circumstance neglected, the operator might have the mortification of finding, after the wound is healed, that although the eye-lid is shortened, on the whole, from the eye-brow to the place of the recision, yet it is not equally shortened, in all cases, on the side of the edge of the eye-lid and the cicatrix of the skin. Hence the tarsus would remain inverted as before, or not be sufficiently turned outward to keep the eye-lashes from rubbing against the eye. This inconvenience would oblige the patient to submit to a second operation, done lower down than the first.

Things being thus arranged, the surgeon, holding up the fold of skin by means of the forceps in his left-hand, is with a pair of probe-pointed, sharp curved scissors, to cut off the whole of the duplicate, being first sure that one of the blades of the instrument is applied close to the edge of the eye-lid. If both eye-lids should be affected, the same operation must immediately be done upon both of them, with such cautions, and in such proportion, as the extent of the disease, and the degree of inervation of each eye-lid may require.

Scarpia next differentiates us from employing any future to unite the wound, and represents, that it will be sufficient to keep the eye-brow as much downward as possible, if the operation has been done on the upper eye-lid, or, if on the lower, to support it against the inferior arch of the orbit, by pressing it from below upwards, so as to keep the edges of the wound from becoming separated. Then the lips of the
the wound are to be put into exact contact, by means of strips of adhesive plaster, which should extend from the superior arch of the orbit to the zygoma, and the support of the wound in apposition will be still more securely effected by placing two compresse, one on the eye-brow, and another on the zygoma, together with a bandage.

On taking off the first dressings, the third day after the operation, the surgeon will find that the patient can open his eye with ease, and that the inverted tarbus and eye-lashes have resumed their natural position and direction.

In the partial or incomplete trichiasis, or that which only occupies a half, or a third of the whole length of the tarbus, and in subjects who have had the skin of the eye-lids very loose, Scarpa has often had the pleasure of finding the wound perfectly united on removing the first dressing.

When, however, only a part of the incision has healed, while the rest seems disposed to heal by suppuration and granulation, the surgeon covers the wound with a small piece of lint, spread with the unguentum ceruse, and if the fore should become flabby, it must be touched, every now and then, with the argentum nitratum, until the cure is perfected, which commonly happens in the course of a fortnight.

Thus far, Scarpa's observations have related to the radical cure of the second, or most frequent kind of trichiasis.

With regard to the first form of this disease, or that in which the eye-lashes project against the eye-ball, without the natural position of the tarbus being at all altered (a case which is fortunately very rare), the accomplishment of a cure is very difficult, since, as we have already explained, neither the pulling out of the hairs, nor burning the situation of their roots, are means at all to be depended upon for producing a complete cure of the disorder; and since turning the tarbus out of its natural position would make the patient liable to an irrecoverable flowing of the tears over the cheek, attended with a chronic thickening of the lining of the eye-lid.

The treatment of this species of trichiasis is still imperfectly understood, and seems to claim more attention than appears hitherto to have been paid to it. In the instance of this form of the disease which Scarpa met with, only two or three of the eye-lashes inclined against the eye-ball. He found, on turning the eye-lid a little out, opposite to the situation of the faulty hairs, that he could not, indeed, completely put them in their natural position; but he saw that he could thus remove them so far from the cornea, that they would not rub against it, without altering the position of the eye-lids so much as to occasion a perpetual discharge of the tears over the cheek. And, as in the patient alluded to, the skin about the eye-lid was very tense, Scarpa deviated from the above rule, by making an incision with the back of a lancet, near the tarbus, three lines long, and he took away a small piece of skin of the same length; but very little more than one line broad. When the cut healed, the operation was found to answer as well as the nature of the cafe would allow, though the cure was not complete, nor would it have obviated all inconveniences in cases of greater extent.

The trichiasis being cured, something more always remains to be done, for the purpose of correcting the cause of the disease, as well as curing the disorder of the eye, occasioned by the previous friction and irritation of the inverted hairs. The usual indications are, to restore the tone of the vessels of the conjunctivae, to leffen the swollen Meibomian glands, and to remove any cloudiness of the cornea.

Two new methods of performing the operation, for the cure of trichiasis, have been recently proposed by Dr. Crampton and Mr. Saunders.

The following is the account which Dr. Crampton gives of his plan, which he tried in one instance with complete success. 46 Let the eye-lid be well turned outwards by an affilant; let the operator then with a lancet divide the broad margin of the tarbus completely through, by two perpendicular incisions, one on each side of the inverted hair or hairs; let him then, by a transverse section of the conjunctiva of the eye-lid, unite the extremities of the perpendicular incisions. The portion of cartilage contained within the incisions, can then, if inverted, with ease be restored to its original situation, and retained there by small strips of adhesive plaster, or perhaps, what is better, by a supferrium palpebrae, adapted to the length of the portion of the tarbus which it is intended to sustain, should one or two hairs be displaced without inversion of the tarbus." 47 Eflay on the Entropion, p. 55.

Mr. Saunders entertained a favourable opinion of Dr. Crampton's operation for the cure of the disease in its early stage; but he contended, such a vicious bending of the tarbus inward was not the consequence of repeated obliquely, attended with ulceration of the conjunctiva and lining of the eye-lid; and that every endeavour to rectify the wrong position of the tarbus, and restore its original direction, would be fruitless. Hence, he believed, that its excision was decidedly indicated; an operation which is said to be followed by no pain or uneasiness, and which is sure in its effect. No particular shortening of the eye-lid ensues; the deformity is materially lefiened; and unless the cornea be already too opaque, perfect vision is re-established.

Mr. Saunders directs a piece of thin horn, or a plate of silver, having a curvature corresponding to that of the eye-lid, to be introduced under this part, with its concavity towards the eye-ball. On this instrument the eye-lid is to be stretched. An incision is to be made through the integuments and orbicularis palpebrarum, down to the tarbus, immediately behind the roots of the cilia. The cut should extend from the punctum lacrymale to the external angle. The exterior surface of the tarbus is then to be dissected, until the orbital margin is exposed, when the conjunctiva is to be cut through directly by the side of the tarbus, which must now be deflagged at each extremity. The punctum lacrymale must be left uninjured. The operation is described as being exceedingly simple, and if any embarrassment arises, it is from the hemorrhage of the ciliary artery, the blood sometimes obscuring the punctum lacrymale, just when the operator is about to divide the tarbus by the side of it. No dressings are required, it being merely necessary to keep the eye covered for a few days. The skin will continue to be elevated, just as the perfect eye-lid was; and though less completely, yet enough to leave the pupil clear, when the eye is moderately directed upward. In all the cases in which Mr. Saunders operated, a fungus grew from the wound. He recommends the recurrence to be destroyed with cautery, or the knife.

Respecting this operation, we shall merely observe, that it is more severe than that advised by professor Scarpa, and must leave more disfigurement. Unles$, therefore, the latter method prove ineffectual, we see no reason for abandoning it.

Inversion of the lower eye-lid is much less common than that of the upper one. The late Mr. Saunders never saw this disease arise from the same causes which induce it in the upper eye-lid, though he acknowledges the possibility of such a case. However, he met with several instances of the affection, in consequence of encysted tumours, which,
as they increased, carried the orbital edge of the tarsus outwards, and, in the same proportion, inclined the ciliary edge towards the globe of the eye.

An inversion of the inferior palpebra is sometimes produced by inflammation and swelling of that part of the conjunctiva which connects the eye-lid with the eye-ball. In cases of ophthalmia, this membrane often forms between the latter parts of the infer. fold, which is situated just on the inside of the orbital edge of the tarsus, and pushes it outward; while the contraction of the orbicularis muscle turns the ciliary edge inward, and inclines it between the swelling of the conjunctiva and the eye. In this particular case, Mr. Saunders affirms, that replacing the eye-lid in the early stage of the disease, and maintaining it so, until the ophthalmia has been lefled by proper means, will be found effectual. But when the conjunctiva is much thickened and indurated, Mr. Saunders recommends cutting such dis ease part of it away, and the application of compreges to keep the orbital margin of the tarsus inward.

Albinus has recorded a species of trichialis, which originated from the growth and inversion of one of the hairs upon the cannae lacrymatis. The plan of relief consisted in plucking out the irritating hair; but, as Scarpa observes, it should have been mentioned whether the hair grew again, and in what direction. Scarpa on Diceses of the Eyes, 4. Saunders on Diceses of the Eyes, chap. 3. Cramp ton on Entropion. S. Cooper's Pract. of Surgery, p. 206. edit. 3.

TRICHIDES, in Ickbyology, a name used by the ancients for a fith of the harengiform kind, probably the pilchard, which they called alfo sardines and sardella.

TRICHILIA, in Botany, a name apparently originating with Browne, and which De Theis has derived from τρίς, three-fold, no otherwise applicable to this fine genus, than as the capillus has three cells and three valves, very constrictive in Sloane's figure of the original species, which probably the author had under his eye. Professor Martyr leaves this name unexplained.—Browne Jam. 278. Linn. Gen. 211. Schreb. 285. Willd. Sp. Pl. v. 2. 552. Mart. Mill. Dict. v. 4. Ait. Epit. 275. Swartz Ind. Occ. 730. Juft. 265. Poiret in Lamarck Dict. v. 8. 56. Gaertn. t. 95. (Portedia ; Cavan. Diff. 365.)—Clafs and order, Decandria Monogyne. Nat. Ord. Trilabiate, Linn. Melis, Juff.

Gen. Ch. Cal. Perianth inferior, of one leaf, bell-shaped, short, with five small teeth. Cor. Petals five, lanceolate, spreading. Nectary cylindrical or conical, tubular, with top teeth, shorter than the petals, formed, as it were, out of the ten combined filaments. Stam. Filaments none; anthers ten, erect, sessile on the margin of the nectary, and rising above it, deciduous. Pil. Germin superior, obovate, obscurely three-lobed; style short; stigma capitate, with three notches. Peric. Capsule roundish, slightly triangular, of three cells, and three valves at length reflexed, with partitions from the centre of each. Seeds solitary, pendulous, ovate, with a pulpy coat, or tunic.

Obt. The parts of the flower vary, or differ in different species, from five and ten to four and eight. The cells and valves of the capsule are, in some instances, but two, as in the Portia of Cavanilles. The seeds have truly a more or less pulpy coat, though not a distinct tunic. It is remarkable that Cavanilles has not admitted Trichilia into his Differtations on Monadelphiaus Plants, where this genus is as much entitled to a place as any others of Juffieu's Melis. Probably he was not furnifhed with any materials to describe or delineate the species. The gardens certainly could not supply him.

1. T. birta. Green-flowered Trichilia. Linn. Sp. Pl. 550. Willd. n. 1. Swartz Obs. 171. (T. n. 1; Browne Jam. 278.) Pruno forte affinis arbor, folio alato, flore herbaceo pentapetalato racemo; Sloane Jam. v. 2. 128. t. 220. f. 1.)—Leaves pinnate, of about feven elliptical, pointed, smooth leaflets. Clusters denfe, names confemed.——Native of Jamaica, in the meadows about Kingston and other places, on a dry gravelly soil. Browne calls it a fbrub; Sloane a tree, about twenty feet high, with a smooth greyish bark, and hanging out at the height of seven feet, or more, several declining branches. The leaves are scattered, not numerous, pinate with an odd one; the leaflets opposite, an inch and half long, uniform, smooth, entire, dark green, on short partial flakks. Flowers greenish-white with purple anthers, in auxiliary compound clusters. Browne lays the feeds of all the species are enveloped in a scarlet waxy substance. Linnaus, and perhaps Browne, confounded this with the following. We do not find much reafon for the specific name birta, which seems more applicable to the following.

2. T. spondiodes. White-flowered Trichilia. Jacq. Amel. 128. Hort. Schoenbr. v. 1. 54. t. 102. Willd. n. 2. Swartz Ind. Occ. 730. (Euonymus caudice non ramosof, folio alato, fructu rotundo triprycreo; Sloane Jam. v. 2. 129. t. 210. f. 2. 3.)—Leaves pinnate, of about fifteen ovato-lanceolate, pointed leaflets; downy at the edges. Clusters rather lax. Stamens distinct.——Native of mountainous woods in Jamaica and Hufipaniola, flowering in the spring. Swartz. In the flore at Schoenbrun, according to Jacquin, it blossomed in September and October.—The stem is fifteen or twenty feet high, slightly branched at the top. Leaves a foot long; their leaflets much more numerous than the former, ovato-lanceolate, not elliptical, more or less hairy, especially at the edges. Clusters several, leafy, crowded than in the foregoing. Flowers yellowish or greenish-white. Stamens not united, though clofely converging into a cylinder, or cone. Capsule roundish, downy, the fize of a small cherry. We should conceive this rather to be Browne's plant, which he terms subhirsuta, but we have no specime to determine the point.

3. T. emetica. Emetic Arabian Trichilia. Vahl Symb. v. 3. 31. Willd. n. 3. (Elecja; Forh. Ægypt.-Arab. 125.)—Armer leaves pinnate; leaflets elliptical, downy beneath, the outer ones largcr;—Frequent on the mountains of Yemen. The Arabs call this tree Roka. The flowers resemble orange-blossoms. The fruits, mixed with perfumes, is used by the Arabian women for washing their hair. The ripe feed are made into an ointment with oil of Sufumam, against the itch. Forkfull found mention of the fruit, in an Arabic book, as an emetic, by the name of Djuws elkaw, whence he took his barbarous generic name above quoted. He describes this species as a large tree, with alternate downy branches. Leaves alternate, pinnate with an odd one, of nine oval-oblong, flaked leaflets, the lower ones two inches in length, the upper or outer ones three; all smooth above, but, according to Vahl, downy beneath; their common flakc, about a fpan long, is also downy. Stipulas none. Stalks axillary, corymbofally pinched. Flowers twice the size of the latt, greenish-yellow. Stamens united half way up. Capsule obovate, downy, an inch long, with tw o feeds in each cell. Forkfull, Vahl.

4. T. glabra. Smooth Havanannah Trichilia. Linn. Syfl. Nat. ed. 12. v. 2. 294. Willd. n. 4. (T. havanensis; Jacq. Amel. 129. t. 175. f. 38.)—Leaves pinnate; leaflets obovate, obutte, smooth, tapering at the base; the outer-
TRICHILIA.

molt gradually large.—Native of mountainous woods about the
Havannah. A lofty, branched, spreading tree, exhauling a
tetid, very disagreeable scent. Leaves of from five to seven
smothing leaves, nearly sefide; on a slightly winged flalk, about five inches long. Clusters axillary, very short.
Capsules globose, greenish. Jacquin.

Willd. n. 5. (Porteria ovata; Can. Diff. 369, t. 215.)
—Leaves pinnate; leaves smooth, membranous, elliptic-oblance. Clusters axillary, simple, somewhat aggregate. Flowers four-cleft, endemic. Capsules of two valves only.
—Native of bushy places, in the mountainous parts of His-
paniola, flowering in February and March. A tree, whose
trunk is from sixteen to fifteen feet high, branched, smothing, with nearly horizontal, smothing, round, subdived branches. Leaves large and handomely, thin, reticulated with innumer-
able veins. Leaves from two to five inches long, the outer-
molt gradually large, the partial flalk of the terminal one
not longer than the rest. Clusters about an inch long, usu-
ally two or three together, somewhat downy, or silky.
Flowers whitish. Calyx and petals downy. Nectary, or eight
combined flaments, externally smothing, hairy within the
fummel. Capsule roundish, of two cells and two valves, with
two seeds in each cell, one above the other, invexed with a
leaflet vicid pulp.

6. T. majestic. Mulky Trichilia, or Mulk-wood. Swartz
Ind. Occ. 735. Willd. n. 6.—Leaves alternately pinnate;
leaflets ovate, pointed, smothing. Clusters axillary, compound.
Flowers four or five-cleft, monopetalous. Nectary undivided.
Capsule with one seed.—Found in old woods of the
northern part of Jamaica, flowering in May. The inhabi-
tants know this tree by the name of Mulk-wood, because every
part, the bark, bruised leaves, flowers, and fruit, smell powerfully of mulk. The pulp of the seed has a sweet taste.
The trunk is twenty feet high, or more. Leaves alternate,
veiny; shining on the upper side; on very short partial
flalks; their common flalk hearty. Clusters solitaiy, erect, of
many small whitish flowers. Calyx downy. Corolla in
four or five deep ovate figures, with a short tube. Nectary
scarcely longer than the tube of the corolla, undivided, bear-
ing rarely more than eight anthers, though the corolla is
generally five-cleft. Capsule down, of three or four valves.
Seeds solitary, like a drop, with a brittle skin, and a juicy rich
scarlet pul, including a hard oblong kernel, separable into
two parts.

t. 637. Ait. Epit. 375. —Leaves oppositely pinnate; leaflets
effixate-lanceolate, pointed, smothing. Clusters axi-
illary, compound, denfe. Petals four. Nectary in ten
double-pointed figures, with a slightly flaked anther be-
tween the points.—Native of the West Indies? It was lent
by Dr. A. Anderfon, from the botanic garden at St. Vin-
cent's to Sir Abraham Humfe, about the year 1801, and
flowered in his house at Wormleyburn, in 1810. The plant
has a mulky feent, but appears otherwise different from the
falf. The leaflets are even or nine; their common flalk
amothing, except when very young. Flowers pale green,
nu,vous, in short, denfe, compound Clusters. We find them, as
described in Mr. Andrew's work, with four broad-odate
separate petals, though the nectary conflits of ten flat fig-
ments, united half way up, deeply forked at the fimnent, and
each bearing from the fork an odace, inflexed, two-celled
anther, on a very short flender flalk, or filamen. Nothing
is known of the fruit.

Forl. Prodr. 53. Willd. n. 7.—Leaves pinnate; leaflets
obovate. Clusters axillary, compound.” Gathered by
Forster in New Zeeland. His specific character, all we
know of the plant, is not sufficient to distinguish it from our
fourth species, T. glabris, though the two species are prob-
ably widely different.

Willd. n. 8.—Leaves pinnate; leaflets lanceolate, acute.
Clusters axillary, repeatedly compound.” —Native of the
island of Namoka.

10. T. glandulufa. Glandular-wine Trichilia.—Leaves
pinnate; leaflets five or seven, elliptic-lanceolate, bluntly
pointed, with axillary hairs on their veins beneath. Petals
four. Nectary undivided. Stigma depressed.—Native of
New South Wales, near Port Jackson. A specimen from
thence was communicated to us by Sir Joseph Banks, under
the name of T. oitandra of Solander, which not being pub-
lished, we presume to change, as the oitandra species of
this genus are numerous, though this only was then known
to the great botanists who first discovered it. The leaves
agree nearly with T. heterophylla, hereafter described, in fize
and shape, but are all pinnate, and remarkable for axillary
glands, bearing tufts of hairs, along the mid-rib of each leaf-
let beneath, as in the Laurilius, of which we perceive no indica-
tions in any other species, except perhaps the firft. Clusters
axillary, solitary, flalked, as inch or two in length, fimple,
of very few flowers. Calyx four-cleft, minutely fringed. Petals
four. Nectary undivided. Anthers eight, fesile. Stigma
capitate, broad. Capsule triangular, deprefled, with three
deflexed lobes. Seeds in a red, pulpy, elatiic tunic.

(Proteria mucronata; Can. Diff. 370, t. 216.)—Leaves
pinnate or ternate; leaflets elliptic-ovate, pointed. Clus-
ters fimple, axillary and terminal. Petals four. Nectary
undivided. Anthers eight. Stigma club-shaped.—Gathered
by Commenfon in Madagafcar. Leaves smooth; of three or
five flalked, moiily elliptical, taper-pointed leaves, near two
inches long. Clusters in inch long, folitary or in pairs.
Flowers fmall, four-cleft. Fruit unknown.

12. T. trifolium. Three-leaved Weight Indian Trichilia.
Vahl Symb. v. 1. 31. (T. quz Haelfia Loeblingi; Lowh.
B. 188.)—Leaves ternate; leaflets obovate, polited, ob-
tufe; tapering at the base; the odd one much the largest.
—Native of South America, and fome of the Wetr Indian
Iflands, flowering in April and May. A tree fifteen feet high,
exhaling from every part a difagreeable, though not power-
ful, odour. Leaves alternate, flalked; their two opposite
leaflets an inch long, the odd one two inches; all very ob-
tufe, tapering greatly at the base, without any partial flalks.
Clusters axillary, very short, of about fix small, whitith, five-
cleft flowers. Capsule green, with brownish dots, globofe,
of three valves. Seeds with a scarlet skin. The negro
women are faid to procure abortion by a décolation of the roots.
Jacquin.

Vahl Symb. v. 1. 31. Willd. n. 11. (Melia Koepfe; 
Burin. Ind. 101, excludin Plinteket's synonym.)—Leaves
ternate; leaflets ovate, acute; their ribs hairy beneath.—
Native of Java. Branches downy at the extremity. Leaves
flalked; leaflets on short flalks, entire, two inches long, and
we presume all three about equal in fize; common flalk
downy, the length of the leaflets, shorter than the axillary
upright flower-flalks. Flowers in short dense panicles, with
a lanceolate bracte at the bafe of each. Calyx and corolla
visous.

(“Turnee virdens; Helianus in Stockh. Transf. 1788, 294.
t. 10, f. 1.” We fupject an error in the page.)—Leaves
simple,

Eff. Ch. Calyx in five deep linear segments. Staminæ connected at their base, without teeth. Anthers of two cells. Stigma capitatum. Capsule without valves, single-seeded, included in the converging base of the calyx, whose segments are spreading and feathery.

The species of this genus are herbaceous, generally perennial, with alternate leaves. Flowers terminal, capitated or spicate, each accompanied by three membranaceous shining bracteas. The hairs of the calyx, at first close, subsequently become extended, and give the segments a feathery aspect. Trichinium is truly, as its learned author observes, very closely related to Pilosus; see that article. We should indeed feel no scruple in considering them one genus. Perhaps they ought strictly to be referred to the class Monadelphus, or at least they, and their Limnan allies Cmepbrema, Athyriantes, Guloa, &c. should be indicated at the head of that class, for the convenience of young botanists. Why the latter were not all placed there by the author of the sexual system, to the great relief of his fifth clasf, can only be attributed to his peculiar idea of the structure of their flowers. He calls a nectarium, what Mr. Brown efeatues the united base of their filamentæ; but we believe an enlarged consideration of the whole tribe will justify the latter opininon.

3. T. dilutus.—Leaves linear, very narrow, smooth as well as the branches. Spike elongated, rather lax.—From the same country.

4. T. patulatuum.—Radical leaves obovato-opatulate, flat, smooth. Spike cylindrical.—Gathered by Mr. Brown in Van Diemen's island.

5. T. macrocephalum.—Stem-leaves lanceolate, wavy, smooth as well as the angular branches. Spike oblong, with a woolly flax.—Native of the south coast of New Holland.

6. T. incanum.—Leaves lanceolate, hoary and downy as well as the round branches. Spikes nearly ovate, lateral as well as terminal.—Gathered by M. Baudin, on the west coast of New Holland.

We have seen no specimens of this genus, any more than of Pilosus above-mentioned.

TRICHIRI, in Geography, a small island in the Grecian Archipelago; 7 miles E. of Spécia.

TRICHISMIOS, from ἔχις, the hair, in Surgery, a capillary fissure, or fracture of the skull, so called from its being so fine as to resemble a hair put upon the bone.

TRICHURUS, in Ichthyology, a genus of the order of Apodes; the characters of which are, that the head is extended, with lateral opercula or gill-covers; that the teeth are eniform, and semi-fagitated at the apex or tips; that it has seven branchiostegous or gill-membrane rays; that the body is compressed and eniform, and the tail tuberculate, without any fin; whence it is called leprous, and in English fish-tail. There are two Species.

Lepurus or Argenteus; Silvery Trichurus. With the lower jaw longer than the upper; and equally distinguished by the singularity of its shape, and brilliancy of its colour; the body very compressed, tapering towards the extremity, and terminating in a fine point: the whole body, except the fins, has a bright silver-colour; the head narrow and the mouth wide; the lateral line of a gold-colour, commencing at the gills and continued to the tip of the tail; the dorsal fin moderately wide, transparent, and of a yellowish tinge, commencing almost immediately behind the head, and terminating near the end of the tail in a mere membrane, the other parts being brightly radiated; the pectoral fins small and of an oval shape; without any direct vent-fin, but having a series of very small naked spines or rays, about 110 in number, continued from the vent, which is situated about the middle of the body, to nearly the tip of the tail. Its general length is from two to three feet: it is said to be very voracious, swins with rapidity, and in the pursuit of its prey sometimes leaps into small vessels, which happen to be falling by it. It is a native of the rivers and larger lakes of South America, and is considered as an eatable fish: it is also found in some parts of India and in China.

Indicus, or Eleutherus; Brown Trichurus. With jaws of equal length; nearly equal in size to the preceding, but different in the configuration of the jaws, which are of equal length, and in the form of its teeth, which are very minute; the tail less f slander and sharp, and the colour of the whole fish pale brown, variegated with spots of a deeper cast: a native of the Indian seas, and possessing a degree of electrical power.

Gen. Ch. Cal. Perianth inferior, of one leaf, in four or five deep, ovate, acute, spreading, permanent segments. Cor. none. Stam. Filamentæ numerous (sixty or seventy), capillary, longer than the calyx, inserted into the receptacle; anthers small, roundish. Pyl. Germin simple, superior, ovate, villous; stigmas two, thread-shaped, erect, much longer than the flaments, divided at the summit; frigmas obtuse. Peric. Capsule elliptical, with four angles, one cell, and four valves,
valves, clothed all over with numerous rigid, projecting deciduous bristles. *Seeds* numerous, small, inserted into an ovate-oblong, central, unconnected receptacle, and enveloped in a villose membrane.

Eff. Ch. Calyx in four or five deep segments. Corolla none. Styles two, divided. Capsule brittle, of one cell and four valves, with many seeds.

1. *T. laurifolia.* (Abelana guianensis; Aubl. t. 234.) Laurel-leaved *Abelana,* or *Trichocarpus.*—Found by Aublet, on the banks of rivers in Guiana, particularly about one which empties itself into the Sinemari river, thirty leagues above its mouth. This tree bears flowers and fruit in November, and is known by the Caribbee Indians by the name of *Gouloogou-Abelana.* Its trunk is forty or fifty feet high, about two feet and a half thick, with a smooth reddish bark; the wood white, with some redness at the heart. *Branches* numerous and widely extended in all directions. *Leaves* alternate, flaked, elliptical, bluntly pointed, entire, rigid, smooth, undulated, with one rib and many transverse veins; their greatest length seven inches; breadth two and a half. *Flowers* small, in short, simple, axillary or terminal, spreading clusters. *Stamens* white, with yellow anthers. *Capsule,* when its bristles are fallen, about the size of a filbert. Its valves are likewise soon decussate, leaving the seeds enveloped in a red villose membrane. Nothing is recorded of the use or qualities of any part.

**TRICHOCEPHALUS,** in *Zoology,* a genus of the Insecta order of Vermes; the characters of which are, that the body is elastic and contorted, the hinder part thick and elevated, the anterior capillary and of double length, sometimes terminating knotty. Of this genus there are six species, distributed into two classes: viz.

*With Simple Head.*

**Homins.** Above subcrenated, beneath smooth, forepart very subtilely frilated; two inches long.

Equi. Two inches and a half long.

**Aph.** With tail on both sides furnished with crenated scales; equal to the human.

**Muris.** With the head three-knotted: found in the intestine of the mouse, between the duodenum and rectum.

**Vulpis.** With an acute head; neck transversely frilated, and unilateral veiscous. Found in the exuim of the fox.

**With Uncinated or Hooked Head.**

**Lacertae.** With tail on both sides scaly. Found in the intestines of the lizard.

**TRICODA,** a genus of the Infusoria order of Vermes; the characters of which are, that the worm is inconficuously with the naked eye, pellicid, and hairy on the other part. *Grimaldi's* edition of *Linnaeus* comprehends forty-four species.

*Without a Tail.*

**Patella.** Univalve; before and behind furnished with extended unequal bristles. Found in the marishes of Denmark.

**Inquilinus.** Vaginated with a green small cylindrical bag, and retortile pedicle. Found in very pure sea-water.

**Asiana.** Elongated, with the apex of the neck elongated beneath. Found in pure waters.

**Larus.** Dilated forward, with a gibbous back. Found in marishes in which the leaves of the poplar putrefy.

**Unkula.** Smooth, elongated, equal, on the fore-part hairy. Found in putrid infusions of hay and other vegetables.

**Sannio.** Incurvated; above ciliated, below truncated. Found rarely in water furnishing duck-weed.

Vol. XXXVI.

**TRI**

**Linter.** Ovate-oblong, somewhat prominent at both ends. Found by the Greenlanders in water, in which the lichen coriarius has been infused.

**Pubes.** Ovate-oblong, gibbous, on the fore-part depressed. Found in duck-weed water.

**Cyprip.** Obovate, above sinuated towards the hinder part, on the fore-part hairy. Found in water covered with duck-weed.

**Cyclidium.** Ovate, with gaping apex and hairy base. Found in water in which vegetables have been infused.

**Uninarium.** Ovate, with a very short hairy beak. Found in an infusion of hay.

**Lepus.** Ovate, with hairy apex and brilly base. Found in animal and vegetable infusions.

**Calodium.** Broadish, oblong, on the fore-part furnished with shining small cornicles. Found in vegetable infusions.

**Silurus.** Oblong, hairy before and behind, with a ciliated back. Found in water abounding with conviva.

**Mytilus.** Subclavated, at both ends wider, green and ciliated. Found in marish-water.

**Unkula.** Pitcher-shaped; before hairy. Found rarely in water covered with duck-weed.

**Lyceus.** Subquadrate, with hooked beak and hairy mouth.

**Semiluna.** Semi-orbicular, on the fore-part below-hairy. Found in duck-weed water.

**Oreis.** Orbicular, emarginated and hairy on the fore-part.

**Cimex.** Above convex, below smooth and hairy. Found in vegetable infusions.

**Charon.** Cymbiform, on the front hairy. Found in sea-water.

**Tinea.** Clavated, on the fore-part hairy; behind thick. Found in hay infusion.

**Trigona.** Convex, before ciliated, and behind eroded.

**Angulus.** Angulated, hairy at the apex. Found in hay-water.

**Pullaster.** Ovate, before sinuated; crilfated in front and hairy at the base. Found in duck-weed water.

**Pulex.** Ovate, before incised; in the front and base hairy. Found as the laft.

**Pelioniella.** Cylindric, before hairy, behind brilly: in vegetable infusions.

**Camelus.** Hairy on the fore-part, thickish in the middle; and on both sides emarginated. Found as the laft.

**Acarus.** Piriform, on the fore-part below hairy, behind pedate: in water covered with duck-weeds.

**Bomia.** Mutabile, on the fore-part furnished with scattered hairs: as the laft.

**Granata.** Spherical, with opaque centre, and hairy periphery: as before.

**Cometa.** Spherical, before hairy, with an appendant globle. Found in very pure water.

**Grandinella.** Spherical, pellicid, above hairy: as the laft.

**Sol.** Globular, radiated: in water kept three weeks.

**Synaster.** Subquadrate, with obtuse beak, and dink with shining pedicles. Found in sea-water that has been kept.

**Rattus.** Oblong carinated, the fore-part having very short hairs, the hind-part a long simple bristle: in stagnant waters.

**Ciliata.** Venticose, behind pectinated with hairs. Found in muffule-water.
SULCATA. With ovate ventricose apex, acuminate, ventral furrow and on both fides hairy: as before.

**With Tail.**

TRISPURA. Broadly, before hairy, behind briliately, finemnt on one side, mucronated on the other. Found in sea-water for some time kept.

DEReciNUS. Oblong, before hairy, behind truncated with a reflex tail. Found in hay-water.

LUDUS. Curvate, above hairy, with an extended tail. Found rarely in the grove-waters of Denmark.

MUSCULUS. Oval, on the fore-part hairy, the hinder part caudate. Found in hay-water.

PISUS. Oblong, on the fore-part hairy, behind very finely extemated in a tail: in duck-weed water.

ON NICULAR. Oblong, before hairy, behind somewhat sharpened: in pure water.

CLAVUS. Before rounded and hairy, behind an acuminate tail. Found in marshes.

PUPA. Aculeated, hairy in front, with a bent tail. Found in duck-weed water.

CLAVA. Clavated, hairy in front, with a reflexile tail. Found rarely in the marshy waters of Denmark.

Eff. Ch. Naked. Powder copious, mealy, encompaossed with a downy or hairy coat.

1. T. fulginosus. Perf. n. 1.—“Large, nearly globular, villous, whitish. Powder bright red, intermixed with clustered threads.”—Found in autumn, on the rotten trunks of Spruce Firs. An inch or two wide, soft, but not melting. The threads to which the *fdis* are attached spreading through the powdery mafs, in little tufts, from a subjacent membrane. *Perfon*.

2. T. rofius. Hofm. Germ. v. 2. t. 16. f. 1. Perf. n. 2. (Farinaria rofia; Sowerb. Fung. 360. f. 3.)—Rose-coloured, encompaossed with a fine, spreading, depressed, filamentous border. Frequent in spring on rotten branches, especially between the wood and bark of the Sallow and Aspen. Half an inch broad, roundish or oblong, with a cobweb-like circumferenc.

3. T. angustatum. (Farinaria arantica; Sowerb. ibid. f. 2.)—Tawny, orbicular. Powdery particles somewhat ovate, partly scattered, with a slight filamentous border. On leaves, often forming, as it were, a little nelf, with a few cottony filaments towards the edges. *Sowerby*.

4. T. feminarium. (Farinaria feminaria; Sowerb. ibid. f. 1.)—Powder black, in little compact globules, on a white, mealy, slightly fibrous, orbicular base.—Observed by the Rev. J. Holme, of Peter-houfe, Cambridge, on the leaves of a Willow. This confits of little white scattered orbicular spots of a white mealy subfiability, from a quarter to half an inch broad, lodging several minute deciduous mafs of black powder, or feeds.

5. T. vivide. Perf. n. 3. "Diff. Meth. Fung. 12." (Pyrenium lignorum 8; vulgare; Tode Fung. Macklcn. v. 1. 33. t. 3. f. 29.)—Roundish or unequal; very soft, with bright-green powder, and whitish fuculent grains.—Found after autumnal rains, among fragments of fallen branches of trees, or of the ftems of large herbaceous plants. Its subfiability is extremely soft, two or three lines in diameter. The white cobweb coat opens at the top, and expose the minute condened grains, or powder, of a most beautiful verdigris-green. *Perfon*, Tode.

6. T. aureum. Perf. n. 4. Obs. Mycol. fasc. 1. 99.—Widely expanded. Hairy coat whitish, very thin. Powder dull yellow.”—This occurs rarely, in fieves or hot-houses, on rotten wood, into which it is funk. Almost three inches broad, being one of the largest of its genus, but scarcely two lines in thickness. The fhiage covering is thin and evanescent. *Perfon*.

10. T. ievus. Perf. n. 8. Obs. Mycol. fusc. 1. 99. —Whitish, spreading, smooth, turning bull-coloured. Powder yellow. This is found on the ground, as well as spreading over mofts, to the breadth of an inch and half or two inches, but is not among the common fpecies. It is more permanent than fome others.

11. T. tuberculatum. Perf. n. 9. Obs. Mycol. fusc. 1. 10. t. 2. f. 8.—Pure white, nearly orbicular; at firft downy; afterwards tubercular. Powder grey.—Frequent after great rains, on the ground in shady woods. When young it is very white, of a cobweb texture, but soon becomes greenish. When full-grown the surface is beft with oblong tubercles. In a few days the whole changes to a grey powder.

TRICHODESMA, from 3, 8, 12, a hair, and 8, 12, a tie, alluding to the connexion of the anthers by their pubescence.—Brown Prodr. Nov. Holl. v. 1. 256. (Borraginoidae; Boerh. Lintg.—Bat. v. 1. 188. fig. F.—K. Boar.—Germ. t. 67. Cynoglofideae; Hnard in Mem. de l’Acad des Sc. for 1718; German edition 194. t. 9. 10. (Pollina; Medicus Phil. Bot. part. 1. 32.)—Claws and order, Pentadacty Monegynia. Nat. Ord. Afferofolos, Linn. Borraginae, Jull.

Gen. Ch. Cal. Perianth inferior, of one leaf, in five deep, erect, permanent segments. Cor. of one petal, wheel-shaped; the length of the calyx; tube short, somewhat funnel-shaped; limb spreading, nearly flat, in five deep, equal, keeled, taper-pointed segments; throat naked. Stam. Filaments five, very short, inserted into the throat of the corolla; anthers oblong, prominent, converging, shorter than the limb, tipped with twifted briliately points, and bound together by their two rows of dorfal hairs. *Pfyl. Germens four, superior; fyle central, thread-shaped, longer than the flamens; stigma fimple, blufht. Seeds. Nuts four, ovate, gibbous, half fink in the cells of the four-winged central column near its fummit.

Eff. Ch. Corolla wheel-shaped, with a naked throat. Anthers connected by dorfal hairs.

Mr. Brown has feparated this genus, confifing of three known fpecies, from the Linnian *Borrago*, for the very fufficient reafon of the corolla having no valves or prominences in
TRI

in its throat; to say nothing of the connexion of the anther; or infection of the seeds. The plants are herbaceous, clothed with pungent bristles; their flowers axillary, or racemose with bracteas. See Borago.

2. T. indicum. Indian Trichodesma. (Borago indic; Linn. Sp. Pl. 197. Willd. Sp. Pl. v. 1. 776. Ait. Hort. Kew. v. 1. 256. Borraginoides angustifolia, flore pallecente ceruleo; Boerh. as above 188, with a plate. Cynoglossoides folio caulem amplaxente; Ifnard as above, t. 9.)—Flowers axillary. Segments of the calyx auricled at the base. Seeds without a border. Leaves clasping the stem.—Native of the East Indies. A tender annual, cultivated by Miller, and flowering throughout the summer and autumn. The stem is much branched, rather diffuse. Leaves felid; oblong, blunter, entire, rough with hairs and canuous points; clasping the stem with their lightly heart-shaped base. Flowers axillary, solitary, stalked, drooping, white, pale blue, or reddish, with five ruffled spots round the mouth. Calyx hairy, each segment acute, much elongated at the base. Seeds pale, nearly smooth.

3. T. zeylanicum. Ceylon Trichodesma. Dr. n. 1. (Borago zeylanica; Linn. Mant. 202. Willd. Sp. Pl. v. 1. 777. Ait. Hort. Kew. v. 1. 257. Jacob. Coll. v. 3. 169. Ic. Rar. t. 314. Burn. Ind. 41. t. 14. f. 2. Anchoa bugloides, lithopherum femine; Pluck. Mant. 13. Phyt. t. 335. f. 4.)—Clusters terminal. Calyx without auricles. Seeds smooth, without a border. Leaves nearly sessile, tapering at the base.—Native of Ceylon, and other parts of the East Indies, as well as of New Holland, within the tropic. Dr. Roxburgh's fent seeds to Mr Joseph Banks, in 1799. This, like the rest, is an annual plant, flowering in the flower about July and August. The herbage is, as Mr. Brown remarks, very variable in its quantity of bristles and soft hairs; the latter, in wild species, are sometimes very abundant, giving the long flower-flake, and calyx, more especially, a hoary aspect. The leaves are oblong or oval, softly opposite. Clusters leafy. Corolla white and semi-transparent. Seeds oval, grey, smooth and highly polished, like our Common Grown well.

TRICHODIUM, received that name from Michaux, who constructed it out of 1b. 15. a taxon, a hair, and 3. form, or appearance, in allusion to the capillary hairs of the panicle.

Gen. Ch. Cal. Glume fingle-flowered, of two linear-lanceolate, acute, awnless, nearly equal valves. Cor. Glume of one valve, shorter than the calyx, ovato-lanceolate, membranous, awnless, smooth, permanent. NeCarya a deeply cloven scale. Stam. Filaments three, capillary, longer than the calyx; anthers oblong, cloven at each end. Fil. Germin roundish-ovate; filyles two, dis tant, short; stigmas loosely feathery, with long roughish hairs. Peric. none. Seed one, roundish, pointed at each end, unconnected with the corolla.

TRI

2. T. decumbent. Decumbent Brittle-gras. Michaux as above. Pursh n. 2. Ait. Epit. 375. (Coronocype perennans; Walt. Carolin. 74. Agrostis anamala; Willd. Sp. Pl. v. 1. 370. A. Coronocype; Frazer Monogr. with a plate.)—Stems decumbent. Leaves spreading, linear-lanceolate, with smooth sheaths. Calyx-valves taper-pointed.—On moil hiils, and in short gras-meadows, from Canada to Carolina, flowering from June to August. Root perennial. This and the foregoing are highly valuable grasses. Pursh. Larger than the first species, with longer and broader smooth leaves, which spread in every direction. Stipula, as Wildenow observes, larger, lanceolate, torn. Panicle large and loose. Flowers about the size of our Agrostis alba, being twice the size of the foregoing, and much more numerous.

This, known by the name of Frazer's New American Gras, was brought from Carolina by that indefatigable collector, in the year 1798. His friend Mr. Walter, in the Flora Caroliniana, extols this grass as one of the Creator's most precious gifts, which he himself was destined to make first known to mankind. Kalm had indeed, long ago, sent a specimen to Linneus, but without any particular account of its use or distinctions, so that his specimen remained undiffigerated from other species, which it much resembles. The solitary valve of the corolla led Mr. Walter to refer this plant to the genus Coronocype, to which it has no other affinity. He was moreover flattered by this name, as concerning with his own idea of the value of his discovery. Nor do we doubt the accuracy of his statements, published in Mr. Frazier's Monograph above cited. Nevertheless, this grass has disappointed the hopes of European cultivators, and has now totally disappeared. "The places that knew it, know it no more." It is not even mentioned in Mr. Sinclair's elaborate and valuable experimental work, the Hortus Graminum Woburniæ, nor by Mr. Dryander in the Hortus Kewensis, though Mr. Axton has supplied the latter defect in his Epitome. So difficult is it to cultivate grasses, in general, away from their native situations, for any agricultural profit, that the disappointment we are obliged to record, is no impeachment of the accuracy of those who still reckon our Trichodium among the best grasses in America.

TRICHOGAMILA, a name of Dr. Patrick Brown's, which he has left, according to his usual custom, unexplained. It appears derived from Sp, sin; a hair, and gama, marriage.
TRI

marriage, alluding to the pubescence enveloping both organs of impregnation.—Browne Jam. 218.—We have seen no specimen of this plant. It is said to grow close to the beach at Bull-bay, in Jamaica. The flower is shrubby, stiff, simple, three or four feet in height and, as many lines in diameter. Leaves round, smooth, alternate. Flowers small and whitish. Outer calyx (rather bracteas) two small deciduous leaves; inner cup-shaped, of one leaf, divided half way down into five ovate segments. Corolla of five oblong, abrupt, somewhat spreading petals, or of one petal divided to the base. Filaments ten, downy, crept, shorter than the corolla. Anthers rounded. German minute, in the bottom of the calyx. Style downy, the length of the stamens, with a blunted stigma. Drupes the size and appearance of a gall-nut, but light and hollow, globose, woody, thin, with a thin coat, of one cell, inclined, rather uneven in its surface. Nuts two, oblong-ovate, two-lobed; one of them usuallv abortive; the other fixed to the bottom of the drupa, but not half occupying its cavity.

Jullifce, Gen. Pl. 260, fulsepts this to be the fame genus with Chlacca or Murrafa (see thefe articles); and Linneus has written Chalcas againfit Browne’s description. We presume it is the fame individual species, which, though of East Indian origin, had accidentally been conveyed to the shores of Jamaica. If this be correct, Browne mifook the leaves for fimple leaves, and perhaps did not meet with its fruit in its natural more juicy flave.

TRICHOMA, in Surgery, the difeafe more commonly called Plica Polonica.

TRICHOMANES, in Botany, an ancient Greek name for some small delicate kind of fern, suppos’d, from the description of Dioscorides, book 4. chap. 157, to be Asplenium Trichomanes of Linneus, which very well answers to that description. The name, from τρίχα, a hair, (whatever may be the origin of the root of the word,) about which etymologians disagree,) alludes to the flinder flinging flalks, common to most of the fern tribe, which procured them the appellation of Capillary herbs, and the reputation of improving the growth of the human hair. Linneus selec’ted this name for a delicate, pellucid, capillary-flaked genus, to which it very fuitable; more efpecially if we take it into confideration, as he probably did, the peculiar character of a prominent hair or flirre, originating from the receptacle of the leaf-vefils.—Linn. Gen. 560. Schreb. 758. Willd. Sp. Pl. v. 5. 498. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 5. 529. Sim. Mem. de l’Acad. de Turin, v. 5. 417. Tracts 255. Swartz Fil. 141. Ind. Occ. 1724. Brown Prodr. Nov. Holl. v. 1. 159. Sprengel Crypt. Engl. ed. 164. t. 5. f. 35. Juss. 16. Lamarck Illust. t. 871.—Chaff and order, Cryptogamia Filices. Nat. Ord. Filices.

Gen. Ch. Fructifications inferred into the margin of the frond, terminal, distinct, tubular. Involucrum of one leaf, urn-shaped, of the texture of the frond, opening outward. Capule of two valves, bound by a ciliated ring, numerous, to the outer part of a cylindrical common receptacle, or column, whose capillary naked point projects beyond the involucrum.

Obf. Hymenophyllum (fee that article) was first separated by the writer of this, from Trichomanes, with which it had, on account of their familiar membraneous pellucid habits, been always confounded. The bivalve involucrum, enclosing the common receptacle, clearly diftinguishes it from the genus before us, whose involucrum has a spreading undivided border.

The second edition of Species Plantarum contains eleven, and the fourteenth edition of Syluma Vegetabilium thirteen, species of Trichomanes, as Linneus underflood the genus. But though from these are deduced what are now referred to Hymenophyllum and Davailla, Willdenow enumerates thirty-four species of genuine Trichomanes. These are distributed into four fections, according to the subdivision of their fronds. We shall felec’t examples.

Sect. 1. Frond fimple. Twelve species in Willdenow. T. reniforme. Kidney-shaped brittle-fern. Forl. Prodr. 84. Willd. n. 1. Swartz Fil. 360. "Schiukru Crypt. t. 130. f. 134." R. A. Hedw. Fil. fac. 3. Fronds kidney-shaped, undivided, on bordered flalks.—Gathered by Forre, as well as by Mr. A. Menzies, in New Zealand. An elegant very fingular fern, with long, creeping, thread-shaped, perennial roots, attached by rigid downy fibres, and throwing up flatter fronds, various in fize, each on a simple smooth flalk, from one to fix inches high, bordered, or fightly winged, efpecially in the upper part. The leaf itself is vertical, kidney-shaped, from one and a half to three inches wide, of a dull olive-green, membraneous, semi-pellucid, smooth, full of numerous, radiating, repeatedly forked veins; the margin entire, fightly值班, in the larger or other fpecies befet with a row of cup-shaped imferred involucrums, each terminating a vein, and each protruding a thick rough column, twice its own length, bearing a number of pale flining annulated capsules.

T. membranaceum. Membranous Brittle-fern. Linn. Sp. Pl. 1560. Willd. n. 5. Swartz Ind. Occ. 1724. (Darea americana lichenoides; Petiv. Mut. n. 763. Adianum mucicofum, lichen petrii facie; Plum. Fil. 83. t. 101. f. a.) Amer. 34. t. 50. f. a; inaccurately copied in Pluk. Phyt. t. 285. f. 3; and again in Petiv. Fil. t. 13. f. 5.) — Fronds fefile, dilated upwards, obfute, undivided, or torn; the margin befet with peltate fcales.—Found on wet, often inundated, flones and rocks about the banks of rivers, in Hifpaniola. This has fcarce erode fronds and membraneous texture of the foregoing, but with a folly glofs. Its black, fagggy, creeping roots bear scattered fronds, defitute of flalks, sometimes roundifh, but mostly wedgfe-shaped, from one to three inches high, varifhly fplit, dilated, and jagged, befet with innumerable crowded radiating veins, and much refembling the texture of a bat’s wing. The margin, as well as the tip of each fegment, bears brown peltate fcales, whose ife is unknown, but which, as Dr. Swartz remarks, might eafily caufe this fern to be taken for an Adiantum, were they not found on the fame individual, though far more fparingly, the proper fructification of a Trichomanes, confliting of deeply imferred, fender, tubular involucrums, dilated, orbicular, and roughifi at the mouth, each with a prominent (not as Swartz fays a concealed) column.

T. mucoidae. Moffy Brittle-fern. Swartz Ind. Occ. 1726. Willd. n. 6. (T. hymenoides; R. A. Hedw. Fil. t. 3. f. 3. Phyllitis feandens minima, mufci facie, folis membranaceae lebrotundia; Sloane Jam. v. 74. t. 27. f. 1.)—Fronds roundifh-oblong, irregularly fcutated, wavy, obtufite, on short hairy flalks. Involucrum prominent, cylinderical; bivalve at the mouth. — Found creeping over the trunks of trees, in low wet places, in Jamaica. The root is black, thick, and woolly, spreading to the extent of feveral inches. Fronds light green, lying over each other, fearfully more than half an inch wide, with frong, branching, but not parallel or crowded veins; the fegments rounded and wavy. Involucrums at length flipped as it were, and projecting entirely beyond the leaf on winged flalks; their margin...
margin of two rounded valves, edged with brown. The column is certainly prominent. Our description differs from Dr. Swartz's in some material points, though taken from his own specimens.

T. reptans. Trailing Britle-fern. Swartz Ind. Occ. 1727. Willd. n. 9. R. A. Hedw. Fil. t. 3. f. 4. bad. — Fronds obovate-oblong, nearly sessile, irregularly pinnatifid, with oblong obtuse segments; their base wedge-shaped. Involucrum immersed, its orbicular mouth not projecting beyond the leaf.—Native of old mossy trunks of trees, in the mountainous part of Jamaica. If we are right in our ideas of this species, it is browner and thinner than the last, with a larger frond, but shorter flalk; the veins much less thick and prominent. The involucrum moreover does not project, till tipped by age, nor is its margin divided. The column is certainly prominent. We do not boast, in this case, an original specimen from the author, and therefore may be mistaken.

T. filusum. Sinuated Britle-fern. Willd. n. 10. Lamarck f. 1. (T. crispsum; Linn. Sp. Pl. ed. 1. 1097, ed. 2. 1560, excluding the synonyms of Plumier and Peyt.)—Frond lanceolate, pinnatifid; tapering at the base; segments ovate, obtuse, somewhat angular, with zigzag veins, and distinct solitary fructifications. — Native of the West Indies; Willdenow says of Guiana. A very elegant and distinct species, sometimes resembling the outline of an oak-leaf, but it is more usually of a linear-lanceolate figure, tapering at each end, four inches, more or less, in height, light olive, pellucid, finely reticulated, flat, rarely a little hairy, with elegant, zigzag, equally diverged veins. Involucrum immersed at the blunt point of each segment, almost always solitary, its dilated orbicular border not projecting beyond the leaf. Column slender, prominent, full twice as long as the involucrum. This seems, by the Linnaean herbarium, to be what Linnaeus intended for T. crispsum; but it is evident from the specific character and name that he had full as much in his contemplation Plumiér's t. 86, quoted for a synonym; and the latter being universally received as the true crispsum, we shall fo retain it. See the next section.

T. polypholoides. Polypondy Britle-fern. Linn. Sp. Pl. ed. 1. 1098. ed. 2. 1561. Swartz Fil. 145. Willd. n. 11. — "Frond lanceolate, pinnatifid, wavy. Flowers solitary, terminal."—Native of India. —"Frond the length and breadth of the finger, pinnatifid almost to the mid-rib; lobes lanceolate, bluntly ferrated, acute at the summit, each of them furnished with a solitary flower at the point. The frond moreover is pellucid, with alternate veins."—Such is Linnaeus's description of this species, which no person has ever discovered, and which can only be determined from his works or herbarium. In the latter nothing presents itself under this name; but the specimen marked crispsum, mentioned under our preceding species, so precisely answers to this description of polypholoides, that we cannot but believe it is the very plant, and that Linnaeus has here fallen into a most complicated mistake. As we are, nevertheless, unable to prove this, we would still retain the excellent name of filusum, to which those who think as we do may refer polypholoides as a synonym, with or without a mark of doubt.

T. elegans. Elegant Britle-fern. Rudge Guian. 24. t. 55. Willd. n. 12.—Barren fronds lanceolate, deeply pinnatifid; fertile ones linear, pinnate, on longer flalks. —Native of watery mossy places in Guiana. Fronds tufted; the barrens ones leafy, pellucid, of numerous, deep, parallel, linear, blunt-tipped, somewhat jagged segments, that are near an inch long; their common flalk round, about two inches in length, nearly smooth; fertile ones fewer, their flalks erect, five or six inches long, the frond itself four or five, and only half an inch wide, scarcely at all leafy, but composed of two dense rows of numerous, crowded, folded, cylindrical, two-edged involucral cups, each with a small orbicular border, and protruding a long, curved, rough, flilly club-shaped column, with the length of the involucrum itself.

Sect. 2. Frond pinnate. Three species; Willd.

T. crispsum. Crisped Britle-fern. Linn. Sp. Pl. 1560. Swartz Ind. Occ. 1731. Willd. n. 14. R. A. Hedw. Fil. t. 4. f. 2. (Trichomanes n. 1; Linn. Hort. Cliff. 476. Polypodium crispsum caliciferum; Plum. Fil. 67. t. 86; copied in Petit. Fil. t. 11. f. 8.)—Frond pinnate; leaflets oblong, obtuse, wavy, crisped, hairy, many-flowered at the extremity; the upper ones confluent.—Native of various parts of the West Indies. The tufted hairy root bears many lanceolate folded fronds, about a foot high, of a light pellucid olive-green, very thin and membranous; their numerous leaflets about an inch long, elegantly crisped and plaited, copiously veined, clothed with feattered tawny hairs. The blunt extremity of each leaflet, except some of the inferior ones, bears from four to six large, densely ferrated, rather crowded, tubular involucrums, with orbicular entire flilly divided calyces. From each proceeds a long flalk, almost capillary, roughen column, whole point when entire is blunt, or rather capitate.

T. floribundum. Many-flowered Britle-fern. Willd. n. 15. (T. pinnatum; Swartz Fil. 142. R. A. Hedw. Fil. t. 4. f. 1. T. rhizophylla; Cav. Leccion. 279. Swartz Fil. 142.)—Frond pinnate; leaflets lanceolate, ferrated; the upper ones deciduous, confluent. Fructification marginal, fringe-like, prominent.—Native of several parts of the West Indies. Twice the size of the last. The leaflets are usually near two inches long, above half an inch broad, alternate, blunt-tipped, nearly smooth, beset with immovable close transverse veins, connected by fine reticulations; their margin undulated and finely ferrated: those of the barren fronds crowded; of the fertile ones remote, most of their ferratures tipped with a little, brown, cup-shaped, entirely prominent and naked involucrum, with a capitate column about its own length. Cavannels speaks of this as the handmoeil species he had seen. His description leaves no doubt as to the identity of his plant, though we have not seen an instance of any sprouuting roots from the tip of the frond, which probably led Dr. Swartz, without seeing specimens, to adopt it as distinct.

Sect. 3. Frond doubly pinnatifid. Six species; Willd.

T. crinimum. Hairy Britle-fern. Swartz Ind. Occ. 1730. Willd. n. 19. R. A. Hedw. Fil. t. 1. —Frond pinnate; leaflets obtuse, pinnatifid, decurrent, confluent; hairy at the margin and veins; segments often cloven. Stalk hairy. —Found on the trunks of trees, on the lofty mountains of Jamaica. Frond about three inches in length, pale, pellucid; its tawny-haired flalk scarcely so long. Involucrum here and there imbedded at the ends of the segments of each leaflet, with a dilated, fringed, orbicular margin. Column long, rough, compact with a taper point. The segments of the leaflets are lanceolate, blunt-tipped, not to generally divided in our specimens as in Hedwig's figure.

T. pycidiiferum. Covered Britle-fern. Linn. Sp. Pl. 1561. Swartz Ind. Occ. 1739? Willd. n. 21. (Filicula pycidiiferum; Plum. Fil. 73. t. 50. f. E; copied in Petit. Fil. t. 13. f. 13.)—Frond pinnate; leaflets oblong, obtuse, decurrent, pinnatifid, with linear, obtuse, decurrent, entire, mostly three-clipped segments. Stalks all winged. Involucrum closed by a lid bearing the column.—Found by Plumier
mier on molly trees in Hispaniola. He is our only certain authority for this species, the description of Swartz not answering exactly to his account, and the figure in R. A. Hedwig, t. 29, f. 2, indicating something very different. The true *T. pyxidiferum* is so named because the involucrum is formed like a box with a convex lid, through which latter the long prominent column is continued. We have seen indications of no such character in any other species. The column is crested and hairy. *Fronds* stalked, three or four inches high, smooth, very thin, their common as well as partial flanks winged throughout, and of the same linear form as the segments of the leaflets, which are notched at the end. *Involucrum* one or two about the lower part of each principal leaflet cup-shaped, quite cloaked by the above-mentioned lid.

*T. europaeum*. European Britle-fern. (T. pyxidiferum; Hedf. 461. Bolt. Fil. 56. t. 3.) *Hymenophyllum tunbridgense* fil. Fl. Brit. 1142. *H. alatum*; Engl. Bot. t. 1417. *F. humilis* repens, foliis pellicoides et plenudantis figure of the latter, this will be found to differ chiefly in *involucrum* and leaflets oblong, decurrent, pinnatifid, with linear, obtuse, decurrent, entire segments. Stalks all winged. *Involucrum* open, with a slightly spreading border. Few plants of any country have caused more curiosity, or more diversity of opinion, than this fern, originally discovered by Dr. Richardson "at B-shank, scarce half a mile from Bingley, Yorkshire, at the head of a remarkable spring." From thence Mr. R. T. Seide and Mr. Dick-son have brought us young plants, like *Dillenius* f. 4, but which could not find one like his f. 3. The botanists of Ireland have been more fortunate. Mr. J. T. Mackay met with perfect specimens in fruitification, on rocks about the cataracate, at the bottom of Turk mountain, Killarney. Some of these, more perfect than what is figured in Engl. Bot., lead us to con-consider with Mr. Brown's opinion, expressed in his *Prodromus*, in removing this plant from *Hymenophyllum*, to the present genus. It was indeed considered by Linnaeus as not distinct from *T. pyxidiferum*, nor is this opinion so wide of the truth as has been supposed. By a comparison with Plumer's specimen, we believe this to be more compound, with a smaller, more slender, two-edged *involucrum*, in which we can discover nothing like a lid. Its margin is narrow, but rather spreading. The *capsules* are few and large, bright yellow, with a broad ring.

*Column* long and prominent. Some appearances in this and other species lead us to believe the *column*, laden with *capsules*, is generally protruded out of its *involucrum* after the *capsules* are ripe, and it may therefore, in a very early state, be found entirely inclosed therein. This being the only European Trichomanes, we hope our specific name may be allowed, that of *alatum* being preoccupied; see Wildl. n. 17.

*T. venosum*. Veiny Britle-fern. Brown Prodr. n. 1.—"Frond pinnate; leaflets linear, veiny, wavy, somewhat crenate; the lower ones lobed or pinnatifid at the base, and bearing a solitary involucrum at their inner margin."—Gathered by Mr. Brown, in the island of Van Diemen, and near Port Jackson, New South Wales. This shows akin to the two last, but we have seen no specimens.

*T. trichoides*. Capillary Britle-fern. Swartz Ind. Occ. 1741. Wildl. n. 23. (T. tenellum; R. A. Hedw. Fil. t. 3. f. 1.)—*Frond* tripinnate; leaflets linear, almost capillary, divided, emarginate. *Involucrum* flaked, lateral, solitary, near the base of the principal branches. In moist, shady, grassy places, in the cooler parts of Jamaica and Hispaniola. This is a peculiarly delicate and slender fern, from two to four inches high, whose ramifications are so exceedingly narrow as to appear capillary, though the ultimate divisions are truly leafy, conflating of a very mid-rib, bordered with a continued, even, entire, feebly crenate, leafy margin at each side, slightly dilated upward, and blunt at the end. The fructification is lateral and solitary, much as in the three preceding; each *involucrum* flaked, tubular, two-edged, with a broad, orbicular, wavy margin. The column is very long and capillary.

*T. rigidum*. Rigid Britle-fern. Swartz Ind. Occ. 1738. Wildl. n. 29. R. A. Hedwig Fil. t. 2.—*Frond* tripinnate; leaflets pinnatifid, with linear, entire, taper-pointed segments. Common flanks two-edged, rigid. *Involucrum* flaked, lateral, solitary, near the base of the secondary branches. Found about the roots of trees, on the lofty mountains of Jamaica. The creeping *root* sends up numerous rigid upright *fronds*, twelve or eighteen inches in height, of which at least one half consists of a brown, shining, round, firm *frill*. The leafy part is finely and elegantly divided, is a cinnamon green, and the mouth spreading. *Column* very rigid and inflexed; *Involucrum* urn-shaped, with a membranous spreading border. *Column* thick, not much protruding.

*T. radicans*. Winged Climbing Britle-fern. Swartz Ind. Occ. 1736. Wildl. n. 30. (T. scanderi; R. A. Hedwig Fil. t. 6, excluding the synonyms.)—*Frond* doubly pinnate; leaflets pinnatifid, with linear, cloven, obtuse segments. Common and partial flanks smooth, all winged. *Stem* climbing, creeping. Found on the mountains of Jamaica, creeping up the trunks of trees to a great extent, the downy rully-coloured main *frond*, or *root* as it might be called, being firmly attached to the bark of the tree, throwing out little radicles as it goes. *Fronds* scattered, from nine to twelve inches long, on winged *frills* measuring from one to three inches, ovato-lanceolate, twice or thrice pinnate, dark green, smooth, the *frills* of all their subdivisions bordered with an entire uninterrupted wing; branches, leaflets and segments alternate. *Involucrum* cylindrical or somewhat ovate, slightly winged with a portion of the segment which it carries, very narrow at the mouth spreading. *Column* long and slender. A very different species from the following, for which it has been mistaken by several botanists, to some of whom, though not quoted by Hedwig, we can trace his error.

*T. scanderi*. Great Climbing Britle-fern. Linn. Sp. Pl. 1562. Wildl. n. 31. Swartz Ind. Occ. 1737. (Adiantum scanderi ramosissimum, lacinii retusus díficéntum; Plum. Fil. 76. t. 93; copied in Petiv. Fil. t. 12. f. 5.)—*Frond* tripinnate; leaflets oblong, pinnatifid, with linear obtuse segments. Common *frills* round; partial winged, hairy. *Stem* climbing, creeping. Native of mountainous woods in Hispaniola, where it was gathered by Plumer, and since by Dr. Swartz. A much larger plant than the foregoing, creeping over the trunks of old trees. Each *frond*, two feet high, has a round, not bordered, main *frill*, the partial ones only being winged. All the leaflets and their *frills* are clothed with long loose hairs, of a shining or golden brown, such as are often likewise observable on the main *frill*. The colour of the latter is a little olive than the leaf, and its reticulations much coarser. *Involucrum* much the same, nor do we find the column, when perfect, shorter in one than the other. Sloane's v. 1. t. 68, may be intended for *T. scanderi*, but it is not sufficiently exact to afford any information.

*T. tamarijiforinum*. Tamarisk Britle-fern. Jacq. Coll. v. 3. 285. t. 21. f. 2. Wildl. n. 34.—*Frond* doubly pinnate; leaflets lanceolate, pinnatifid, with linear, very narrow, smooth
smooth segments. Common stalk round, brilily; partial winged, smooth. Involucrum flaked.—Native of the isle of Bourbon. Our specimen was communicated by M. Thévenin the younger Linnaeus, who took it for T. cruciatum; but there is no appearance of any common trailing fern. The frond is almost two feet high. Stalk pale and smooth where naked, and in the leafy part of the frond blackish and hifid. Divisions of the leaflets peculiarly fine, regular and delicate, bluntish, sometimes emarginate, olive-green, without any hairs. Involucrum short and roundish, on a stalk more or less winged; its mouth spreading. Column long.

TRICHONEMAS, in Gardening, comprehends plants of the herbaceous fern kinds,—the maiden-hair ferns; among which, the species which are cultivated for garden use and variety, are the canary maiden-hair fern (T. canariensis); and the Tunbridge maiden-hair (T. tunbrigdenae). These are both perennial plants, which have something curious and interesting in their frondose growth and habit, and are therefore proper to be cultivated for the ornament and variety which they afford.

Method of Culture.—Both these plants may be increased by slipping their branches, or dividing their roots, and planting them in pots of light earth in the first fortnight, and the latter kind either in the same way, or in a dry border of light mould, the former to be removed in the winter season to the protection of the greenhouse, but the latter to remain where planted, or some put into pots, to be placed out in particular situations, as occasion may require.

They both form a singular variety when put in allemand with other different plants of the exotic greenhouse sorts, and other kinds in the borders and various compartments.

Gen. Ch. Cal. Sheath inferior, more than half the length of the corolla, of two lanceolate, entire, permanent valves. Cor. of one petal, superior; tube very short, funnel-shaped; limb regular, divided to its very base into five nearly equal, somewhat spreading, concave segments. Stam. Filaments three, inserted into the mouth of the tube, erect, much shorter than the corolla, downy; anthers rather large, converging, oblong, cloven at the base. Fil. Ger. Germen roundish; style thread-shaped, erect, longer than the filaments; stigma three, deeply divided, equal, spreading, very slender, rather abrupt. Peric. Capsule roundish, membranous, tined, of three cells and three valves. Seeds several, globose. Eff. Ch. Sheath of two valves. Corolla with a very short tube, and equal regular limbs. Filaments downy. Stigma three, deeply divided, very slender. Capsule roundish. Seeds globose.

Off. The shortness of the tube, divided stigmas, and pubescent filaments, distinguishing this genus from U. (See that article.) The leaf character is but lightly perceptible, and the others may perhaps hardly be thought sufficient to separate plants so precisely alike in habit. We shall nevertheless enumerate the species as given by Mr. Ker, Glawer.

1. T. Bulbocodium. Channel-leaved Trichonema. Ker n. 4. Ait. n. 1. (Jxia Bulbocodium; Linn. Sp. Pl. 51. Willd. Sp. Pl. v. 1. 196. Jacq. Coll. v. 3. 265. Lc. Rav. t. 271. Curt. Mag. t. 265. Redout. Liliac. t. 88. Sm. Fl. Græc. Sibth. t. 30. Compend. Fl. Brit. ed. 2. 5. Engl. Bot. t. 2549. Dickc. H. Sicc. fæc. 18. n. 1: Sifyrinchium Theophrasti; Column. Echir. 328. t. 327. Focus verrucous; Ger. Emm. 153. t. 1.)—Leaves native of grassy hillocks, and sandy ground near the sea, in the south of Europe, from Jersey and Guernsey to the Archipelago, in which last country it is very abundant, flowering in March and April. We have no where seen this pretty plant more beautiful, with its numerous varieties, than on the hillocks around the celebrated fountain of Eggeria, near Rome. There all the different appearances of the flower, with respect to size and colour, which the above figures represent, and indeed many more, may be collected at once; nor can they fail to convince an observing botanist that they are no more distinct species, than our red or blue garden anemonies. The bulb is ovate, the size of a fibber, with many entire smooth coats. Leaves radical, recurved and widely spreading, narrow, smooth, silky. Stalks one or two, combined at the bafe, single-flowered, more or less curved, round, smooth, much shorter than the leaves, though considerably elongated after flowering. Sheath somewhat coloured. Corolla from one to two inches long, purplish, pale rose-coloured with a yellow bafe, or almost white in the border, always variously streaked; the backs of the three outer segments greenish; all the segments elliptical, but various in breadth. Capsule membranous, corrugated, purplish. We cannot separate Mr. Ker's refusum, for which he cites Curt. Mag. t. 265, however different that figure may, at first sight, appear.

2. T. cruciatum. Square-leaved Trichonema. Ker n. 3. Curt. Mag. t. 575. Ait. n. 2. (Jxia cruciata; Willd. Sp. Pl. v. 1. 197. Jacq. Ic. Rav. t. 290. Bulbocodium pedunculis nudis uniformis, foliis fabulatis linearius longifimis; Mill. Ic. 160. t. 2403; not 260, as in Hort. Kew. an almost unique error of the kind in the accurate Mr. Dryander, caused by the awkward roman numerals.)—Leaves linear, four-fided, with as many deep channels.—Native of the Cape of Good Hope. The leaves are more erect than in the former, various in breadth, but always known by their four-fided figure, displayed in a transverse section. The stalk is solitary, short and fimbrious. Corolla variable in size, pale crimson or purplish, streaked, externally green; its segments acute and recurved.

4. T. speciosum. Crinum Trichonema. Ker n. 5. (Jxia Bulbocodium, var. flore speciosiflorum; Andr. Rev. t. 170.)—Leaves linear, channelled, the length of the stem, which bears a solitary leaf near the top.—Native of the Cape of Good Hope, from whence Mr. G. Hibbert received its bulbs in 1805. These flowered in his garden at Clapham the following March. This appears most like to the first species in its leaves, except their being more erect, and fearfully exceeding the length of the stem. The latter, though fimbrious, bears one leaf near the top, according to Mr. Andrews, who is only by authority. We are aware that the European T. Bulbocodium, when it has two flowers, persists
bears also a leaf at the junction of their flanks. The flower of the present plant is uncommonly handsome, near two inches long, of a rich crimson; violet at the base; its three outer segments yellowish at the back, with crimson veins. The flower is narrow, green and leafy, leaves membranous, or coloured, than in most of the rest.

5. T. pudicum. This is merely mentioned by Mr. Ker, as the *Asia pudica* of Dr. Solander in Sir Joseph Banks’s herbarium, without any indication of its character or distinctions.

The able writers from whom we adopt this genus, indicate several European as well as African species, that remain hitherto undefined. Of the latter we have not sufficient materials to judge; but the probability of there being some such cannot be doubted. What we have seen of the European specimens would, however, render us much on our guard against those of exotic origin.

**TRICHONIUM**, in *Ancient Geography*, a town of Greece, in Etolia.

**TRICHOPHORUM**, in Botany, from πυδος, πυδος, a bristle, and σκις, to bear, because of the bristles encompasing the seed, in allusion to *Eriophorum*, (see that article,) out of which the present genus is extracted.—*Perfoon Encycl. v. 1. 60.* Pursh 57.—Clas and order, *Triandria Monogynia*. Nat. Ord. Calamiaria, Linn. Cypereides, Jull.

Gen. Ch. Cal. Spike, or Catkin, imbricated every way, with ovate, flat-tight, pointed, keeled, loose scales, differentiating the flowers. Cor. none. Stam. Filaments three, capillary; anthers erect, oblong. Pfij. Germen superior, roundish, very small; style thread-shaped, the length of the scale, deciduous; filaments three, elongated, reflexed. Peric. none. Seed solitary, beaked, ovate, triangular, with from five to nine capillary, wavy, brown bristles at the base, five times its own length. Receptacle cylindrical, cellular, and toothed.

Eff. Ch. Glumes chaffy, imbricated every way. Corolla none. Styline deciduous. Seed triangular, beaked, surmounted at the base with from five to nine hairs, scarcely longer than the spike.

Obf. The difference between this genus and *Eriophorum* confits in the comparatively small number of hairs surmounting the base of the seed, and their much shorter proportion, to say nothing of their brown hue. All these circumstances certainly give the *Trichophorum* a different, and far less brilliant, aspect. It is in fact more akin to various species of *Stirpus*, whose seeds are accompanied by short, flat, rough bristles.

2. T. alpinum. Alpine Hair-rush. Pursh n. 2. (Eriophorum alpinum; Michaux Boreal.-Amer. v. 1. 34.) —Stem naked. Spike solitary.—In bogs on the mountains of Pennsylvania, Vermont, &c. flowering in August. Perennial. Stem triangular, as in the first species, but quite naked. Leaves radical, few, leataceous, channelled. Mic-

chaux, Pursh. We have Newfoundland specimens from Mr. Frazer, which answer to these characters. If so, the spike consists of scarcely more than three or four flowers, and the bristles of the seed are about the length of the flowering tawny scales.

**TRICHOPUS**, from πυδος, a hair, and σκις, a foot-expulsive of the long taper flat of the capsule.—*Garten. v. 1. 44. t. 14.—Clas and order unknown.

Eff. Ch. Capsule inferior, membranous, with three wings, and three cells, not burbling. Seeds two in each cell, triangular, deeply notched.

1. T. zeylanicus. Bentula of the Cingalese, described by Garttner from the collection at Leyden. Capsule ovate, very thin, without valves, each angle extended into a wavy membranous border; each side marked with a longitudinal furrow; partitions from the centre of each valve, very thin; the base running down into a triangular flalk, gradually tapering to a fine capillary extremity. Seeds rufily-coloured, tawny, variously and deeply notched or lobed. Skin simple. Albumen conformable to the seed, with a longitudinal furrow, hard, cartilaginous, pale. Embryo very minute, in the lowest part of the albumen, monocotyledonous.

Garttner observes some affinity between this plant and the *Commelina* tribe, but the inferior capsule appeared to him to denote a very distinct genus, of which he could discover no traces in any author.

We do not perceive why the great length of the flalk was admitted by Garttner into the generic character, as the capsule being inferior, renders it a mere flower-falk. No following botanist has thrown any light on this genus.

**TRICHOPUS**, in *Ichthyology*, a new genus of fishes, described by Cepede from the MSS. and drawings of Commeron; the characters of which are, that the body is compressed, and that the ventral fins have an extremely long filament. Cepede has unnecessarily divided these fishes into two distinct genera, calling one “Ofphronemus,” and the other “Trichopus.” These fishes are natives of the Indian seas and rivers, and are distinguished, one species excepted, by the remarkable length of one ray of the ventral fins, which extends the whole length of the body, or even beyond it.

Species.

**GORAMY**; Rufescue Trichopus. With a silvery cast on the sides, and the second ray of the ventral fins extremely long; *Ofphronemus Goramy* of Cepede. Native of the fresh waters of China, where it is greatly esteemed as an article of food, and known by the name of “Goramy.” It is a prolific species, and easily introduced into new situations, having been imported into Java, and many other of the eastern islands.

**ARABICUS**; Greenish Trichopus. With violet and blue stripes, and second ray of the ventral fins extremely long; *Ofphronemus Goramy* of Cepede. Native of the fresh waters of China, where it is greatly esteemed as an article of food, and known by the name of “Goramy.” It is a prolific species, and easily introduced into new situations, having been imported into Java, and many other of the eastern islands.

**SATYRUS**; With sinking forehead, projecting chin, and extremely long, single-rayed ventral fins; *Trichopode Monotier of Cepede*. This fish is known in some countries by the name of “Goramy,” or “Goramy.”

**PALLAS**; Brown Trichopus. With pale undulations; a black spot on each side of the body and tail; and long single-rayed ventral fins. Described by Dr. Pallas as a species of Labrus, and by Kolreuter, in the Peterburg Transact. as a Sparus. See *Labrus Trichopus*.

**MONODACTYLUS**; Silvery Trichopus. With brownish back; and short, single-rayed, rigid ventral fins; *Monodactylus.*
dusty falciforme of Cepede, and described by him under the genus Monodactylus. Shaw’s Zoology, vol. iv. pt. 2.

Gen. Ch. Male. Cal. Perianth of one leaf, club-shaped, very long, smooth, with five small reflexed teeth at the mouth. Cor. of one petal, united with the calyx, flat, spreading, deeply divided into five ovate-lanceolate segments, fringed with very long, branched, capillary, spreading subdivisions. Stam. Filaments three, very short, crowning the rim of the calyx; anthers five, combined into a cylindrical upright body, marked all over with a line curved up and down in all directions, bearing the pollen.

Female, on the same plant, Cal. Perianth as in the male, superfi hirsute, Cor. as in the female, inferior, oblong, slender; fyle thread-shaped, the length of the calyx; stigmas three, oblong, awl-shaped, spiculating. Peric. Berry oblong, coated, of three widely separated cells. Seeds numerous, compressed, obtuse, tumi catted.

Female, Calyx with five teeth. Corolla in five deep segments, with a branched fringe. Style three-crested. Berry oblong.

1. T. anguina. Snake Hair-blossom, or Snake Gourd. Linn. Sp. Pl. 1432. Wildl. n. 1. Ait. n. 1. Curt. Mag. t. 722. (Anguina finenis, flore albo elegantissimo, &c.; Mich. Gen. 12. t. 9. Mill. 1c. t. 32. Curcubita finenis, fructu longo anguino, &c.; Tilla. P. 49. t. 22.)—Fruit cylindrical, elongated, incurved. Leaves heart-shaped, lobed, wavy, with little pointed teeth. Native of China and Cochinchina, according to Micheli and Louriezo. A tender annual in our flowers, whose seeds are often imported from the East Indies. The herbage is grazing, luxuriant, and much branched, like the rest of its tribe, with tendrilis, and broadish melon-like leaves, whose under surface is finely downy. Flowers in loose long-stalked clusters, conspicuous for their snowy white, and capillary or cobweb-like border, by which, in the warm littis of a flower, they seem suspended in the air, though the leaf breath might destroy them. The fruit, three or four feet long, and an inch or two in diameter, of a dark shining green, often marked with white, more or less coiled or undulated, his on the ground, partly shaded by the leaves, and has the appearance, at first sight, of a large snake. Hence Micheli took his generic name, which is most commodiously, as a specific one, made into an adjective.

2. T. ficora. Rough Hair-blossom. Louriezo. Cochinch. 589. Wildl. n. 2. (T. angustata; Lamarck Dict. v. 1. 190; Wildl.)—Fruit roundish, many-lobed. Leaves roundish-heart-shaped, rough, very rugged. Stalks fingleflowered.—Native of woods in Cochinchina, where it is called Dau nho tii. Stem thorny, many-furrowed, climbing by means of cloven tendrilis. Leaves alternate, reticulate. Flowers solitary, on simple axillary stalks, white, with a short fringe. Fruit small, red, roundish, with twelve lobes, and five cells. Seeds numerous, flat, oblong. This description of Louriezo does not, as to the fruit, answer well to the character of the genus; but that part is known to be the leaf uniform or conflant of any, in this tribe, even in the same species.

3. T. faiidiflora. Fetid Hair-blossom. Jacq. Coll. v. 2. 341. Tc. Rar. t. 624.—Fruit ovate, pointed, furrowed. Leaves oblong-heart-shaped, vilifid, nearly entire. Corolla fringed with simple teeth. Native of the coast of Guinea. Jacquins says it proved a greenhouse plant with him, flowering in summer in the open air. The root is perennial, tap-shaped. Whole plant vilifid and fetid like putrid flesh, or the Stapelia hirfuta, which odour adheres to the hands of any person who touches it. Stems one or more, annual, herbaceous, branched, leafy, rising by tendrils to the height of eight feet. Leaves drooping, hairy, stalked, from one and a half to three inches long; pales beneath. Flowers small, yellow; their border befit with brightly teeth. Fruit tawny, measuring with its beak about an inch and a half. Nothing can lefs anotifer to the idea of the original species than the present, nor ought they to rank in the same genus.

4. T. nervifolia. Rib-leaved Hair-blossom. Linn. Sp. Pl. 1432. Wildl. n. 4. (Tota-piri; Rheede Hort. Malab. v. 8. 337. t. 17. Raii. Hort. v. 3. 337.)—Fruit ovate, acute. Leaves oblong-heart-shaped, three-ribbed, toothed.—Found about Craganore, on the coast of Malabar, flowering in the rainy seafon. Stems slender. Leaves paler beneath. Flowers white, with a long entangled fringe. Fruit like a cucumber. A freezing medicine is made of the leaves, with garlic, supposed useful in the epilepsy. The juice of these leaves, mixed with some kind of oil, is used to anoint the temples of maniacs; to whom also a fummigation, made by a woolen thread dipped into the juice of the leaves and bruised fruit, and then burnt, is thought in India to be beneficial.

6. T. cucumina. Cucumber Hair-blossom. Linn. Sp. Pl. 1432. Wildl. n. 6. Ait. n. 2. (Padaevalam; Rheede Hort. Malab. v. 8. 30. t. 15. Raii. Hort. v. 3. 337.)—Fruit ovate, acute. Leaves roundish-heart-shaped, deeply lobed, angular, wavy. Native of sandy ground among trees, on the Malabar coast, flowering in June and July. Every part is fetic. Root widely spreading, fibrous, annual. Stems herbaceous, angular, hairy, not very harsh. Leaves soft and downy, divided down to the stalk. Flowers white, small, with a long entangled fringe. Fruit yellowish; the seeds lodged in red pulp. Prepared with sugar, this fruit is thought to help digestion, and cure pains of the stomatch and bowels, killing worms, promoting expectoration, &c. The juice of the root is purgative and emetic, useful in intermittent fevers.

7. T. amara. Bitter Hair-blossom. Linn. Sp. Pl. 1432. Wildl. n. 7. (Colocynthis florae albo simbriato, fructu oblongo; Plum. Amer. 86. t. 100. Raii. Hort. v. 3. 332.)—Fruit oblong-ovate, obtuse. Leaves heart-shaped, frutinate, rough; dotted beneath.—Gathered by Plumier, in the woods of Filipina, flowering in December, and bearing ripe fruit in April. The leaves are remarkably small, hardly an inch and a half in breadth or length, roughish, with
with minute points. Flowers white, as large as in T. angina, but with a simple, much shorter fringe. Fruit four or five inches long, and an inch and a half in diameter, contracted at the base; its rind thin, smooth, greenish, variegated; the pulp white and very bitter, with brown seeds.

10. T. pilosa. Villous Hair-bloom. Willd. n. 10. Ait. 8. (T. cominitula; Lamarck Dict. v. 1. 191.) Anguria frutica parvo, florum segmentis ramosis; Plum. Is. 14, t. 24.—Fruit elliptic-oblong. Leaves in three deep lobes; the lateral ones cloven; all entire.—Native of the West Indies. M. Thouin sent it in 1810 to Kew, where it blossoms in the Rove about June and July. The root is a huge, globular, perennial, tuberculated, fleshly mass, near a foot in diameter. Stems annual, climbing by simple tendrils. Segments of the leaves lanceolate, divaricated, two or three inches long. Flowers somewhat umbellate. Corolla with a longish rather fparing fringe at the end of each segment, if we may rely on Burman's copy of Plumier's figure. Willdenow has taken rather an unwarrantable liberty in changing Lamarck's printed names, of this and our fifth species; though in the present instance certainly for the better, the resemblance of horns, in the flower, being probably a deception.

11. T. latifolia. Jagged Hair-bloom. Willd. n. 11.—Fruit ovate, acute. Leaves heart-shaped, palmate, with five or seven lobes, toothed, smooth.—Native of the East Indies. Sent by Klein to Willdenow, who describes it with a smooth, flender, angular, climbing stem. Leaves two or three inches long, remotely toothed. Male flowers about fix together, in axillary corymbose clusters; with ovate toothed petals; femarae ones solitary, on axillary fläks; their petals fringed.

TRICHOSTEMA, fô called by Gronovius, from $\zeta_5\zeta \gamma_5\omega_5$, hair, and $\zeta_5\mu_5\sigma_5$, the flamen of a flower, alluding to the peculiarly long capillary filaments of the original species.—Linn. Gen. 300. Scheib. 397. Willd. Sp. Pl. v. 3. 170. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 3. 425. Pursh 414. Juff. 116. Lamarck Illutr. t. 515.—Clas and order, Didynamia Gymnophylma. Nat. Ord. Verticillae, Linn. Labiate, Juff.

Gen. Ch. Cal. Perianth inferior, of one leaf, twoflapped; the upper lip twice the largest, in three equal acute segments; lower in two deep acute segments. Cor. of one petal, ringent; tube very short; upper lip composite, fribate; lower in three deep segments, the middle one obovate, very small. Stam. Filaments four, capillary, remarkably long, incurved, two rather shorter than the rest; anthers simple. Pijl. Germin four-cleft; style capillary, the length and shape of the filaments; stigma cloven. Peric. none, except the enlarged, inflated, closed calyx, so reflexed that its upper lip becomes the lower. Seeds four, roundish.

Oft. It is necessary to note, that the above characters, as far as respects the flamen, agree with the specific definition of one of the two Linnaean species only. Linnaeus has left a manuscript remark, that "Adanson refers this genus to TRICHEUM;" see that article. He certainly does so, in his Familles des Plantes, v. 2. 188, like Dillenius; but in contradistinction to his own just character of the latter, comprising in the way of an upper lip.

1. T. dichotomum. Marjarom-leaved Annual Trichostema. Linn. Sp. Pl. 834. Willd. n. 1. Ait. n. 1. Pursh n. 1. (Trichostemma; Linn. Hort. Cliff. 493. T. flaminus longiflora exsertis; Gron. Virus. ed. 2. 90.)—Stamens very long, prominent. Leaves rhomboid-lanceolate. Flowering branches twice forked.—In fields and on funny hills, from Pennsylvania to Carolina. Annual, flowering in July and August. Flowers large, fine blue. The whole plant has an agreeable refractive scent. Pursh. Root fibrous. Stem a pan high, flat, round, or ovate, with opposite crossing branches. Leaves opposite, lanceolate, obtuse, entire, rough, the lower ones accompanied by axillary tufts of small leaves, or rudiments of branches. Flowering branches from the bases of the upper leaves, taller than the stem, crossing each other, and bearing a leaf similar to those just decribed. Each branch ends in a panicked form, with forked divisions, the proper flower-fläks single-flowered. Stamens fetaconis, very long; Calys reflexed after flowering. Linn. Hort. Cliff.

Pursh adopts from Walter, Fl. Carol. 164, a variety with linear leaves, called by that writer T. linear.

2. T. brachiatum. Self-leaved Trichostema. Linn. Sp. Pl. 834. Willd. n. 2. Ait. n. 2. Pursh n. 2. (Teucrium virginicum, origani folio; Dill. Elth. 389. t. 285.)—Stamens short, within the flower. Leaves ovato-lanceolate. Flowering branches opposite, paneled.—Native of Virginia, according to Dillenius. Mr. Pursh never knew this species in the Bankian herbarium, nor have we examined an authenticated specimen. The habit of the plant seems much like the last, but the leaves are more fellite. Dillenius's representation of the parts of the flower, though, doubtless, accurate, but ill agrees with the Linnaean generic description, nor are those parts far unlike those of a Teucrium. The flamen are strongly incurved, or involute, and therefore do not project out of the flower. We suspect this may not be a distinct species from the foregoing. Both require elucidation from American botanists.

3. T. spirale. Spiral Trichostema. Loureir. Cochinch. 371. (Cây râu meo of the Cochinchinse.)—"Stamens very long and spiral. Leaves ovate, acute."—Native of Cochinchina. Stem herbaceous, crect, square, four feet high, with opposite crossing branches. Leaves opposite, entire, downy. Flowers pale violet, in long terminal spikes. Corolla ringent, its upper lip fribate. Stamens very long, rolled up spirally, and retained within the corolla. Loureiro. This last character answers exactly to Dillenius's plate of T. brachiatum, to which Loureiro thought his plant nearly akin. Not having, probably, access to that plate, he did not discover how well it agreed, even where he thought the difference greatest.

TRICHOSTOMUM, from $\zeta_5\zeta_5\gamma_5\omega_5\zeta$, a hair, and $\zeta_5\mu_5\alpha_5$, the mouth, because the fringe of this mof is remarkable.

Eff. Ch. Capsule oblong. Fringe of thirty-two capillary straight teeth, approximately or united in pairs.

*Trichostomum* of Hedwig has, or ought to have, all the teeth of its fringe minutely connected together, at the very base, in pairs. The genera which the writer of this article first prefumed to reduce to the present, as above indicated, have distinct teeth, though those teeth nevertheless approach each other in a similiar manner. These genera differ among themselves in having separated or united flowers. None can be more naturally akin than they all are, and they have been distinguished by obscure and difficult, as well as unnatural marks. Of this so good a judge as Mr. Turner could not but be aware, and we are happy in having his concurrence. What is said under the article Dicranum of the general habit of that genus, is in a great measure applicable to this; except a remarkable difference in the aspect and texture of their fringes. This part in *Trichostomum*, instead of being broad, stout, tranversely furrowed, red, with pale points, is long, slender, and of even thickness and colour. The small and unbranched species of the two genera most resemble each other. The great branched hoary *Trichostoma*, com-prehended under *Bryum hypnoides* of Linnaeus, Hudson, &c. are least allied to *Dicranum*. We are not aware of any apphysiae, or glandular base, to the capsule, in the genus before us.

The species are commodiously disposed in two sections, distinguished by the separation or combination of their teeth. Eighteen are natives of Britain, which is about the number that Hedwig reckons up all together. We shall defererie the most remarkable.

Sec. 1. Teeth of the fringe all disting. at the base. Five British species.

_T. trifarium._ Three-ranked Fringe-mofs. Fl. Brit. n. 1. Engl. Bot. t. 1707. (Cynodontium trifarium; Hedw. Sp. Muc. 57. Swartzia trifaria; Hedw. Crypt. v. 2. 76. t. 28. Bryum trifarium; Dickf. Crypt. fac. 3. 8.)—Leaves lanceolate or awl-shaped, in three rows, keeled, entire. Capsule oval. Stem branched.—Native of barren billy ground. Dr. Abbot discovered it at Clapham springs, near Bedford. None but a differing botanist would distinguish this little moss from many others, far more common. The tufts are perennial, scarcely half an inch high, of a dull rufy green. Leaves with a strong, often reddish, mid-rib, but no brilily point; the lower ones broadest. Flowers terminal, each consisting of a few united flowers, and still fewer brown pills, of which latter one only comes to perfection. Fruit-flake hardly an inch high, rather wary, bulbus at the base, its lower half red. Capsule erect, fimm, of a thinning brown. Lid conical, slightly curved, scarcely so long as the capsule. Fringe paler in our specimens than in Hedwig's plate, but drawn rather too long in Engl. Bot.

_T. capillaceum._ Capillary Fringe-mofs. Fl. Brit. n. 2. Engl. Bot. t. 1152. (Swartzia capillacea; Hedw. Crypt. v. 2. 72. t. 26. Bryum capillaceum; Dickf. Crypt. fac. 1. 4. t. 1. f. 6. Fl. Dan. t. 1000. f. 1. B. alpinum; Linn. Hudf. 485, excluding the synonym of Dillenius. B. n. 1806; Hall. Hist. v. 3. 44. t. 45. f. 1.)—Leaves capillary, in two rows; beathing and dilated at the base. Capsule elliptic-cylindrical. Lid conical. Stems very densely tufted. Not uncommon in bogs on the mountains of Scotland, Wales, and the north of England, as well as Switzerland and Sweden, bearing capsules in April or May. Though figured by Haller, this moss was little understood by British botanists, when the writer of the present article gathered it on the Pentland hills, near Edinburgh, in May 1782, and communicated it to Mr. Dickson, to whom it was new. The flms are several inches high, very slender, rustly, crowded into dense and wide perennial tufts, foaked in water, and conspicuous for the delicate bright green of the fine capillary leaves which clothe their summer shoots. The numerous fruit-flakes, an inch and half or two inches long, red and shining, at length zigzag, are of an equally slender and delicate habit. Capsule erect, small, nearly cylindrical, thin, smooth, pale shining brown, darker or tawny at the edge, as is the small conical lid. Veil very slender. Fringe brownish, deciduous.

_T. papillosum._ Papillary Fringe-mofs. Fl. Brit. n. 5. Engl. Bot. t. 2333. (Bryum papillosum; Dickf. Crypt. fac. 4. 12. t. 11. f. 5.)—Leaves awl-shaped, keeled. Capsule elliptical, nearly erect, gibbous on the lower side at the base. Lid conical. Stem branched.—Found by Mr. Dickson alone, on turfy bogs, in the Highlands of Scotland. The flms are branched and level-topped about half an inch high. Leaves dark-green, slender, imbricated every way, entire. Fruit-flakes an inch or inch and half high, terminal, erect, red, with a cylindrical sheath at the base. Capsule red-brown, smooth, with a prominence, as a short spur, at the base, which renders this species very remarkable and distinct, but does not seem to be of the nature of an apphysia. The lid is conical, short. Teeth of the fringe certainly thirty-two.

Sec. 2. Teeth of the fringe connected in pairs at the base. Thirteen British species.

_T. lanuginosum._ Toothed Hoary Fringe-mofs. Hedw. Sp. Muc. 109. Crypt. v. 3. 3. t. 2. Fl. Brit. n. 8. Engl. Bot. t. 1348. (T. ferratum; Ehrh. Crypt. n. 94. Bryum hypnoides a; Linn. Sp. Pl. 1584. Fl. Dan. t. 476. B. hypnoides polycphalum, lanuginosum, montana; Dill. Muc. 372. t. 47. f. 32.)—Leaves lanceolate, with a pellucid toothed point. Capsule ovate. Stem procumbent, branched in a pinnate manner. This, a genuine specimen of the habit of a *Trichostomum*, is a very common moss in dry mountainous woods, and on caespitose rocks, stones, walls or heathen bearing capsules, though rarely, in autumn. The copiously branched, arching, clastic, leafy flms compose large light soft tufts, on which many a tried hunter or botanist has reposed. The leaves are of a dull yellowish-green, rendered hoary, when dry, by their flat white inflexed points, which are curiously bordered with short, broad, abrupt teeth, in a manner unlike every other species, and not ill resembling the cogs of a wheel. Fruit-flakes from the small branches, lateral, solitary, half an inch long, tawny, twilled when dry. Capsule erect, brown, smooth, thick and short, with an awl-shaped lid, and a pale reddish fringe. The well is conical, brown-pointed, splitting up in many different parts, not all at one side.

nelled, with a pellucid finely ferrated point. Capfule ovate. Stem erect, with very short branches.—One of the most landfome, as well as most rare, of its genus. Dr. Richar-
dfon originally sent it to Dillenius from the highest part of Snowdon. Two of our best British cryptogamists, Meffrs. Borrer and Hooker, found it in fructification, in 1808, on the fandy shores of the Tay near Dunkeld. The fronds are perennial, two or three inches high, eret, in loose tufts, leafy, fecondifdivided, and furnifhed moreover with abundance of short spreading branches, which give the plant that re-
semble to Erica vulgaris, expreffed in the name. Leaves deep green, or tawny; spreading and recurved, revolute, entire, keeled with a deep channel refembling a mid-rib, and tipped with a fine ferrated hair-like point, moft visible when dry. Fruit-flalks terminating the last year’s floots, about an inch and a half long, red, finally dark purple, twifled. Capfule eret, smooth, brown. Lid red, awl-
shaped, ftraight, nearly of the fame length. Fringe purple, almofl as long, ftraight and flider. Veil fringed with jagged teeth, not fplitting.

T. canuncbus. Common Hoary Fringe-mofs. Hedw. Sp. Mufc. 111. Crypt. v. 3. t. 3. Fl. Brit. n. 10. Engl. Bot. t. 2534. (Bryum hypnoidea s. Huds. 480. B. hypnoidea hirfutie canecibus, vulgaris; Dill. Mufc. 368. t. 47. f. 271) — Leaves ovato-lanceolate, with a central channel, but no nerve, and a pellucid rough point. Capfule ovate. Stem eret, with upright branches.—Very common every where, on open, dry, fandy heaths, or moors, both in mountainous and maritime situations, bearing capfules about February or March, but not frequently. The branches are more level-
topped and afcending than in the falt-described, and the leaves of a yellower green, becoming very hoary when dry, in confequence of their white points, rough in every direction. The want of a mid-rib in this species, though there is a furrup appearing like one, has been pointed out as a means of diftinguifhing it from the reft, efpecially from T. ericoides. But the fame character is found, as we have already defcribed, in that species; while fome of Dillenius’s precifions of the prefeft, very carefully examined, prove to have an actual rib. There are poffibly accidental fragments of another species. The prefeft certainly has no mid-rib, and has its capfule, fringe, and lid accord exactly with ericoides. The latter may be, as Hedwig thought, but a variety of this more common and lefs elegant kind. Whether there be any permanent difference in the rough-
nefs of the points of their leaves, which affords a clear dif-
tinction in T. languiufum, can only be determined by a more minute examination than our materials will admit.

habitant of dry rocky mountains in the North, bearing plenty of capfules in the fpring, whose empty blackened remains continue long. This species approaches feveral mountain kinds of Dicranum in habit, but is a genuine Trichophorum. The hoarifiefs of the old plants arifes partly from a whitifh hue afumed by the leaves in decay, and partly from their fecondarily pellucid edges; but not from any pellucid or hair-like point, the want of which renders T. fajiculare very diftinct from the three foregoing. Its fringe too is much shorter, and the leaves have a mid-rib.

T. glaucus. Glaucescent Fringe-mofs. Hedw. Crypt. v. 3. t. 123. t. 37. B. Fl. Brit. n. 14. Engl. Bot. t. 2381. (Bryum glaucus; Dickf. Crypt. fac. 4. 10.) — Leaves linear-lanceolate, acute, rather glaucous. Capfule ovate, slightly furrowed. Stem eret, somewhat branched.—Native of Sweden and Scotland, in which laft country Mr. Dickfon discovered this pretty and uncommon fpecies, growing in fhyer rather mountainous situations. We have not heard of it from any other perfon. The flesms compose perennial leafy tufts, scarcely half an inch high. Leaves eret, point-kefis, rather incurved when dry, of a light-green, flightly glaucous, entire, keeled, with a mid-rib; the upper ones molt elongated and tapering. Capfules peculiarly light-coloured and furring, with a purple fringe, and a con-
nical oblique lid, reddifh at the bafe, half the length of the capfule. The internal cavity of the latter does not reach to the bottom, which, as the thin outer coat of the capfule dries, caufes a contraction there, like an aphyfis, but of a very different nature. The fame appearance is obfervable in fome fpecies of Bryum with club-shaped fruit.

T. lineare. Linear-leaved Fringe-mofs. Fl. Brit. n. 17. Engl. Bot. t. 1598. (Bryum lineare; Dickf. Crypt. fac. 3. 6. t. 8. f. 2.) — Leaves linear-lanceolate, imbricated, acute. Capfule elliptical. Lid conical, oblique. Stem eret.—Native of Scotland, Wales, and Northumberland, in wet places, on a calcareous or fandy foil, bearing capfules in the fpring. Stems tufted, branched, perennai, an inch or more in height, clothed with dark-green leaves, which vary from an almoft linear to an ovate form, and turn either yel-
lofli or blackifh, from conftant immersion in water, or from its dripping upon them. Fruit-flalks red, an inch long. Very fmall. The apfeft of this mofs, efpecially when growing in a wet fhye place, is much like Dicranum pellucidum, and it has caufed fome miftakes by that means. Still more perhaps does it refeemble a Tortula, (fee that article,) but the short ftraight delicate fringe truly indicates a Trichophorum. The teeth, ftanding in pairs, are connected by one common bafe, according to Mr. Sowerby.

nanus.)

6. Fontanilis alpina; Dickf. Crypt. fac. 2. 2. t. 4. f. 1. (Hypnum nigricans; Villars Dauph. v. 3. 905. B.) — Leaves lanceolate. Capfules ovate, nearly fettle at the ends of the lateral floots. Stem feeding, very much branched. Native of rivers, in various parts of England, as the Thames at Lambeth, the Isis at Oxford, and the Oufe at Oakley, Bedfordshire. The mountain variety 6 inhabits the fliny beds of the more rapid freams of Scotland, Wales, and the north of England. Both are firmly attached to walls or ftones under water, their numerous tufted, branched leafy floms, four or five inches long, floating with the fream. The leaves are of a very dark dull olive-green, narrower and almost black in the variety 6, loosely imbri-
cated, lanceolate, entire, acute, keeled, with a frong rib; all undulated and twisted when dry. Capfules terminating the lateral branches, folitary, eret, ovate, brown, fmooth. Lid half as long, conical, rather curved. Fringe long, tawny or red, its teeth variously connected and pierced at the bafe, flightly convoluted when dry, foon falling off. The habit of this mofs is fo little like the reft of its genus, that we cannot but with the character of its fringe were more decidedly fufficient to eflablish a new one. The specific name moreover, though expressive, is barbarofly con-
struced.

Some species referred to *Trichofothum* by Hedwig, on account of the approximation of their teeth, we consider as *Grimmia*, because they have only fifteen teeth, not thirty-two. An instance occurs in *G. homomalla*, Fl. Brit. 1194. Eng. Bot. t. 1900, fo like *barnesomallia*, which immediately precedes it in these works, that they can hardly be distinguished but by the above minute character. We acknowledge indeed that the dwarf species of *Trichofothum*, in general, have almost entirely the habit of *Grimmia*. But the difference between the numbers fifteen and thirty-two, in their teeth, appears, by the analogy of other genera, a most certain and natural generic distinction. See *Grimmia*.

**TRICHIURU**, in *Natural History*, a term used by some authors to express such flies as have one or more hairs growing out at their tails: these are called *alfo feticuda*.

**TRICHIRUS**, the name of a stone described by the ancients, and said to yield three colours: in their common way of preparing bodies of this kind for medicinal use (which was by rubbing them down on a porphry or other hard stone with water), this first coloured the water black, then red, and lastly white. It seems to have been a kind of hematites, or blood-stone.

**TRICKANDORE**, in Geography, a town of Hindoostan, in the province of Tinewelly; 30 miles E.S.E. of Palamcottta.

**TRICKUT**, one of the Nicobar islands. N. lat. 8° 3'.

**TRICLARIA**, in Mythology, an epithet given to Diana, in Achaia; and Paufanias tells us (In Corint.) that Menalippos and Cometho gratified their luft in the temple of Diana Tricaria. This profanation, as it is said, was followed with a general barrenness, insomuch that the earth produced no fruit, and with an epidemic diemter, which swept away numbers of people. The Achaeans, having consulted the oracle of Apollo, were anwered by the priestesses, that the impiety of Menalippos and Cometho was the cause of all their calamities, and that the only way to appease the goddes was to sacrifice to her every year a boy and a young virgin.

**TRICLINÍUM**, in Antiquity, the name given by the Romans to the room in which they eat; and also to the beds upon which they reclined at meat, so called, because it was contrived to accommodate three persons.

**TRICOCCÆ**, in Botany, one of the natural orders among the *Fragmenta* of Linnaeus, where it ranks as the thirty-eighth, between the *Columniferae* and *Siliquose*, (see those articles,) though without having scarcely any affinity of characters or qualities with either. The name is derived from *trikoç* three, and *xoxoc*, a grain, or feed, and alludes to the form of the seed-veil, apparently composed of three combined lobes, each of which comprehends a single-seeded cell. (See *Dicoccus*.) We are not however to understand that every such seed-veil belongs to this order. *Thex* is one exception among several; while, on the other hand, some genera which do belong to it may have only two lobes to their fruit; witness *Mercarialis*; while *Plunkettia* has four, and *Hora* a much greater number. The valvæ are generally powerfully clasping, serving by that means to fasten the seeds widely, as soon as they are fully ripe.

The plants composing this natural order have alternate, molly simple, leaves, often furnished with glands. Their secrcted fluids are milky, and extremely acrid, their milk being a natural emulsion, of a most virulent reifin, or gum-refin, mixed with a watery liquid. The *calyx* and *corolla* have, as Linnaeus observes, always something unusual in their conformation, especially about the *necary*. The *style* is generally peculiar, being three-cleft, sometimes very deeply, and each branch again divided. Many of the genera have separated, either monocious or dioecious, *flowers*. The *fems* are either shrubby, sometimes very feby; or herbaeous, with annual or perennial roots.

*Euphorbia* is selected by Linnaeus to exemplify the order of *Tricoccæ*. No genus can be more natural or distinct, however different the habit, or herbage, of some of the numerous species from each other. According to the generally received idea of this genus, its *flowers* are simple or united, each having a *calyx* of one concave or inflated leaf, whose four or five marginal teeth bear as many abrupt, coloured, nectariferous glands. These latter, in some inances, as *E. corollata*, assume perfectly the appearance of petals. Yet Linnaeus was always much puzzled and surprized at the petals thus originating from the teeth of the calyx, of which he could scarcely find another example. Other peculiarities in this remarkable genus could not escape so accurately an observer, as the long stalk which elevates the germs out of the flower, and turns it to one side; and the progressive nature of the flower, as well as their anthers, which come forth in succession. The herbage too is remarkably various, arborescent and succulent, or herbaceous; spinous or unarmed; the leaves opposite, or alternate, or deficient. Two species having an irregular calyx, gibbous underneath, were separated into a distinct genus by Dillearius, under the faulty name of *Thymoloides*, but they are too naturally akin to the rest to justify such a measure.

Although the above is the generally received idea of *Euphorbia*, Jussieu, Gen. Pl. 386, has hinted that the flower is perhaps a compound one, consisting of a central female floret, with many monocious male ones, distinguished by chaffy scales, all in one common involucrium. Mr. Brown, in his very inductive Remarks on the Botany of Terra Australis, published at the end of captain Flinders’s Voyage, has confirmed this opinion, by an additional observation. He conceives what all authors have taken for a joint in each filament, to be in fact the separation of the filament from its footstalk; or in other words the base, or receptacle, of the flower, or floret, which is entirely distinct of a proper perianth and corolla; the female floret likewise having its foot-stalk, on whose dilated, sometimes obseously lobed, fuminit, the sefolle germens is placed. In support of this doctrine, it is suggested that the real filament is, as in other plants, produced subsequent to the formation of its anther, and of the flalk below the joint; their surfaces moreover, in some species, being different in nature. But the most conclusive certainty is given to Mr. Brown’s theory, by the discovery of a new genus, hitherto unpublished, having an involucrum nearly limalar to *Euphorbitis*, including several *fassiculii* of monocious male flowers, around a solitaire female: in this there is an obvious perianth, regularly divided into lobes, at the joint of each sepopped filament, as well as at that by which the germens is connected with its flalk.

The above idea of *Euphorbitis*, as a monocious genus, brings it nearer to the rest of this natural order, which have almost universally separated, either monocious or dioecious, flowers. At least such is the case with the genera properly belonging to it, and which constitute Jussieu’s order of *Euphorbitis*, or *Euphorbiaceae*.

**TRICOLLORI**, in Ancient Geography, a people of Gallia Narbonensis, whose whole capital was Alaracita; who occupied the territory of Siders.

**TRICOLONI**, or *Tricholos*, a town of Arcadia, N. E.
TRI

N. E. of Megalopolis. Here was a temple of Neptune, near it a sacred wood, and at a small distance a temple of Diana, venered by the Allobroges. Hannibal, having passed the Rhone, took his route on the left, through the country of the Tricaitini, and touching on the territory of the Vocontii, entered into that of the Tricori.

TRICOMIA, a town of Asia, in Phrygia Major.

TRICOR, a name by some of the chemical writers have called gold.

TRICORD, an ancient musical instrument with three strings. The first lyre of Mercury is supposed by many to have had but three strings. Most of the writers on music among the ancients, have supposed that the three sounds of this primitive lyre, were E, F, G.

Julius Polliux called the \( \text{pandora} \) or \( \text{pandura} \), the instrument with three strings.

The emperor Heliodorus, says Lampadius, furnished his Pharellia, and also by Livy and Polybius, in their account of the march of Hannibal. Livy says that Hannibal, having passed the Rhone, took his route on the left, through the country of the Tricaitini, and touching on the territory of the Vocontii, entered into that of the Tricori.

Ascending along the Rhone, he arrived on the fourth day of his march at the junction of a river with the Rhone, on the confines of the Allobroges, who inhabited the territory between these rivers. This river is called Scoras by Polybius, and Arar (the Saone) by Livy. Some critics, however, are of opinion that this name is erroneous, and that it was Iare.

TRICORNIS, in Anatomy, an epithet applied to the lateral ventricle of the brain. See Brain.

TRICORYNE, in Botany, from \( \text{tris} \) threes, and \( \text{kapos} \) a club, expressive of the three club-shaped feed-veils.

This genus ranges naturally between \( \text{Amorbeus} \) and Mr. Brown's \( \text{Cafea} \). The species are herbaceous, with fibrous, mostly perennial, roots. Leaves grassy, narrow. Branches, if any, accompanied by an interior \( \text{filipa} \) or \( \text{bractea} \).

Flowers umbellate, erect, yellow, their partial flanks having a joint at the summit. Corolla twisted as it fades, and soon falling. Seed-veils resembling coated nuts, one of them sometimes abortive, but rarely more than one.

1. \( \text{T. simplicia} \).—Stem undivided. Leaves flat, roughish at the edges. Umbel solitary, of from ten to sixteen flowers. Partial flanks three as long as the involucrum. Observed by Mr. Brown at Port Jackson, New South Wales.

2. \( \text{T. eliator} \).—Stem round, smooth, leafy; branches smooth, panicled, angular and flirated. Leaves flat. Umbels of from five to seven flowers. Native of the same country.

3. \( \text{T. scabra} \).—Stem round, biped, leafy. Branches panicled, angular and flirated, rough. Leaves flat, minutely toothed. Umbels of from five to seven flowers. Native of the tropical part of New Holland.

4. \( \text{T. tenella} \).—Stem slender, round, forked, smooth, leafy, fanky. Umbels of two or three flowers. Found by Mr. Brown on the south coast of New Holland.

5. \( \text{T. huepe} \).—Stem much branched, leafy, fanky, angular, smooth. Branches four-angled. Umbels of few flowers. Gathered by Sir Joseph Banks, in the tropical part of New Holland, and seen only in his herbarium by Mr. Brown.

TRICOT, in Geography, a town of France, in the department of the Oise; 13 miles N.W. of Compeigne.

TRICRANA, in Ancient Geography, an island situated on the coast and to the S.E. of the peninsula of the Argolid, having to the S. the island Arifera, to the N.W. that of Hydraea, and to the N. the promontory of Acra. Paufanias mentions this island.

TRICRATUS, in Botany, so named by the late Mr. L'Heritier, from \( \text{tris} \) three, and \( \text{kaps} \) power, or diffusion; perhaps in allusion to the three-fold affinity or resemblance of the plant, indicated by Juifieu, who remarks that it has the habit of \( \text{Valeriana} \), the flowers of \( \text{Pullus} \), and nearly the character of \( \text{Mirabilis} \). We still do not perceive any reason for Juifieu's original name, \( \text{Abronia} \), (from \( \text{alpha} \) pretty and \( \text{decalas} \) being superseded by the above. L'Her. Monogr. with a plate. Willd. Sp. Pl. v. 1. 807.

Gen. Ch. Cal. Periandria none. Cor. of one petal, inferior; tube funnel-shaped, inflated at the base, then suddenly constricted; limb shorter than the tube, flat, equal, in five deep, inerely heart-shaped segments. Nectary cup-shaped, of one leaf, enfolding the germen, and united with the inflated base of the tube. Stam. Filaments five, thread-shaped, unequal, shorter than the tube, to which they are united in their lower part, and inflected into the nectary; anthers oblong, within the tube. Pet. Germ. superior, roundish, embraced underneath by the nectary; style one, thread-shaped; stigma undivided. Peric. none. Seed. Nut elliptic-oblong, pointed at each end, five-angled, invetted with the hardened base of the corolla, of one cell.

1. \( \text{T. admirabilis} \). L'Heritier, as above. Willd. n. 1. (Abronia umbellata ; Lamarck Ilistr. 469, t. 105.)—Native of the sea-coast of California, where its seeds were collected by Mr. Colignon, a gardener who was sent out with La Peyrouse. These produced flowering plants in the Paris garden in 1788. The herbage is delicate, with several branches spreading on the ground; whether perennial or annual is not mentioned. Leaves simple, opposite, ovate, entire, on long stalks. Flowers in axillary, long-stalked heads, with an ovate \( \text{bractea} \) under each flower. Tube green. Limb of an elegant rose-colour. This little plant is perhaps the only fruit of La Peyrouse's unfortunate expedition.

TRICRENA, or Tricrina, in Ancient Geography, the name of three fountains, a place in Peloponnese, in Arcadia, E. of Pheneos.

TRICUSPID, in Anatomy, three-pointed, one of the valves of the heart, placed at the right auriculo-ventricular aperture. See Heart.

TRICORNÉ, in Natural History, a genus of bivalve shells.

TRIDAC-
TRI DA CTYLIA, in *Or nithology*, a genus of birds, separated by Dr. Shaw from *Picus*, on account of the number of toes; this having but three, whereas the genuine *Picus* are all furnished with four. Its generic characters are, beak, many-fided, straight, wedge-shaped at the tip; nodulets covered with aspicuous renicate feathers; and feet with only three toes, placed two before and one behind. The species are the following.

**Hirsuta**. Downy, varied with black and white. See *Picus Tristisculus*.

**Urdulata**. Waved, varied with black and white, in white. The southern three-toed woodpecker of Latham. First described by Biffon, and by him paid to inhabit Cayenne.

**TRIDAX**, in *Botany*, from γις, three, and δαμ, to bite, or wound, because of the three deep divisions of its marginal florets. Such is the explanation of De Theis, and it seems consonant with the meaning of *Linneus*; yet the latter in his *Philosophia Botanica* enumerates this word, which he considers as synonymous with ηδας, lettuce, among the old Greek names incapable of explanation. Possibly he had forgotten his original idea, between the writing of his *Hortus Cliffortianus* and the *Philosophia*; especially as he had not once seen the plant. Pliny speaks of *Ofreia triadacna*, a kind of vipers, so called because one of them was large enough for three bites, or mouthfuls.—Linn. Gen. 435. Schreb. 568. Willd. Sp. Pl. v. 2214. Mart. Mill. Dict. v. 4. Juff. 190. Gaertn. v. 2. 451. No figure.—Cliffs and order, Syngehes Polygramma—Samifus. Nat. Ord. Compos. fita opoifotolia, Linn. Corymbiferis, Juff.

Gen. Ch. *Common Calyx* cylindrical, imbricated, with ovate-oblong, sharpish, upright scales. Cor. compound, radiant. Florets of the dikk all perfect, tubular, funnel-shaped, erect, five-toothed; those of the radius female, ligulate, in three deep segments of equal length, the middle one narrowed. Stam. in the perfect florets, Filaments five, capillary, very short; anthers united into a cylindrical tube. *Pijf.* in the perfect florets, German oblong; style bristle-shaped, the length of the stamens; stigma obtuse; in the female ones, German oblong; style thread-shaped, the length of the corolla; stigma obtuse. *Peric.* none. except the permanent calyx. *Seeds*, in both kinds of florets, solitary, oblong. Down simple, rather longer than the calyx. *Recept.* flat, clothed with lanceolate chaffy scales, shorter than the seeds.

1. *T. procerum*. Procumbent Tridax. Linn. Sp. Pl. 1268. Willd. n. 1. Mill. Dict. ed. 8. (Tridax; Linn. Hort. Clif. 418. After americanus procumbens, folius incontinens et hirsutis; Houfouf's MSS.)—Gathered at Vera Cruz by Dr. Houfouf, who sent seeds to Miller. The latter cultivated this plant, in his back-flow at Chelsea, but it flowered sparingly, and seldom perfected seed. He sent a dried specimen to Clifton, which Linneus described, but there is none preferred in the Linnean collection, nor has any figure of the *Tridax* ever appeared. It seems to be herbaceous and perennial, propagating itself by the trailing *flans*, which throw out roots, and are hairy, clothed with opposite, nearly sessile, round, hairy, ovate *leaves*, an inch and half long, acute at each end, sharply ferrated, their lowest and largest ferratures, which are about the middle of the leaf, making a sort of angle at each side. *Flower-flanks* long, naked, siphon, at siph terminal, but afterwards becoming lateral. *Flowers* solitary, erect, pailih copper-coloured, or whitish; *Linneus erroneously supposed the radius to be yellow.*

**TRIDE**, in the *Manager*, signifies short and swift: thus a *tride pace*, is a going of short and quick motions, though united and easy. A *tride career* is a very fast gallop, with the times or motion short and nimble: and so of other motions. Some apply the word only to the motion of the haunches.

**TRIDENT**, *Tridens*, an attribute of Neptune; being a kind of sceptre, which the painters and poets put into the hands of that god. It is in form of a spear, or fork with three prongs, whence the word.

The poets tell us, that Neptune makes the earth open whenever he strikes it with his trident.

Mythologists give several reasons for affixing to Neptune the trident. Some say that it was designed to denote by its three points, the quality of the three lorts of waters that are upon the earth; those of the sea, which are salt; those of the fountains, that are sweet; and those of the ponds, that partake of both these qualities. Others say, that it alludes to Neptune's threefold power over the sea, which he troubles, affluage, and prefers. But without hunting after mysteries, it is sufficient to allow, that the trident was a kind of sceptre used by ancient kings.

**TRIDENT**, among *Mathematicians*, is used for a kind of parabola, by which Descartes constructed equations of six dimensions.

Female, at the base of the fame spike, *Cal. Perianth inferior*, of the structure of the male. Cor. none. *Pijf.* German superior, roundish; *styles* from fifteen to twenty, thread-shaped, longer than the stamens, collected into three bundles; *stigmata* thickish. *Peric.* Capsule roundish, bristly, of three cells and three valves. *Seeds* solitary, angular at the inner side, gibbous externally.

Female, *Calyx of five leaves*. Corolla none. Styles numerous, in three bundles. Capsule of three cells, with solitary seeds.

We cannot precisely reduce these plants to any known genus.
Trie, in Geography, a town of France, in the department of the Upper Pyrenees; 13 miles E.N.E. of Tarbe.

Tribe le Chateau, a town of France, in the department of the Oise; 3 miles W.N.W. of Chaumont.

Triebel, a town of Lower Lusatia, in the circle of Guben; 12 miles W. of Sorau. N. lat. 57° 36'. E. long. 14° 51'.--Alfo, a town of Saxony, in the Vogtland; 3 miles S.S.W. of Oelsnitz.

Triebschebach, a river of Saxony, which runs into the Elbe, near Meißen.

Triedrostyla, derived from 1τρίς, 1θρίς, 1θές, a side, and 1κολόν, a column, in Natural History, the name of a genus of sprints.

The bodies of this genus are sprints, in form of trigonal columns, adhering by one end to some solid body, and terminated at the other by a trigonal pyramid. Of this genus there are four known species. Hill.

Trieil, in Geography, a town of France, in the department of the Seine and Oise; 6 miles N. of St. Germain.

Trielen, a small island in the English Channel, near the coast of France. N. lat. 48° 22'. W. long. 4° 50'.

Triemerus, the three-day fly, in Natural History, a fly somewhat like the butterfly; it has four large yellowish wings, and a long body, with a head furnished with long antenna, large eyes, and a spiral trunk. It is found among the nettles and mallow.

Triemimeris, τριημερίς, semiteraria, a kind of cyathura in Latin verbe, in which, after the fifth foot of the verbe, there remains an odd syllable, which helps to make up the next foot.

As in, Ille latus nivem nulli subitus hyacintho.

Trienach, in Geography, a bay of the county of Donegal, Ireland, on the west coast. N. lat. 54° 53'. W. long. 8° 17'.

Triennial, an epithet applied chiefly to offices or employments which last for three years.

Thus we say, a triennial government; most regular monasteries have triennial superiors; that is, they elect new ones at the end of each three years.

In 1695, an act was made for triennial parliaments, i.e. for parliaments which should be dissolved, and the members elected anew, every three years. Till that time, the king had it in his power to prorogue and continue his parliaments as long as he pleased. This opened a door to corruption, which the triennial bill was intended to prevent.

The triennial act has, from some other views, been since repealed; for the great struggles usual at elections, the great ferment it usually put the nation into, the great expenses upon that occasion, with other considerations, determined the legislature, in 1717, to change triennial parliaments for perpetual ones. See Disolution of Parliament.

Triens, in Antiquity, a copper money, of the value of one-third of an ac, which on one side bore a Janus's head, and on the other a water-rat.

This was the piece of money used to be put in the mouths of the deceased, to pay Charon his fare for their passage into another world.

Triens, or Triental, was also used for a drinking cup; and that which was ordinarily used. It contained four cyath.

Gen. Ch. reformed. Cal. Periathium, inferior, of about seven linear-lanceolate, pointed, spreading, permanent leaves. Cor. of one petal, star-shaped, flat, in seven deep, ovato-lanceolate segments, alternate with the calyx, very slightly connected. Stam. Filaments seven, capillary, inserted into the base of each segment, spreading, the length of the calyx; anthers simple, as before. Gyn. fr. with rigid spreading style, thread-shaped, equal in length to the stamens; stigma capitata. Peric. Capsule ovate, of one cell, and as many ovale, rigid, cartilaginous, thick-edged valves as there are calyx-leaves, and opposite to them, highly polished internally. Seeds several, nearly orbicular, convex externally, angular within, blackish, dotted, each enveloped in a snow-white, finely reticulated, combined, membranous tunic. Recept. central, globose, very large, with a cavity for each seed.

Obf. Linnaeus remarks that feven is the moft usual number in the parts of fructification, though sometimes liable to vary. He adds, that the fruit is a dry berry, not burling with valves like a capsule. So Gaertner likewise represents this fruit; and as botanists have hardly feen it, they have, like ourselves, adopted the opinions and defcriptions of these great writers. Yet nothing is more certain, if we may believe our eyes, than that the fruit of Trientalis from Scotland, lies above fetter, four or five inches high; it is freven-edged, equal in length to the flames; stigma capitata. Peric. Capsule ovate, of one cell, and as many ovale, rigid, cartilaginous, thick-edged valves as there are calyx-leaves, and opposite to them, highly polished internally. Seeds several, nearly orbicular, convex externally, angular within, blackish, dotted, each enveloped in a snow-white, finely reticulated, combined, membranous tunic. Recept. central, globose, very large, with a cavity for each seed.

Obf. Linnaeus remarks that feven is the moft usual number in the parts of fructification, though sometimes liable to vary. He adds, that the fruit is a dry berry, not burling with valves like a capsule. So Gaertner likewise represents this fruit; and as botanists have hardly feen it, they have, like ourselves, adopted the opinions and defcriptions of these great writers. Yet nothing is more certain, if we may believe our eyes, than that the fruit of Trientalis from Scotland, lies above fetter, four or five inches high; it is freven-edged, equal in length to the flames; stigma capitata. Seeds several, nearly orbicular, convex externally, angular within, blackish, dotted, each enveloped in a snow-white, finely reticulated, combined, membranous tunic. Recept. central, globose, very large, with a cavity for each seed. It is high time for us to correct this, too long neglected, error.

1. T. europa. European Chickweed Winter-green. Linn. Sp. Pl. 488. Fl. Lapp. ed. 2. 109. Willd. n. 1. Brit. n. 1. Engl. Bot. t. 15. Fl. Dan. t. 84. (Herba trientalis; Bauh. Hist. v. 3. 556. Pyroa alines flore major; Bauh. Prodr. 100; copied in Morifon, fect. 12. t. 10. f. 6.)—Leaves elliptical.—Native of turfy heaths, or of woods on the fides of hills, in Scotland and the northern countries of Europe, as well as some parts of the north of England, flowering in May and June. The perennial root is slightly tuberous, with many long whitish fibres. Stem simple, rigid, or five inches high; it is almost naked, except at the top, where it is crowned with a tuft of nearly sessile, bright green, smooth, entire leaves, delicately veined, an inch and half or two inches long; tapering at the base; more or less blunt at the extremity. Among them are several axillary, capillary flaks, about the fame length, each bearing a very pretty and delicate white flower, with yellowish, or pale pink, petals and stigma. Linnaeus was particularly fond of this plant, and has celebrated its "faceinating beauty" in his elegant and eloquent Flora Lapponica.

TRIESTE, See TRIESTE.

TRIESTY, mountains in the north-western part of the county of Mayo, Ireland, near the Mullet, and immediately north of Tullaghan bay.

TRIETERIA, in Antiquity, Alps which the Bochoutians and Thracians held every three years in honour of Bacchus, and in remembrance of his expedition into India, which lasted three years.

TRIETERIS, in the Ancient Chronology, a cycle of three years.

Thales, it is said, observing that the lunar revolution never exceeded thirty days, appointed twelve months of thirty days each; so that the year consisted of three hundred and sixty days: and in order to reduce these months to an agreement with the revolution of the sun, he intercalated thirty days at the end of every two years, whence that space of time was called a "period of three," because the intercalation was not made till after the expiration of full two years, though really it was only a period of two years; as we are informed by Conforinus, De Die Natali, cap. 18.

TRIEWALD, Martin, in Biography, an eminent mathematician and engineer, was born at Stockholm in 1691, and being intended for trade, he travelled to England for information and improvement on subjects that concerned his commercial pursuits. Disappointed in prospects of this kind, he changed his object; and was fortunately engaged by the proprietor of some coal-mines near Newcastle to superintend the machinery of his works. This situation corresponded to his genius and inclination; and he was thus led to pay particular attention to mechanics, both in theory and practice. In 1736 he returned, after an absence of ten years, to his native country, where he continued a steam-engine and read lectures in philosophy, illustrated by a course of experiments, similar to those of Defaguiries, which he had attended in London. He thus attracted the notice of the king and of the States, who conferred upon him a pension, with the title of director of machinery. He also proposed some improvements in the manufacture of iron and steel. Thus diligently and actively employed for the benefit of his country, he received a commision as captain of engineers and inspector of fortifications; and he invented various machines connected with those offices, models of which are preserved in the Academy of Sciences at Stockholm and also in the Academy of Lund. Diving was also an object of his attention, and on this subject he wrote a treatise, entitled "On diving under water," Stockholm, 1741, 4to. (See Diving-Bell.) For this invention he received honorary rewards both from his own sovereign and the king of France. In 1729 he was elected a member of the Society of Upfal; and the same honour was conferred upon him by the Royal Society of London and other learned bodies. Triewald died suddenly in 1737. He communicated various papers to the Academy of Sciences at Stockholm, which appear in its Memoirs for the years 1739, 1740, and 1747. Beckman's Hist. of Inventions. Defaguiries' Philos. Gen. Biog.

TRIXAHEDRIA, formed of tet, thrice, xi, fax, and xel, in Natural History, the name of a genus of fishs.

The bodies of this genus are perfect and pellucid crystalliform fishs, having composed of thrice five planes, being composed of an hexagonal column, terminated at each end by an hexagonal pyramid: of this genus there are three known species. Hill.
TRIFALTIGKERT, in Geography, a town of Prussia, in Natangen; 16 miles S.S.E. of Königberg.

TRIFAX, among the Romans, a jujube three cubits long, which was thrown by the catapulta.

TRIFELS, in Geography, a citadel of Javann, in the department of Mont Tonnerre. Here Richard I., king of England, was kept, when he appeared before the diet of Worms; 1 mile S.E. of Anweiler.

TRIFOLIA STRUM, in Botany, Baltard Trefoil, a name given by Micheli, Nov. Gen. Pl. 26. t. 25, to such species of Trifolium as have their legume projecting beyond the calyx, which he, on that account, separates from thence. Neither the character, nor the name, has been adopted by the following writers. See Trifolium.

Gen. Ch. Cal. Perianth inferior, of one leaf, tubular, five-toothed, permanent. Cor. papilionaceæ, with long, more or less, mostly permanent, withering; standard reflexed; wings shorter than the standard; keel of one petal, shorter than the wings. Stam. Filaments two, distinct, one simple, one in nine segments; anthers simple, roundish. Fil. Germenis oblong-ovate; styleawl-shaped, ascending; stigma simple, smooth. Peric. Legume short, of one valve, and one cell, not burting, scarcely exceeding the calyx in length, deciduous. Seeds one to four, roundish.

All botanists have perceived the difficulty of defining the technical characters of this genus, and yet none can be, in itself, more natural. Linnaeus reckoned it the most difficult in the whole vegetable kingdom to discriminate by any efferential mark. He comprehends under Trifolium, as may be seen above, various other genera of good systematic writers, differing among themselves as follows. Melilotus of Tournefort and Jussieu, has a legume longer than the calyx, with loosely spiked flowers; Triphylloides of Michell, a legume longer than the calyx, with capitae flowers; Lupinus of Buxbaum, a legume with several feeds, and five leaflets in each legume of Rivinus, a permanent corolla, whose standard is infixed and flatish, ribbed or plaited; Lagopus of the fame author, a flatish calyx, equal in length to the corolla; and finally Triphyllides of Pontedera, has a monopetalous corolla, the standard wings and keel being all united into one tube; which is likewise the case with a great many more species than this author, or Linnaeus, has indicated.

Linnaeus admitted the inflorescence as a part of his natural, and even his essential, character of this genus, defining it as "a little umbel or head." He was always very unwilling to adopt this measure, and we presume to think he has, if no cafe, referred it to with advantage. In the present it is neither correct nor discriminative, scarcely any species being really umbellate, and though many are capitate, as many are spiked, while several are racemose. We have therefore followed the example of Jussieu, who in this influence willy lays aside the inflorescence; attempting a more full and explicit character from the parts of fructification themselves.

In natural affinity the present genus comes nearest to Tri- conella, which will presently follow in alphabetical order. Some of the Meliloti especially, closely accord therewith, both in characters, habit, and qualitative parts only in an upper and cutaneous, allied to those of new hay and bitter almonds, moist powerful, and very permanent, in the dried herbage. Some compare it to the smell of a pig-flye. The Blue Melilot, and Common Fenugreek, poiffes this odour in the greatest perfection.

Trifolium is a very extensive genus. Linnaeus has forty-fix species in the fourteenth edition of his Systema Vegetali um; Willdenow has seventy-two in his Sp. Pl.—Eighteen are natives of Britain. Fifty-fix are enumerated by Mr. Aiton in his Hortus Kewensis. We have three to add from the Prodr. Fl. Græc., two or three American ones of Mr. Pursh, and a few from other sources. It is necessary to take a view of the whole, partly for their more correct botanical distinction, though in general they are better defined than the species of moly, equally extensive and natural, genera. A correct knowledge of these plants is supremely important to the agriculturist; because the qualities of some, very near in external appearance, differ widely in utility; and because there are many, hitherto little observed, which promise to be as valuable as any of the species. Some of these are known and cultivated in other countries, and others may be well worthy of trial. Unless they are first accurate distinguished, nothing respecting them can either be perfectly understood, or clearly communicated.

The species are distributed into five very natural sections, and all are herbaceous. Some in each section are annual, others perennial. The fems are branched. Leaves alternate, more or less flat, of three, moistly obovate, and equal, toothed or entire, rarely linear, leaflets, with a pair of membranous ribbed stipules united to the base of the footstalk. Inflorescence terminal or lateral, generally flat, either tufted, capitate, spiked or racemose. Flowers red, purple, white or yellow; sometimes, though rarely, fragrant.

Sect. 1. MELOLITI. Legumæ projecting beyond the calyx; with several feeds. Flowers racemose.

1. T. ceruleum. Blue Melilot Trefoil. Linn. Sp. Pl. 1077. Willd. n. 1. Ait. n. 1. Bieber. Taur. v. 2. 267. (T. odoratum; Ge. Em. 1195. Melilotus ceruleus; Rivin. Tetrap. Irr. t. 9. Lotus fylveficus; Camer. Epit. 894; not 724, as in Wild. and Ait. after Linn.; the latter being T. arvensis. A good coloured figure wanting.)—Chaffers roundish-ovate, long-flat. Legumes half-naked, beaked, with flight longitudinal ribs, and two seeds. Stem erect. Stipulas entire. —Native of Bohemia, Tauria, Germany, &c. in dry barren ground, flowering in summer. Cultivated in our gardens, for curiosity, ever since the time of Turner, Gérarde, &c. The root is annual, fibrous. Stem two or three feet high, smooth, angular, leafy, scarcely branched. Leaflets pale, elliptical, toothed, an inch long, smooth; the odd one flat. Flowers pale blue, in numerous, solitary, long-flat, axillary heads, all the way up the stem. The whole plant, either fresh or dried, has a sweet liquorice-like scent, falling a great
Ait. Ait. Ait. Ait.

2. T. indicum. Indian Melilot Trefoil. Linn. Sp. Pl. 1077. Wildl. n. 2. Ait. n. 2. (Melilotus lutea Indica orientalis erecta, foliis rotundis parvis, spicis florum ex foliorum alis multiplicatis; Pluk. Phyt. t. 45. f. 4.)—Cluffers cylindrical. Legumes narrow, strongly reticulated, fingle-feeded, obtuse. Stem erect. Stipulas nearly entire.—Native of the East Indies. Cultivated at Oxford before 1680. Annual, flowering in summer. Smaller and more flender than the foregoing, with long slender clusters of small, yellow, drooping flowers. The leaflets also are smaller and narrower. Legumes not much bigger than mustard-seed, turbid, pale, roundish-elliptical, strongly corrugated, with a fort of elevated net-work, and tipped with the capillary fyle, not properly beaked. Such is the Linnean plant, which does not agree with Wildenow's definition. We cannot answer for the varieties enumerated in Sp. Pl. Some are said to have white flowers. The yellow fades greatly in what we have examined, before the corolla falls. Wildenow has in his Enumeratio, 759, distinguished the β, which is Pluknet's-t. 45. f. 5, as a species, by the name of Melilotus rugulosa.

3. T. juckensteinei. Sicilian Melilot Trefoil. Linn. Mant. 275. Suppl. 339. Wildl. n. 3. Ait. n. 3. Sm. Fl. Græc. Sibth. t. 741, unpublished. Desfont. Atlant. v. 2. 104. T. frutico racemoso, Borec. Mus. 163. t. 134. Melilotus juckensteinei procumbens, foliis rugulis sublongis, spicis florebus rufi; Rais Hist. 952. Tourn. Infl. 407. Minima recta lutea, siliquæ crisulae currit in capitulum conglutinis, femine flore naturali; Moris. v. 2. 162. f. 2. t. 15. f. g. t. 16. f. 9, very good.)—Clutters shorter than the leaves. Legumes narrow, ovate, pointed, with crowded, concentric, interbranching ribs, single-feeded. Stems decumbent.—Gathered by Ray, in a moist situation, on the tongue of land separating the port of Messina from the fratts of Sicily. Professer Desfontaines met with it in fields in Barbary; and Dr. Sibthorpe in cultivated ground every where throughout Greece. It there bears the name of τίτικα, which belongs indeed to moss of this genus, in modern Greek. Dr. Sibthorpe judged it to be the same plant of Dioscorides, point equally difficult to disprove or establish. This species is little known in our gardens, though cultivated in Morison's time, whose figure cannot be mistaken. The root is said to be annual, though furnished with many little fleshy granulations, to enable it to refit occasional drought, such as occur in Vicia labiroides, and other annual vetches. Stems several, a foot long, diffuse or procumbent, the central one only being erect, all stout, smooth, leafy, scarcely branched. Clusters axillary, oblong, hardly longer than the common footstalks, each on a short stalk, and composed of ten or twelve yellow flowers, twice or thrice as large as the leaf. The leaves are not very different. Legume one-third of an inch long, peculiarly disfigured by its ovate, oblique, pointed, somewhat compressed, figure, and especially the numerous concentric elevated lines, like coil'd horse-hair, more or less interbranching in the middle, which occupy its fides. The luxuriance in the herbage, and the nature of its root, indicate this plant as worthy of agricultural experiment, though its precumbent mode of growth may be an objection to the mower. It is certainly very different from Mr. Sinclair's T. macrorhizum, Hort. Gram. Woburn. 290, of which we propose to speak under T. officinalis.

4. T. mauritianum. Barbary Melilot Trefoil. Wildl. n. 4. Ait. n. 4. Sm. Fl. Græc. Sibth. t. 742, unpublished. (Melilotus fucata; Desfont. Atlant. v. 2. 193.)—Clutters longer than the leaves. Legumes naked, nearly orbicular, obtuse, pointeles, with concentric elevated ribs, single-feeded. Stems diffuse.—Native of cultivated fields in Barbary and Sicily; very abundant about Messina, according to Signor Arrodi. There can be no doubt as to the synonym of Desfontaines. We have not seen the work of Schoubeoe, cited by Wildenow. This is an annual species, with numerous branching diffuse floras, but more flender in every part than the last. Leaflets elliptic-lanceolate, obtuse. Flowers yellow, small, very numerous, in long, flender, linear, long-filaked clusters, much exceeding the leaves. Legume hardly so big as in T. indicum, formed as it were of a convoluted line or hair, some-what in the manner of the leaf, but the whole legume is not a quarter so long, nor has it any elongation or point. These two species have, nevertheless, been confounded by botanists, for want of a good figure of the prent, which deficiency the Flora Græca will supply.

6. T. polonicum. Polish Melilot Trefoil. Linn. Sp. Pl. 1078. Wildl. n. 6. Ait. n. 6.—Clutters lax, on very long flanks. Legumes naked, two-feeded, lanceolate, pointed, transversely corrugated. Stem erect. Leaflets pointed, nearly entire.—Native of Poland. Sent to Kew garden in 1788, by M. Thouin. A very diffident annual species, of a flender habit. Stem quite round. Leaflets obovato-lanceolate, acutely pointed, rather silky, and somewhat glaucous, almost perfectly entire; the odd one hardly an inch long. Flowers yellow, daintif, small, on long and flender partial flasks; their common ones at least twice the length of the leaves. Legume rather compressed, pendulous, a quarter of an inch long, beaked, and tipped with the fyle, not hairy.

7. T. spicatum. Spiked Melilot Trefoil. Sm. Procr. Fl. Græc. Sibth. n. 1783. Fl. Græc. t. 745. unpublished.—Legumes naked, single-feeded, spik'd, erect, corrugated, acute. Stipulas awl-shaped, entire. Stem erect.—Gathered by Dr. Sibthorpe, in the isle of Cyprus. Root annual. Stem less than or eighteen inches high, and Leaflets obovato, toothed, half an inch long. Spikes flaked, about as long as the leaves, consisting of yellow, deflexed flowers; when in fruit becoming twice as long, more lax, and somewhat racemose, the legume being slightly flaked, erect, roundish-obovato, with a short broad point, tipped with the capillary white fyle; their fides marked with concentric elevated corrugations. Seed globose.

8. T. dentatum. Toothed Melilot Trefoil. "Waldit. et Kitab. Hung. v. 1. 41. t. 42." Wildl. n. 7. Ait. n. 7.—Legumes racemose, naked, two-feeded, somewhat rugose, rather acute. Stipulas toothed at the base. Stem erect.—Native of moift meadows in Upper Hungary. Perennial. Abundantly different from the officinalis, the leaflets being sharply and double toothed; the fipulas also toothed, and deeply divided at their base. Wildenow.

cultivated fields, on clay or marle, throughout Europe, flowering in June and July. Not rare in England. Dr. Sibthorp met with it in moist low situations, throughout Greece and the Archipelago, and confirmed the old opinion, of its being the Melilotus of Dioscorides. From this old Greek's venerable authority the plant has long been esteemed medicinal, but is now out of use; nor is it cultivated, with us at least, for any agricultural purpose. The seeds, even in a very small quantity, poison the flavour of flour. (Martin. Sinclair.)

The root is annual. Stem branched, two or three feet, or more, in height, angular and furrowed. Leaflets dark green, smooth, obovate, serrated. Flowers full yellow, veiny, in long dense clusters. Keel and wings equal, and nearly as long as the standard. Legume hairy, tranfverfely wrinkled, but not very strongly. Stigma capitate.

Mr. Sinclair's specimen named T. macrofibra, in his elaborate and very valuable agricultural work, the *Hortus Graminibus Woburnensis*, 291, does not exhibit any marks of specific difference from the officinal, of which however it appears to be an important variety, differing in its biennial root, larger leaflets and flowers. The seeds are two in each legume, never, as is sometimes the cafe with the officinal, more than two. It produces a great crop of fodder, or hay, at the time of flowering, but little afterwards. If kept from flowering, the root will last four or five years. Such is Mr. Sinclair's account, who nevertheless affords to our opinion of its being a variety. We have no means of ascertaining whether this may be Willdenow's *macrofibra*, our n. 5, but it does not answer to his character. We can vouch for its being widely different from *seif-anen*, n. 3. Can it be Willdenow's officinale ?

10. T. germanicum. White German Melilot Trefoil. (T. officinale β; Willd. n. 8. Sm. Prodr. Fl. Græc. Sibth. v. 2. 94. Melilotus; Rivin. Tetrap. Irr. t. 6: M. germanicus; Ger. Em. 1205. M. vulgaris; Willd. Enum. 790. M. officinarum germanicus, flore albo; Tour. Infr. 407. Lotus sylvætris, flore albo; Tabern. Kreuterb. 893.)—Legumes racemose, naked, fingle-fed, corrugated, obovate, acute. Stipulas fetaceous. Stem erect. — Native of cultivated fields in Germany. Dr. Sibthorp observed it near Theffalonica. Root biennial. Stem taller than the leaf. Flowers white. Wings longer than the keel, though shorter than the standard. The figure of Rivinus answers better to this description than to our common T. officinale, and was probably taken from what is the moft ufual German plant. We have never compared specimens, but must obferve, that the stipulas are fometimes perfectly fetaceous in our officinal. — Gerard feems to have been well acquainted with the *germanicum*, as was also his editor Johnson.

13. T. italicum. Italian Melilot Trefoil. Linn. Sp. Pl. 1078. Willd. n. 9. Ait. n. 9. (Melilotus italicus; Camer. Hort. 99. t. 29, excellent. Willd. Enum. 790. M. filicus pendentibus, curvis, latea, &c.; Morif. fib. 2. t. 16. f. 4.)—Legumes racemose, naked, two-fed, elliptical, obtuse, strongly corrugated and crisp. Stem erect. Leaflets roundish-ovate, nearly entire.—Native of Italy, Barbary, and Greece. Dr. Sibthorp gathered it on the dry parts of the famous mount Hymetthus, near Athens. This species has long been cultivated in curious gardens, both in England and the continent. Gerard describes it under his Melilotus, n. 2, but the figure does not agree. The root is annual. Stem flat, angular, leafy, about two feet high, overtopped, as the fruit advances, by the numerous, elongated, upright, cylindrical clusters, of pendulous, roundish-elliptical legumes, each as big as a small pea, conspicuous for their strong, prominent, zigzag, and plaited wrinkles, by which the present species is clearly distinguished. Its leaflets moreover are of a much broader and rounder figure than any of the foregoing, rather wavy than serrated. Stipulas ovate, taper-pointed, toothed. Flowers yellow. Dr. Sibthorp conjectured, with great probability, that this might be the kind of Melilot, mentioned by Dioscorides as growing in the fouth of Italy, about Nola, of a yellowish colour, and weaker scent.

14. T. hamatifum. Hooked Melilot Trefoil. Bieberift. Taur. v. 2. 207. (Vaccinargium melioti facie minus; Buxb. Cent. 2. 39. t. 44. t. 11) — "Legumes racemose, naked, compressed, fingle-fed, ribbed, hairy, with a hooked point. Stipulas awl-shaped, undivided. Stems erect and floping."—Gathered by the chevaher de Steven, in Georgia, and the southern part of Tartary. "The root is annual, fimple. Stems ferval, from three to nine inches long, rarely more, flightly branched. Clusters axillary, falked, fhort and fomewhat capitate. Flowers yellow, the fize and shape of T. officinale. Calyx hoary. Legume ovate, deflexed, hoary; smooth at the base; terminating in a long inflexed point. Seed kidney-shaped, of a dirty yellow. Leaflets wedge-shaped, sharply toothed. Stipulas fmall." We have been no fpecimen.

15. T. creticum. Cretan Melilot Trefoil. Linn. Sp. Pl. 1078. Willd. n. 10. Ait. n. 10. (T. peltatum creticum; Bauh. Pin. 329. Prodr. 142, with a figure. Morif. fect. 2. t. 14. f. 3.)—Legumes racemose, naked, two-fed, membranous, compressed, bordered, nearly orbicular. Stem ascending.—Native of Crete, Greece, and Barbary. Root annual. Stem branched, twelve or eighteen inches high. Leaflets broad, thick and fethy, like those of T. italicum, bordered with fallow-toothed, inodorous. Flowers pale yellow. Legumes very remarkable for their broad, elliptical, nearly orbicular, flattif figure, half an inch in diameter, in loose clusters, two or three inches long. They are reprefeented much too turgid in the above engravings, especially in Morifon's.

16. T. orthopodioides. Bird's-foot Trefoil. Linn. Sp. Pl. 1078. Willd. n. 11. Fl. Brit. n. 2. Engl. Bot. t. 1047. Curt. Lond. falc. 2. t. 53. Fl. Dan. t. 368. (Vaccinargium humile repens, orthopodioidei filiquis brevibus erectis; Rau Syn. 331. t. 14. f. 1.)—Legumes about three on a falk, naked, eight-fed, twice the length of the calyx. Stems procumbent.—Native of England, France, and Denmark, on barren gravelly heaps, among short grafs, flowering in June and July. The fibrous annual root is furnifhcd with fibrous tubercles, fuch as are mentioned under n. 3. Stems mostly fimple, defpeffed, two or three inches long, clothed with little leaves, refembling many of the third fectton, the falks of the leaflets being all equal; and neither they, nor the flender pale-purple flowers, two or three on each fhort axillary falk, having any affinity to the Meli-
TRIFOLIUM.

Melliti, with which the present species is associated entirely on account of its many-seeded, tranferably furrowed, prominent, bivalve legumes, which moreover are umbellate, not racemose. This species therefore connects the Melliti by its fruit, with the true Trefoils by its habit, stipulas, inflorescence, &c. We should gladly have retained the genus *Mellitus*, adopted of late, from preceding writers, by Willdenow in his *Enumenrio Plant. Hort. Berol.* had we found his generic characters faithful. These are the decidual corolla, and the burling legume, longer than the calyx. But the legume of most of the *Mellitus* does not burst, any more than that of a genuine *Trifolium*. Their general habit indeed, and their peculiar odour, agree far better with *Trigonella*, (fee that article,) than with *Trifolium*.

Sect. 2. Lotoidea. Legumes covered by the calyx; with several seeds.

17. T. L. apinafter. Baflard-lupepe Trefoil. Linn. Sp. Pl. 1079. Willd. n. 12. Ait. n. 12. Mart. Ruft. t. 16. Curt. Mag. t. 879. (T. leguminus polypermnis, folis pluribus; Gmel. Sib. v. 4. t. 6. f. 1.)—Flowers in short unilatral tufts. Leaves five, without a naked common stalk. Legume with many seeds.—Native of Siberia. Observed also near Constantinople by the abbé Seftini and Dr. Sibthorp. It sometimes appears in our gardens, from exotic seeds; but though hardly as to cold, does not endure long. The root is naturally perennial, tap-shaped. Stems erect, simple or branched, a foot, more or less, in height. Leaves lanceolate, about an inch and half long, smooth, elegantly veined and finely toothed, ufually five, rarely six or seven, each on a minute partial stalk, crowning the ribbed common one, which is bordered all the way up, on each side, with a long and broad membranous stipula. Flowers crim- fon, occasionally white, numerous, handform, in terminal heads; their partial stalks directed one way, hairy, each with a little cup-like membranous bractea at the base.

Heads nearly globofe. Legumes two-seeded. Stem erect. Leaves lanceolate, finely ferrated. Stipulas rhombo- boid, toothed at one side.—Native of Italy, Spain, France, Hungary and Barbary. Michelli gathered it in various garly or heathy places about Florence, flowering in May. The root is annual. Leaves somewhat like thofe of *T. Lupinafter*, n. 17, in shape, but the lower leaves have a long common stem. The stipulas are remarkable for their square figure. Heads of flowers small, dense, on long, solitary, axillary stalks. Corolla white. Legume half-oval, with a recurved beak. We agree with Willdenow, though we have not compared specimens, that the plant of Desfontaines is very near that of Michelli. Indeed we cannot find marks to define it as even a variety. Linneus adopted his *T. fritium* from the late-named author, in writing the second edition of *Sp. Pl.*, but before that work was printed, he obtained a spe- cimen of what he thought the fame, and this is elabo- rately defcribed there, though the crofs annexed to the fpecifi- c character, as in the original manucript before us, indi- cates his not having been the plant. What he there defcribed is *T. parviflorum* of Ehrlift, Willdenow's n. 56, our n. 66. We must presume that this defcription, according fo very ill with what profeffor Desfontaines found in Barbary, pre- vented his recognizing the Linnian plant.

21. T. efifflum. Tufted White Trefoil. Willd. n. 17. Reymier Mem. pour fervir à l'Hift. Phyf. et Nat. de la Suisse, v. 1. t. 162, with a plate, under the French name of *Trefo gazonant*. (T. Thali; Villars Dauph. v. 3. 478. t. 41.)—Heads roundish. Flowers slightly filiform, erect. Legumes mostly four-seeded. Leaves obovate, minutely toothed. Stems decumbent, tufted, shorter than the flower-stalks. Native of the mountains of Switzerland and Dau- phiny, in barren, wafte, or trodden places. This most re- fembles our Common White Trefoil, or Dutch Clover, hereafter defcribed, but the short, defpered, entangled stems, though compofing a defe turf, do not creep. The root is woody and perennial. Stalks of the flowers, and even of the leaves, longer than the items; the former terminal, foltary, erect, from two to five inches in length, bearing a globular, but slightly racemofe, head of white flowers, purplis at the base, less defpered than in *T. repens*, but we find no perceptible difference as to the comparative inequality of their calyx-leafs. Legume small, elliptical, compofed, strongly ridged at each margin, beaked with the permanent fide and capitale figur: enveloped in the dry, brown, ribbed corolla, and containing three or four small fees. No valuable properties with refepect to agriculture have been discovered in this plant, nor has it been hitherto raised in England.

TRIFOLIUM.

The Curt., the Melilotus in above obtusfo, variable, fupinum copiouily veiny, others nearly rifienlis partly ftout and furnished, while others have been confounded herewith. This is one of the species well worthy of agricultural experiment, though hitherto unnoticed in England. Its crop must be very con-

considerable.

Linnaeus calls the stem “ascending” yet the fpecimen in his herbarium is perfectly erect, though zig-zag in the upper part. Ehrhart, in his Physophyllum, n. 26, gives, under the name of T. hybridum, Upal fpecimens whose stem is decumbent, or partly ascending, hollow, but not zig-zag. The leaflets are narrower, as well as much more harply and copiously ferrated, than in the Linnaean specimen, and the flower-flalks are longer. This appears to be the Trifolium pratense com- 

This decumbent or ascending plant, doublets known to Linnaeus, must have been comprehended in his idea of T. hybridum, of which it is probably a variety. Ehrhart has named it, according to a mode of his own, Dubroma, indicating its value as food for oxen. The tubular stem clearly distinguishes these two plants, whether species or varieties, from all to which they are near akin, especially from the following, and T. repens.

The leaflets vary greatly, and are fometimes wedge-shaped. The definitive character of the stem being not tubular, but 

flaked, emarginate, finely ferrated; the lower ones partly entire. Flowers white, on hairy partial flalks, com- 

Some fpecies, named in the herbarium, are not noticed. Though not much larger than obovate, emarginate, finely ferrated; the lower ones partly entire. Flower-flalks four-feeded. Leaflets variously heart-shaped, or round, and taper-pointed. Some fpecies, named in the herbarium, are not noticed. Though not much larger than obovate, emarginate, finely ferrated; the lower ones partly entire. Flower-flalks four-feeded. Leaflets variously heart-shaped, or round, and taper-pointed. Some fpecies, named in the herbarium, are not noticed. Though not much larger than obovate, emarginate, finely ferrated; the lower ones partly entire. Flower-flalks four-feeded. Leaflets variously heart-shaped, or round, and taper-pointed. Some fpecies, named in the herbarium, are not noticed. Though not much larger than obovate, emarginate, finely ferrated; the lower ones partly entire. Flower-flalks four-feeded. Leaflets variously heart-shaped, or round, and taper-pointed.
TRIFOLIUM.

26. T. conspersum. Tufted Trefoil. Linn. Sp. Pl. 1580. Wild. n. 20. Ait. n. 18. (T. carminianum; Michaux Boreal.-Amer. v. 2. p. 58; Pursh n. 3? Poiret in Lamarck n. 2? Lagopus americanus, floribius majoribus comosis; Poit. Muf. 26. n. 254.)—"Heads globose. Flowers flaked, imbricated. Standard deflexed, permanent. Legumes four-seeded."—Native of America. Linnaeus. The carminianum of authors, here quoted with doubt, is described as diminutive and erect; its leaflets inerly heart-shaped, rounded, smooth, fringed and finely crenate; stipulas cloven; heads reflexed, of few flowers; corolla being projecting beyond the calyx; seeds about three. This is found in sandy fields near Charlestown, South Carolina, flowering from June to August, and is perennial. Flowers smaller, white, Pursh. How far the opinion of Poiret, adopted by Pursh, that the above two plants constitute one species, is correct, we are utterly unable to determine, having seen neither; but Petiver's definition of the flowers is altogether at variance with that of Michaux and Pursh.

27. T. alpinum. Dwarf Alpine Trefoil. Linn. Sp. Pl. 1580. Wild. n. 21. Ait. n. 19. Dicki. Dr. Pl. 38. (T. n. 369; Hall. Hist. v. 1. 161. T. alpinum, flore magno, radice dulci; Bauh. Prodr. 143. no figure. T. alpinum rheticus, affragaloideis; Bauh. Hist. v. 2. 376. T. angustifolium alpinum; Ger. Em. 1207. Trifolium angustifolium alpino; Pon. Bald. 154.)—Heads hemispherical, somewhat racemose and whorled. Flower-inflect radical, naked. Legumes two-seeded, pendulous. Leaflets linear-lanceolate.—Abundant in the alpine pastures of Switzerland, Italy, the Pyrenees, and the south of France, flowering in August. The most unscientific visitor of those beautiful scenes could hardly overlook this plant, whose large bright crimson flowers, each above an inch long, seem to spring almost immediately from dense tufts of no less elegant leaves. If this species, procured for the English gardens about forty years ago by Dr. Pitcairn and Dr. Fathergill, be still preferred, a coloured figure of it would be highly acceptable to the public. The root is perennial, thick and woody, running very deep into the ground, and paid to have the sweetness of liquorice. Stems very short, or scarcely any. Herbage smooth. Stipulas long, lanceolate, membranous, finely frilled. Common flower-inflect simple, often not taller than the leaves. No other species can be confounded with this.

28. T. involucratum. Striped-flowered Trefoil. Wild. n. 49. Donn. Cant. cd. 5. 183.—Heads roundish, dense, each with an orbicular, ribbed, many-toothed, spinous involucrem. Stem erect, branched. Leaflets lanceolate. Stipulas many-toothed. Legumes two-seeded.—Native of the west coast of North America, from whence its seeds were brought by Mr. Meuzies, and raised in the Cambridge garden in 1791. We obtained specimens there August 30, 1796. Yet this species does not occur either in Hort. Kew., or in Pursh, nor did we discover it in Widdowson, till we had hit on the same name, he having greatly misplaced it, in the next fiction, after T. angustifolium. The root is annual. Stem twelve or eighteen inches high, branched, leafy, hollow, round, smooth like the root of the plant. Stipulas membranous, with many unequal brilbly teeth. Leaflets elliptic-lanceolate, toothed, an inch or an inch and half long. Heads of flowers above an inch broad, on long, stout, frilated, axillary stalks, and each subtended by a very remarkable membranous orbicular involucrem, wholly strong, close, radiating ribs, end in unequal spinous teeth. Flowers feiller. Calyx ribbed and spinous, membranous, pale with green teeth. Corolla variegated with purple and white. Legume ovate, abrupt, compressed, with two entirelly distinct valves, and two seeds. The whole plant sometimes becomes very diminutive from natural.

Sect. 3. LAGOPODA. Calyx more or less villous.

29. T. subterraneous. Subterraneous Trefoil. Linn. Sp. Pl. 1580. Wild. n. 22. Fl. Brit. n. 4. Engl. Bot. t. 1548. Curt. Lond. f. 2. t. 54. Rivin. Tetrap. Irr. t. 13. f. 1. (T. pumilum fupinum, ficolus longis albis; Ral Syn. 327, t. 13. f. 2.)—Heads of about four flowers. Calyx-teeth linear, hairy. Involucrem central, reflected, rigid, flat-like, embranching the fruit.—Native of Italy, the Levant, France, and England, on dry gravelly heaths, among short grass, flowering in May, and very common in Hyde park, Greenwich park, &c. Root annual, knobbed. Stems deflated, spreading, almost concealed by the numerous leaflets, each long, pale purple-veined. Leaflets inerly heart-shaped, dark green, hairy. Flowers at the end of a stem, erect, each bearing three or four flores, conspicuous for their long white corolla. After flowering, these stalks bury the legumes, which are thin and single-headed, in the ground, and fix them there, by shooting out several spreading firm and thick fibres, constituting an involucrem of the fruit, though apparently like roots. The herbage of this species is trifling, and though it conduces to the spring verdure of many an otherwise barren tract, has nothing to encourage cultivation.

30. T. globulorum. Globular Cotton-headed Trefoil. Linn. Sp. Pl. 1581. Wild. n. 23. Sm. Fl. Grac. Sibth. t. 744, unpubl. (T. orientale, capite lanigino; Tourn. Cor. 27.)—Heads globos, many-flowered. Calyx very hairy all over, with linear teeth. Upper flowers numerous abortive, densely villous. Stems decumbent.—Native of Arabia and Syria, as well as of Cyprus and Asia Minor. A rare annual species, which Linnaeus cultivated from Haffelquilt's seeds, and which may have been in our gardens a century ago, though not at present to be met with. It preserves some analogy with the last, though very unlike in appearance, having many pink flowers, in upright heads, and the stems are far less deflated. The leaflets have each a white transverse stripe, but not constantly. The analogy alluded to confits in the flowers, which perfect seed, being overwhelmed and borne down by a number of abortive ones above them. These seem to grow out as the number of sides, in the form of empty calyxes with innumerable, woolly, entangled teeth. No figure of the present species has yet appeared, but Mr. Baker has prepared a very admirable drawing for the Flora Graeca.

31. T. bifidum. Brittle-headed Trefoil. Desfont. Atlant. v. 2. 200. t. 209. f. 1. Wild. n. 24. (T. hirs- tum; Allien, Auct. 26.)—Heads terminal, solitary, globose. Calyx very hairy, with taper teeth. Involucrum of several roundish-ovate pointed leaves. Stem erect.—Gathered by Desfontaines in fields in Barbary, near Mafcar; by Allioni in Monteferrat. Root annual, long and tapering. Stem erect, a foot high, more or less branched in a corymbose manner, frilled, leafy, thaggy with soft hairs, as are likewise the leaves and their stipulas. Leaflets obtuse, finely toothed, obtuse, not emarginate. Heads many-flowered, sessile, subtended by three or four close, membranaceous, ribbed, hairy bracteae, all pointed, and a fully
foliary leaf like those lower down. *Corolla* rose-coloured, longer than the calyx-teeth, which however gradually extend beyond it as the flower fades. We much doubt whether this be a distinct species from the following. The *bracteas* are very similar, except being pointed, and the position of the *flora* as well as the form of the *leaflets*, are known to be uncertain marks.

32. T. Cherei. Hairy Pink Trefoil. *Linn. Sp. Pl. 1081*. Willd. n. 25. Ait. n. 22. *Sm. Fl. Grce. Sibth. t. 745*, unpubl. (T. glomerus perfonata, Cherei; Buhl. Hift. v. 2. 377. Lagopus minor, fupinus, mollis et compreffo capite, flore albo; Barrel. t. 8. 1899.)—Heads terminal, foliary, globose. Calyx very hairy, with taper teeth. Involucrum of three roundish-ovate pointless leaves. Stems procumbent.—Native of France, Spain, and Barbary, in barren dry places. Dr. Sibthorp gathered it on the shores of Greece and the Archipelago. The seeds are sometimes introduced into our gardens from abroad. This is a little annual species, usually with several procumbent *flora*, three or four inches long; in a flaved flat having a foliary more erect one. *Leaflets* inerely heart-shaped, with a dark-purple mark. *Flowers* numerous, in dense heads. *Corolla* twice as long as the calyx, pale bluish-coloured, with a long crimson *floral*; but the calyx-teeth subfubsequently rife above it. The involucral leaves are like the leaf, except in being blunt, and are also accompanied by a leaf.—*T. pidum*, Willd. n. 26. Biebr. Taur. v. 2. 210, appears not to differ from *T. Cherei*, and is doubtless Dr. Sibthorp's plant gathered on the shores of Greece and the Bosphorus. Nothing can be more uncertain than the spots on the leaves, which gave occasion to the name; and the proportion of the *corolla* to the calyx depends on the period of examination. Barretier faithfully represents it longer as the *calyx* in *Cherei*, when the flower is in perfection.

33. T. *spherocephalum*. Round-headed White Trefoil. *Desfont. Atlant. v. 2. 201. t. 209. f. 2*. Willd. n. 27.—Heads terminal, foliary, globose. Calyx very hairy, with taper teeth, twice the length of the corolla. Involucrum of three rounded leaves. Stems procumbent.—Native of fields in Barbary, near Mafcar. *Desfontaines*. Very like the last, except its little white corolla, shorter than the calyx. The citation of Barretier, copied by Willdenow from Desfontaines, is the very fame which, in the preceding page, he had transferred from Linnæus, though less exactly given by the latter. The proportion of the corolla does not answer to this, but to *T. Cherei*, which may very probably have occasionally, but Barretier says it has, a white *floral*. We should hardly scruple to reduce these three last described, with *pidum*, to one species.

34. T. facetum. Thyme-headed Trefoil. *Allion. Pedem. v. 1. 305. t. 59. f. 3*. Willd. n. 28. (T. thymiflorum; Villars Dauph. v. 3. 487. T. parvum rectum, flore glomerato cum unguiculis; Buhl. Hift. v. 2. 378. Treffe des glaciars; Rey. Mem. pour servir à l'Hist. Phys. et Nat. de la Suisse; v. 1. 166.)—Heads terminal, mostly in pairs, hemispherical, leafy. Calyx densely hairy, with taper teeth, as long as the corolla. Upper *floralibus* bracteaceus, ovate, acute. *Leaflets* wedge-shaped, emarginate.—Native of the sandy beds of torrents, among the alps of Dauphiny and Piedmont, or the glaciers of Switzerland. Our specimens from M. Reynier's herbarium were gathered at the glaciers of mount Sylvo, which terminates the valley of St. Nicholas in the Vallaas, by the celebrated herbalist M. Thomas. The root is described as biennial. *Stems* several, a finger's length, simple, leafy, rather silky than hairy, crowned with one or two small, densely silky heads, of little white *flowers*; the central ones, according to Villars, imperfect or abortive. *Leaflets* small, silky, fearfully toothed, deeply emarginate. *Stipulas* purplish, ribbed, acute, for the most part lanceolate, but those of the two opposite leaves, close under the heads of flowers, are broad and ovate, serving as *bracteas*.

37. T. hiratum. Hairy Cape Trefoil. *Thunb. Prodr. 136. Willd. n. 31.*—"Heads globose, hairy. *Leaflets* oblong, hairy."—Found also at the Cape, by *Thunberg*. It is impoffible to form a correct idea of these three last species, from the above characters, which but fcarcely well a number already known, to which the author appears never to have adverted. We merely regret to have these plants here for future inquiry.

40. T. *rotundifolium*. Round-leaved Lillac Trefoil. *Sm. Prodr. Fl. Grce. Sibth. n. 1795. Fl. Grce. t. 747*, unpubl.—Heads globose, terminal, foliary, with lanceolate bractees. Calyx very hairy, longer than its teeth. *Stems* fimple, diffuse. *Leaflets* nearly orbicular, toothed, hairy.—Gathered by Dr. Sibthorpe in the Morea. A very pretty and diflinguifh annual species, which seems never to have been noticed before. The *flora* are fcarce a span long, clothed, like the rilt of the herbage, with copious hairy hairs. *Leaflets* remarkably round, not half an inch in diameter, strongly and unequally toothed. Calyx tubular, very flightly inflated, with short, lanceolate, upright teeth. *Corolla* twice the length of the calyx, elegantly variegated with
TRIFOLIUM.

with pale purple and white, its petals distinct. German hairy.

41. T. Lagopus. Oblong Hairy Trefoil. Willd. n. 34.

42. T. pilosum. Stipulaceous Cape Trefoil. Thunb. Prodr. 136. Willd. n. 35.—"Hills villous, or 3erennial. Stem herbaceous, decumbent at the base. Leaflets jagged, villous."—Found at the Cape of Good Hope, by Thunberg, whose specific character is all we know of this species. The word "herbaceous" is truly superfluous in any specific character of a *Trifolium*.

43. T. microcephalum. Little-headed Trefoil. Pursh n. 4.—"Ascending, downy. Leaflets ovate, emarginate, finely toothed. Stipulas ovate, pointed. Heads minute, flaked, of a few yellow flowers. Involucrum ovate, awned. Calyx awned, as long as the corolla."

—Found by governor Lewis, on the banks of Clarke's river, flowering in July. Perennial. Flowers exceeding small, pale purple. Pursh. Some specimens from the north-west coast of America answer nearly to these characters, except being quite smooth, and we are persuaded they are only a diminutive flat of *T. involucratum*, n. 28.

44. T. rubens. Red Long-spiked Trefoil, or Clover. Linn. Sp. Pl. 1081. Willd. n. 36. Ait. n. 26. Jacq. Ait. 1792. t. 383. Mart. Ruff. t. 9. (Lagopus major, spicul longiori; Ger. Em. 1192.)—Spikes long and cylin- drical. Calyx-teeth hairy; the lowermost about the length of the monopetalous corolla. Stipulas fwoor-shaped, longer than the footstalk. Leaflets lanceolate, sharply serrated. Stem erect.—Native of Italy, the fonth of France, Germany, and Switzerland, especially in the warmer meadows of the latter, where, according to Haller, this handfome species is very common. It flowers in summer, and found a place in our English gardens in Gerarde's days. Root perennial. Stem one or two feet high, erect, firm, full of solid pith, smooth like the very elegant, finely serrated, and armed, leaflets, which are two inches long. Their common flark is united almost entirely to the long, entire, even, sharp-pointed flipulas, which reach far beyond it. Flowers crimson, in dense, cylindrical, thick, blunt spikes, two or three inches long, beft with the prominent brightly calyx-teeth, of which the lowermost is much the most conspicuous. This Trefoil, though not hitherto brought into cultivation, feems, as profefor Martyn observes, of a good quality, and sufficiently productive.

45. T. pratense. Common Purple Trefoil, or Clover. Linn. Sp. Pl. 1082. Willd. n. 37. Fl. Brit. n. 6. Engl. Bot. t. 1770. Mart. Ruff. t. 3, and t. 36. Fl. Dan. t. 989. Ait. A "Tr. of Linn. Soc. v. 1. t. 240. Mat. Valgr. v. 2. 189. (T. pratense purpureum; Puch. Hill. 817. Trifolium; Rivin. Tetrap. Irr. t. 11. f. 1.)—Spikes ovate, dense. Stems ascending. Corolla monopetalous, unequal. Four of the calyx-teeth equal. Stipulas awned.—Common in grassy meadows and pastures throughout Europe, flowering from May to September. In its native situations, particularly on dry calcareous or gravelly hills, this valuable plant is truly perennial, although, like Sainfoin, less permanent in cultivated manured land. For its agricultural properties, and management, see Clover. Great difficulties have long attended the botanical discriminations of this and other species, which we shall pretently describe; but they are for ever set at rest, by the most minute and laborious details of Mr. Aizelius, in the first volume of the Linnean Society's Transactions. Nor is this question merely curious or speculative; for the qualities of the plants, in an economical view, are as widely different as can well be. The root of *T. pratense* is tapering and branched, but not creeping. Stems about a foot high, more or less, slightly branched, leafy, foldy, downy in the upper part. Leaflets elliptical, more or less acute, entire, smooth, with a pale lunate spot. Upper leaves, near the flowers, mostly opposite. Stipulas rather broad, pale, purple-ribbed, with taper points. Spikes terminal, solitary, leafy, of numerous light-purple flowers, with a sweet, but faint scent, their petals united at the base, and combined with the filaments. Calyx hairy, ten-ribbed, its lowest tooth longer than the rest, but much shorter than the corolla. The figures in Fl. Dan. and Martyn represent the cultivated plant; that of Eng. Bot. the wild one. What Dillenius represents, in his edition of Ray's *Synopsis*, t. 13. f. 1, seems merely a starved plant. There is said to be a procumbent, very hairy, kind, found on the loftiest mountains of Switzerland and Dau- phiny, which is also but a variety.

46. T. medium. Zigzag Trefoil, or Baftard Clover. Linn. Faun. Succ. ed. 2. 358. Hudf. ed. 1. 284. Ait. Tr. of Linn. Soc. v. 1. t. 235. Mart. Brit. Bot. t. 190. Mart. Ruff. t. 2. (T. flexu- ofam; Jacq. Ait. r. 386. T. alpestris; Fl. Dan. t. 662. Hudf. ed. 2. 326, but not of Linneus.)—Spikes lax. Stems zigzag, branched. Corolla monopetalous, nearly equal. Two upper calyx-teeth shorted. Stipulas linear, taper-pointed. Native of most parts of Europe, particularly in elevated calcareous pastures, or on a gravelly soil over clay, flowering in July. Differs from the last in its zigzag, more branched, stem, whose pith is very thin and peliucid, that the centre seems hollow. The longer and finceur litoralis, and more lax spikes, as well as the fringed elliptical leafets, somewhat glaucous beneath, further mark this species, which ought to be carefully distinguished, as being deifique of any value to the farmer. The root is perennial.

47. T. alpefr. Oval-spiked Narrow-leaved Trefoil, or Clover. Linn. Sp. Pl. 1082. Willd. n. 39. Ait. n. 29. Jacq. Ait. r. 433. Mart. Ruff. t. 1. Ait. Tr. of Linn. Soc. v. 1. 243. (T. folio longior, flore purpureo; Rivin. Tetrap. Irr. t. 12. f. 1.)—Spikes globose, more numerous. Calyx-teeth hairy; the lowermost as long as the monopetalous corolla. Stipulas bristle-pointed. Leaflets lanceolate, nearly entire. Stem simple, erect.—Native of mountain forests, in Siberia, Germany, Thrace, and Swit- zerland. The late Mr. Davall, who never met with this species, except in one little spot, in a forest near Orbe, was perfuaded it was unknown to Haller, in his n. 376, though taken for this, being probably our *medium*. Among fifteen or sixteen plants, Mr. Davall saw but one with two heads of flowers. The root is perennial. Stem straight, angular, downy, a foot high. Leaves most like *T. rubens*, as beautifully frated with veins, but far less vividly toothed. Stipulas hairy, linear, united to the footstalk about half its length only; their points almost thread-shaped, very long, hairy, shorter than the lower footstalk, longer than the upper. Flowers crimson, in a round head, overtopped by the upper leaves. Of no use for cultivation, affording few leaves, and never branching.

Stipula.
TRIFOLIUM.

Stipulas awned. Stem branched. Leaflets ovate, obtuse, slightly and minutely toothed."—Found by Mr. Schoutboe in Morocco. Root annual, or biennial. Wild. We know nothing more of this species.

Leaflets an inch and a half or two inches long, elliptic-lanceolate, either quite entire, or bluntly toothed towards the end, which is tipped with a little fpine point. Stipulas oblong, ribbed, united to the lower half of each footstalk; their margins twice as long as the footstalks. Calyx furrowed, its upper part, and long teeth, clothed with long and dense fally hairs. The prominent rounded angle of each wing of the corolla retains, in the dried femen, a remarkable whitenefs, something of which may be feen in T. ochroleucum.

Profeflor Willdenow, in a note to his Enumeratio, 793, has feparated Tournefort's plant by the name of armenium, diftinguifhing it chiefly by the leaflets being linear-lanceolate, and emarginate; for the flight differences in the proportion of the lower calyx-tooth and tube of the corolla, as well as the caflual branching of the stem, are of no moment. Our Bithynian fpecimens have certainly narrower leaflets than one fent from Piedmont; but thofe in the Linncean herbarium, as well as the plates of Jacquin and Allioni, are intermediate between the two. We have not examined an authentic fpecimen of Tournefort, but there is no reafon, from Willdenow's definition, to fuppofe his a different species.

51. T. elongatum. Long-beaked Trefoil. Wildl. n. 41. — "Spikes lax, embifie, foliary. Lower calyx-tooth the length of the wings of the monopetalous corolla. Standard very long. Stipulas lanceolate. Leaflets lanceolate, villous. Stem ascending, branched." — Native of Galatia. Perennial. The whole plant is villous. Stem half a foot high, branched from the base, round, ftriated. Leaflets toothed at the extremity. Stipulas oblong, with a lanceolate point. Calyx tubular, villous; with fetaeous teeth, four of which are nearly equal. Standard lanceolate, twice as long as the wings or keel. Differs from T. alpifcri in having small leaves, a longer standard, a branched ascending fem, and in being a hairy plant. Willdenow.

52. T. canescens. Hoary Oriental Trefoil. Wildl. n. 42. Ait. n. 31. Sims in Curt. Mag. t. 1168. (T. trichocephalum; Bieberf. Taur. v. 2. 212. T. orientale canescens, capitulo oblongo, fortiidé albo; Tourn. Cor. 27.) — Spikes ovate, lax, foliary. Calyx-teeth hairy, lanceolate, all nearly equal. Corolla monopetalous. Stipulas taper-pointed. Leaflets elliptical, villous. Stem fimpie, ascending. — Native of Cappadocia, and of the alpine heights of Caucasus, towards Armenia. Mr. Lodidges of Hackney received it from the neighbourhood of mount Caucasus. A hardy perennial, flowering in May. Root cylindrical, rather woody, branching at the top into several leafy tufts. Stems feveral, a fpans high, or not fo much, covered with clofe fally hairs, feightly hairy. Leaflets hardly an inch long, more or less acute, very nearly entire; moft ftriated with fine elevated ribs near the edge. Stipulas pale, minute and feparate, gradually tapering into a hairy point. Spike thick, two inches long, Calyx hairy; its lowest tooth very little the longer. Corolla cream-coloured. We conceive there can be no doubt of the correctness of the above fynonyms, though we have not compared fpecimens.

53. T. ochroleucum. Sulphur-coloured Trefoil. Linn. Syst. Nat. ed. 12. v. 3. 233. Wildl. n. 47. Ait. n. 36. Fl. Brit. n. 5. Engl. Bot. t. 1224. Jacq. Auffr. t. 40. Curt. Lond. f. a. 6. t. 40. Mart. Ruft. t. 35. Afzel. Tr. of Linn. Soc. v. 1. 229. (T. squarrosum; Linn. Sp. Pl. 1082. Wildl. n. 44. Ait. n. 33.) — Spikes elliptical, hairy. Lowest calyx-tooth very long, linear, finally reflexed and rigid. Stem ceref, downy. Lowest leaflets inferiofe heart-shaped. — Found in dry, bufty, gravelly or calcareous patures, in England, Switzerland, Austria, and the fouth of Europe, as far as Conftantinople, flowering in June or July. Root branching, perennial. Habit of the plant between pratensis, medium, &c. with which it agrees in flox, and pannonicum, which it refembles in fhape of the flowers. The white point of the wings, when dry, is confiderefe thick. The flowers are十二 or thirteen inches long, high, folid, but little branched, and of a fliff, fender, bare afpèct. Leaves dilant, on longifh stalks; the uppermoft opposite; leaflets linear-oblong, or somewhat elliptical, thefe of the lower leaves short, rounded, or obcordate; all hairy, and almost perfectly entire. Stipulas linear, tubular, clofie, with fimpie ribs, and a very taper point. Head terminal, flaked, eref. Calyx furrowed, hairy, with brifte-leafe teeth, the lower one thrice the length of the reft, and, after flowering, till more elongated, wijie, and reflexed, giving the head a feafer-like afpèct. Corolla monopetalous, yellow-fih cream-coloured, with a long eref standard. Le- gumceembranous, with one feed, in the fwellling tube of the calyx.

We remove this fpecies nearer to its allies than where Willdenow has placed it. In an advanced flate, it was defcribed by Linneus as diffus, by the name of squarrosum, but the original fpecimen from Sauvages's herbarium has enabled us to correct this mistake. The fynonym of Morifon, feet. 2. t. 13. f. 1, evidently belongs to T. anguf- tifolium, n. 57, though possibly his "other fpecies, with a round leaf," may be ochroleucum; but this is of little importance. What T. squarrosum of Bieberf. Taur. v. 2. 214, with a purplifh flower, may be, we cannot determine. It is requisite to correct an error in Fl. Brit. where Fuchs is cited improperly, his plant being T. montanum, here-after defcribed.

TRIFOLIUM

footstalks even to its uppermost opposite leaves, and also an emarginate standard; from obovate-lanceolate, with a long point, and the calyx-teeth nearly equal; from both it is distinguished by the annual or biennial root, roundish leaflets, white flowers, and whole aspect. 

55. T. maritimum. Tresel-headed Trefoil. Hudsf. ed. i. 284. Fl. Brit. n. 8. Engl. Bot. t. 220. Willd. n. 43. (T. bellatum; Hudsf. ed. 2. 326. T. bellatius glabrum; Ger. Em. 1208. Pluk. Phyt. f. 4. T. spicatum minus, flore minore dilutae purpureae; Morif. feé. 2. t. 14.)—Spikes terminal, nearly globose. Calyx-teeth lanceolate, leafy; finally spreading. Stipulas lanceolate. Leaflets obovate. Native of muddy marshes, especially near the sea, in various parts of the English coast, from Norfolk to Somerfetshire, or does this Trifolium seem to be known in any other part of the world. The plant is annual, flowering in June and July. Stems numerous, near a foot high, spreading or decumbent, branched, very leafy, round, fringed, a little hairy. Leaflets from half an inch to an inch long, of a narrow ovate, bristle-shaped, the dark green, hairy. 

56. T. incarnatum. Crimson Trefoil. Linn. Sp. Pl. 1083. Willd. n. 45. Ait. n. 34. Curt. Mag. t. 328. Sm. Fl. Græc. Sibth. t. 748, unpublished. (Lagopus maximus; Clf. Hift. v. 2. 246. Ger. Em. 1192. L. latifolius; Rivin. Tetrap. Irr. t. 17.)—Spikes cylindrical, obtuse, leaflet-like, hairy. Leaflets ineradically heart-shaped, rounded, crenate, hairy. Calyx-teeth awl-shaped, nearly equal.—Native of Italy, France, Switzerland, &c. Gathered by Dr. Sibthorp on the celebrated mount Athos. This is a hardy, annual, and considerably ornamental plant, long known in our gardens, flowering in July, but not in such general cultivation as it deserves. The broad roundish leaflets; obtuse, wavy, red-veined stipulas; and especially the long denf dufed spikes, of a peculiarly rich and beautiful crimson or carmine colour, readily distinguishes this species. As the seed ripen, the spreading, rigid, pointed calyx-teeth render the spikes very prickly. The stem is erect, softly hairy, eighteen or twenty-four inches high.

57. T. angustifolium. Narrow-leaved Trefoil. Linn. Sp. Pl. 1083. Willd. n. 48. Ait. n. 37. Sm. Fl. Græc. Sibth. t. 749, unpublished. (T. alpeccrum angustifolium elatus; Barrel. Irr. t. 658. Lapogus hispanicus; Rivin. Tetrap. Irr. t. 16. L. angustifolius hispanicus; Clf. Hift. v. 2. 247. Ger. Em. 1193. T. spicatum minus, flore minore dilutae purpureae; M. Em. t. 751.)—Spikes cylindrical, hairy. Leaflets linear, pungent. Calyx-teeth bristle-shaped or nearly entire, dark green, nearly roundish, rather longish.—Native of the south of France, Spain, Italy, Germany, Carniola, Caucaus, Greece, and the Archipelago, flowering early in summer. In the latter countries it goes by various modern Greek names, synonymous with Cast's tail. This Trefoil has often been raised in our gardens, being a hardy annual, distinguished from the last by its very narrow, very gravelly leaflets, and the pale pink, or lilac, hue of its corolla.

59. T. flclatum. Starry-headed Trefoil. Linn. Sp. Pl. 1083. Willd. n. 51. Ait. n. 39. Compend. Fl. Brit. ed. 2. 110. Engl. Bot. t. 1545. Sm. Fl. Græc. Sibth. t. 756, unpublished. (T. bellatum purpureum monspeliacanum; Bauh. Hift. v. 2. 376. f. 2. Morif. fét. 2. t. 13. f. 9.) Lagopus minor echinus, capite globoflato, floribus purpureis; Barrel. Ic. t. 860.—Spikes terminal, hairy, ovate. Calyx-teeth spreading, leafy, equal, taper-pointed. Leaflets ineradically heart-shaped, toothed. Stipulas elliptical. Stems spreading.—Found in sandy fields throughout the south of Europe, and every part of the Levant, flowering in June and July. Tradefant cultivated this pretty plant, and Gerard has left us a good description, but no figure. Hudfon latterly mistook his own maritimum, n. 55, for the flclatum; but the latter was discovered by Mr. W. Borrer in Suffolk, in 1804, growing plentifully between Shoreham Harbour and the sea. The herb is annual, varying much as to luxuriance, always considerably hairy, spreading or diffuse. Leaflets small and abrupt. Flowers white, or blush-coloured, monopetalous, the standard erect, rising much above the very hairy calyx, whose enlarged, red or tawny, teeth spread in a flary manner after flowering, when their crimson bases are entirely contrasted with a dense tuft of white cottony hairs, which clofe the mouth, and conceal the little membranous single-feeded legumes.

60. T. leucanthum. White-bloomed Tartarian Trefoil. Biebebr. Taur. v. 2. 2. 214.—"Spikes villous, nearly globose, flaked. Calyx spreading, with nearly equal teeth, shorter than the corolla. Stipulas awl-shaped. Leaflets obovate-oblong, slightly ferrated at the exstreme."—Native of dry hills, in the southern parts of Tartary, flowering in May and June. Pallas mistook it for T. flclatum, to which it is described, in the above work, as being very near; but the stems are only about a finger's length, stipulas lanceolate-awl-shaped, entire, (which is the most material distinction,) leaflets much oblong; at leaf the upper ones, flowers smaller, the villous hairs of the calyx (we presume in its mouth) reddish, not white.

TRIFOLIUM.

T. pratense, but the leaflets are shorter and rounder, sometimes marked at each side with a small marginal purple streak, not a central spot. Flowers either light rose-coloured, or white. Calyx very remarkable, especially as the fruit advances, for its broad, ovate, pointed, hairy, many-ribbed teeth, or segments, forming a sort of fiveangled shield, green and leafy, its mouth closed by an oblong valve, under which is the small, membranous legume, with a gibbous seed. The great inequality of its calyx-teeth distinguishes this plant from the _fistulatum_ and _maritimum_; its broad stipulas approach the former, but are totally unlike the latter. Indeed these three species, though more naturally allied, by the peculiarities of their _calyx_, to each other than to any of the foregoing besides, are very unlike in habit. Many of the following accord with them in the leafy nature of _their_ calyx, but differ in having lateral heads, to say nothing of their much smaller dimensions.

62. T. albicans. Whitith Starry Trefoil. Retz. Obs. facs. 4. 30. Willd. n. 53. Ait. n. 41.—'Spikes stalked, nearly globular. Calyx spreading; its lower tooth linear-awl shaped. Stipulas linear-awlshaped. Leaflets oblong, stems diffusif.—The native country of this species is unknown. Professor Retzius raised the plant from seeds he obtained under a wrong name, Mr. Atten mentions it as from Tarsus, at about 786. It is an annual, flowering in July and August. The _stems_ are branched, round, slightly downy; _branches_ knotty at the base. _Leaves_ opposite; _leaflets_ of the lower ones ovate, of the upper lanceolate, with a short recurved terminal bristle, the margin and keel fringed. _Stipulas_ streaked with green and white. _Heads_ on long straight stalks, without floral leaves; nearly globular when in flower, ovate in fruit. _Calyx_ cylinrical, downy, with close-preceded awl-shaped teeth; the lowermost three ribbed, about the length of the corolla, which is yellowish-white and monopetalous; the dorsal ones, which are rather shorter than the two next, are cleft to close to the corolla, that their points are hidden under the lateral teeth. As the _fruit advances_, the _calyx-teeth_ become dilated and spreading, as in _T. fistulatum_. _Retzius._ We have seen no specinmen.

64. T. cichoriun. Little Hedge-hog Trefoil. Bieb. Taur. v. 2. 216.—'Heads ovate, terminal and axillary, stalked, leafy. Calyx-teeth awl-shaped, unequal, hairy, shorter than the corolla. _Stems_ declining, branched. Leaflets oblong-oblong, entire.'—Native of mount Caucasus. _Annual. Habit of T. lappaceum_, n. 38. _Stems_ rather hairy, with subdivided branches. _Stipulas_ awl-shaped, hairy. _Leaflets_ entire, slightly hairy. _Flower-flakes_ much longer than the heads. Calyx liriated, downy all over; tube very short; teeth extremely narrow, finely pointed, clothed with spreading hairs; the lowermost longest; all widely expanded when the fruit ripens, as in _T. lappaceum_. Corolla monopetalous, pale, twice the length of the calyx, with a long lanceolate flabellum. We have seen no specinmen. This species appears indeed to be very near _lappaceum_, though ranged after _fistulum_ by the learned author who is our only guide.

66. T. parviflorum. Small-flowered Trailing Trefoil. Ehrb. Beitr. v. 7. 165. Pl. Scot. n. 29. Willd. n. 56. Bieb. Taur. v. 2. 218.—_Heads_ globose, axillary, stalked, nearly smooth. _Calyx-teeth_ awl-shaped, rather unequal, spreading, recurved, longer than the corolla. _Stems_ procumbent. _Leaflets_ obovate, toothed.—Native of Hungary and Siberia. _Willdenow._ Linneas knew this plant, but confounded it with _tripanum_; see n. 20. It is most akin to _glomeratum_, in size, habit, smoothness, mode of growth, and peculiar characters; but differs essentially in the length and form of its _calyx-teeth_, as well as the stalked _heads_, and remarkably membranous pellucid _stipulas_, with green awl-shaped teeth. The <i>corolla</i> seems to be fethile coloured. A few hairs are sometimes seen on the _calyx_, which is very strongly ribbed.

67. T. _fistulatum._ Soft Knotted Trefoil. Linn. Sp. Pl. 1085. Willd. n. 57. Pl. Brit. n. 12. Engl. Bot. t. 1843. (T. parvum hirtulum, _floribus parvis dilute purpureis_, in _glomerulosis_ oblongis, _Stevens._ Vail. Pars. t. 380. f. 13. 3. _Vaill._ Parif. t. 33. f. 2.)—Heads ovate, fethile, lateral and terminal. _Calyx_ elliptical, hairy, furrowed, with bristle-shaped, rather unequal, teeth. _Leaves_ downy.—Native of dry, rather barren, sandy pastures, in Germany, Hungary, France, Spain, and England, flowering in June. _Root_ annual, with small fibril knobs. Whole herb downy, and very soft to the touch, by which it is known from all the species which it otherwise refembles. _Stems_ procumbent, from three to five inches long, branched, round, often zigzag. Leaflets obovate, finely tooched. _Stipulas_ ovate, broad, pointed, somewhat membranous between the ribs. _Heads_ mostly terminal. _Calyx-teeth_ green, fringed, lengthened out after flowering. _Corolla_ pale colore, abouot as long as the _calyx_. _Germen_ with rudiments of two _seeds_; _legume_ with only one, which is thrice as large as that of _glomeratum_, n. 65.

68. T. gemelum. Twin-headed Trefoil. Willd. n. 58. _Heads_ oblong, terminal, in pairs. _Calyx_ hairy; its teeth bristle-shaped, unequal, longer than the corolla. Leaflets wedge-shaped, entire, finely tooched at the extremity. _Stems_ simple.—Native of Spain, from whence specimens were sent by the abbé Pourret, to professor Willdenow, under the above name. _Root_ annual. _Stems_ a
TRIFOLIUM.

finger's length, or more, diffuse, villous. *Leaflets* villous, hoary, lanceolate-wedge-shaped, frayed with veins. *Stipulas* lanceolate-pointed, membranous, ribbed. One of the heads stalked, the other sepal.

70. T. alexandrinum. Egyptian Trefoil. Linn. Sp. Pl. 1085. Amoen. Acad. v. 4. 286. Willd. n. 60. Ait. n. 45. Fork. *Egypt.-Arab.* 139.—*Heads* ovate, on axillary *flalks*, longer than the leaves. *Calyx* hairs; its teeth awl-shaped, unequal. Stern erect. Floral leaves opposite. Leaflets elliptic-lanceolate, with shallow teeth. *Native of Egypt*. The root is annual. *Stems* a foot or more in height, naked in the lower half, round, fluted, smooth. *Leaflets* uniform, an inch or inch and half long, somewhat downy, about the length of the *common flalks*. *Stipulas* oblong, veiny, with green leafy awl-shaped points, of their own length. The lowest *leaves* only are opposite, one of them embracing the *flower-flalks*, the other the main *flank*, which rises some inches above it, bearing many alternate leaves, and perhaps more flowers. *Heads* solitary, near an inch long. *Corolla* monopetalous, white; *standard* linear, obtuse, longer than the *wing*, which are marked by a small prominent calloity at their base. *Stigma* downy towards the *standard*.

Forkill says, this is the Trefoil univerally cultivated in Egypt, being the *beef*, and indeed the principal fodder for cattle in that country. It is fown only at the reefs of the Nile; and where the fields are too high to be inundated by that river, they are watered by means of hydraulic engines, the *feeds* being committed to the earth while it is wet. The produce is three separate crops, the plants growing each time about half an ell in height, and there are three months between each harvest. After the last they die. The first crop is the *beef*. When the *Trefoil* is wanted for *seed*, it is fown along with the wheat. Both are gathered at once, by the hand, not reaped or mown, and are threshed out together, the *Trefoil* seed being afterwards sepaed by a forge. Our British agriculturists do not appear to know any thing of this species of *Clove*, which being so important in its own country, might be worth trying, at least, in this. We beg leave to recommend it to their notice. The plant was introduced at Kew, in 1756, by Mr. Hennemann, and we trust its progeny has been continued. For the occupants of low oozy lands in the fens it promises most benefit, provided the Egyptian mode of culture be the most eligible.

71. T. siccum. Siccum Trefoil. Linn. Mant. 276. Willd. n. 61. Fl. Brit. n. 13. Engl. Bot. t. 1049. Tr. of Linn. Soc. v. 2. 357. Jacq. Hort. Vind. v. 1. 24. t. 60.—*Heads* sessile, lateral, roundish, nearly smooth. *Calyx*-teeth lanceolate, acute, recurved, longer than the *corolla*.—Found in the loose blowing sand of the *seacoast* of Sicily and England, *flowering* in June and July. Mr. Wigg first discovered and ascertainment it near Yarmouth. Others have met with the plant, along the coast, from that place to Landguard fort. This little annual species is more truly subterraneous than our n. 29, the *flens* and *flowers* being often buried entirely in dry sand, the leaves only peeping above the surface, so that the species might well remain in obscurity. In smooths and general habit it comes so near to *glimeratum*, n. 65, that we have sometimes doubted its being more than a variety, caused by peculiarity of situation. But the *calyx-teeth* are lanceolate, by no means heart-shaped, and extend considerably beyond the *corolla*, which is closed so as to protect the organs of reproduction, which perform their functions under the dry sand. To provide against accidental, each *legume* has two *seeds*, both which are often perfect. The *petals*, naturally rose-coloured, are rendered whitish by the exclusion of light. The *flipulas* are broad. *Leaflets* wedge-shaped, finely toothed, smooth.

72. T. unfiorem. Dwarf White Trefoil. Linn. Sp. Pl. 1085. Amoen. Acad. v. 4. 285. Willd. n. 62. Sm. Fl. Græc. Sibth. t. 752, unpubl. (T. vernum repens, flore albo exiguo; Buxb. Cent. 3. 18. t. 31. f. 2. Melilotus cretica humilima humifusa, flore albo magno; Tourn. Cor. 28. Spica trifolia; Alpin. Exot. 169. t. 168.)—*Stems* much shorter than the *footstalks*, depressed. Stalks fingle-flowered, aggregate, shorter than the points of the *flipulas*. *Tube* of the *calyx* longer than its awl-shaped teeth. *Native of Syria*. Arabia, and the neighbourhood of Constantinople. Dr. Sibthorp observed it on the loftiest mountains of Crete, as well as in Lemnos, Greece, and Asia Minor. The root is perennial. *Stems* several, most like those of *T. cespitosum*, n. 21, in their depressed position, but full shorter, closely invested with feathering membranous *flipulas*, whose long, green, awl-shaped points extend beyond the axillary *flower-flalks*. The latter, a quarter or half an inch long, grow usuall three together, from one common base, attended by very minute *bracteas*, each of them bearing a large white *flower*, full an inch long, whose *calyx* is tubular, ten-ribbed, nearly smooth, with rather unequal hairy teeth, half the length of the tube, having curved points. *Standard* broadish, erect, emarginate, longer than the *wing* or *keel*. *Footstalks* twice as long as the *flowers*, measuring full two inches, slightly hairy. *Leaflets* broadly obovate, smoothish, strongly ribbed, with fine, sharp, partly hooked, marginal teeth. It is very probable this species may have several *seeds* in each *legume*, and may belong to the second section. This point we want materials to determine.

Sect. 4. VESICARIA. Calyx inflated, seeling after *flowering*.

73. T. spinosum. Bladdery Trefoil. Linn. Sp. Pl. 1085. Willd. n. 63. Ait. n. 47. Sm. Fl. Græc. Sibth. t. 753, unpubl. (T. caule nudio, glomerulus glabris, &c.; Bauh. Hist. v. 2. 379, bad.)—*Heads* ovate. *Calyx* of the *fruit* ovate, tubid, smooth, with bristle-shaped recurved teeth. *Bracteas* membranous, lanceolate. *Stem* and branches *erect*.—*Native of Languedoc, Italy, and Cyprus*, in cultivated fields. *Root* annual. *Stems* numerous, spreading, a span high, leafy, branched, smooth like the whole plant, which has the general aspect of our common purple *Clover*, though totally different when examined. *Flipulas* from two to four inches long. *Leaflets* obovate, frayed, toothed, marked with white. *Stipulas* pale, membranous, ovate, taper-pointed, entire. *Heads* solitary, terminal, ovate or roundish. *Corolla* long and slender, crimson, with a white tube; *standard* ovo-lanceolate, erect, entire. *Calyx* tubular, membranous, flesh-coloured, very smooth, with five nearly equal, green, flender, spreading teeth, one-third the length of the tube. As the fruit advances, the tube becomes inflated, obliquely elliptical, with many red ribs, connected by fine reticulations; the teeth rather unequal, and recurved; the *corolla* remaining dry and hard- ended in the mouth of the *calyx*, and inveting the *legume*, which
which is four-seeded, furnished with a long prominent beak. Each flower has a narrow lanceolate bract; besides the five broader ones under the head. The latter are said to be wanting in T. turdium, Bieberit. Taur. v. 2. 216, which is perhaps a variety, with paler flowers.

75. T. refulsum. Revered, or Salamanca, Trefoil. Linn. Sp. Pl. 1086. Willd. n. 63. Ait. n. 48. (T. folliculatum, five vasciarium, minus, purpureum; Bauh. Hift. 379. T. pratense folliculatum, flore inverso; Barn. Ic. v. t. 73. n. 824. t. 872.)—Heads roundish. Flowers recurved. Calyx of the fruit inflated, oblong, membranous, reticulated, downy, with two terminal spinous teeth. Stems prostrate.—Native of Germany, Flanders, Italy, all Greece, and the Archipelago, flowering in the spring. A smooth annual plant, much agreeing in habit with our English glomeratum, but larger, and the lateral heads of little cripmin flowers are supported by longiflalks. Each flower is turned on its back. The heads in seed are twice as large, being then near an inch broad. Calyx of the fruit much enlarged, split lengthwise, pale green, beautifully reticulated with strong veins, terminating in two teeth only, and be sprinkled with short tawny hairs. Legumes two-seeded. Leaflets obovate, ribbed, ferrated. Stipulas short, abrupt, with lanceolate teeth. We presume T. biacus, Forl. Egypt.-Arab. 139, can hardly be different from the precent species.

76. T. tomensum. Woolly Ball Trefoil. Linn. Sp. Pl. 1086. Willd. n. 65. Ait. n. 49. (T. fragiferum; Rivin. Tetrap. Irr. t. 10. f. 2. T. fragiferum tomentosum; Magn. Monsp. t. 265. t. 264. T. glomerulus tomentosus per caulis longitudinem; Bauh. Hift. v. 2. 379.)—Heads globosae. Calyx of the fruit inflated, globose, membranous, reticulated, denfely woolly, with two minute terminal teeth. Stems prostrate.—Native of the south of France, as well as of Spain, Portugal, Barbary, Greece, and the Levant. Cultivated by Parkinson, before 1640. Ait. Root perennial. Stems numerous, from two to six inches long, branched, prostrate, but not creeping. Leaflets obovate, smooth, obtuse, nearly ribbed, bordered with minutely spinous teeth. Stipulas ovato-lanceolate, pointed. Heads lateral, flatkled, shorter than the leaves and footalks, hemispherical while in flower, in which state the tube of the calyx is very smooth, with three teeth, on the under side; gibbous and woolly on the upper, with two teeth. As the fruit ripens, each head becomes an aggregate ball, half an inch in diameter, of globular, crowded, denfely woolly calceae, exquisitely reticulated with pink veins. Nothing can be more distinct from the lafl, yet their specific characters are not easy to define in a flaking manner. Linnaeus justly remarks, that this speces comes nearer to refulsum, with which its corolla agrees, than to fragiferum, which it so much resembles in fruit. Some copies of Rivinus want the figure above cited, which was added to the plate after its firfl publication.

77. T. fragiferum. Strawberry-headed Trefoil. Linn. Sp. Pl. 1086. Willd. n. 66. Fl. Brit. n. 14. Engl. Bot. t. 1050. Curt. Lond. falc. 2. t. 55. Fl. Dan. t. 1042. Ger. Em. 1288. (T. fragiferum, flore oblongo; Vaill. Parif. t. 22. f. 2.)—Heads roundish, on flalks much longer than the leaves. Calyx of the fruit inflated, globose, membranous, reticulated, nearly smooth, with two awl-shaped, terminal, curved teeth. Stems creeping.—Native of low moist pastures or heaths, especially by rivers, in a black boggy soil, throughout Europe, from Sweden to Greece, and in Asia Minor, flowering in summer. Rosse perennial. Herbage to like T. repens as to be easily confounded therewith, except that the heads of flowers are smaller, and most generally pink; though oftener white in Sweden. Stipulas lanceolate, large, acute, white and membranous, with green veins. The head, when perfecfling fruit, strikingly resembles a hawberry in shape, in size and colour, but being larger than that of the last species, nearly smooth, and more richly coloured with red and green. The two spinous points of the calyx are also far more considerable. Legumes with two seeds. This Trefoil is eaten by cattle, but its crop is late, and of trifling amount.

78. T. phyloides. Bladder-headed Trefoil. Bieberit. Taur. v. 2. 217.—"Heads roundish. Calyx of the fruit inflated, membranous, downy, with five nearly equal bristle-shaped teeth, as long as the tube. Flower-flalks as long as the leaves. Stems procumbent, very smooth."—Native of Georgia. Chev. de Steven. Refembles the last, but is a distinct species. Stems scarcely taking root, long and slender, very smooth, not clothed with scattered spreading hairs as in T. fragiferum, any more than the footalks and flower-flalks. Stipulas narrower, with a longer point. Leaflets larger, and of a brighter green. Flower-flalks shorter. Flowers with partial flalks a line in length, which render the head less dense. Calyx-teeth all nearly equal, resembling the two terminal teeth of the last. Corolla redder; with a longer and narrower standard. Such is the description of the author quoted. The calyx-teeth appear to us to afford the most decided specific distinction. T. fumens of the fame writer is probably, as he auspots, only a more slender variety of his phyloides, with longer flalks, smaller heads, and fewer flowers; but especially smaller calyx-teeth.

Seft. 5. LUPULINA. Standards of the flowers inflaxed.

79. T. montanum. White Mountain Trefoil. Linn. Sp. Pl. 1087. Willd. n. 67. Ait. n. 51. Bieberit. Taur. v. 2. 218. (T. folio longiore, flore albo; Rivin. Tetrap. Irr. t. 12. f. 2. T. pratense album; Fuchf. Hift. 818. 1c. 472. T. majus primum; Cluf. Hift. v. 2. 245. T. majus flore albo; Ger. Em. 118.)—Spikes standard. Roundish. Stalkuald, awl-shaped, withering. Stem erect. Leaflets elliptical, with bristle teeth.—Native of dry mountainous pastures, in Germany, Switzerland, Savoy, and Crete, flowering in August. Dr. Pitcairn is said to have imported it in 1786. The root is woody and perennial. Stems about a foot high, filky as well as the footalks. Lower leaflets broader and obtuse; upper more lanceolate and very acute; all smooth above, light green, nearly ribbed. Heads flatkled, at first hemispherical, but from the drooping of the lower most flowers, as they fade, soon becoming elliptical, and near an inch long. Corolla white. Tube of the calyx pale, hairy about the top only; teeth about as long, awl-shaped, erect, rather unequal, remaining unchanged. The standard, like the other petals, does indeed remain in a dried hardned state, but scarcely more than in T. hybridum, repans, &c. to which the present species is so nearly related in every other respect, and so little like the rest of this feclion, that we could wish to remove it from hence, were not Linnaeus and every other author against us.

TRIFOLIUM.

decumbent.—Found wild on the mountains of Crete, and in the isles of Cyprus and Zant. Mr. Hawkins observed this beautiful Trefoil as the only plant made into hay in the latter country. It might perhaps be tried with advantage in the dry open parts of the south of England. The root is annual, if we may judge by appearances. Herbage rather glaucous, nearly smooth. Stems spreading in every direction, much branched, purplish, about a foot high, but by culture they would certainly become more luxuriant. Leaflets obovate, toothed, emarginate. Striplus lanceolate. Heads numerous, above an inch broad, on axillary flalks, longer than the leaves. Calysk smooth or hairy, its tube very short, and two upper teeth not longer; three lower (Willdenow erroneously says the upper) thrice as long, shorter than the claws of the petals. Standard of a dull but elegant blac hue, strongly ribbed, sharply toothed, withering and permanent, turning brown as it fades. Wings and keel yellow, shorter, the latter very small. The flowers are not reverfed. Willdenow was milled by a dired specimen.

84. T. minus. Lesser Yellow Trefoil. Relb. Cant. 290. Fl. Brit. 1403. Compend. 111. Engl. Bot. t. 1256. Ait. n. 55. (T. filiforme; Fl. Brit. 793.; T. filiforme; Ehrh. Herb. n. 49. T. procumbens; HUD. 318. Curt. Lond. fac. t. 14. T. lupulinum alterum minus; RAI. Syn. 533. t. 14. f. 3. T. luteum minimum; GER. 1186.) Heads hemipherical. Flower-flalks straight and rigid. Standard nearly smooth. Stems prostrate. Common footstalk very short below the leaflets.—Very frequent in dry gravelly pastures, of England, Germany, and Switzerland, flowering in June and July. Root small, annual, often furnished with little flabby knobs. Stems but little branched, from six to twenty-four inches long; most succulent and brittle in the larger variety, Engl. Bot. f. 1, which Dr. Becke recommends as likely to prove a most valuable plant, for cultivation in upland pastures, being highly acceptable to cows and sheep. The central leaflet is elevated on a much more considerable parallal flalk than in the foregoing or the following species, while the common footstalk, though variable, is in general remarkably short. Leaflets obovate and emarginate, or obcordate, serrated. Flowers from twelve to fifteen only, pale yellow, making a little hemipherical head, and all finally deflexed. Standard scarcely wrinkled or furrowed. Legea small, elliptical, singe-leafed. See the next species.
ohovate, obtuse. Seeds rarely more than one in each legume. Calyx-teeth very unequal, taper, hairy. Linnaeus confounded this with the preceding, as appears by his herbarium. Others have thought it not distinct from the following; but we trust both those mistakes are now sufficiently cleared up.

85. T. siliforme. Slender Yellow Trefoil. Linna. Sp. Pl. 1088. Fl. Suec. ed. 2. 261. Wild. n. 72. Fl. Brit. 1424. Engl. Bot. t. 1257. (T. lupulinum minimum; Dill. in Rait Syn. 331. t. 14. f. 4.)—Heads lax, of few flowers. Flower-flats capillary, wavy. Smooth, staminal. Stems prostrate. Leaflets all nearly sessile.—Native of rather moist gravelly pastures, among short grass, in Scania, as well as in England, flowering in June and July. Annual, like the last, but usually more prostrate, and much smaller, discoverable chiefly by its little yellow heads of flowers, entangled by its capillary flaks, among the radical leaves of short grass, on grass-plats, where the soil, though gravelly or sandy, is somewhat moist, and prone to bear mofs. The stems are about a finger's length, numerous, slender, and branched. Leaflets narrow, nearly or quite sessile, on a short common stalk. Flowers from three to eight, drooping, each on a very slender, though elongated, partial stalk, and all leaning toward one side. Calyx quite smooth; its teeth less remarkably disproporionate than in T. minus. Leaves obovate, sometimes two-leaved, scarcely covered by the withered pale-brown corolla, whose standard is not at all furrowed. Sometimes the size of this species exceeds that of the smaller variety of the last; but if the above characters be attended to, no confusion can arise.

Linnaeus, at the end of this genus, classifies the various species according to their inflorescences, whether racemose, umbellate, fasciculate, capitate, or spiked; which serves to shew the impropriety of any generic character derived from thence.

TRIFORIUM, the gallery which usually goes round a church of the pointed style, over the side-aisles, so called by Gervafius and other ancient writers.

TRIFORIUS, in Mythology, an epithet given to Diana; which see.

TRIGA, in Antiquity, a kind of car, or chariot, with three horses.

The trigia, in reality, was only drawn by two horses; so that it was properly a biga; but it had, besides, a third horse tied to the others, like a led horse, for change. Statius calls the third horse, equus funalis; Hefychius, παλαιος; and Dionysius Halicarnassensis, στρις.

We do not find the trigia on any ancient monument; but it was a long time in use among the Romans, at their lati Circensia. The Greeks, who first introduced it, soon abandoned it.

TRIGAL, or TRIGA, in Geography, a town of Prufia, in Natangen; 9 miles S. of Lick.

TRIGAMY, a third marriage; or the state of a person who has been married three times.

In the ancient church, trimagia was only allowed to such as had no children by their former marriages.

If, having children by one or both the former, they married again, after forty years of age, they were excluded from communion for five years. If they were only forty years old, the penance was but four years. See Bigamy.

TRIGAUULT, Nicholas, in Biography, a Jefuit missionary, was born at Donuar in 1576, and having entered into the Society of Jefus, was sent, in 1610, on a mission to the East Indies. After a year's residence in China, he came to Europe for a recruit of missionaries, and returned with forty-four associates. At length his life and labours terminated at Nanking in 1628. Of his works, which were numerous, we shall only mention his treatise entitled De Christiana Expeditione apud Sinas et Matthi Ricci Commentarium, etc., 1615, 4to.

TRIGEMINI Nervi, in Anatomy, the nervae of the fifth pair of the head. See NERVE.

TRIGINTAL. See TRIDENTAL.

TRIGA, or GUNNARD, in Ichthyology, a genus of fish of the order of the Thoraciz; the characters of which are, that the head is large, mailed, and marked by rough lines; the eyes large and round at the vertex; the mouth large; the palate and mandibles armed with sharpened teeth; and the nolabris double; the aperture of the branchia or gills large; the gill-cover (piny), and the gill-membrane ventrally; the body covered with scales, wedge-formed; the back straight, with a longitudinal furrow on both sides; the lateral line near the back, straight; the abdomen thick, the ventral and pectoral fins large, and, in some species, near the pectoral fins are finger-shaped processes.

Species.

CATAPHRACIA; Red Gunnard. With double fingers; forked elongated fin, and octagonal mailed body: its length is about twelve inches; the longitudinal rows or divisions of the body are marked by many serrated or aculeated lines; beneath the throat is a pair of ramified cirri; the pectoral fins and tail are pale-brown; the other fins pale-yellow, and nearly transparent; rays of the first dorsal fin running out beyond the membrane. A native of the Mediterranean.

LYRA; Red Gunnard. Silvery beneath, with triple fingers, and bifid denticate fin. This is the Piper of the Britifh Zoology. Its length is from one to two feet more; its lateral line formed of small scales; its scales are small, pectoral fins large, slightly tinged with dull blue; tail of like colour; the other fins yellowish, with red rays. Native of the European seas, and considered as an excellent fish for the table.

GURNARDUS; Grey Gunnard. With triple fingers, and lateral line mailed with rounded whitish scales; length the same; that of the former; colour above deep green, with blackish and red spots, beneath silver; scales small, lateral line strongly marked with a series of larger, rounded, whitish scales, with a dusky central spot. Native of the European seas, and not uncommon about our own coasts, feeding on worms, insects, &c.

CUCULUS; Red Cuckow Gunnard. Silvery beneath, with triple fingers, and first dorsal fin marked by a black spot: elegant species, about a foot in length, of a more slender shape than the lat; colour on the upper parts a beautiful red, more or less distinctly marked by whitish transverse bars; scales extremely small; lateral line composed of pointed white scales edged with black, and a simular row on each side of the back; fins transparent; the first dorsal marked on the edge by a black spot, the second tinged near its edge with yellow. Native of the European seas, and esteemed as a food.

LUCERNA; with triple fingers, sub-bifid fin, and lateral line bifid at the tail. Native of the Northern seas, and conjectured to be a variety of T. hirundo.

HICUNDO; Grey-brown Gunnard. Silvery beneath, with triple fingers, and very large ovalicose pectoral fins spotted with...
with blue: the Sapphiric gurnard of the British Zoology; and stock-fish of Willughby. Of the same size with the grey gurnard; scales middle-sized, lateral line rough, pectoral fins very large, of a violaceous olive, sometimes richly edged and spotted with blue. Native of the European seas, occasionally springing out of the water to some distance by means of its large pectoral fins.

Lineata; Red Gurnard. Marked above by dusky-fanguine spots, with the body crossed on each side by numerous perpendicular lines: the streaked gurnard of the British Zoology. Size and habit of T. cucusulus; colour bright-red, abdomen silvery; on each side of the back, close to the base of the dorsal fins, a row of broad, serrated, short processes of a yellow colour; lateral line formed by a row of similar ones; scales small, sides above and below the lateral line marked into very numerous, narrow perpendicular divisions; pectoral fins large, rounded, of a dusky-brown, spotted with black; rest of the fins yellowish, with a tinge of red, especially the tail, which is slightly natived. Native of the Mediterranean sea.

Asiatica; Silvery Gurnard. With quadruple fingers; body smooth, finnot smooth and prominent; anterior gill-covers serrated; pectoral fins calcuated. Native of the Indian seas.

Evolans; Springing Gurnard. With triple fingers, and three serrated spines between the dorsal fins; allied to the T. volitans, but furnished with three separate pectoral processes; the pectoral fins very large, but less than those of the next species; the pectoral fins blackish. Native of the American seas.

Volitans; Red Gurnard. With aculeated scales, very large pectoral fins spotted with blue, and septral fingers connected by a membrane; the Miltus of Salvian, Albovandus, Willughby, &c. This is a highly fingular and beautiful species; length about twelve inches; colour crimson above, pale or whitish beneath; head blunt, armed on each side with two very strong large spines, pointing backwards; the whole body covered with very strong carinated and sharp-pointed scales, hardly separable; first dorsal fin pale violet, crossed with deeper lines, and at its origin two separate rays longer than the rest; second dorsal fin pale, with the rays barred by brown; pectoral fins very large, transparent, of an olive-green, richly variegated with numerous bright-blue spots, fix pectoral processes separate, but united, and appearing like a small fin on each side of the thorax; tail pale violet, with the rays crossed by dusky spots, and strengthened on each side of the base by two obliquely transverse bony ribs or bars. Native of the Mediterranean, Atlantic, and Indian seas, where it swins in shoals, and is often seen flying out of the water to a considerable distance.

Japonica, or Alata; the Japanese Gurnard. With eleven fingers on each side, paleated by a membrane. About four inches in length; head angular; lower jaw and hinder margin of the gill-covers furnished with two strong spines. Native of the Japanese sea.

Adriatica. With the body verticillated by scales, with aculeated lateral line; pectoral fins black beneath, and triple fingers; supposed to be a variety of T. lineata, and differing from it by being varied with bands of black spots, and having the spots of the pectoral fins dispersed into two transverse bands, the edges being marked beneath by a row of blue spots. Observed in the Adriatic sea.

Minuta. With triple fingers, and bicipitae back. A small species: head hard and rough, emarginated and denticulated in front, and furnished with two spines above the eyes; posterior gill-covers spiny; pectoral and ventral...

Obi. Gartner and Brown, perhaps more justly, consider the fruit as an assemblage of three or five single-fedded capsules, without valves. Analogy confirms this opinion. Eff. Ch. Calyx of three leaves. Petals three, like the calyx. Styles none. Capsule superior, of three or fix cells, separating at the base. Seeds solitary.

3. T. mexicannum. Mexican Arrow-grafs. Kunth Nov. Gen. and Sp. v. 1. 244.—Capsules of fix cells. Spike very long. Leaves cylindrica. Root tuberos.—Native of moift upoloped situations in New Spain, flowering in January. Root perennial, oblong, horizontal, the thickens of a fwan’s quill, very denfely clothed with the rudiments (rather probably the remains) of leaves. All the leaves are radial, linear, narrow, blunthifh, smooth, two or three inches long, feathering at the bafe. Stalk erect, round, smooth, fix or eight inches high, including its eleyter, which measures half as much. Stamens fix. Stigmas red. Two or three of the cells, or capsules, are generally abortive. Kunth.

4. T. procera. Tall Arrow-grafs. Brown n. 1.—“Capsules of fix cells. Stigmas linear, recurved. Spike very long. Leaves linear, rather cylindrical at the bafe.”—Found by Mr. Brown, near Port Jackfon, as well as in the tropical part of New Holland.

7. T. dubium. Doubtful Arrow-grafs. Brown n. 2.—“Capsules of three, oblong-cylindrical, distinct cells; one or two of them here and there abortive. Spike elongated.”—Gathered in the tropical part of New Holland by Mr. Brown.

TRIGLOCHINE, in Anatomy, a fynonym of the tripyridval pide. See TRICUSPID.

TRIGLYPS, formed from τρίγλυπος, q. d. three engravings, from τρίς, sculp, in Architecture, a sort of ornamentals repeated at equal intervals in the Doric freeze. Each triglyph consists of two entire gutters, or channels, cut to a right angle, called glypha, and separated by three interlines, called by Vitruvii femora, from each other, as well as from two other half-channels which are at the fides.

The ordinary proportion of triglyphs, is to be a module broad, and one a half high. But this proportion, M. le Clerc observes, sometimes occasions ill-proportioned interculomations in the porticoes; for which reason he chooses to accommodate the proportion of his triglyphs to that of the interomulation.

The intervals between the triglyphs are called metopes.—Under the channels, or glypha, are placed guttae, or drops.

The triglyphs make the most distingjuishing character of the Doric order. Some imagine them originally intended for the conveyance of the guttae that are underneath them; others fancy they bear some resemblance to a lyre, and thence conjecture the ornament to have been originally invented for some temple faced to Apollo. See DORIC.

TRIGLYPH, Capital of a. See CAPITAL.

TRIGLYPTON, in Ancient Geography, a town of Italy, on the other fide of the Ganges, in the country called Randa-marcotta.

TRIGNO, in Geography, a river of Naples, which runs into the Adriatic, 12 miles N.W. of Ternoli.

TRIGOLO, a town of Italy, in the department of the Upper Po: 5 miles S.E. of Crema.

TRIGON, Trigonius, formed from τρίγωνος, triangle, in Geometry, a triangle. TRIGON, in Astrology. See TRIPLICITY.

TRICON, in Astronomy, denotes an aspect of two planets, wherein they are 120 degrees distant from each other; this is called also trine.
The trigons of Mars and Saturn are by astrologers held
mallic aspects.

The Trigonum, was also a musical instrument, used
among the ancients. The trigon was a kind of triangular lyre, or harp, and
was invented by Ibycus. It was used at feasts, and played on by women, who
struck it either with a quill, or beat it with small rods of different lengths and weights, to occasion a diversity in the sounds. See Trigonum.

Trigon or Triangle of Signs, is the name of an instru-
ment used for drawing the arcs of the signs upon dials: it may be made of brafs or any other solid matter, and of any size at pleasure. This instrument is constructed after the following manner: first draw the line a b (Plate XXXI. Astronomic, fig. 5) representing the axis of the world, and a e perpendicular to it, representing the radius of the equi-

cocial; and about the point a describe the circular arc d e c at pleasure. Then reckon 23\(^{1/2}\) both ways from the point e upon the said arc for the sun's greatest declination, and draw the two lines a d, a c, for the summer and winter tropics: likewise draw the line d e, which will be bisected by the radius of the equinoctial in e; about which point, as a centre, draw a circle, whose circumference passes through the points d and e of the tropics, and divide the circumference into 12 equal parts, beginning from d: through each point of division equally distant from d and e, draw occult lines parallel to the radius of the equinoctial circle: these lines will intersect the arc d e in the points, through which and which the centre a, lines being drawn, will represent the beginnings of the signs of the zodiac at 30° distance from each other. But to divide the signs into every 10th or 5th degree, the circumference must be divided into thirty-six or seventy-two equal parts. The characters of the signs are annexed as in the figure; and when the trigon is divided into every 10th or 5th degree, the letter of the month is placed to the 9th or 18th of each sign agreeing with it. However, this instrument may more readily be made by means of a table of the sun's declination; for having drawn the two lines a b and a c at right angles, lay the centre of a protractor on the point a, with its limb towards the point c; and keeping it fixed, count 23\(^{1/2}\) on both sides of the radius a e for the tropics of \(\phi\) and \(\phi^2\), 20\(^{1/2}\) for the beginnings of the signs \(\beta\), \(\gamma\), \(\delta\), and \(\epsilon\); and 11° 30' for \(\zeta\), \(\eta\), \(\iota\), and \(\kappa\). And thus the spaces for each sign may be graduated in every 10th and 5th degree by means of a table. The equinoctial points of \(\pi\) and \(\omega\) are placed at the end of the radius of the equinoctial a e. Trigon of Diurnal and Nocturnal Arcs. These are drawn upon sun-dials by curve-lines, like the arcs of the signs, and by means of them the shadow of the figure shows how many hours the sun is above the horizon, in any given day, &c.

The trigon of signs is the name for all latitudes, the sun's
decimation being the same for the whole earth; but the diurnal arcs are different for every particular latitude, and as many of these arcs are drawn upon a dial, as there are hours of difference between the longest and shortest days of the year. For the construction of this fort of trigon, draw the right line R Z (fig. 6) for the radius of the hour-line of 12, or of the equinoctial; and about the point R, with any opening of the compasses at pleasure, describe the cir-
cular arc T S V, and lay off both ways on it from the point S two arcs, S V, S T, each equal to the complement of the latitude. Then draw the right line T X V, about the point X, a as a centre, describe the circumference of a circle T Z V Y, which divide into forty-eight equal parts by dotted lines, drawn parallel to the radius of the equinoctial R Z: then these lines will intersect the diameter T X V in points, through which and the point R you may draw the radii of the trigons. The angles which all the radii make at the point R may be found trigonometrically by the following proportion: as radius is to the co-tangent of the latitude, so is the tangent of the difference between the meridional arc at the time of the equinox, and the arc propounded to the tangent of the sun's required declination.

The trigon of signs may be annexed to a rule or index. A (fig. 7.) in order to draw the arcs of the signs upon great
dials. The diurnal arcs may be drawn likewise upon this trigon, but the arcs of the signs and diurnal arcs too must
not be drawn upon one and the same dial, for avoiding con-
fusion. In the centre of the index there is a small hole, through which is put a pin, that the instrument may turn about the centre of a dial. The trigon slides along the in-
dex, and may be fixed in any part of it by means of the screw B. The arcs of the signs with their characters are
round about the circumference, and there is a fine thread fixed in the centre, in order to extend over the radii quite to the hour-lines of a dial.—For a farther account of these instrumens and their use, see Bion's Conatr. and Use of Math. Instr. by Stone, p. 231, &c.

TRIGONAL LEAF, among Botanists. See LEAF.

TRIGONAL NUMBERS. See TRIANGULAR NUMBERS.

TRIGONELLA, in Botany, the diminutive of trigona,

Gen. Ch. Cal. Perianth inferior, of one leaf, bell-shaped, divided half way down into five little, awl-shaped, nearly equal, teeth. Cor. Papilionaceous, apparently tripetalous; standard nearly ovate, obtuse, reflexed and spreading; wings two, ovate-oblong, reflexed and spreading outwards, in such a manner that, with the standard, they almost con-
stitute a regular tripetalous corolla; keel very short, obtuse, occupying the centre of the flower. Stam. Filaments in two distinctlets, one simple, one in nine segments, short, ascendency; anthers simple, roundish. Pist. German ovate-
oblung, compressed; style simple, ascending; stigmas simple. Peric. Legume linear-oblong, compressed, much longer than the calyx, of one cell, and two valves. Seeds numerous, roundish.

EE. Ch. Standard and wings nearly equal, spreading,
in the form of a tripetalous corolla. Stigma smooth. Le-
gume of one cell, with many seeds, compressed, longer than the calyx.

Obf. Linnaeus remarks that the figure of the corolla alone is this a distinct genus. We could with that character were more evident. The closest affinity exists between some Trigonella, which we shall indicate, and the Meliloti, constituting the first section of Trifolium. See that article.

The species of this genus, seventeen in Willdenow, are her-
aceous, for the most part annual, fring-mat-ented plants, with three leaflets on a stalk, and indeed the general habit of Trifolium. Their flowers are tufted rather than properly capitace, usually yellow. T. Fœnum græcum has blueish
flowers, which are quite feasible, or truly capitace, their distance that of a Trifolium, and their beaked legume splitting chiefly along its upper margin. This species certainly does not well accord with the rest.
TRIGONELLA.

1. T. ruthenica. Small, or Ruffian, Fenugreek. Linn. Sp. Pl. 1093. Wildl. n. 1. Ait. n. 13; excluding the synonym of Gmelin, which Linnaeus subfequently discovered to belong to Medicago falcata. (Lotus n. 156; Amm. Ruth. 119, and Melilotus n. 155; ibid. 120.)—Legumes flaked, crowded, drooping, linear-lanceolate, straight. Leaflets lanceolate-obovate, abrupt, with three terminal teeth.—Common throughout Siberia. A hardy perennial, flowering in June and July, sent by the Siberian botanist Amman, to Miller, before the year 1749. Herb nearly smooth. Stems numerous, spreading or decumbent, much branched, round, leafy. Leaves alternate, flaked, of three narrow, delicate leaflets, tapering and entire towards the base, toothed about the extremity; the odd one largest, an inch long, on an elongated partial stalk. Stipulas small, awl-shaped. Flowers yellow within, purplish externally, in short, axillary, capitulate clusters. Standard broad, almost orbicular. Calyx hairy, bell-shaped, with five lanceolate, rather unequal, teeth. Legume half an inch long, compressed, with four or five kidney-shaped seeds. We know of no figure of this species.

3. T. hybrida. Mule Fenugreek. Pourret in Act. Talof. v. 3. 331.—Legumes flaked, rather crowded, pendulous, half-oval, compressed, reticulated with prominent veins. Stem diffuse. Leaflets roundish-obovate, nearly entire. Native of the south of France. A specimen from the author cited this new to be nearly related to the last; but the legume, though full-grown, is but one-third of an inch long, most elegantly marked with elevated reticulations. The leaves too are smaller, and feebly toothed or wavy.

4. T. friata. Striated, or Abyssinian, Fenugreek. Linn. Suppl. 340. Wildl. n. 3.—Legumes umbeltate, linear, compressed, incurved, reticulated; their common flake much shorter than the leaves. Leaflets wedge-shaped, toothed.—Native of Abyssinia, according to the herbarium of Linnaeus, who cultivated the plant at Upfal. Root annual. Stems square, diffuse. Leaflets half an inch long, ribbed, sharply toothed, as well as the stipulas. Flowers light yellow, about six in each long-flaked head, or umbel. Legumes an inch long, narrow, slightly hairy, with five or seven seeds.

5. T. puletrata. Many-horned, or Spanish, Fenugreek. Linn. Sp. Pl. 1093. Wildl. n. 4. Ait. n. 3. (Fennum gracum sylvestre; Ger. Em. 116. 6. Lob. t. 1c. v. 2. 43.)—Legumes nearly sessile, crowded, erect, nearly straight, longer than the leaves; the common flake pointless.—Native of Spain, Italy, and France. Cultivated in the middle of the seventeenth century. Annual. Stem branched from the bottom, diffuse, twelve or eighteen inches long. Leaflets ovate, toothed. Flowers yellow, three or four together in little, axillary, almost sessile, heads. Calyx hairy, as well as the young leaves. Legumes three or four, an inch and half long, narrow, clothed with close hairs, and beautifully reticulated.

6. T. hamoja. Hooked Egyptian Fenugreek. Linn. Sp. Pl. 1094. Wildl. n. 5. Ait. n. 4. Sm. Fl. Græc. Sibth. t. 764, unpubl. (Mellilotus aegyptius, Alchime- lech vocatus; Alpin. Egypt. 122. t. 124. Bauh. Hift. v. 2. 357.)—Legumes racemose, flaked, declining, recurved, nearly cyindrical, even, hairy; their common flake pinous, longer than the leaf.—Native of Egypt, from whence the Linnaean specimen was brought by Halfiquili. Dr. Sibthorp met with it in Cyprus. A small, diffuse, annual, hairy herb, whose leaflets are wedge-shaped, strongly toothed, on a long common stalk. Flowers deep yellow, fragrant, in flaked clusters, half an inch long. Legumes an inch long, curved into a semiflare, quite deflitate of reticulations, both futures peculiarly dim, half-oval; the flowers green and very hairy. The seeds are said to be used by the Egyptians, in fomentations, for all kinds of pains.

7. T. tartu. Twisted Egyptian Fenugreek. —Legumes umbeltate, cylinndrical, twisted, reticulated; their common flake much shorter than the leaves. Leaflets inerfiely heart-shaped, toothed, obscurely ribbed.—Native of Egypt, from whence Dr. Dehile favoured us with wild specimens, under the name of hamoja, but they do not agree with the Linnaean speciemen, nor with the specific character, any more than with the figure in alpinus, as far as any thing can be determined therefrom. The plant of Dr. Dehile is as smooth as possible in every part. Its stems round, branched, firm, hardly a span high. Leaves on long footstalks, rather flathy; leaflets all of equal size and shape, one-third of an inch long; the odd one on a stalk nearly its own length. Flowers yellow, drooping, five or fix in each axillary umbel, whose flake is not half the length of the adjoining common footstalk, and, after flowering, becomes very flout, round, and firm. Legume drooping, rarely more than half an inch the rigid, pale, slightly twisted spirally, quite deflitate of hairnefs, but marked with peculiar oblong reticulations of elevated veins.

8. T. flexuosa. Zigzag Egyptian Fenugreek. Delile Epypt. MSS.—Legumes in nearly sessile umbels, compressed, reticulated, zigzag. Leaflets inerfiely heart-shaped, toothed, obscurely ribbed.—Native of Egypt. A figure of this plant was defined, under the above name, for the great work on Egypt, but we have not heard that it has proceeded so far. This species very closely accord with the laft in habit, and precisely in foliage, but the umbels are nearly sessile, flowers smaller, calyx-teeth longer and more pointed. The legumes are essentially different, not only in their compressed figure, but in being strongly folded, or plated, as it were, into a zigzag poliftion. If expanded, they might possibly equal the length of the laft. Both appear to be annual, and perhaps grow prostrate.

11. T. armata. Thorny-branched Cape Fenugreek. Thunb. Prodr. 137. Wildl. n. 8.—"Legumes lateral, hairy. Leaflets ovate, smooth. Branches becoming pinous."—Native also of the Cape.—We have no further information concerning the three last species.

12. T. spinosa. Thorny-flaked Fenugreek. Linn. Sp. Pl. 1094. Wildl. n. 9. Ait. n. 5. (Fennum gracum...
TRIGONELLA.

cum sylvicole polycraton majus creticum; Brey. Cent. t. 32. f. 1.) — Legumes linear, declinating, compressed, falcate, tranversely veiny, two or three on each very short, axillary, spinous-tipped flanks. — Native of Crete. A hardy annual, cultivated in England above one hundred years ago, flowering in July and August. The flens divides at the base into several rather slender, smooth, simple, diffuse branches, a span long. Leaffets obovate, toothed, emarginate, equal, tapering at the base. Flowers small. Legumes naked, an inch and a half long, narrow, with tranverse, interbranching, but scarcely reticulated, veins. Their length exceeds that of the leafer and footflakes. 13. T. corniculata. Horse-hoe Fenugreek. Linn. Sp. Pl. 1594. Wildl. n. 10. Ait. n. 6. Sm. Fl. Grz. Sibth. t. 767, unpublished. (Melilotus italicus; Fuch. Hist. 528. M. major; Trag. Hist. 592. M. coronata; Ger. Em. 1205.) — Legumes numerous, crowded, declining, compressed, falcate, tranversely veiny, on a spinous-tipped axillary flanks, longer than the leaves. — Native of the south of Europe. A hardy annual, cultivated by Gerarde, flowering in June and July. The flens are numerous, a foot high, nearly erect, zigzag, leafy, and many-flowered, smooth, or a little hairy. Stipulas nearly entire. Leaffets obovate, toothed. Flowers-flasks spreading, stout, each bearing a dense, umbellate tassel, of about ten yellow, highly fragrant flowers, like a little Coronilla. Corolla thrice the length of the calyx. Legume only an inch long, though twice as broad as the leaf, which it imitates in the style of its veins. Seeds kidney-shaped, rough. The modern Greeks know this Trigonella by the name of melon. Dr. Sibthorp observed it in Rhodes, the Morea, and other places in the Levant. 14. T. elatior. Tall Fenugreek. Sm. Prodr. Fl. Grz. Sibth. n. 1830. Fl. Grz. t. 762. (Melilotus syriaca odora; Lob. Eu. v. 2. 42. f. 2. Trifolium italicum, five Melilotus italicus, corniculis incurvis; Bauh. Hist. v. 2. 372. f. 2. Lotus sylviculus, ex codice caesaro; ibid. 373.) — Legumes racemose, pendulous, linear, slightly curved; their flanks longer than the leaves, pointless. Stem erect. Stipulas lanceolate, toothed. — Found by Dr. Sibthorp in Aisa Minor, and the isle of Cyprus. Annual. The flens is twice or thrice as tall as the leaf, and less zigzag. Leaffets three or four times as large, often an inch long, obvate, but varying in breadth, sharply toothed, except about the base. Stipulas copiously and deeply toothed, or jagged. Flowers and legumes in clusters about an inch in length; their common flanks of a longer proportion than the foregoing, the flanks of the spinous point. Legumes compressed, nearly or quite straight, and, as far as we can judge of them, in a half-tube flaps, not marked with elevated veins. Seeds six or seven. A specimen of this is attached, in the Linnæan herbarium, to the coriculata, from which it is very diffignate, and, except its legume and seeds, more nearly allied to the Meliots, (see Trifolium, sect. 1.) than to any other Trigonella. Dr. Sibthorp very justly suspected the Alos crassus of Dioscorides to be T. coriculata, or near it; nor can we doubt this T. elatior being the very plant. If the famous old manuscript at Vienna be admitted as authority, it confirms our opinion. The figure in John Batah, copied from thence, though rudely and unscientifically drawn, is sufficiently indicative of this species. From what occurs, here and there, in the old botanical writers, this Trigonella, neglected by modern syllemaneists, appears to be not of rare occurrence in the south of Europe, and may possibly be met with in botanic gardens. It is well worth the notice of the farmer, for experiment at least, on account of its luxuriant growth, and the quality of many plants to which it is related; as they may possibly be found in great perfection in this species. 15. T. piscata. Spiked Fenugreek. Sm. Prodr. Fl. Grz. Sibth. n. 1831. Fl. Grz. t. 763. unpublished. — Legumes spikèd, pendulous, short, hairy, on a spinous-tipped axillary flanks, longer than the leaves. Stipulas awl-shaped, entire. — Gathered by Dr. Sibthorp in the isle of Seriphius. This is an annual species, with many flens, about a foot high, which partakes of the same ambiguity, respecting the Meliots, as the foregoing. At least the shortests of the legumes, and consequent small number of seeds, aswers belt to Trifolium. But we want certain information on this point, having not seen any rape fruit. The habitat of the plant, especially the spinous flower-flanks, belongs to Trigonella. The leaffets are half an inch in length, obovate-oblung, narrow, smooth, serrated. Flowers yellow, in crowded eflayers resembling spikès, half an inch long, becoming afterwards twice that length, befit with the numerous reflexed beaks of the crowded pendulous legumes. The lowest tooth of the calyx is very short; the four others long and awl-shaped. 16. T. parviflora. Small-flowered Fenugreek. — Legumes in capitade clusters, ascending, linear-lanceolate, compressed, flighty curved, with about two seeds; their flasks as long as the leaves, pointed. Stem ascending. Stipulas ovate, pointed, toothed. — Found by M. Du Cros, in a meadow near the mill of Coinhus, in Switzerland. The flens are a span high, decumbent at the base. Size and aspect of the plant like T. monspeliaca, hereafter described, but some of its characters accord more with elatior, to which it has other-wile little resemblance. The flanks, calyx, legumes, and young leaves, are more or less silky. Leaffets broadly ovate, the lower ones rather quadrangular, none more than half an inch long, most of them less; all toothed, ribbed, of a light green. Flowers very small, yellow, on partial flanks as long as themselves, collected into hemispherical silky heads. Calyx-teeth lanceolate, as long as the corolla, somewhat unequal. Legume half an inch long, curved upwards, veinless, contracted at each end, containing only one or two seeds. This species seems to have escaped the notice of all authors that have fallen in our way. It was sent for coriculata, but the legumes are totally different, and the flowers not a quarter fo large, neither is the flens zigzag. 17. T. monspeliaca. Trailing Fenugreek. Linn. Sp. Pl. 1585. Wildl. n. 11. Ait. n. 7. — Walth. et Kitab. Hung. v. 2. 152. f. 142. Sm. Fl. Grz. Sibth. t. 765. unpublished. (Fenugreacum polycraton; Riv. Tetrap. Ir. t. 82. F. minus monspeliaca; Brey. Cent. t. 33. f. 2. Securidaca genus triphyllon; Bauh. Hist. v. 2. 373.) — Legumes spreading, crowded, curved, compressed, hairy, obliquely veined, shorter than the leaves, on a very short pointed flanks. Stems prostrate. — Native of the south of France, Hungary, Switzerland, Greece, Cyprus, and Asia Minor. A hardy annual with us, sometimes cultivated for curiosity, flowering in June and July. Stems quite flat on the ground, hardly a span long, a little hairy, like the rest of the plant. Leaffets sharply toothed; their common footflanks an inch long. Flowers deep yellow, twice the size of the last. Calyx hairy, with rather unequal teeth, scarcely half so long as the corolla. Legumes declining, not an inch in length, pretty marked with oblique transverse ribs, and clothed with scattered close hairs. Seeds several, rough. 18. T. alba. Smooth Cape Fenugreek. Thunb. Prodr. 147. Wildl. n. 125. — " Legumes umbellate, reflexed, smooth. Leaffets ovate, smooth, toothed." — Found by Thunberg, at the Cape of Good Hope. We have not seen
seen this plant. If the leaflets are really ovate, not obovate, it is a very remarkable species indeed.

mens of this rare species was sent by Burmann, with the above synonym, by which we learn that it was gathered in Egypt by Lippi, who did not live to publish his discoveries. (See Lippi.) This is a flender, delicate, smooth, apparently decumbent, plant, resembling *Medicago lacinia*. The leaflets are about six inches long, unbranched, angular. Leaflets a quarter of an inch long, abrupt, ribbed, very deeply and sharply toothed at the end. Stipulas piliferate, acute. Flower-flats axillary, shorter than the foot-flats, tipped with a small point. Flowers from three to six, yellow. *Calyx* pale, slightly hairy, with awl-shaped teeth of its own length. *Legume* twice the length of the calyx, minutely reticulated, rather hairy, acute at each end.

ders of fields about Madrid, flowering in May. Its seeds were brought from thence to Kew, by the late marchioness of Bute. This little annual species is closely related to the laf, being of the fame size, with several quadranular flemas. But the leaflets are more oblong, and deeply pinnatifid, not merely cut about the extremity. Flowers from three to five in the bolum of each leaf, on very short flats, pale yellow. *Calyx* like the leaf. The legumes, as Cavallines observes, are totally different, an inch or more in length, very narrow, flably curved, with many feds. Only two or three legumes seem to be perfected, though the flowers are described as rather numerous.

—Native of the fouth of Europe. Dr. Sibthorp found it plentifully on the shores of Aja Minor, as well as in Rhodes and Cyprus; more sparingly on mount Hymentus near Athens. It has long been cultivated for the fake of its seeds, which from the days of Dioscorides have been thought cooling and detergent. Their fcent is very powerful, refembling Melilot; which renders them disagreeable in fomentations and cafaplains, the only ufe for which they have been retained in the apothecaries' shops. They are now nearly exploded. (See Fenugreek.) The herbage is used in fome European countries for fodder. The root is annual. Stems various in luxuriance and direétion, from one to two feet long, reddifh, flat, leafy and hairy. Leaflets inverfely heart-shaped, various in fize from a quarter of an inch to an inch, miffly smooth, of a deep, rather glaucous, green, more or less toothed. Footflats hairy, rather longer than the leaflets. Flowers two or three, axillary, fopples, yellow, white, or pale blue; standard an inch long, emarginate, erect; wings and keel much shorter, by no means affinering to the generic character. *Calyx* hairy, with awl-shaped, nearly equal, teeth. *Legume*, in a wild flat, about an inch long, veiny, a quarter of an inch broad, tapering into an oblique beak, longer than itfelf, but very varied in that refpect: in the cultivated plant, the length of the legumes, containing above a dozen feds, greatly exceeds that of the beak. Dr. F. Buchanan, in his Journey through the Myfors, v. 1. 374, relates, that the herb, known by the name of *Mentha*, cultivated in gardens, is always ufed green. When fown for the feed, as grain, the ground is plowed twice at the fame feaon, and divided into plots like a kitchen-garden. The feed is fown, covered by hand, and according to the nature of the foil, and watered once in ten or fifteen days. "The ripe feed," fays this author, "fells very high, and is reckoned the moft delicate kind of pulfe. The young leaves are ufed as greens, and the un-
ripe legumes put into Curtseys." We find these feeds are one ingredient in the receipts for Curry powder, communicated from India. *T. gladiana*, Bieb. Taur. v. 2. 222, muft be preferred a variety of the species before us.

—Native of the Eaf Indian, from whence its feeds were fent by Dr. Roxburgh to Kew, in 1703. An annual fow plant, flowering in July and Auguf. The whole herb is minutely hairy, or fiky. Stems a foot long, round, branched. Leaflets obfavo, narrow, three-quarters of an inch long, all equally near febile, on a flalk of their own length. Flowers small, yellow or reddifh, drooping, on very short flats, ufually two together, from the bofoms of the leaves. *Calyx*-teeth lanceolate, leafy. *Legumes* an inch and a quarter or an inch and a half long, comprefled, narrow, pale, hairy, with many feeds. We fhould have fuppofed the feeds of this species to have made an ingredient in the Curry powders of India; but we find nothing of this kind recorded, nor is the plant mentioned in the admirable work of Dr. Buchanan, cited under the laf species.

**Trigonella foitils**, in Natural History, the name of a fopples shell, of the cockle kind, but approaching to a tri-
angular figure, having a broad bottom to which it defcribes, almost in fright lines: on each fide from the head or caro, thefe are uufually found fmall, but there are fome met with of four or five inches round: they are found at dif-
terent depths, in flow quarries, bedded in the matter of the ftrata; and that often in the hardeft flone. In fome in-
stances, the fhefles are found remaining in their native flate; but moft frequently the fhef is perifhed and gone, and there is a floy or fpappar matter depofited in its place. Hill.

taeae, Linn.? *Moplistis affine*, Jull. Gen. Ch. Col. Perianth inferior, of one leaf, turbi-
nate; limb in five segments, the two upper ones most deeply divided, erect, spreading. Cor. papilionaceous, of five petals; standard erect, pitted at the bafe, flat, with a claw; wings longer and narrower, reflexed; keel of two conver-
verging petals. Nectary two scales at the bafe of the germen. Stam. Filaments ten, united into one common

sheath.
TRI

fleath, separate above, some of them often abortive, and the common fleath finally splits into two; anthers oblong.

P. Germen superior, ovate, small; style short, ascending; stigma capitate, flat, with a membranous border. Pericarpi. Capsule oblong, acute, with three angles and three intermediate channels, of one cell and three valves, which are boat-shaped, double, the outer coat coriaceous, inner membranous, lined with wool. Seeds numerous, roundish, enveloped in long wool, and connected with a triple thread-shaped receptacle.

Wild. n. 1.—Leaves ovate, downy and hoary beneath.—Native of Guiana, growing chiefly by way sides, in cultivated grounds, or in the borders of groves and thickets, bearing flowers and fruit at various seasons. The stem is shrubby, with twining branches, supporting themselves upon neighbouring trees, round, downy and leafy. Leaves opposite, flaked, entire, three inches long and one and a half broad, veiny. Stipulas ovate, in pairs, deciduous. Clusters compound, terminal. Flowers aggregate, small, yellow, with a red keel. Fruit three inches, or more, in length, clothed with reddish down, splitting from the base.

Wild. n. 2.—Leaves elliptical, smooth and shining on both sides.—Found on the banks of a rivulet, near the base of the hill of Courou, in Guiana. The branches of this species are smooth, but twine round any thing in their way, like the preceding. Leaves only one and a half or two inches long, oval, entire, on shortish stalks. Clusters several at the ends of the branches, accompanied by some leaves. Flowers opposite, accompanied by small bracteas, white, with yellow anthers. Fruit about an inch long, greenish, rather rough to the touch. Seeds enveloped in soft white wool. Nothing is mentioned of any useful properties in either of these plants.

TRIGONIS, so called by Jacquin, because each of its petals forms an inverted isosceles triangle. See CUPANIA.

TRIGONOMETRICAL, Auxiliary. See Artificiali Trigonometria.

TRIGONOMETRY, from τριγονοϛ, triangle, and μετραω, measure, signifies literally the measure of triangles; but it is used here to denote that science which relates to the determination of the sides and angles of triangles, from certain parts which are given. When it is applied to the solution of plane triangles, it is called plane trigonometry; and its application to spherical triangles, is called spherical trigonometry.

Trigonometry, from its numerous and important uses, may be considered as one of the most interesting branches of the pure mathematics: practical and physical astronomy, navigation, surveying, geodesia, mechanics, is short nearly every branch of the pure and mixed mathematics, with the exception of geometry and arithmetic, are either wholly or in part connected with the principles of trigonometry; and we accordingly find that the improvements in this department have kept pace with, or rather perhaps have preceded, those which modern authors have introduced into all the other branches of the exact sciences: in fact, the trigonometry of the Greeks, and that of the moderns, which immediately followed the invention of logarithms, and, lastly, the analytical form given to it by Euler, Lagrange, &c. exhibit the same science under three very distinct characters, of which it will be proper to give a sketch as an introduction to the present article.

It is very uncertain at what time trigonometry first began to be cultivated as a science, no records having yet been discovered which enable us to trace it to a higher age than to that of Hipparchus, who flourished about 150 years before Christ, and who, as we are informed by Theon, wrote a work, in twelve books, on the chords of circular arcs, which, from the nature of the title, must have been a treatise on trigonometry: but the earliest work extant on this subject is the Spherics of Theodorus, in which the several propositions are demonstrated after the manner of Euclid; and the next in order to this, is a work by Menelaus, who flourished about the middle of the fifth century of the Christian era, and who is said to have written nine books on this subject; but of which, only three have been transmitted down to our times. The fix that are lost consisted principally of tables and the nature of their construction, which if we posseffed them would, in all probability, be rather matters of curiosity than of real utility. The earliest tables of trigonometry, of any importance, that we possefs of the ancients, are those given by Ptolemy in his Almagest, in which he adopts the sexagesimal division of the radius, and of the arc whose chord is equal to radius, and then eliminates all the other arcs by 60ths of that arc, and all the other chords by 60ths of that chord. From the time of Ptolemy, viz. from about the beginning of the second century, nothing of importance, except what we owe to Theon, was added to the science of trigonometry, till about the close of the eighth century after Christ, when the ancient method of computing by chords was changed for that of sines, an alteration first introduced by the Arabians, to whom we are also indebted for several axioms and theorems which are at present considered as the foundation of modern trigonometry; but they still continued the sexagesimal division; and in this state it remained till Purbach, about the middle of the 15th century, constructed a table of sines to the division of the radius into 600,000 equal parts, and computed them for every ten minutes of the quadrant; and afterwards Regiomontanus, the disciple and friend of Purbach, carried the computation to every minute, dividing the radius into 1,000,000. He also enriched this science with many new theorems and precepts, which, except for the use of logarithms, render the trigonometry of this author little inferior to that of our times.

Soon after the period here mentioned, several other mathematicians also contributed to the advancement of this science, either by some useful alterations in the form of the tables, or by other improvements; amongst whom we may mention, as the most distinguished, Werner, Copernicus, Rheinhold and Maurolycus: but the most complete work which had yet appeared, was published by Viete in 1579; and some other tracts on the same subject and due to the fame author were published by Schooten in 1646.

The first part of the work to which we have above alluded, was entitled "Canon Mathematicus seu ad Triangula, cum Appendicibus," in which there is given a table of sines, tangents, and secants for every minute of the quadrant to radius 100,000, with their differences; and towards the end of the quadrant, the tangents and secants are extended to eight or nine places of figures. They are also arranged after the manner of our modern tables, increasing from the left-hand side to 45°, and then returning backwards from the right-hand to 90°: so that each number and its complement stand upon the same line.

The second part, entitled "Univeritalium inspiciönum ad canonem mathematicum," contains, besides a regular account
count of the construction of the tables, a copious treatise on plane and spherical trigonometry, with their application to a variety of curious subjects in geometry and mensuration, and other branches of mathematics; and also a number of particulars relating to the quadrature of the circle, the duplication of the cube, and similar problems, which were all treated of in a manner worthy of the genius of their author. The tract published by Schooten likewise contains many curious theorems due to Viete, particularly relating to what the author calls angular sections; viz., to the multiples and submultiples of arcs; and general formulae for the chords and consequent for the sines of the sums and differences of arcs; and of such as are in arithmetical progression, which have since been so extensively and usefully applied, both in this science and in some of the higher branches of analysis. See Arithmetice of Sines.

The next writer on this subject, deserving of particular notice, was Rheticus, who formed the design of computing the trigonometrical canon for every ten seconds of the quadrant to fifteen places of figures; and although he did not execute the whole of this laborious enterprise, he nevertheless accomplished that part of it which related to the sines and cosines, all of which he calculated according to his original plan; besides those of every single second for the first and last degrees of the quadrant; but was deterred from publishing the table on account of the expense attending the impression. The work, however, was afterwards completed and published by his disciple and friend Otho, under the title of "Opus Palatinum de Triangulis" (folio 1596); but it was found to contain many errors, which were afterwards corrected by Piticus, and the whole published under the new title of "Thefaurus Mathematicus, &c.," folio 1613.

The Trigonometry of the same author, which was published in 1599, is also a very complete work, and was long considered, both with respect to its tables and its numerous practical applications, as the most commodious and useful treatise on the subject then extant.

We might here enumerate many other writers of this period, who disdained themselves either by their computation of new tables, or by their inventions of theorems; but the discovery of the use of logarithms, which happened about this time, produced a complete revolution in the method of treating this subject, and which therefore renders it unnecessary for us to enter into any minute explanation of the particular inventions and improvements of the authors to whom we have above alluded. Amongst the earliest promoters of trigonometry, after the invention of logarithms, was Napier himself, to whom we are not only indebted for that admirable discovery, but also for the new and exalted analogies which he introduced into trigonometry, and which still bear his name, as likewise for the well-known rules called the five circular parts. (See Parts.) Our limits, however, will not allow of tracing the history of this science, through all its successive improvements, from the time of Napier to the present day; we shall therefore content ourselves with referring to the article Logarithm for an account of many of the most useful and valuable tables of the logarithmic kind, and shall merely mention Briggs as an author who contributed much to the advancement of this science, both by the assistance that he afforded to the practical calculator in many intricate and abstruse computations, and by the numerous improvements of a higher kind, with which his works abound. Other writers afterwards, either by the construction of tables, or by the simplification of the rules and processes hitherto adopted, reduced the practice of trigonometrical operations to their simplest possible state, at least while it retained that geometrical form, which in the earlier stages of this science it naturally assumed. But about the middle or rather towards the close of the last century, trigonometry was again subjected to another complete revolution, by changing the geometrical form for the analytical one; and it is probable that to this change we are indebted for many of the most brilliant discoveries of that of late years have enriched the two great branches of astronomical science. The foundation of this method, however, may be traced to a much higher date than that to which we have above alluded; viz., to the time of Viete, whose theorems for the differences and sums, as also for the multiples and submultiples of the chords of arcs, which, although left without demonstration, and in the latter case probably formed by induction from the law of the terms and their co-efficients, have nev ertheless been the germ of most of the numerous and elegant formulae which have since enlarged and enriched this branch of the mathematics.

The exponential formulae also for the sines and cosines of arcs, first given by De Moivre, greatly contributed to the progress of the analytical branch of this subject, by abbreviating its operations, and shortening the labour of involution. See Arithmetice of Sines.

Having given this brief sketch of the history of trigonometry, it now remains for us to explain and illustrate its principles, and the various methods of applying it and of performing the requisite computations. With this view we shall commence with the definitions of all the terms which most frequently occur in this doctrine, in order to save the explanations which it would otherwise become necessary to make to the different articles in the body of the work.

In plane trigonometry, the circle is supposed to be divided into 360 equal parts, called degrees; every degree into 60 equal parts, called minutes; and every minute into 60 equal parts, called seconds; and so on into thirds, fourths, &c.; and the measure or quantity of an angle is estimated by the number of degrees, minutes, and seconds, contained in the arc by which it is bounded; the degrees being marked or denoted by a small °, the minutes by one dahl, as ', the seconds by two dahls, &c.; thus, 70 degrees 16 minutes 17 seconds, is written 70° 16' 17".

It may be observed, however, that the division of the circle is perfectly arbitrary, and that any other number might have been employed instead of 360; and the subdivisions might also have proceeded upon any other scale as well as the sexagesimal: and accordingly, the modern French mathematicians have adopted a different division, viz., they suppose the entire circle to be divided into 400 degrees, or each quadrant into 100 degrees; the next subdivision is the 10th of a degree, the next 100th, and so on; and hence the measure of an angle is expressed by them in the same manner as any other integral and decimal quantity, which notation is undoubtedly far superior to that in common use.

The complement of an angle or angle, is what it wants of 90°, or of a quadrant; and the supplement of an angle, is what it wants of 180°, or of a semicircle; thus, if an angle measures 50°, its complement is 40°, and its supplement 130°.

As to the several lines made use of in this science, they will be readily understood by a reference to Plate II. Trigonometry, fig. 14. aided by the following definitions; viz.

The sine or right sine of an arc, is a line drawn from one extremity of an arc perpendicular to the diameter which passes through the other extremity: thus, B F is the sine of the sine A B, or of the supplemental arc B D E.

The curved sine of an arc, is that part of the diameter which is intercepted between the arc and its sine: thus, A F is the curved sine of the arc A B, and D F the curved sine of the arc E D B.
TRIGONOMETRY.

The tangent of an arc, is a line touching the circle in one extremity of that arc, and continued thence to meet a line drawn from the centre through the other extremity of it, which last line is called the secant of the fame arc: thus, A H is the tangent, and C H the secant of the arc A B; also E I is the tangent, and C I the secant of the supplementar arc B D E; and this latter tangent and secant are equal to the former, but are accounted negative, as being drawn in an opposite or contrary direction to the former.

The cofine, cotangent, and cofecant, of an arc, are the finite, tangent, and secant of the complement of that arc; the letters co being only a contraction of the word complement. Thus, the arcs A B, B D, being the complement of each other, the finite, tangent, and secant of the one of these, is respectively the cofine, cotangent, and cofecant of the other: thus,

\[ B \, F, \text{ the fin. of } A \, B, \text{ is the cof. of } B \, D. \]
\[ B \, K, \text{ the fin. of } B \, D, \text{ is the cof. of } A \, B. \]
\[ A \, H, \text{ the tan. of } A \, B, \text{ is the cotan. of } B \, D. \]
\[ D \, L, \text{ the tan. of } B \, D, \text{ is the cotan. of } A \, B. \]
\[ C \, H, \text{ the fec. of } A \, B, \text{ is the cofec. of } B \, D. \]
\[ C \, L, \text{ the sec. of } B \, D, \text{ is the cofec. of } A \, B. \]
\[ F \, A, \text{ the verf. of } A \, B, \text{ is the coverf. of } B \, D. \]
\[ D \, K, \text{ the verf. of } B \, D, \text{ is the coverf. of } A \, B. \]

The above are the principal definitions relating to plane trigonometry, as far as regards the solution of plane triangles, which is that part of the subject to which we must more particularly confine our remarks in this article: what concerns the mutations or changes in the quantities above defined in passing successively round the circumference, and their particular values at certain points, have been already explained under the article Arithmetic of Sines, to which the reader is referred. In every triangle there are six parts; viz. three sides and three angles, any three of which being given (except the three angles), the other three may be found; and that either by geometrical construction, arithmetical or logarithmic computation, or by instrumental operation: that is, either by constructing the figure with the compases and a scale of chords, or other instrument for measuring angles; or by means of tables of natural or logarithmic sines, tangents, &c. in which the computation depends upon the proportionality of the sides of similar triangles; and lastly, by means of a Gunter or other scale constructed for this particular purpose, by which the results are obtained by the proper application of a pair of compases to certain lines on the scale: in the present article, however, we shall only attempt an illustration of the second method.

There are only three distinct cases in trigonometry; viz.

1. When a side and its opposite angle are two of the given parts.
2. When two sides and the included angle are given.
3. When the three sides are given.

Cafe 1.—When a side and its opposite angle are two of the given parts.

As any one side:
Is to any other side: So is the sine of the angle opposite to the former:
To the sine of the angle opposite to the latter.

This analogy supposes two sides and one angle to be given: if two angles and one side be given, the order of the terms becomes,

As the sine of any angle:
Is to the sine of any other angle: So is the sine opposite to the former:
To the sine opposite to the latter.

Vol. XXXVI.

For let \( A B C \) (fig. 15.) represent any triangle; take \( A \, c, B \, c \), equal to each other, and let them represent the tabular radius; then \( c \, a, c \, b \), will also be the tabular sines of the angles \( A \) and \( B \). Now by similar triangles,

\[ A \, C : A \, c :: C \, D : c \, a \]
\[ B \, C : B \, c :: C \, D : c \, b. \]

Consequently, since \( A \, c = B \, c \), and the third terms being equal, we have

\[ A \, C : B \, C :: C \, D : c \, a \text{ or } A \, C : B \, C :: \text{fin. } B : \text{fin. } A; \]

which is the same as the theorem in words.

Hence in the triangle \( A B C \) (fig. 16.), let \( A \, B, B \, C \), and the angle \( A \) be given; then it will be

\[ B \, C : B \, A :: \text{fin. } A : \text{fin. } C, \]

or \( \text{fin. } C = \frac{B \, A \times \text{fin. } A}{B \, C}. \)

Again, if the angles \( A \) and \( B \) were given, and the side \( B \, C \); then,

\[ \text{fin. } A : \text{fin. } B :: B \, C : A \, C, \]

or \( A \, C = \frac{\text{fin. } B \times B \, C}{\text{fin. } A}. \)

It should be observed here, that the angle found by the first of these analogies is ambiguous, or uncertain, viz. whether it be acute or obtuse, unless its magnitude be such as to prevent the ambiguity; for when this is not the case, there will be two different triangles, which have the same three parts, but the other three different in each; and there is nothing in the abstract solution to determine which of the two is the required one: but in any practical case, there will be always found some circumstance or other to decide the question. This will be understood from fig. 17, where there are two triangles \( A \, B \, C, A \, B \, C' \); in each of which the sides \( A \, B, B \, C, \) or \( B \, C', \) and the angle \( A, \) are the same; and, therefore, the angle \( C, \) determined by the analogy, may be either \( B \, C \, A \) or \( B \, C' \, A, \) which are the supplementations of each other, and which two angles, we have shown in the definitions, have always the same sine. The tabular sine, however, is always that belonging to the acute angle; and, therefore, when the obtuse angle is required, the acute angle must be subtracted from 180o, which will be the obtuse angle. But if the angle be a right angle, or greater than a right angle, the acute angle found by the table must be the required angle; and, therefore, in this case, there is no ambiguity.

Let us propose, as an example, a triangle \( A \, B \, C, \) in which the side \( A \, B = 345, B \, C = 232, \) and angle \( A = 37^{\circ} 20'. \)

First, to find the angle at \( C. \)

\[ \begin{align*}
\text{As the side } B \, C &= 232 \quad \text{2.5654886} \\
\text{Is to side } A \, B &= 345 \quad \text{2.5378191} \\
\text{So is sine } < A &= 37^{\circ} 20' \quad 9.7827958 \\
\text{To sine } < C &= 64^{\circ} 24' \quad 9.9551269
\end{align*} \]

That is, by adding together the logarithms of the second and third terms, and subtracting the first, we obtain the logarithmic value of the sine of \( < C, \) which is found in the table to answer to the angle \( 64^{\circ} 24'. \) But we have found that

Vol. XXXVI.
an angle and its supplement have the same sine; therefore, the
side we have found may either answer to the angle $64° 24'$,
or to its supplement $115° 36'$. This question, therefore,
involved that ambiguity to which we have above alluded;
and we must proceed to find the third side under each of the
values of the angle $C$, and the two corresponding values of
the angle $B$.

Since the sum of the three angles of a triangle $= 180°$,
\[
\begin{align*}
\angle A &= 37° 20' \\
\angle C &= 64° 24'
\end{align*}
\]
\[
180° - (101 44') = 78° 16' = \angle B.
\]
Again,
\[
\begin{align*}
\angle A &= 37° 20' \\
\angle C &= 115° 36'
\end{align*}
\]
\[
180° - (152 56') = 27° 4' = \angle B.
\]
Hence, from the first values of the angles $C$ and $B$, we
have,
\[
\begin{align*}
\text{As fin. } \angle A &= 37° 20' \\
\text{Is to fin. } \angle B &= 78° 16'.
\end{align*}
\]
\[
\text{So is } BC = 232, 2.3654880
\]
\[
\text{To } AC = 374.56, 2.5735213
\]
Again, assuming the second values of the angles $B$ and $C$, we
have,
\[
\begin{align*}
\text{As fin. } \angle A &= 37° 20' \\
\text{Is to fin. } \angle B &= 27° 4'.
\end{align*}
\]
\[
\text{So is } BC = 232, 2.3654880
\]
\[
\text{To } AC = 174.07, 2.2407293
\]
The side and angles sought are, therefore, $AC = 374.56$, or $174.07$; and the angle $B = 78° 16'$, or $27° 4'$; and
angle $C = 64° 24'$, or $115° 36'$; either of which results
equally answer all the conditions of the original data. But
it is obvious, that if the given angle $A$ had been a right
angle, or greater than a right angle, this ambiguity could
not have had place; because, in that case, the other two
angles are necessarily acute.

Case 2.—When two sides and their included angle are the
three given parts.

As the sum of the sides :
Is to the difference of the sides ::
So is the tangent of half the sum of the required angles :
To the tangent of their half difference.

Then to half the sum add half the difference for the
greater angle, and subtract it for the less. The three angles
of the triangle being thus known, the required side may be
found by Case 1.

Note.—The half sum of the angles is found by substracting
the given angle from $180°$, and taking half the remainder;
or, instead of the tangent of the half sum, the cotangent of
half the given angle may be used, being the same thing.

Let $ABC$ (fig. 18.) be any triangle; produce $AB$, making
$BE = BC$; also take $BD = BC$; join $DC$ and $CE$, and draw $DF$ perpendicular to $DC$. Now since
$DB$, $BC$, and $BE$, are all equal to each other, a femi-
circle described from the centre $B$, and with the radius $DB$,would pass through $D$, $C$, and $E$; consequently $DCE$ is
a right angle, or $CE$ is perpendicular to $DC$, and is there-
tore parallel to $DF$; and hence $DF$ and $EC$ are re-
spectively the tangents to the angles $DCE$, and $CDE$ to
the fame radius $DC$. But $CDE$ or $CDB$ is half the sum
of the angles $BAC$ and $BCA$; for since $DB = BC$, the
angle $BDC$ is evidently $= \frac{1}{2}$ the external angle
$CBE$, which is equal to the sum of the angles at $A$ and $C$;
therefore, $CDB = \frac{1}{2}$ to half sum, and $DFC = \frac{1}{2}$
the difference of the fame angles $ABC$ and $CAB$; for
$ABC = BCD + DCA$, and consequently $BAC =
DCE$, or $BDC - DCA$; therefore $DCE = \frac{1}{2}$
their difference. Whence $CE$ is tangent of half the sum,
and $DF$ the tangent of half the difference of the angles $A$
and $C$; and it is evident from the construction that $AE$
is the sum of the sides, and $AD$ is the difference of the
fame; consequently, since $DF$ and $CE$ are parallel, we have
$AE = AD :: CE : DF$;
that is,
As the sum of the sides $AB + BC$ :
Is to the difference of the sides $AB - BC$ ::
So is the tangent of half the sum of the angles $A$ and $C$ :
To the tangent of their half difference.

Let us take as an example a triangle (fig. 19.), in which
the following dimensions are given, viz.
$AB = 75$, $AC = 58$, $A = 108° 24'$;
then will $AB = 75$ $A = 75$ $A + B + C = 180°$ c
\[
\begin{align*}
AC &= 58
\end{align*}
\]
\[
\begin{align*}
A &= 108 24
\end{align*}
\]
\[
\begin{align*}
\text{Sum} &= 133,
\end{align*}
\]
\[
\begin{align*}
\text{differ.} &= 17
\end{align*}
\]
\[
\begin{align*}
BC &= 71 36
\end{align*}
\]
\[
\begin{align*}
\frac{1}{2}(B + C) &= 35 48
\end{align*}
\]
\[
\begin{align*}
\log. \ of \ AB + AC &= 2.1238516
\end{align*}
\]
\[
\begin{align*}
\log. \ of \ AB - AC &= 1.2304489
\end{align*}
\]
\[
\begin{align*}
\log. \ of \ tan. \ \frac{1}{2}(B + C) &= 0.9854089
\end{align*}
\]
\[
\begin{align*}
\log. \ of \ tan. \ \frac{1}{2}(C - B) &= 11.0885818
\end{align*}
\]
\[
\begin{align*}
\log. \ of \ tan. \ \frac{1}{2}(C - B) &= 8.6646667
\end{align*}
\]
\[
\text{The nearest corresponding number to which is } 5° 16'.
\]
\[
\frac{1}{2}(B + C) &= 35 48', 
\frac{1}{2}(B + C) &= 35 48'
\]
\[
\frac{1}{2}(C - B) &= 5° 16', 
\frac{1}{2}(C - B) &= 5° 16'
\]
\]
\[
\begin{align*}
C &= 41° 4' \\
B &= 30° 32'
\end{align*}
\]
If the other side $CB$ were required, having found the
angles, it may be exactly determined by the first case.

Case 3.—When the three sides of a triangle are given, to
find the three angles.

Assume any side of the triangle as a base (fig. 20.), and let fall
a perpendicular upon it from the opposite angle; then say,
As the base :
Is to the sum of the other two sides ::
So is the difference of the fame sides :
To the difference of the segments of the base.

To the base or sum of the segments add the half difference
for the greater segment, and subtract it for the less.

The segments being thus found, the angles may be de-
termined by the first case. The demonstration is here very
obvious; for, by the 47th proposition of the first book of
Euclid,
\[
A D^2 + DC^2 = AC^2
\]
\[
B D^2 + DC^2 = BC^2
\]
therefore,
TRIGONOMETRY.

Therefore, \( A \, D^2 - B \, D^2 = A \, C^2 - B \, C^2 \);

consequently,
\[ A \, D + B \, D : A \, C + B \, C :: A \, C - B \, C : A \, D - B \, D; \]

which is the same as the theorem in words.

As an example, let a triangle be proposed (fig. 21.), in which the three sides are as follow, viz.

\[
\begin{align*}
A \, B &= 36, A \, C = 45, B \, C = 40 \\
A \, C &= 45, A \, B = 36, A \, B &= 36 \\
A \, C + A \, B &= 81, F \, C = 9 \\
\log \text{ of } B \, C &= 1.6020600 \\
\log \text{ of } A \, C + A \, B &= 1.9084850 \\
\log \text{ of } F \, C &= 0.9542425 \\
\text{Sum of log.} &= 2.8627275 \\
\log \text{ of } C \, G &= 1.2666757 \\
\log \text{ of } G \, E &= 1.5563025 \\
\log \text{ of whole side} &= 10.0000000 \\
\log \text{ of } E \, B &= 1.0370729 \\
\log \text{ of sin. of } E \, A \, B &= 9.4807254 \\
\log \text{ of } A \, C &= 1.6532125 \\
\log \text{ of whole side} &= 10.0000000 \\
\log \text{ of } C \, E &= 1.4604225 \\
\log \text{ of sin. of } E \, A \, C &= 9.8108097 \\
\end{align*}
\]

The third preceding cases include all the possible varieties that can arise in the solution of plane triangles; but, under certain relations of the data, more simple operations may frequently be employed. Some of these solutions we shall investigate analytically at the conclusion of this article, and it will therefore be sufficient to point out in this place a few particulars relative to the solution of right-angled plane triangles.

In any right-angled triangle, any of the unknown parts may be found by the following proportions.

As radius:
Is to either leg of the triangle:
So is the tangent of the adjacent angle:
To the opposite leg; and:
So is the secant of the same angle:
To the hypothenuse.

For \( A \, B \) (fig. 22.) being supposed the given leg, let \( A \, D \) represent the tabular radius, describe the arc \( E \, D \), and draw \( D \, F \) perpendicular to \( A \, D \); so shall \( D \, F \) represent the tabular tangent, and \( A \, F \) the tabular secant of the angle \( A \); and because of the parallels, as \( A \, D \) \( : \, A \, B :: D \, F : B \, C :: A \, F : A \, C \), which is the same as the theorem in words.

Whence
\[
\begin{align*}
B \, C &= A \, B \times D \, F \times \tan \, A \quad \text{rad.} \\
A \, C &= A \, B \times A \, F \times \sec \, A \quad \text{rad.} \\
\end{align*}
\]

When the hypothenuse is given, each of the legs will represent, or have the ratio of, the sines of their opposite angles, the hypothenuse itself being assumed for the radius.

In this case, therefore, it will be

As radius:
Is to the hypothenuse:
So is the sine of either acute angle:
To the opposite side.

That is
\[
\begin{align*}
A \, E : A \, C :: A \, G : B \, C; \\
\end{align*}
\]

or
\[
\begin{align*}
\text{rad. : } A \, C :: \sin \, A : A \, B \\
\text{rad. : } A \, C :: \sin \, B : A \, B \\
\end{align*}
\]

Note.—The radius is equal to the sine of 90°, or to the tangent of 45°.

The preceding theorems have been deduced from the geometrical properties of triangles and of their several parts; and they exhibit the simplest and most direct mode of solution that can be obtained generally for each case; but there are certain other forms of solution which are much more readily applied under particular relations of the data, which it will be proper now to consider, and in which we shall adopt the analytical mode of investigation instead of the geometrical one hitherto pursued.

Let \( A \, B \, C \) (Plate III, fig. 1.) be any plane triangle; \( C \) the vertical angle; \( C \, D \) a perpendicular let fall upon the base \( A \, B \); and let \( a, b, c \) denote the sides respectively that are opposite to the angles \( A, B, C \).

Then because \( A \, C = b, A \, D \) is the cosine of \( A \) to that radius; consequently, when radius is 1, \( A \, D = b \, \cos \, A \).

In like manner, \( B \, D = a \, \cos \, B \); therefore \( A \, D + B \, D = A \, B = a \, \cos \, B + b \, \cos \, A \).

If one of the angles, as \( A \), were obtuse, the result would still be the same; because, while on the one hand \( \cos \) \( A \) would be negative, \( A \, D \), lying on the contrary side of \( A \) to what it does in the figure referred to, it must be deducted from \( B \, D \) to leave \( A \, B \); and a negative quantity subtracted, is equivalent to a positive quantity added; and by letting fall perpendiculars from the angles \( A \) and \( B \) upon the opposite sides, or upon their continuations, precisely analogous results will be obtained; and hence we derive immediately the following fundamental equations.

\[
\begin{align*}
a &= \tan \, C + \cos \, B \quad \text{rad.} \\
b &= \cos \, C + \cos \, A \quad \text{rad.} \\
c &= \cos \, B + \cos \, A \quad \text{rad.} \\
\end{align*}
\]

Again, it is obvious, that in the same manner as we found \( A \, D = b \, \cos \, A \), and \( B \, D = a \, \cos \, B \), we might also obtain \( D \, C = a \, \sin \, A \) and \( D \, C = b \, \sin \, A \); therefore \( a \, \sin \, A \).

\( B = b \, \sin \, A \); whence also \( b = \sin \, A \).

In like manner we have \( a = \tan \, C \); and \( b = \tan \, B \).

Or changing the denominators, the relations of all the six quantities may be thus expressed:

\[
\begin{align*}
f \, \sin \, A &= f \, \sin \, B \quad \text{rad.} \\
f \, \sin \, A &= f \, \sin \, C \quad \text{rad.} \\
f \, \sin \, B &= f \, \sin \, C \quad \text{rad.} \\
\end{align*}
\]

These
TRIGONOMETRY.

Thefe formulae fhew immediately the truth of our firft theorem, viz. "the fides of plane triangles have the fame ratio as the fides of their oppofite angles."

Again, fince \( a : b : \) fin. \( A : \) sin. \( B, \) we have \( a + b : a - b :: \) sin. \( A + \) fin. \( B : \) sin. \( A - \) sin. \( B; \) that is,

\[
\begin{align*}
a + b &= \text{fin. } A + \text{fin. } B \\
a - b &= \text{fin. } A - \text{fin. } B.
\end{align*}
\]

But

\[
\frac{\text{fin. } A + \text{fin. } B}{\text{fin. } A - \text{fin. } B} = \frac{\text{tan. } \frac{1}{2} (A + B)}{\text{tan. } \frac{1}{2} (A - B)}.
\]

See Arithmetic of Sines; consequently

\[
\begin{align*}
a + b &= \tan. \frac{1}{2} (A + B) \\
a - b &= \tan. \frac{1}{2} (A - B)
\end{align*}
\]

Or \( a + b = \tan. \frac{1}{2} (A + B) : \tan. \frac{1}{2} (A - B); \)

that is, "the fum of the fides is to the difference of the fides, as the tangent of half the fum of the oppofite angles is to the tangent of half the difference," which is our fecond theorem; and other forms of folution are readily obtained from the two fundamental equations (I.) and (II.) viz.

\[
\begin{align*}
a &= b \text{ cof. } C + c \text{ cof. } B \\
b &= a \text{ cof. } C + c \text{ cof. } A \\
c &= c \text{ cof. } B + b \text{ cof. } A
\end{align*}
\]

For multiplying the firt of these equations by \( a, \) the fecond by \( b, \) and the third by \( c, \) and each of the equations thus obtained being taken from the fum of the other two, there will arife

\[
\begin{align*}
b^2 + c^2 - a^2 &= 2bc \text{ cof. } A \\
a^2 + c^2 - b^2 &= 2ac \text{ cof. } B \\
a^2 + b^2 - c^2 &= 2ab \text{ cof. } C
\end{align*}
\]

(III.)

Hence, when two fides and the contained angle are given, we have

\[
\begin{align*}
a &= \sqrt{\left\{ \frac{1}{2} (a + b + c) - \frac{1}{2} (a + b + c) - a \right\}} \\
b &= \sqrt{\left\{ \frac{1}{2} (a + b + c) - b \right\}} \\
c &= \sqrt{\left\{ \frac{1}{2} (a + b + c) - c \right\}}
\end{align*}
\]

(IV.)

And when the three fides are given,

\[
\begin{align*}
\text{cof. } A &= \frac{(b + c - a) (b + c - a)}{2bc} \\
\text{cof. } B &= \frac{(a + c - b) (a + c - b)}{2ac} \\
\text{cof. } C &= \frac{(a + b - c) (a + b - c)}{2ab}
\end{align*}
\]

(V.)

These formulae are very convenient for computation, the former when the cofine of the given angle has any real fractional value, and the latter, when the three fides are completely integral, and small numbers: in other fcases, they will be found more convenient under the following form, viz.

\[
\begin{align*}
\text{cof. } A &= \frac{(b + c - a) (b + c - a)}{2bc} \\
\text{cof. } B &= \frac{(a + c - b) (a + c - b)}{2ac} \\
\text{cof. } C &= \frac{(a + b - c) (a + b - c)}{2ab}
\end{align*}
\]

(VI.)

Or we may substitute for \( \text{cof. } A \) its equal \( 2 \text{ cof. } \frac{1}{2} A - 1, \)

(see Sin.); and we have,

\[
\begin{align*}
\text{cof. } A &= \sqrt{\left\{ \frac{1}{2} (a + b + c) - b \right\}} \\
\text{cof. } B &= \sqrt{\left\{ \frac{1}{2} (a + b + c) - a \right\}} \\
\text{cof. } C &= \sqrt{\left\{ \frac{1}{2} (a + b + c) - c \right\}}
\end{align*}
\]

(VII.)

which is purely logarithmic: the \( \text{cof. } \frac{1}{2} B, \) and \( \text{cof. } \frac{1}{2} C, \) being precisely analogous to the above, are omitted.

And in a similar manner, we find

\[
\text{fin. } \frac{1}{2} A = \sqrt{\left\{ \frac{1}{2} (a + b + c) - c \right\}} \\
\text{fin. } \frac{1}{2} B = \sqrt{\left\{ \frac{1}{2} (a + b + c) - a \right\}} \\
\text{fin. } \frac{1}{2} C = \sqrt{\left\{ \frac{1}{2} (a + b + c) - b \right\}}
\]

(VIII.)

And again, by division,

\[
\frac{1}{2} (a + b + c) - a
\]

(IX.)

Of thefe several rules for the determination of the fides and angles of plane triangles, we have before observed, that the formulae (IV.) and (V.) are fett adapted to small integral values of the fides; and to real fractional values of the cofine, in other fcases, one or other of the three latter will fett apply. When the angle fought is very small, it is ufually better to employ \( \text{N}^5 \) (VIII.) than \( \text{N}^5 \) (VII.). The method indicated in \( \text{N}^5 \) (IX.) is commodious, and very correct, except when \( A \) is either very small or near \( 180^\circ. \)

In fome fcases, where great accuracy is required, the operator may wifh to obviate the uncertainties that would arife from the ufe of fome of thefe formulae; for which purpofe Dr. Mafkeyne has given, in the Introduction to Taylor's Logarithms, the following rules in reference to the fides and tangents of very small arcs.

1. To find the Sine.—To the log. of the arc reduced into fconds, with the decimal annexed, add the conftant quantity \( 4.6855749, \) and from the fum subtract one-third of the arithmetical complement of the log. cofine, and the remainder will be the log. fine of the given arc.

2. To find the Arc from the Sine.—To the given log. fine of a small arc, add \( 5.3144251, \) and one-third of the arithmetical complement of log. cofine; subtract 10 from the index of the fum, the remainder will be the logarithm of the number of fconds and decimals in the given arc.

3. To find the Tangent.—To the log. arc and the conftant quantity \( 4.6855749, \) add two-thirds of the arithmetical complement of the log. cofine, and the fum is the log. tangent of the given arc.

4. To find the Arc from the Tangent.—To the log. tangent add \( 5.3144251, \) and from the fum subtract two-thirds of the arithmetical complement of log. cofine; take 10 from the index, and there will remain the logarithm of the number of fconds and decimals in the given arc.
TRIGONOMETRY.

Trigonometry, Spherical, relates to the resolution and calculation of the sides and angles of spherical triangles, which are formed by the intersection of three great circles of the sphere, and which, like plane triangles, confit of six parts, viz. three sides and three angles. See Spherical Triangle.

In plane trigonometry, any three of the six parts of a triangle being given, except the three angles, the other parts may be found; but in spherical trigonometry this exception has not place, for any three of the six parts being given, the rest may thence be determined, the sides being measured or estimated by degrees, minutes, &c. the same as the angles.

Spherical trigonometry is divided into right-angled and oblique-angled, or the resolution of right and oblique-angled spherical triangles. When a spherical triangle has a right angle, it is called a right-angled spherical triangle; and when one of its sides is a quadrant, or 90°, it is called a quadrantal triangle.

The solution of all the cases of spherical trigonometry, although much more numerous than those in plane trigonometry, depends upon only three fundamental equations.

Theorem 1.—In any spherical triangle, the sides of the sides have the same ratio as the sines of their opposite angles.

Let O (fig. 2.) be the centre of the sphere, and having joined OA, OC, OB, draw AD perpendicular to the plane OBC; also make DE perpendicular to OB, and DF to OC; and join AE, AF.

Then, because AD is perpendicular to the plane OBC, each of the planes ADE, AFD, which pass through AD, will also be perpendicular to that plane; and since ED is perpendicular to OB, and the plane ADE to the plane OBC, the line AE, which lies in the plane ADE, and is drawn from the fame point E, is also perpendicular to OB. Again, in like manner, because FD is perpendicular to OC, and the plane AFD to the plane OBC, the line FA, which lies in the plane AFD, and is drawn from the fame point F, is perpendicular to OC; and, therefore, the angles AED and AFD, which measure the inclination of the planes AOB, AOC, will measure the angles CBA, BCA, of the spherical triangle ABC. Also AF, being perpendicular to OC, is the sine of the angle AOF, or of the arc AC; and AE, which is perpendicular to OB, is the sine of the angle AOB, or of the arc AB. But ADE, AFD, being right-angled plane triangles, right-angled at D, we shall have AD = AE sin. AED, and AD = AF sin. AFD. Whence, by equality, AE sin. AED = AF sin. AFD; consequently

AE : sin. AFD :: AF : sin. AED, or

that is, the sines of the sides have the same ratio as the sines of the opposite angles.

Hence, if A, B, C, be supposed to denote the three angles of any spherical triangle, and a, b, c, the corresponding opposite sides, we may from the above deduce the following fundamental equation, viz.

\[
\sin A \sin B \sin C = \sin a \sin b \sin c \quad (I).
\]

Theorem 2.—In any spherical triangle,

As the rectangle of the sides of any two sides : is to the radius ::

So is the rectangle of radius and the cofine of the other side, minus the rectangle of the cofines of the same two sides :

To the cofine of the angle included by those sides.

For, having joined OA, OB, OC, (fig. 3.) draw FD in the plane OBC, and DE in the plane OAB, each perpendicular to their common section OB, and join EF. Then, because the angle EDF is the measure of the inclination of the planes OBC, OAB, it is also the measure of the spherical angle ABC or B. And because

\[
\text{cuf. EDF} = \frac{DE^2 + DF^2 - EF^2}{2 DE \times DF},
\]

\[
\text{cuf. EOF} = \frac{OE^2 + OF^2 - EF^2}{2 OE \times OF},
\]

\[
EF^2 = OE^2 + OF^2 - 2OE \times OF \times \text{cuf. EOF},
\]

See Form (V.) Plane Trigonometry.

And by substituting this in the first equation, \( \text{cuf. EDF} = \frac{DE^2 + DF^2 - EF^2}{2 DE \times DF} \),

\[
\text{cuf. B} = \frac{OE \times OF \times \text{cuf. EOF} - OA^2}{DE \times DF} \quad (II.)
\]

Whence, since \( \frac{OE}{DE} = \frac{1}{\sin DOE} \), and \( \frac{OF}{DF} = \frac{1}{\sin DOF} \), &c. if these values be substituted in the former equation, we shall have

\[
\text{cuf. B} = \frac{\text{cuf. AC} - \text{cuf. AB} \times \text{cuf. BC}}{\sin AB \times \sin BC},
\]

which necessarily involves the conditions given in the enunciation of the theorem.

Here again, assuming A, B, C, to denote the angles, and a, b, c, the corresponding opposite sides, we deduce the following set of equations, viz.

\[
\begin{align*}
\text{cuf. a} & = \text{cuf. b} \times \text{cuf. c} + \text{fin. b} \times \text{fin. c} \times \text{cuf. A} \quad (I. I.) \\
\text{cuf. b} & = \text{cuf. a} \times \text{cuf. c} + \text{fin. a} \times \text{fin. c} \times \text{cuf. B} \\
\text{cuf. c} & = \text{cuf. a} \times \text{cuf. b} + \text{fin. a} \times \text{fin. b} \times \text{cuf. C} \quad (I. I. I.)
\end{align*}
\]

These equations will apply equally to the supplemental triangle; thus putting for the sides a, b, c, \( 180^\circ - a', 180^\circ - b', 180^\circ - c' \); and for the angles A, B, C, \( 180^\circ - a', 180^\circ - b', 180^\circ - c' \), we shall have

\[
- \text{cuf. A'} = \text{cuf. B'} \times \text{cuf. C'} - \text{fin. B'} \times \text{fin. C'} \times \text{cuf. a'}.
\]

And here, again, we have three symmetrical equations applying to any spherical triangles, viz.

\[
\begin{align*}
\text{cuf. a} & = \text{cuf. b} \times \text{fin. c} - \text{cuf. b} \times \text{fin. c} \\
\text{cuf. b} & = \text{cuf. c} \times \text{fin. a} - \text{cuf. c} \times \text{fin. a} \\
\text{cuf. c} & = \text{cuf. a} \times \text{fin. b} - \text{cuf. a} \times \text{fin. b}
\end{align*}
\]

Another important relation may also hence be readily deduced; for, substituting for the cuf. b in the third of the equations N°. (II.) its value in the second; substituting also for cuf. a', its value \( - \text{fin. a} \), and then striking out the common factor fin. a, we shall have

\[
\text{cuf. c} \times \text{fin. a} = \text{fin. c} \times \text{cuf. a} \times \text{cuf. b} + \text{fin. b} \times \text{cuf. c}.
\]

But equation N°. (I.) gives \( \text{fin. b} = \frac{\text{fin. b}}{\text{fin. c}} \); and hence,
hence, by substitution,

\[
\frac{\text{cof. } \alpha \times \text{sin. } \epsilon}{\text{sin. } \epsilon} = \frac{\text{sin. } \beta \times \text{cof. } C \times \text{sin. } \epsilon}{\text{sin. } C}
\]

Dividing by \(\text{sin. } \epsilon\), we have

\[
\frac{\text{cof. } \alpha}{\text{sin. } \epsilon} = \frac{\text{cof. } \alpha \times \text{cof. } B}{\text{sin. } \epsilon}.
\]

Thus, again, we get three symmetrical equations:

\[
\begin{align*}
\text{cot. } \beta & = \text{cot. } \beta \times \text{cof. } C \times \text{sin. } \epsilon, \\
\text{cot. } \epsilon & = \text{cot. } \epsilon \times \text{cof. } A \times \text{sin. } B, \\
\text{cot. } \delta & = \text{cot. } \delta \times \text{cof. } A \times \text{sin. } B.
\end{align*}
\]

The classes of equations Nos. (I.) (II.) (III.) and (IV.) comprehend the whole of spherical trigonometry; or, in fact, \(N^0 (I.)\), from which all the others can be derived, may be regarded as comprehending the whole. They require, however, some modifications to adapt them to logarithmic computations, which we shall now endeavour to illustrate.

1. Solution of Right-Angled Spherical Triangles.—Let us suppose the angle \(A\) to be the right angle, then \(\text{sin. } A = 1\).

\[
\begin{align*}
\text{sin. } A & = \frac{\text{sin. } B}{\text{cof. } B}, \\
\text{sin. } B & = \frac{\text{sin. } C}{\text{cof. } C}.
\end{align*}
\]

For the same reason, Equation 1. \(N^0 (I.)\) gives:

\[
\begin{align*}
\text{sin. } A & = \frac{\text{sin. } B}{\text{cof. } B}, \\
\text{sin. } B & = \frac{\text{sin. } C}{\text{cof. } C}.
\end{align*}
\]

And upon the same hypothesis, \(\text{cot. } A\) becomes \(\epsilon\); so that Equation 1. \(N^0 (IV.)\) becomes:

\[
\begin{align*}
\text{cot. } A & = \frac{\text{cot. } B}{\text{cot. } B}, \\
\text{cot. } A & = \frac{\text{cot. } B}{\text{cot. } B}.
\end{align*}
\]

The equations 2. and 3. of \(N^0 (I.)\) give also upon the same hypothesis, that is, angle \(A = 90^\circ\):

\[
\begin{align*}
\text{cot. } B & = \frac{\text{cot. } B}{\text{cot. } B} \times \text{cof. } C, \\
\text{cot. } C & = \frac{\text{cot. } C}{\text{cot. } C} \times \text{cof. } B.
\end{align*}
\]

And, lastly, from \(N^0 (IV.)\):

\[
\begin{align*}
\text{cot. } B & = \frac{\text{cot. } B}{\text{cot. } B} \times \text{sin. } \beta, \\
\text{cot. } C & = \frac{\text{cot. } C}{\text{cot. } C} \times \text{sin. } \epsilon.
\end{align*}
\]

From these equations, by a few obvious transformations, the six usual cases of spherical right-angled triangles may be solved as follows.

Cafe 1.—Given the hypotenuse \(A\), and an angle \(B\), to find the other parts.

Here,

\[
\begin{align*}
\text{sin. } B & = \text{sin. } A \times \text{sin. } B, \\
\text{cot. } B & = \text{cot. } A \times \text{cof. } B.
\end{align*}
\]

It may be proper to observe, that the rules of the signs, given under the article Arithmetic of Sines, will serve in all these cases to determine the kind or affection of the unknown parts.

In working by logarithms it must be observed, that when the resulting logarithm is the logarithm of a quotient, \(10\) must be added to the index; and when it is the logarithm of a product, \(10\) must be subtracted from the index.
TRIGONOMETRY.

11. Resolution of oblique-angled spherical Triangles.—This may be effected by means of four general cases, comprehend- ing two or more problems.

Case 1.—Given three of these four things, viz. two sides and their opposite angles and C, to find the fourth.

This case comprehends two problems, in one of which the unknown quantity is an angle, in the other a side; which are both resolved by means of equation N° (I) from which we have

\[
\sin C = \frac{\sin c \sin B}{\sin b}; \quad \sin e = \frac{\sin C \sin b}{\sin B}.
\]

Case 2.—Of the four following things; viz. a, b, c, and an angle, any three being given, to find the fourth. This case comprehends three problems.

1. When the three sides are given, to find an angle.

Here, from equation N° (II.) we have

\[
\begin{align*}
\text{c}of. A &= \frac{\text{c}of. a - \text{c}of. b \text{c}of. e}{\sin b \sin e} \\
\text{c}of. B &= \frac{\text{c}of. b - \text{c}of. a \text{c}of. e}{\sin a \sin e} \\
\text{c}of. C &= \frac{\text{c}of. c - \text{c}of. a \text{c}of. b}{\sin a \sin b}
\end{align*}
\]

In this form, however, the equations are not adapted to logarithmic computation. We must therefore refer to the formulae given under the article Sine, where we have

\[
1 + \text{c}of. A = 2 \text{c}of. \frac{1}{2} A, \quad \text{and} \quad 1 - \text{c}of. A = 2 \sin \frac{1}{2} A.
\]

Hence,

\[
2 \text{c}of. \frac{1}{2} A = \frac{\sin b \sin c - \text{c}of. a - \text{c}of. b \text{c}of. e}{\sin b \sin e} = \frac{\text{c}of. a - \text{c}of. (b + c)}{\sin b \sin e}.
\]

Hence, also, \(2 \sin \frac{1}{2} A = \frac{\cos (b - c) - \cos a}{\sin b \sin e}\)

The latter of these, divided by the former, gives

\[
\tan^2 \frac{1}{2} A = \frac{\cos (b - c) - \cos a}{\cos a - \cos (b + c)};
\]

which is equivalent to

\[
\tan^2 \frac{1}{2} A = \frac{2 \sin (a + b - c) \sin (a + e - b)}{2 \sin (a + b + c) \sin (b + e - a)}.
\]

See Sines.

Hence we have, for the tangents of the half angles of these three symmetrical equations; viz.

\[
\tan \frac{1}{2} A = \sqrt{\frac{\sin \frac{1}{2} (a + b - c) \sin \frac{1}{2} (a + e - b)}{\sin b \sin e}}.
\]

\[
\tan \frac{1}{2} B = \sqrt{\frac{\sin \frac{1}{2} (a + b - c) \sin \frac{1}{2} (b + e - c)}{\sin a \sin e}}.
\]

\[
\tan \frac{1}{2} C = \sqrt{\frac{\sin \frac{1}{2} (a + e - b) \sin \frac{1}{2} (b + e - a)}{\sin a \sin b}}.
\]

The expressions for the sines of the half angles might be obtained with equal facility. As they are symmetrical, we shall put down but one; viz.

\[
\sin \frac{1}{2} A = \sqrt{\frac{\sin \frac{1}{2} (a + b - c) \sin \frac{1}{2} (a + e - b)}{\sin b \sin e}}.
\]

And expressions for the cosines and cotangents of the half angles may be readily found from the above by the forms \(\cos \frac{1}{2} = \frac{\cos a - \cos b \cos e}{\sin a \sin b}\).

When two sides, as b and e, become equal, the expression for \(\sin \frac{1}{2} A\), becomes \(\sin \frac{1}{2} A = \frac{\sin \frac{1}{2} a}{\sin b}\).

If \(a = b = c = 90^\circ\), then \(\sin \frac{1}{2} A = \frac{\sqrt{2}}{2} = \frac{1}{2} \sqrt{2} = 45^\circ\); and \(A = B = C = 90^\circ\).

Leaving other corollaries to be deduced by the reader, let us proceed to the next problem in this case.

2. To find the side opposite to the given angle C; that is, given two sides and the included angle, to find the third side. Find from the data a dependent angle \(\alpha\), such, that

\[
\tan \alpha = \text{cot} C \tan b.
\]

Substitute for \(\text{cot} C\) in the third equation N° (II.) its value in this, and it will become

\[
\text{cot} c = \text{cot} a \text{ cot} b + \sin a \text{ cot} b \tan \alpha
\]

\[
= \text{cot} b \left(\frac{\text{cot} a \text{ cot} \alpha + \sin a \tan \alpha}{\text{cot} c}\right)
\]

or if \(\alpha = 0\) and \(\text{cot} c = \text{cot} \alpha = \frac{\text{cot} b}{\text{cot} C}\).

Hence \(a\) is known by adding \(\alpha\).

Case 3.—Of the four following parts; viz. two sides, and two angles, one opposite, the other adjacent; three being given, to find a fourth.

This case presents four problems.

1. Given \(a, \alpha, b,\) to find \(C\).

2. Determine an are \(\theta\) by this condition.

\[
\text{cot} c = \text{cot} \theta \text{ cot} b, \quad \text{or} \quad \frac{\text{cot} c}{\text{cot} B} = \frac{\text{cot} \theta}{\text{cot} C}.\]

3. To find the side \(a\), not opposite to the given angle;

\(b, \alpha\), and \(C\) being given

Here find \(\alpha\), as before, by N° (XII.) then from N° (XIII.) we have

\[
\text{cot} (a - \theta) = \frac{\text{cot} \theta \text{ cot} a}{\text{cot} b}.
\]

Hence \(a\) is known by adding \(\theta\).

Case 4.—Of the four following parts; viz. two sines, and two angles, one opposite, the other adjacent; three being given, to find a fourth.

This case presents four problems.

1. Given \(a, \alpha, B,\) to find \(C\).

Determine an are \(\theta\) by this condition,

\[
\text{cot} \theta = \text{cot} \alpha \text{ cot} B, \quad \text{or} \quad \frac{\text{cot} \theta}{\text{cot} \alpha} = \frac{\text{cot} C}{\text{cot} B}.
\]

Substitute
SUBSTITUTE this value of cot. \(c\) for it in Equation 3.

Substitute the value of cot. \(C\) for it in Equation \(N^o\) (IV.) and it will reduce to

\[
\cot C = \frac{\cot a \cot (B - \phi')}{\cot \phi''} \quad \text{(XIX.)}
\]

4. Given \(a, c, C\), to find \(B\).
Determine \(\phi''\) from \(N^o\) (XVIII.) ; then

\[
\cot (B - \phi'') = \frac{\cot c \cot \phi''}{\cot a} \quad \text{(XX.)}
\]

from which \(B\) becomes known.

Cafe 4.—Of these four parts; viz. the three angles and a side, (suppose \(c\)), any three being given, to find the fourth.

This case comprises three problems.

1. Given three angles to find a side.

Suppose Equation 1. \(N^o\) (XI.) to be applied to the solution of the supplemenental triangle, by changing \(a, b, c\), and \(C\) into \(a', b', c', \) and \(C'\). Then to bring it back to the triangle proposed, let there be substituted for \(a', b', c', \) and \(C'\), the corresponding values \(180^o - A, 180^o - B, 180^o - C\), and \(180^o - c\); those equations will then be transformed into the following, which are applicable to the present problem.

**TRIGONOMETRY.**

Substitute this value of \(\cot c\) for it in Equation \(N^o\) (IV.) and it will become

\[
\text{fin. } a = \cot \phi' \cot B = \cot a \cot B + \sin B \cot C.
\]

Whence \(D\) becomes known.

Here \(\phi'\) must be found by \(N^o\) (XV.) and then from \(N^o\) (XVI.) when

\[
\text{fin. } (a - \phi') = \cot C \text{ sin. } \phi' \frac{\cot B}{\cot a}.
\]

Whence \(a\) becomes known.

3. Given \(B, C, a\), to find \(c\).
Find a dependent angle \(\phi''\), by making

\[
\cot C = \cot a \tan \phi'' = \cot C \cos \phi'' = \cot \phi''.
\]

The following are the expressions for the sines of the half angles; viz. \(a, b, c\).

\[
\begin{align*}
\text{fin. } a & = \sqrt{\cot \phi''} \\
\text{fin. } b & = \sqrt{\cot \phi''} \\
\text{fin. } c & = \sqrt{\cot \phi''}
\end{align*}
\]

It may here be observed, that notwithstanding the denominators are negative in the above expressions, the whole fraction under the radicals are always positive.

2. Given \(A, B, c\), to find \(C\).
Here, by applying in like manner the equations \(N^o\) (XII.) and \(N^o\) (XIII.) to the supplemenental triangle, we shall have

\[
\cot \phi = \cot c \tan B; \quad \text{(XXIII.)}
\]

from which the supplemenental angle \(\phi\) may be determined, and thence

\[
\cot C = \cot a \text{ sin. } (A - \phi) \quad \text{(XXIV.)}
\]

3. Given \(B, C, \) and \(c\), to find \(A\).
Find \(\phi\) from \(N^o\) (XXI.) then from \(N^o\) (XXV.) there results

\[
\text{fin. } (A - \phi) = \cot C \cos \phi \quad \text{(XXV.)}
\]

from which \(A\) becomes known.

Of the Analogies of Napier.—In the introduction to the

The present article we had occasion to mention the analogies of Napier, which it may not be amiss to illustrate before we proceed any farther in our investigations. These analogies are four simple and elegant formulas, which we owe to the celebrated inventor of logarithms, of which two serve to determine any two angles of a spherical triangle by means of two opposite sides and their included angle; while the other two serve to find any two sides by means of their opposite angle and the contained side. They, therefore, together with equation \(N^o\) (I.), will serve for the solution of all the cases of oblique-angled spherical triangles. The investigation of these analogies may be given as follow.

If from Equation 1. \(N^o\) (II.) \(\cos e\) will be exterminated, there will result, after a little reduction,

\[
\cot A \sin e = \cot a \sin b - \cot C \sin a \quad \text{(XXVI.)}
\]

and, by a simple permutation of letters,

\[
\cot B \sin e = \cot b \sin a - \cot C \sin b \quad \text{(XXVII.)}
\]

Adding these equations together, and reducing them, we have

\[
\text{fin. } e = (\cot A + \cot B) = (1 - \cot C \sin (a + b)).
\]

Now
Now from N° (I.) we have
\[
\begin{align*}
\sin a &= \sin b = \sin c, \\
A &= \sin B = \sin C.
\end{align*}
\]
Clearing these equations of their denominators, and respectively adding and subtracting them, there results
\[
\begin{align*}
\sin c (\sin A + \sin B) &= \sin C (\sin a + \sin b), \\
\sin c (\sin A - \sin B) &= \sin C (\sin a - \sin b).
\end{align*}
\]
Dividing each of these two equations by the preceding, there will be obtained,
\[
\begin{align*}
\sin A + \sin B &= \sin C \times \frac{\sin a + \sin b}{\sin a + \sin b}, \\
\sin A - \sin B &= \sin C \times \frac{\sin a - \sin b}{\sin a - \sin b}.
\end{align*}
\]
Consequently, from the relation established under Arithmetic of Sines,
\[
\tan \frac{1}{2} (A + B) = \cot \frac{1}{2} C \cdot \cot \frac{1}{2} (a + b),
\]
\[
\tan \frac{1}{2} (A - B) = \cot \frac{1}{2} C \cdot \cot \frac{1}{2} (a - b).
\]
And these equations, expressed as analogies, are,
\[
\begin{align*}
\cot \frac{1}{2} (a + b) : \cot \frac{1}{2} (a - b) &= \cot \frac{1}{2} C : \tan \frac{1}{2} (A + B), \\
\sin \frac{1}{2} (a + b) : \sin \frac{1}{2} (a - b) &= \cot \frac{1}{2} C : \tan \frac{1}{2} (A - B).
\end{align*}
\]
These analogies being applied to the supplemental triangle, by putting 180° - A, 180° - B, &c. for a, b, &c. we have
\[
\begin{align*}
\cos \frac{1}{2} (A + B) : \cos \frac{1}{2} (A - B) &= \tan \frac{1}{2} c : \tan \frac{1}{2} (a + b), \\
\cos \frac{1}{2} (A + B) : \cos \frac{1}{2} (A - B) &= \tan \frac{1}{2} c : \tan \frac{1}{2} (a - b).
\end{align*}
\]
From a due consideration of these four analogies, it results,
1. That \(\frac{1}{2} (A - B) < 90°\), or that the difference of two angles of a spherical triangle is less than 180°.
2. That \(\frac{1}{2} (a + b) \) and \(\frac{1}{2} (A + B)\) are always of the same affection.
3. That the difference of two sides is always less than 180°.
4. That \(a - b\) and \(A - B\) have always the same sign; whence it follows, that the greatest angle is opposite to the greatest side, and reciprocally.
To thefe it may be added,
5. That the leat angle is opposite to the leat side, and the mean angle to the mean side.
One or other of these observations will serve to remove the ambiguity in the doubtful cases where \(a, b, \) and \(A, B, \) or \(A, B, \) and \(b, \) are given.
We may now collect the most commodious of these theorems, and present in one place all that will be usually required in the solution of oblique-angled spherical triangles.

1. \(\sin A \sin a = \sin B \sin b = \sin C \sin c\)
2. \(\tan \frac{1}{2} A = \sqrt\left\{\sin \frac{1}{2} (a + b - c) \sin \frac{1}{2} (a + c - b) \sin \frac{1}{2} (a + c - b)\right\}
3. \(\tan \frac{1}{2} B = \sqrt\left\{\sin \frac{1}{2} (b + c - a) \sin \frac{1}{2} (a + b - c) \sin \frac{1}{2} (a + b - c)\right\}
4. \(\tan \frac{1}{2} C = \sqrt\left\{\sin \frac{1}{2} (a + c - b) \sin \frac{1}{2} (b + c - a) \sin \frac{1}{2} (a + b + c)\right\}
5. \(\tan \frac{1}{2} a = \sqrt\left\{\cos \frac{1}{2} (B + C - A) \cos \frac{1}{2} (A + B + C) \cos \frac{1}{2} (A + C - B)\right\}
6. \(\tan \frac{1}{2} b = \sqrt\left\{\cos \frac{1}{2} (A + C - B) \cos \frac{1}{2} (A + B + C) \cos \frac{1}{2} (A + B - C)\right\}
7. \(\tan \frac{1}{2} c = \sqrt\left\{\cos \frac{1}{2} (A + B - C) \cos \frac{1}{2} (A + B + C) \cos \frac{1}{2} (A + C - B)\right\}
8. \(\tan \frac{b - a}{2} = \tan \frac{1}{2} c \sin \frac{1}{2} (B - A) \sin \frac{1}{2} (B + A)
9. \(\tan \frac{b + a}{2} = \tan \frac{1}{2} c \cos \frac{1}{2} (B - A) \cos \frac{1}{2} (B + A)
10. \(\tan \frac{c - b}{2} = \tan \frac{1}{2} a \sin \frac{1}{2} (C - B) \sin \frac{1}{2} (C + B)
11. \(\tan \frac{c + b}{2} = \tan \frac{1}{2} a \cos \frac{1}{2} (C - B) \cos \frac{1}{2} (C + B)
12. \(\tan \frac{a - c}{2} = \tan \frac{1}{2} b \sin \frac{1}{2} (A - C) \sin \frac{1}{2} (A + C)
13. \(\tan \frac{a + c}{2} = \tan \frac{1}{2} b \cos \frac{1}{2} (A - C) \cos \frac{1}{2} (A + C)
14. \(\tan \frac{B - A}{2} = \cot \frac{1}{2} C \sin \frac{1}{2} (b - a) \sin \frac{1}{2} (b + a)\)
TRIGONOMETRY.

15. \( \tan \frac{B + A}{2} = \cot \frac{1}{2} C \)  
   \[ \text{cof.} \frac{1}{2} \left( b - a \right) \]  
   \[ \text{cof.} \frac{1}{2} \left( b + a \right) \]

16. \( \tan \frac{C - B}{2} = \cot \frac{1}{2} A \)  
   \[ \text{fin.} \frac{1}{2} \left( c - b \right) \]  
   \[ \text{fin.} \frac{1}{2} \left( c + b \right) \]

17. \( \tan \frac{C + B}{2} = \cot \frac{1}{2} A \)  
   \[ \text{cof.} \frac{1}{2} \left( c - b \right) \]  
   \[ \text{cof.} \frac{1}{2} \left( c + b \right) \]

18. \( \tan \frac{A - C}{2} = \cot \frac{1}{2} B \)  
   \[ \text{fin.} \frac{1}{2} \left( a - c \right) \]  
   \[ \text{fin.} \frac{1}{2} \left( a + c \right) \]

19. \( \tan \frac{A + C}{2} = \cot \frac{1}{2} B \)  
   \[ \text{cof.} \frac{1}{2} \left( a - c \right) \]  
   \[ \text{cof.} \frac{1}{2} \left( a + c \right) \]

20. \( \tan \frac{1}{2} c = \tan \frac{1}{2} \left( b - a \right) \)  
   \[ \text{fin.} \frac{1}{2} \left( b + A \right) \]  
   \[ \text{fin.} \frac{1}{2} \left( B - A \right) \]

21. \( \tan \frac{1}{2} c = \tan \frac{1}{2} \left( b + a \right) \)  
   \[ \text{cof.} \frac{1}{2} \left( B + A \right) \]  
   \[ \text{cof.} \frac{1}{2} \left( b - A \right) \]

22. \( \tan \frac{1}{2} a = \tan \frac{1}{2} \left( c - b \right) \)  
   \[ \text{fin.} \frac{1}{2} \left( C + B \right) \]  
   \[ \text{fin.} \frac{1}{2} \left( C - B \right) \]

23. \( \tan \frac{1}{2} a = \tan \frac{1}{2} \left( c + b \right) \)  
   \[ \text{cof.} \frac{1}{2} \left( C + B \right) \]  
   \[ \text{cof.} \frac{1}{2} \left( c - b \right) \]

24. \( \tan \frac{1}{2} b = \tan \frac{1}{2} \left( a - c \right) \)  
   \[ \text{fin.} \frac{1}{2} \left( A + C \right) \]  
   \[ \text{fin.} \frac{1}{2} \left( A - C \right) \]

25. \( \tan \frac{1}{2} b = \tan \frac{1}{2} \left( a + c \right) \)  
   \[ \text{cof.} \frac{1}{2} \left( A + C \right) \]  
   \[ \text{cof.} \frac{1}{2} \left( A - C \right) \]

26. \( \cot \frac{1}{2} C = \tan \frac{1}{2} \left( b - a \right) \)  
   \[ \text{fin.} \frac{1}{2} \left( b + a \right) \]  
   \[ \text{fin.} \frac{1}{2} \left( b - a \right) \]

27. \( \cot \frac{1}{2} C = \tan \frac{1}{2} \left( b + a \right) \)  
   \[ \text{cof.} \frac{1}{2} \left( b + a \right) \]  
   \[ \text{cof.} \frac{1}{2} \left( b - a \right) \]

28. \( \cot \frac{1}{2} A = \tan \frac{1}{2} \left( c + b \right) \)  
   \[ \text{fin.} \frac{1}{2} \left( c + b \right) \]  
   \[ \text{fin.} \frac{1}{2} \left( c - b \right) \]

29. \( \cot \frac{1}{2} A = \tan \frac{1}{2} \left( c - b \right) \)  
   \[ \text{cof.} \frac{1}{2} \left( c + b \right) \]  
   \[ \text{cof.} \frac{1}{2} \left( c - b \right) \]

30. \( \cot \frac{1}{2} B = \tan \frac{1}{2} \left( a - c \right) \)  
   \[ \text{fin.} \frac{1}{2} \left( a + c \right) \]  
   \[ \text{fin.} \frac{1}{2} \left( a - c \right) \]

31. \( \cot \frac{1}{2} B = \tan \frac{1}{2} \left( a + c \right) \)  
   \[ \text{cof.} \frac{1}{2} \left( a + c \right) \]  
   \[ \text{cof.} \frac{1}{2} \left( a - c \right) \]

We are indebted for many of the above transformations to Gregory's Trigonometry; others have been derived from Bonnycastle's treatise on the same subject.

We shall now conclude this article, by illustrating the solution of spherical triangles by means of Napier's five circular parts. See PART and CIRCULAR PART.

Solution of right-angled spherical Triangles, by Napier's circular parts.—If either one or both the sides, including the right angle, come into the question, for it among the data, write its complement to a quadrant. Since then by the general rule delivered under the article CIRCULAR PART, and rendered logarithmic, the whole fine, with the fine complement of the middle part, must be equal to the fines of the disjunct parts, and the cotangents of the conjunct parts; from the sum of those data subtract the third datum; the remainder will be some fine or tangent, the side or angle corresponding to which, in the table of fines, &c. is the side or angle sought.

This universal rule being of great service in trigonometry, we shall apply it to the various cases thereof, and illustrate it with examples; which examples, in the case of disjunct or separate parts, will at the same time illustrate the common

method; but in the case of contiguous parts they admit of other solutions.

1. Given the hypotenuse BC, 60°, and the angle C, 30° 30'; to find the opposite leg AB. Since AB is the middle part, and C and BC are disjunct (see PART); the product of the whole fine, into the cofine of the complement AB, i.e. the fine itself of AB, is equal to the product of the fines of C and BC. Therefore from the log. fine of C 9.6606997  
   + fine of BC 9.9037530  
   Sum 19.5683235  
   Subtract whole fine 10.0000000  
   Remains fine of AB 9.5382353  

The nearest corresponding number to which, in the tables, is 20° 12'.

2. Given the hypotenuse BC, 60°, and the leg AB, 20° 12'; to find the opposite angle C. It is evident from the preceding problem, that from the sum of the whole fine, and the fine of the leg AB, the fine of the hypotenuse BC is to be subtracted, the remainder is the fine of the angle C. The example therefore of the former case is easily converted into an example of this.

3. Given the leg AB, 20° 12', and the opposite angle C, 23° 30'; to find the hypotenuse BC. It is evident from the first case, that from the sum of the whole fine, and the fine of AB, is to be subtracted the fine of the angle C, and the remainder is the fine of the hypotenuse BC.

4. Given the hypotenuse BC, 60°, and one leg AB, 20° 12'; to find the other leg. Since BC is a mean part, and A B and A C are disjunct parts, the product of the whole fine, into the cofine of the hypotenuse BC, is equal to the product of the fines of the complements, i.e. the cofines of the legs A B and A C. Therefore from the whole fine 10.0000000  
   Cofine of BC 9.6689700  
   Sum 19.6989700  
   Subtract cofine of AB 9.9724310  
   Remains cofine of A C 9.7265390  

The corresponding number to which, in the tables, is 32° 11'; therefore A C = 57° 49'.

5. Given the legs A C, 57° 49', and A B, 20° 12'; to find the hypotenuse BC. It is evident from the preceding case, that the whole fine is to be subtracted from the sum of the cofines of the legs A B and A C; the remainder is the cofine of the hypotenuse BC. The example, therefore, of the preceding case is easily applied to this.

6. Given the leg A C, 57° 49', and the adjacent angle C, 23° 30'; to find the opposite angle B. Since B is a middle part, and A and C are disjunct parts; the product of the whole fine, by the cofine of B, is equal to the product of the fine of C, and the fine of the complement, i.e. the cofine of A C. Therefore from the fine of C 9.6606997  
   Cofine A C 9.7265310  
   Sum 19.3872307  
   Subtract whole fine 10.0000000  
   Remains cofine of B 9.3872307  

The nearest number corresponding to which, in the tables, is 12° 15'; therefore B = 77° 45'.

7. Given the leg A C, 57° 49', and the opposite angle B, 77° 45'; to find the adjacent angle C. It is evident from the preceding case, that the cofine of A C is to be subtracted...
TRIGONOMETRY.

16. Given the oblique angles B, 77° 44', and C, 23° 30'; to find the hypotenuse B C. From the sum of the cotangents of C and B, subtract the whole fine; the remainder is the cofine of B C.

Solution of oblique-angled spherical Triangles. 1. In an oblique-angled spherical triangle A B C, \( \angle \geq 5^\circ \) two sides, A B and B C, being given, together with an angle, A, opposite to one of them, to find the other, C; the rule is,

As the sine of the fine B C is to the sine of the opposite angle A; so is the sine of the side B A to the sine of the opposite angle C.

Suppose, for example, B C, 39° 29'; A, 43° 20'; B A, 66° 45'; then will

\[ \begin{align*}
\text{Sine of } B C & = 9.8033572 \\
\text{Sine of } A & = 9.8364771 \\
\text{Sine of } B A & = 9.9032168 \\
\text{Sine of } C & = 19.7996939
\end{align*} \]

The nearest corresponding number to which, in the tables, is 82° 34'.

2. Given two angles C, 82° 34', and A, 43° 20', together with the side A B, 66° 45', opposite to one of them, C; to find the sine B C opposite to the other of them, A; say, as the sine of the angle C is to the sine of the opposite side A B; so is the sine of the angle A to the sine of the opposite side B C. The former example may suffice for the present case.

3. Given two sides A B, 66° 45', and B C, 30° 29', together with an angle opposite to one of them A, 43° 20'; to find the angle included by them, B. Suppose the angle C to be acute, since the other, A, is also acute, the perpendicular B E falls within the triangle. In the right-angled triangle A B E, therefore, from the given angle A, and side A B, find the angle A B E. Since B E is assumed as a lateral part in the triangle A E B, the angle E B C is a middle part, and the sine B C must be a conjoint part; the cofine of the angle E B C will be found by subtracting the cotangent of A B from the sum of the cofine of the angle A B E, and the cotangent of B C. If then the angles A B E and B C E be added together, or in case the perpendicular fall without the triangle, be subtracted from each other, you will have the angle required B.

Cofine of E B C = 9.5942557. The nearest number corresponding to which, in the tables, is 9° 29'; therefore A B C = 79° 3'.

4. Given two angles, A, 43° 20', and B, 79° 3'; together with the adjacent side A B, 66° 45'; to find the sine B C opposite to one of them.

From one of the given angles, B, let fall a perpendicular B E to the unknown side C A; and in the right-angled triangle A B E, from the given angle A, and hypotenuse A B, find the angle A B E; which, subtracted from the other angle.
angle A B C, leaves the angle E B C. But if the perpendicular shall fall without the triangle, the angle A B C should have been subtracted from A B E. Since as the perpendicular B E is taken for one of the lateral parts, the middle part in the triangle A B E is the angle B, and the conjunct part A B; in the triangle E B C the middle part is the angle B, and the conjunct part C B; the cotangent of the side B E C is found by subtracting the cofine of E B A from the sum of the cotangent of A B, and the cofine of E B C. The example of the preceding case is easily applied to this.

5. Given two sides A B, 66° 45', and B C, 39° 29', with the angle A opposite to one of them, 45° 20', to find the third side A C.

Letting fall, as before, the perpendicular B E; in the right-angled triangle A B E, from the given angle and hypothenuse A B, find the side A E. Since assuming B E for a lateral part in the triangle A B E, A B is the middle part, and A E is the separate part; and in the triangle B E C, B C is the middle part, and E C a disjunct part; the cofine of E C is found by subtracting the cofine of A B from the sum of the cofines of A E and C B. If then the segments A E and E C be added together, or in case the perpendicular fall without the triangle, be subtracted from each other, the side A C will be had.

6. Given two sides A C, 65° 31', and A B, 66° 45', together with the included angle A, 43° 20', to find the third side B C opposite thereto.

Letting fall the perpendicular B E, find, in the right-angled triangle, the segment A E E; which, subtracted from A C, leaves E C. If the perpendicular fall without the triangle, A C is to be subtracted from A E. Since by assuming the perpendicular B E for a lateral part in the triangle A E B, A B becomes a middle part, and A E a separate part; in the triangle E B C, B C is the middle part, E C a separate part; the cofine of B C is found by subtracting the cofine of A E from the sum of the cofines of A B and E C.

7. Given two angles, 43° 20', and B, 79° 3', together with the side E C, 39° 29', opposite to one of them; to find the side A B adjacent.

Letting fall the perpendicular C D from the unknown angle C, to the opposite side A B; and that falling within the triangle; from the given angle B, and the hypothenuse B C, seek in the right-angled triangle C B D for the segment C D. Since assuming the perpendicular C D for a lateral part in the triangle C D B, D B is the mean part, and the angle B a conjunct part; and in the triangle C D A, A D is the middle part, and the angle A a conjunct part; the cofine of the segment A D is found by subtracting the cotangent of the angle C D from the sum of the cofine of D B, and the cotangent of the angle A. If then the segments A D and D B be added, or in case the perpendicular fall without the triangle, be subtracted from each other, the result will be the side A B required.

8. Given two sides A B, 66° 45', and B C, 39° 29', with the included angle 79° 3'; to find the angle A opposite to one of them.

Letting fall the perpendicular C D, find the segment B D, as in the preceding problem. This, subtracted from A B, leaves A D. If the perpendicular fall without the triangle, A B is to be added to D B. And since by assuming the perpendicular C D for a lateral part in the triangle C D B, B D is the middle part, and the angle B a conjunct part; and in the triangle C D A, A D is the middle part, and the angle A a conjunct part, the cotangent of the angle A is formed by subtracting the line of D B from the sum of the cotangent of the angle B, and of the line of A D.

9. Given two angles A, 43° 20', and B, 79° 3', together with the adjacent side A B, 66° 45'; to find the angle C opposite to the same.

From one of the given angles B, letting fall the perpendicular B E to the opposite side A C; in the right-angled triangle A B E, from the given angle A, and hypothenuse A B, we find the angle A B E; which, subtracted from A B E, leaves the angle B E C. In the perpendicular C D falls the angle A B E; the perpendicular C D is to be subtracted from the angle B E C. Since by assuming B E for a lateral part in the triangle C E B, the angle C is a middle part, and the angle C B E a disjunct part; and in the triangle A E B, the angle A is the middle part, and the angle A B E the disjunct part: the cofine of the angle C is found by subtracting the sum of the cofine of A B, from the sum of the cofine of the angle A, and the cofine of A E B.

10. Given two angles, 43° 20', and C, 82° 34', together with the side A B, 66° 45', opposite to one of them; to find the other angle.

From the angle B sought, let fall a perpendicular B E; and in the right-angled triangle A E B, from the given angle A, and hypothenuse A B, find the angle A B E. Since assuming the perpendicular B E for a lateral part in the triangle E C B, the angle C is the middle part, and the angle C B E a disjunct part; and in the triangle A B E, the angle A is the middle part, and the angle A B E a disjunct part: the sum of the cofine of A B from the sum of the cofine of C, and of the cofine of A E B. If then A B E and E B C be added, or in case the perpendicular fall without the triangle, be subtracted form each other, the result will be the angle required A B C.

11. Given the three sides, to find an angle opposite to one of them.

1. If one side A C (Plate II. fig. 8.) be a quadrant, and the leg A B be less than a quadrant, find the angle A. Continue A B to F, till A F become equal to a quadrant; and from the pole A draw the arc C F, to cut the arc B F at right angles in F. Since in the right-angled triangle C B F, we have given the hypothenuse B C, and the side F B, or its complement A B to a quadrant; we shall find the perpendicular C F, which being the measure of the angle A C B, that angle is found of course.

2. If one side A C be a quadrant, and the other A be greater than a quadrant, seek again the angle A: from A B subtract the quadrant A D, and from the pole A describe the arc C D, cutting the arc A B at right angles in D. Since in the right-angled triangle C D B, the hypothenuse B C, and side D B, or excesses of the side A B beyond a quadrant, is given, the perpendicular C D will be found as before, which is the measure of the angle A required.

3. If the triangle be isoseles, and A C = C F; and the angle A C F be required; bisect A F in D, and through D and C draw the arc D C. Since D C is perpendicular to A F, the angles A and F, and A C D and D C F, are equal; from the hypothenuse A C, and leg A D, given in the right-angled triangle A C D, we find the angle A C D; the double of which is the angle required A C F; and from the same data may the angle A or F be found.

4. If the triangle be fealeous, and the angle A (Plate III. fig. 5.) be required; from C let fall the perpendicular C D, and seek the half-difference of the segments A D and D B, by laying, as the tangent of half the bale A B is to the tangent of half the sum of the legs A C and C B; so is the tangent of their half-difference to the tangent of the half-difference of the segments A D and D B; add then the half-difference of the segments to the half-bale, to find the greater segment; and subtract the same from the feet for the less.

Thus
Thus having in the right-angled triangle $\triangle CAD$, the hypotenuse $AC$, and the side $AD$, the angle $A$ is found thence. After the same manner is $B$ found in the other $\triangle CBD$, from $C B$ and $C D$ given.

12. Given the three angles $A$, $B$, and $C$, to find any of the sides. Since in lieu of the given triangle, another may be assumed, whose sides are equal to the given angles, and the angles to the given sides; this problem is resolved after the fame manner as the preceding one.

TRIGNONUM, or Triangular Harp, an ancient musical instrument. (See Plate of ancient Instruments.) One of this kind was taken from an ancient painting in the museum of the king of Naples, in which it is placed on the shoulder of a little dancing Cupid, who supports the instrument with his left hand, and plays upon it with his right. The trigonum is mentioned by Athenæus, lib. iv. and by Julius Pollux, lib. iv. cap. 9. According to Athenæus, Sophocles calls it a Phrygian instrument; and one of his Deipnosophists tells us, that a certain musician of the name of Alexander Alexandrinus was so admirable a performer upon it, and had given such proofs of his abilities at Rome, that he made the inhabitants παραγωγοὶ, μουσικῶς μαθον. It may not be unworthy of remark, that this little instrument resembles the Cither harp, or $\frac{1}{2}$ of a filfnis, or of a filfnis. The performer too, being a native of Alexandria, as his name implies, makes it probable it was an Egyptian instrument upon which he gained his reputation at Rome.

TRIGUERA, in Botany, was so called by the late Abbé Cavanilles, in honour of his friend Don Candido Maria de Trigueros, who gathered this plant, then supposed entirely non-descript, in Andalusia. Another genus was originally thus designated, now Lagenaea lobata of Willdenow, Sp. Pl. v. 3. 733. The present feems to be a good genus, though the plant on which it is founded proves to be the rare and little-known Verfachum Ojibeki of Linnaeus, as the writing of the present article first discovered.—Cavan. Diff. ii. after page 106. Schrebl. Gen. 114, Willd. Sp. Pl. v. 1. 839, Mart. Mill. Dict. v. 4.—Clafs and order, Pentandria Monogynia. Nat. Ord. Linde, Linn. Sonca, Jufh. Gen. Ch. Cal. Perianth inferior, of one leaf, permanent, divided half way down, into five unequal acute segments. Cor. of one petal, bell-shaped; tube very short; limb inflated, plaited, five-creft, longer than the calyx; the two upper segments refexed. Nectary a short, membranous, five-toothed cup, surrounding the germin. Stam. Filaments five, very short, inserted into the teeth of the nectary at the outside; anthers arrow-shaped, converging. Pifi. Germin inferior, roundish, with two furrows; ilye thread-shaped, straight, rather longer than the flamines; stigma obtuse. Peric. Berry dry, nearly globular, of four cells. Seeds two in each cell, roundish, compressed, rough, one over the other. Eff. Ch. Corolla bell-shaped, irregular. Nectary with five teeth, surrounding the germin, and bearing the flamines. Berry dry, of four cells, with two seeds in each. Obs. Cavanilles observed one or two of the cells to be occasionally abortive.

1. T. ambrosian. Mulky Trigueria. Cavan. Diff. 2. A. Willd. n. 1. (Verfachum Ojibeki; Linn. Sp. Pl. 535. Willd. Sp. Pl. v. 1. 1006; excluding, from both, he reference to Toucormont, and the left-named place of growth. Ob. it. 52.)—Leaves deciduous, obovate, ferried. Calyx villos.—Native of Spain, towards the coast, and of Salé in Barbary, flowering in the spring. Root annual. Stems simple, erect or decumbent, angular, leafy, fpan high. Leaves alternate, two inches long, somewhat hairy, coarsely ferrated, tapering at the base, and somewhat decurrent; the upper ones smaller. Flower-falx axillary, in pairs, single-flowered, drooping. Calyx covered with woolly hairs. Corolla deep violet, an inch wide; nearly black in the throat. Seeds blackish, hard. The whole plant, called in Spanish Almizquera, and Moradilla, has a pleasant musky scent. It is spoken of as possessing the emollient narcotic virtues of Deadly Nightshade, and Hennock, being, like those plants, useful in cancers of the breast; so far at least as to allay the pain.

2. T. inodora. Scentselp Trigueria. Cavan. as above. Willd. n. 2.—Leaves febile, ovato-lanceolate, entire. Calyx smooth.—Found in Andalusia with the foregoing, and vulgarly named Moradilla blanca.ine. Differs from the first in the smoothness of every part. The flowers are handfome, drooping. Throat very pale violet, or yellowish-white, with five stipes; limb pale violet, or purple, with entire pointles lobes.

TRIGUEROS, in Geography, a town of Spain, in the province of Seville; 8 miles N.N.E. of Moguer.

TRIGNYA, in Botany, from τόνος, three, and γύνα, a female, the name of an order in many classes of the Linnean artificial system, distinguished by the flowers having three filfnis, or of three filfnis. One of the latter, Vifum, and Sambucus, in the fifth clas, are inftances. The order in queftion occurs in the 1st, 2d, 3d, 5th, 6th, 8th, 9th, 10th, 11th, 12th, and 13th clas; in the 4th and 7th it is wanting. Indeed in the 13th clas, this order is but uncertain, Delphinium and Aconion, on which Linnaeus founded it, being variable in the number of filfnis. In the 12th clas, Iofandria, it forms such unnatural and troublesome diftincions, as to be much better abolished. See Pentagynia.

TRIHIILATÆ, fo denominated from trex, tris, three, and bilum, the scar of a feed, because some of the principal genera are remarkable for the broad fcares of their three feeds; the 23d natural order among the fragmenta of Linnaeus, flanding between his Caryophyllæ and Carydites, in the latter of which it only has any, even the slightest, affinity.

This is in itself but a heterogeneous assemblage, embracing several of Jullien's orders, particularly the Sop니다, Acera and Malpigida, as also his Milie. It consists of three fections. In the firft are Melis, Trachila, Guarea and Turra; to which Linnaeus was afterwards inclined to add Cordela and Scentenius. The fecond fection consists of Malpigida, Baumferia, Hires, Tripeteris, Aeer and £felsius; and the third, of Staphylea, Sapindus, Paulhinus, Cardiospermum and Tropadon, in which Linnaeus afterwards added Hippocratea, more certainly belonging to the second fection.

Cavanilles, in his Differtations on Monadelphous Plants, has added many new genera to the Tribilation; but he is excelled beyond measure by Gisecke in his edition of the Præleffiones of Linnaeus; where an account is given, not only of these genera, but of various others, collated by Cava- nilles as monadelphous, though contrary to the general opinion, see Monadelphæ.

TRIHING, Triathing, or Thriting, from the Saxon, direting, an extent containing three or four hundred, or the third part of a thric, or province. See Tritheing.

Mr. Thereby thinks the word ought to be written threating. See Thoreth. Ducatus Leodenf. p. 85.

These thritings still subsist in the county of York, where by an easy corruption they are denominated riders.

The word is also used for a court held within that circuit, which was the same with what we now call a court-baz, which is above a court-baron, and inferior to the county court.

TRIKALA,
TRIKALA, in Mythology, is a name of the Hindoo deity Siva. One of his names is Kala, or Time, and the epithet Tri prefixed denotes his omniscience and omnipresence as to all times, past, present, and to come; a mythological triad or union of time. The honourable designation of Trikala is sometimes given to, or assumed by, individuals of supposed profundity of knowledge, especially if of an inspired or prophetic description. The conso of Siva in this form or character is Trikali, or Trikala-devi-kumari, meaning the divine triple-maid, or triform divine maiden Kali. See TRISAKTI.

TRIKALA-DEVI. See the preceding article.

TRILATERAL, a term applied to all three-sided figures. See TRIANGLE.

TRILEUCUM PROMONTORIUM, or Laparia Caryi, in Ancient Geography, a promontory on the northern coast of Spain, N. of the name of the Callaici. According to Ptolemy, it lay between Flavium Brigantium and the mouth of the river Mearus or Mearius.

TRILIX, in Botany, a Latin word, used for a tussie of three threads, woven or twined together; but how it applies to this plant, we are not informed. Mutis, its discoverer, called the genus Jacquinia. De Theis understands the above name as merely equivalent to triple, and alluding to the three calyx-leaves, and three petals, which perhaps is right. —Linn. Mant. 153. Schreb. 347. Willd. Sp. Pl. v. 2. 1129. Mart. Mill. Dict. v. 4. Juff. 435.—Clasf and order, Polyandria Monogynia. Nat. Ord. uncertain.

Gen. Ch. Cal. Perianth inferior, of three ovate, acute, spreading, flat, permanent leaves. Cor. Petals three, lanceolate, acute, smaller than the calyx. Stam. Filaments numerous, capillary, the length of the corolla; anthers roundish, minute, two-lobed. Fil. Germ. superior, five-angled; style cylindrical; stigma simplex. Peric. Berry oblong, five-angular, of five cells, covered by the calyx. Seeds numerous, roundish, minute.

Eff. Ch. Petals three. Calyx of three leaves. Berry of five cells, with many seeds.

1. T. butea. Linn. Mant. 247. Willd. n. 1. —Gathered at Cartagena, in South America, by Mutis, from whose description alone, contrary to his usual practice, Linnaeus adopted this genus into his system. This, the only species, is a shrub two fathoms in height, with very numerous, round, roughish branches. Leaves alternate, stalked, somewhat peltate, ovate, rather heart-shaped, pointed, serrated, veiny, downy. Footstalks round, smooth. Flowers yellow, not from the corolla, but the anthers, generally terminal, racemose, their partial flalsk simple, round, downy.

TRILL, in Music, a plain shake upon a single note, formed by a beating in the throat on the vowel oo, or by the shaking of the palate on the throat in one found upon a note: this grace is usually made in cloths or cadences, and when on a long note, admiration or passion is expressed, the trill is made in the latter part of such note; but most commonly on binding notes and such as precede the closing note. See TRILLIUM.

TRILL-HOOK, those used to hold the sides of a cart up to the horse.

TRILLETTO, in the Italian Music, a little short shake or quaver; it differs from trillo only in point of continuance, being its diminutive.

TRILLION, in Arithmetic, the number of a billion of billions. After billions, we reckon by trillions, which makes a class of numeration, and is divided, like the other classes, into three places: thus we say, trillions, ten of trillions, hundreds of trillions, &c.
TRILLIUM.

ątalked."—In sphagnous bogs, on the high mountains of Pennsylvania, Carolina, and Canada, flowering in May and June. Flowers white, with purple veins at the bottom. Berry scarlet. Purp. We received from the late Rev. Dr. Muhlenberg, in 1799, a specimen answering precisely to this description, but not at all to Willdenow's name of undulatum. The leaves are an inch and half long, taper-pointed, on short stalks. Flower-stalk half that length. Petals an inch long, white, with slender parallel veins, which are of a fine purple at the base, even in the dried specimen. Authors purple. German and flyte yellowish-white.

5. T. pumilum. Blunt-leaved Trillium. Pursh n. 5. (T. pusillum; Michaux Boreal-Amer. v. 1. 215.)—Flower-stalk erect. Petals scarcely longer than the calyx. Leaves ovate-oblong, obtuse, fleshy.—Native of the pine-woods of Lower Carolina, flowering in May. Petals pale flesh-coloured. Michaux. Specimens in the Linnaean herbarium, which answer well to this description, were most unaccountably confounded by Linnæus with his felle. They are incribed "Trillium, füe Tradescantia affinis, flore colorato unico tripetala, radice tuberofa."—Clayton. The stem is slender, five or six inches high. Leaves an inch and a quarter, or an inch and a half, broad, of a rather narrow elliptical shape. Flower on a very short stalk; in one specimen nearly fleshy. Calyx-leaves exactly like the foliage, but only a quarter the size. Petals with fine, copious, interbranching veins, becoming purplish as they advance in age.

6. T. cernuum. Drooping Trillium. Linn. Sp. Pl. 484. Wildl. n. 1. Ait. n. 1. Pursh n. 6. Sm. Speciel. 3. t. 4. Curr. Mag. t. 954. (Solanum tripylum, flore hexapetala carneo; Cat. Carol. v. 1. 45. t. 45, on the authority of the author's herbarium, though his figure gives no idea of the plant.)—Flower-stalk recurved. Petals lanceolate, the fize and shape of the calyx-leaves, reflexed. Leaves rhomboid, abruptly pointed, on very short stalks.—In shady rocky situations, from Pennsylvania to Carolina, particularly on the banks of Schuylkill, near Philadelphia, flowering in May. Petals white. Berries purple. This may be called the largest of the genus, as I have often seen it near two feet high, with leaves measuring nine inches in diameter. Purp. Our garden speciemens are but one-third as large. The flower is perfectly reflexed. Petals white, with green ribs. Authors and Briquet purple. German pale yellow, ovate, with five wings.

7. T. erectum. Upright-stalked Trillium. Linn. Sp. Pl. 484. Wildl. n. 2. Ait. n. 2. Pursh n. 7. Curr. Mag. t. 470. (T. rhomboideum; Michaux Boreal-Amer. v. 1. 215. Redout. Lilac. t. 154. Solanum tripylum canadense; Cornut. Canad. 166. t. 169.)—Flower-stalk erect. Flower inclining. Petals elliptical, pointed, spreading, the length of the calyx. Leaves rhomboid, pointed, fleshy.—On the mountains, in boggy soil, from Pennsylvania to Carolina, flowering in May. Purp. The leaves are three or four inches long, and three broad at the obtuse lateral angles. Flower-stalk nearly three inches long, erect, except a little curve at the top, from the drooping of the flower, which is fleshy, and larger than any of the foregoing species. Calyx-leaves an inch and quarter long, ovate, pointed, spreading, green. Petals the same length, but broader and more elliptical, dark purplish-brown. German and fliwet purple. Berry, according to Pursh, almost black. This is certainly T. erectum of Linnaeus, though the specimen in his herbarium has no resemblance to it, having half a dozen flower-stalks, and not being an original specimen, nor of any authority. The specific name is not one of the best, there being several species equally erect, but rhomboideum is liable to the same objection. Had we found a better in any work of character, we might have been induced to ferve from our general rule of not changing established Linnean names. We do not profess to be bound to keep any others, unless they are good.

8. T. pendulum. White Small-flowered Trillium.—Wildl. Hort. Berolin. t. 35. Ait. n. 3. Pursh n. 9? (T. erectum β; Curr. Mag. t. 1027. Pursh n. 7.)—Flower-stalk erect. Flower inclining. Petals ovate, pointed, spreading, longer than the calyx. Leaves rhomboid, pointed, fleshy.—Native of the mountains of Pennsylvania and Carolina. We received a specimen from Dr. Muhlenberg in 1805, the same year in which Mr. Maffon sent plants to Kew. It flowers in April and May, and though nearly allied to the last, must surely be a distinct species. Every part is much smaller; the leaves more rhomboid; flower less strongly fetid than the erectum, with white petals, a reddish germen, and yellow authors and flyte. Mr. Pursh seens to have inferred this species twice; see his n. 7, and 9. We have not had an opportunity of consulting the Hortus Botanicus, but we rely on Mr. Dryander in Hort. Kew.

9. T. grandiflorum. Large-flowered Trillium. Salis. Parad. t. 1. Pursh n. 10. Ait. n. 4. (T. erythrocarpum; Curr. Mag. t. 855, excluding Micaux's synonym. T. rhomboideum γ; Michaux Boreal-Amer. v. 1. 216.)—Flower and its stalk drooping. Petals ovate; their claws converging into a tube; limb spreading thrice as broad as the calyx, and much longer. Leaves ovate, somewhat rhomboid, pointed.—On the mountains and rocky banks of rivers, in Virginia and Carolina, flowering in May. We received a specimen in 1797 from the honourable Mrs. Barrington's garden at Mongewell, the root having been sent perhaps a year or two before from North America. Mr. Maffon is said to have sent the same to Kew in 1799. This is a large and landfome species. The petals are snow-white, veiny, two inches long; their bases convoluted into a sort of tube. Authors yellow. Calyx-leaves ovato-lanceolate, an inch and half long, green.

10. T. obovatum. Obovate Trillium. Pursh n. 8.—Flower-stalk erect. Petals obovate, bluntish, flat, spreading, fercarly longer or broader than the calyx. Leaves ovate, rhomboid, pointed, perfectly fleshy.—Found in Canada, near Montreal. Flowers dark rofe-coloured, probably white when first opening. Purp. This author mentions some specimens in the herbarium of A. B. Lambert, &c. agreeing in every respect herewith, which are the T. camtsibacium of Pallas. This perhaps is what Dr. Sims speaks of, under a similar name, in Curr. Mag. t. 855. We have not examined either.

Trillium, in Gardening, furnishes plants of the low, tuberous-rooted, flowery, perennial kind, among which the species mostly cultivated are, the drooping trillium (T. cernuum); the upright trillium (T. erectum); and the fleshy-flowered trillium (T. fleshy).

Method of Culture.—These plants may be increased by seeds, which should be sown on a shady border as soon as they become ripe in the autumn; when they appear in the spring, the plants should be kept clean from weeds, and in the
the autumn following be planted out where they are to remain and flower.

They succeed best in light soils, where the situation is rather shaded.

They all afford variety in such places.

TRILLO, in Geography, a village of Spain, situated on a small river near its union with the Tagus, and once famous for its curious water-mills, for sawing of timber brought down by the stream, but no longer existing. It is now celebrated for its medicinal waters, efficacious in cutaneous complaints, both externally and internally applied. The baths are up the river, on the opposite side of the Tagus, about the distance of a mile. They are divided into "Los quatro Banos," called the king's bath, divided into four separate baths, all equally commodious and handsome, with their proper appurtenances. The countess's bath, so named after the lady of the count de Cifuentes, who is lord of the place, is close to the river, but judiciously built and remarkably solid, to refurbish every impurity of the stream. According to the analysis of Dr. Ortega, these waters participate of five substances, two volatile, and three fixed: viz. a phlogistic vapour, extremely anodyne, penetrating, and friendly to the nervous system; of a moderate quantity of gas, calcareous earth, common salt, selenitic salt; and that to sixteen ounces of water, one may calculate twenty-five grains and a half of fixed principle. Dr. Ortega observes, that the lightness of this water may enter into competition with that of distilled water, the purest we know of: therefore its effects may be more easily accounted for; that the heat of the water does not equal that of the blood, in a person in good health, and comes near to that tepid degree prescribed by the physicians in artificial baths.

TRILLO, Ital. a shake, in Music. Tofi has devoted his third chapter (in Galliard's Translation, p. 41.) to the importance, use, and acquisition of a shake. He advises the vocal student, with the assistance of the matter, to strive at retaining one that is "equal, distinctly marked, easy, and moderately quick, which are its most beautiful qualifications." The student will find the shake on the femitone or half-note much easier to acquire than that on the whole tone; which it will be necessary to practise first, and most frequently ever, as it includes the other. Tofi describes seven different kinds of shake, but none are worth the study but those on the tone and half-tone, which must at first be practised slowly, and its rapidity increased by minute degrees.

The beat, or trillo mormente, differs little from the shake; in fact it is the shake revered, ending upon the upper of two notes, instead of the lower. This grace was much used by fingers in the former part of the last century, particularly in recitatives, and after the appoggatura from the note below. Mingotti was the last great finger whom we remember to have frequently used the trillo mormente, or beat. Maneini, however, gave a chapter to it in 1774. But he was of the Bernacchi school, which would now be called animal.

TRILLOBOUS LEAF, among Botanists. See Leaf.

TRILOCULAR CAPSULE, See Capsule.

TRILOKAN, in Mythology, a name of the Hindoo deity Siva. The name means with three eyes, that god being in some of his forms, and often in pictures and statues, so represented. Siva corresponds in many points with the many-named and multifiform Jupiter of the Greeks. We are informed by Paufanias, that Triophalamos was an epithet of Zeus, and that a statue of him with three eyes was found so early as the Trojan war. From these circumstances, combined with many others, Sir W. Jones was led to conclude that the identity of Jove and Siva, falls little short of being demonstrated. See SIVA.

TRILOPUS, in Botany, a name given by Mitchell to the Linnean genus Hamamelis. See that article.

TRIM, in Carpentry, is to fit one piece into another.

TRIM OF A SHIP, is her belt plouche, proportion of ballast, arrangement of her sails, and position of her masts for falling.

Thus, the trim of the hold denotes the most convenient arrangement of the various materials contained in it, with relation to the ship's motion or stability at sea.

Trim, when applied to the sails, denotes the general arrangement which is best calculated to accelerate the ship's course, according to the direction of the wind.

Trim, when expressed of the masts, denotes their position with regard to the ship and to each other, so that they should not be too far forward or aft, nor too near nor too far apart; and, according to the situation or quality which communicates a greater velocity to the vessel, they should either be upright, or inclining aft or forward.

Hence, to find the belt way of making a ship fail swiftly, is to find her trim.

"Trim a Boat, To," is to set the paffengers so as to keep the boat even on both sides. See Boat.

"Trim the Sails, To." See Tack.

TRIMMED, Shorn, in Sea Language, denotes the situation of a ship's sails in a fleet wind.

Trim, in Geography, the shire-town of the county of Meath, Ireland, situated on the river Boyne. Though the affize-town, it is a place of no importance, but it was formerly walled and defended by a strong castle, and it has some ruins of religious foundations. Before the Union, it was represented in parliament. It is 22 3/4 miles N.W. by W. from Dublin.

TRIMACRUS, or GRIMACE, in the Ancient Prosody, a foot in verse, consisting of three long syllables.

TRIMALLORE, in Geography, a town of Hindoostan, in the Carnatic; 15 miles N. of Tanjore.

TRIMANETORE, a town of Hindoostan, in the Carnatic; 15 miles E. of Warriore.

TRIMAPORE, a town of Hindoostan, in Maravar; 9 miles N. of Trumian.

TRIMARKISIA, in the Manoe and War, a body of horse among the ancient Gauls, so called because each soldier had three horses attending him, so that when one was either killed in battle, or overcome by fatigue, he might immediately mount another. The Tartars of the Krim retain the practice; for they never undertake an excursion, without allowing three horses to one rider; and many ancient nations, beside the Gauls, observed the same method.

TRIMBERG, or Trimberg, in Geography, a town of the duchy of Wurzburg; 20 miles E. of Schweinfurt.

TRIMBUCK, a town of Hindoostan, in Baglan; 18 miles W. N.W. of Nafuck.

TRIMELES, in the Ancient Greek Music, a name or air for flutes.

TRIMELWADI, in Geography, a town of Hindoostan, in the Carnatic; 15 miles N. N.W. of Tanjore.

TRIMERES, in the Ancient Greek Music, a name which was executed in three different modes successively: the Phrygian, the Dorian, and the Lydian. Some ascribe the invention of this compound name to Saccadas the Argian, and others to Clonas of Thegea.

TRIMILCHI, a name by which the English Saxons called the month of May; because they always milked their cattle three times a day in that month.
TRIMITHUS, in Ancient Geography, a town in the eastern part of Cyprus, at some distance from the coasts, N. of Eucoilla, and E. of the promontory Pedalmis.

TRIMMANUM, or TRIAMMHHON, a town of Lower Moesia, near the Danube; marked in Anton. Itin. on the route from Viminacium to Nicomedia, between Scadana and Exapantnus.

TRIMMERS, in Architecture, pieces of timber framed at right angles to the joints, against the ways for chimneys, and well-holes for stairs.

TRIMODIA, among the Romans, a bag like an inverted cone, in which fowers carried their feed. It was from supplied from their neck, and was so called from its containing three bunches.

TRIMONEER, a corruption of timoneer.

TRIMONTIUM, or TRIMONIUM, in Ancient Geography, a town of Albion, belonging to the Selgovae, according to Ptolemy; probably situated where Amnian now stands. —Also, one of the names of Philippopolis in Thrace. Ptol.

TRIMPS, in Geography, a town of Prussia, in Bartenland; 12 miles S. of Inferburg.

TRIMURTI, in the theological disquisitions of the Hindoos, is a word of mythical and varied import. Its most obvious meaning in the Sanscrit tongue is three forms; but as some fects of Eastern theologians profefs to recognize the unity of the deity, the term is used singularly, and is equivalent to triform. In the Trimurti, the Hinduu fancies a union or reunion of the three great forms or attributes of the godhead, personified in Brahma, Vishnu, and Siva; or creation, preservation, and destruction. Many other trine conjunctions are found typified by this mysterious affimblage, of which some notice is taken under our articles O'M, Siva, and Trisula.

The Trimurti, or divine triad, is represented to the senses under the form of three heads joined. The well-known monolithic sculpture in the Elephanta cavern temple is of this subject. Of this trine bust, Niebuhr, Maurice, and others have given representations. (See Elephanta and Mahakala.) One very like it was dug out of the ruins of an ancient temple on the island of Bombay, by the author of the Hindoo Pantheon, and an engraving is given of it in plate 81 of that work. A second Trimurti was found at the same time, but instead of being merely three heads, they are furnissed with a body. This usual form is also engraved for the work just mentioned; and the granite originals of both plates are deposited by the author in the museum at the East India House. The miniature bust of the gigantic sculpture in the Elephanta cave is so large as to weigh several tons. The Hindoos have other modes of representing the Trimurti; three heads and bodies on one legs, and other familiar whimsicalities, not unlike the crude delineations of the early Trinitarians of the West.

The Hindoos are very prone to combinations of three in one, and fancy they see something very mysterious in such typifications. As well as that just noticed of the powers or attributes of the deity, they combine three letters in a monogram, and have such a reverence for it, that the found which its articulation would convey is never uttered, or uttered most reverently. These characters are equivalent to our A, U, M, and the found would be like O'M.

The sun is a Trimurti, his properties of creative heat, preserving light, and destructive energy in an igneous form, comprehending the grand attributes of the deity, personified in Brahma, Vishnu, and Siva.

The Hindoos have a female Trimurti, composed of the confrons or Saktis, or energies of the great powers. These are Saraswati, Lakshmi, and Parvati; which fee.

Comparing the Hindoo triad with three of the gods of Greece, Cronus, Jupiter, and Mars, are those secret in character and attributes to the Eastern polytheistic trinity. But the Greeks, largely as they seem to have borrowed from the mythology of the Hindooos, do not appear to have popularly adopted their male Trimurti. The female triad may be recognizable in the Parce of the Weft, as noticed under Sakti. The three goddesses give each a name to a fared river, and a fuppofed junction of these waters is a fruitful subject to the Hindoo enthuasif or poet. See Taiveni and Saraswati.

Several other articles beginning with the Sanscrit word tri, contain something illustrative of the propenfity of the Hindoos to triune combinations.

TRINACIA, or TRINACRIA, in Ancient Geography, a rich and powerful town of Sicily, and confidered as the chief town of the island. Some writers have called it Tracia.

TRINCA, in Geography, a town of South America; in the province of Tucuman; 66 miles N. of St. Miguel de Tucuman.

TRINCATTY, one of the Nicobar islands. N. lat. 8° 6'. E. long. 94° 4'.

TRINCAVELLI, Vettor, in Biography, an eminent physician, was born at Venice about 1491. He studied at Bologna and Padua; and having graduated at the latter university, he settled at Venice, where he became professor of philosophy, and acquired distinction in the practice of medicine. In 1551 he was promoted to the chair of medical professor at Padua, with a very considerable stipend. He died at Venice in 1563, and was honoured with a public funeral. He was a good Greek scholar, and was the first professor at Padua who commented on the works of Hippocrates in the originals. He also translated many of Galen's treatises; and edited in the original Greek the works of Themistius, of Johannes Grammaticus, the Manual of Epiictetus with Arrian's Commentary, Arrian's Alexander's Expedition, Stobaeus, Hefiod, and other Greek writers. A collection of his works has been printed in 2 vols. fol. Haller. Gen. Biog.

TRINCIA, in Botany, Ambros. Phyt. 543.

Camer. Hort. Med. 173. See TRINICA.

TRINCOLI, in Geography, a town of the island of Ceylon, near the E. coast; 84 miles S.E. of Cady. N. lat. 7° 10'. E. long. 82° 6'.

TRINCOMALIEE, or TRINCOMALYEY, a town and harbour of Ceylon, lying in N. lat. 8° 30'. E. long. 8° 34'. The town runs in a N.E. direction along one branch of the bay. The country around it is mountainous and woody; the soil uncultivated and barren; and the whole appearance wild. The woods, which are very thick, contain abundance of wild beasts of various descriptions; particularly wild hogs, buffaloes, and elephants. The latter often come down to the lakes in the neighbourhood of the fort to drink and bathe; and have been frequently shot within a mile of the town. Trincomalies, from its situation and construction, is naturally strong. It occupies more ground than Columbo, but contains a much smaller number of houses, and those inferior in size and appearance to any that are met with in several towns on the S.W. coast. The circumference of Trincomalies, within the walls, is about three miles; within this space is also included a hill, or rising point, immediately over the sea, and covered with a great quantity of thick jungle, in which wild deer and other game find shelter. This rising ground is very little inhabited.

TRI
most of the houses being close to the landing place, which lies in the lowest part. Even the lower parts of the fort were much incumbered with wood till within these few years. The fort is strong, and commands the principal bays, and particularly the entrance into the grand harbour, or inner bay, which affords in all seasons and in every variety of weather a secure shelter to ships of all descriptions, being land-locked on all sides, and sufficiently deep and capacious to receive the largest vessel, or any number of vessels. The whole navy of England might find accommodation in this harbour. Its situation is such, that in other monsoons, ships can arrive at or depart from it, and make their passage good from or to any part of the calmer world, and whole fleets may remain within it, at every season of the year, in perfect security. This harbour is overlooked by fort Oltenburg, a strong fort flanking on a cliff, which projects into the sea; it was originally built by the Portuguese out of the ruins of some celebrated pagodas which once stood here. This fort cannot be attacked by sea, unless the fort of Trincomalee be first taken, and the entrance of the harbour forced. In the bay the waters are so bold, and the water so deep close up to them, that it is almost possible to leap from the rocks into the vessels that moor alongside of them. At the extremity of the rock, on which the fort stands, a strong battery is erected, where the flagstaff of the fort is placed.

This harbour, from its nature and situation, is that which stamps Ceylon one of our most valuable acquisitions in the East Indies. As soon as the violent monsoons commence, every vessel which is caught by them in any other part of the bay of Bengal is obliged immediately to put to sea, to prevent inevitable destruction. At these seafons Trincomalee and Bombay alone, of all the ports on the different coasts of the peninsula of India, are capable of affording a safe retreat. The incautable advantages to be derived from such a harbour are increased by its proximity and easy access to our settlements in the bay of Bengal. A vessel from Madras may arrive here in two days, and can at any time enter the harbour. These circumstances point out Trincomalee as an object of particular attention to our government, and of far more consequence to retain than the whole of the rest of the island. It will, however, require great encouragement and many improvements to render the town populous or anywise equal to Columbo. For the country around is not by any means so fertile as to tempt settlers to reside there; nor are the natural productions calculated to attract commerce. The climate has also been looked upon as the hottest and most unhealthy of the whole island. But the woods and marshes which rendered the climate inaluableous have been already in great measure cleared and drained, and the beneficial effects of these improvements were soon experienced. It is to be hoped that remedies may in the same manner be applied to the other defects under which Trincomalee at present labours: its trade is nothing, as there are no valuable natural productions to nourish it; but, from its situation, it is capable of becoming the richest emporium of the East. The want of commerce, and the uncultivated state of the surrounding country, are defects which flow mutually from each other; and the removal of one would soon, in a great measure, do away the other.

The Malivonga (which fee) falls into the magnificent bay of Trincomalee. (Percival's Ceylon.) This harbour, says Barrow ('Travels in Southern Africa, vol. ii.), is to a maritime province a jewel of inestimable value; it holds the bay of Bengal at its mercy, and affords every facility of overawing and controlling the navigation of the straits of Sunda and Malacca. Our Asiatic possessions, commerce and marine, would consequently lie open to the depredations of the masters of Ceylon. Trincomalee was taken by the British troops in 1705; 70 miles N.E. of Candy.

TRINDELEN, a rock in the Scaggaro, at about equal distances between the coast of North Jutland and the coast of Norway; 7 miles N.N.E. from the island of Leffoe. N. lat. 6° 27'. E. long. 11° 1'.

TRINE, Dimension, or threefold dimension, includes length, breadth, and thickness.

The trine dimension is peculiar to bodies or solids.

TRINE, in Astrology, is the aspect or situation of one star with regard to another, when they are distant 120 degrees.

It is also called trigon, and is usually signified by the character Δ.

TRINE, in Rural Economy, a term applied to the quantities of some sorts of articles, as the fellows and spokes of wheels, which of the former is thirteen, and of the latter twenty-five.

TRINETRA, in Mythology, a name of the Hindoo god Siva. It means with three eyes, similar to Trilokan; which fee.

TRING, in Geography, a small market-town in the hundred of Dacorum, and county of Hertford, England; is situated within a short distance of the Icknield way, 30 miles W. by N. from the county-town, and 31 N.W. by W. from London. The manor was granted by William the Conqueror to Robert, earl of Ewe, but it soon afterwards reverted to the crown; and in the year 1148 was given by king Stephen, with all its appurtenances, to the abbey of Feverham, which he had then founded. His grant was confirmed to the monks by succeeding sovereigns; and Edward II. gave them a charter for a weekly market, and two annual fairs to be held at Tring. After the dilution, Henry VIII. granted the manor to the archbishop of Canterbury: it is now the property of sir Drummond Smith, bart. The parish church of Tring is a spacious, well-proportioned edifice, and consists of a nave, side aisles, and chancel, with a mihrab tower at the west end; the walls are supported by strong buttresses, and the whole is embattled. The nave is separated from the aisles by five pointed arches, rising from high clustered columns. The roof is of timber frame-work, with long beams going across: the supports on each side are terminated by carved figures. Most of the windows have obtuse pointed arches, and are divided into three compartments by mullions. In the interior are various monuments. Tring contains four meeting-houses for Dissenters of different denominations. A Sunday school for about eighty boys and girls has been established by subscription. The market-house is a mean edifice on wooden pillars, having a pillory and a cage beneath. The market is held on Fridays; principally for the sale of corn, meat, and flax-plant: the manufacture of the latter constitutes the employment of most of the females in this part of the country. Five fairs are now held annually. The population of Tring, as ascertained under the act of the year 1811, was 1647, occupying 352 houles.

Tring park, the seat of sir Drummond Smith, bart. consists of between three and four hundred acres, ranging on the S.E. side of the town. The mansion is large and convenient, and the principal apartments are spacious and neatly fitted up. The hall is ornamented with Corinthian pillars. On the floor above the hall, and running across the house, is a gallery or ball-room, with a circular dome in the centre. This house was erected about the time of Charles II. by Henry Guy, eq.

At a short distance N.E. from Tring, is Tring Grove, the

**TRINGA**, Sand-piper, in Ornithology, the name of a distinct genus of birds, of the order of the Grallae; the distinguishing characters of which are, that the beak is roundish, and of the length of the head; the nolkrits linear; and that the feet have four toes, the outmost being generally connected at bottom by a small membrane. The species are numerous, and as follow.

**Pusignax.** With red bill and legs; three lateral tail-feathers unsappend, and face granulated with fleshly papilla. See Ruffe.

**Vanellus.** With red legs, dependent creft, and black break. This is the lapwing or ballad plover of Ray, Willughby, Pennant, &c. See Laping.

**Gallinetta.** With red bill and feet; body varigated with yellow and cinereous; beneath white. This is the totanus ruber of Briffon, the totanus alter of Willughby and Ray, and gambet of Pennant and Latham.

**Interpres.** With red legs; black body, varied with white and ferrugious; and white break and abdomen. This is the arenaria of Briffon, the Hebridal sand-piper of Pennant, the turnstone or sea-dotterel of Ray, Willughby, Latham, &c. See Turnstone.

The **Marinella**, or tringa with red feet, blackish tail-feathers, white at the base, grey body, and black break; or arenaria cinerea of Briffon, is a variety.

**Striata.** With bafe of bill and legs red; tail-feathers white with bands of brown, and many white tail-feathers. This is the totanus striatus of Briffon, and striated sand-piper of Pennant, &c. The totanus maximus of Briffon is a variety.

**Bononensis.** With ochraceous legs; long head and neck; body above black, and beneath white; throat and break marked with ferrugious spots. The greater lapwing of Latham.

**Macularis.** With bafe of bill and legs incarnated; body spotted; eye-brows and double band of the wings white. This is the turdus aquaticus of Briffon, the spotted tringa of Edwards, and the spotted sand-piper of Pennant.

**Lobata.** With pubulate bill, bent at the apex; pin- nated legs, and white undulated break; the grey coot-footed tringa of Edwards, and grey phalarope of Pennant and Latham. Of this there is a variety, white beneath, black above, with yellowish longitudinal streaks; the band of the wings white; and legs lobated.

**Hyperionidea.** With pubulate bill, bent at the apex; pin- nated legs; cinereous break, and sides of the neck ferrugious: the cock coot-footed tringa of Edwards, and grey phalarope of Pennant and Latham. Of this there is a variety, white beneath, black above, with yellowish longitudinal streaks; the band of the wings white; and legs lobated.

**Erythropus.** With red legs, front, rump and tail red and white; the body above and wings cinereous-brown; the abdomen ferrugious: the red-legged sand-piper of Latham.

**Alpina.** Teflaceous-brown, with blackish break; tail-feathers cinereous, whitish; legs brownish.

**Helvetia.** With black bill and legs; beneath black; white vent; tail-feathers white with black bands: the Swiss sand-piper of Pennant.

**Ochropus.** With the apex of the bill pointed; legs greenish; back brown and green; abdomen and outermost tail-feathers white: the cinclus tertius of Alder, Ray, and Will., the ocrphus medius of Gofner, and green sand-piper of Pennant and Latham. Of this there is a variety, viz. Littorea, with smooth bill, cinereous legs, and brown tail-feathers: the shore sand-piper of Pennant; and also another variety, with the back and wings brown, with obfolete whitish spots.

**Hypoleucus.** With smooth bill; livid legs; body cinereous with black streaks; beneath white: the common sand-piper of Ray, Willughby, and Pennant.

**Canus.** With smooth bill; cinereous legs; first tail-feathers forked; and the outer white unsappend. This is the knot of Pennant, &c. See Knot.

**Aleutaria.** With black bill and legs; grey body; under and whole face white; collar grey.

**Fascia.** With bill, vertex, hind part of the head, spot near the eyes, and abdomen black; front and rounded tail white; back cinereous; seven first tail-feathers white.

**Cinclus.** With bill and legs black; collars white; tail and rump grey and brown. This is the leaf nippe of Ray and Sloane, the wagtail of Browne, the fanderling of Albinus, and the purre of Pennant. The cinclus with brown legs is a variety.

**Calidris.** With bill and legs blackish; body beneath olivaceous; and rump variegated: the dusky sand-piper of Latham.

**Pusilla.** With brown bill and legs; body beneath red; outer tail-feathers with a white shaft, and variegated rump; the little sand-piper of Pennant; found in St. Domingo, north of Europe, and rarely in England.

**Glaicola.** With smooth bill; greenish legs; body punctated brown and white; break whitish: the wood sand-piper of Pennant and Latham; found in Sweden.

**Ruficollis.** With black legs; head above and neck variegated with ferrugious and black; and ferrugious throat: the red-necked purre of Latham.

**Squatarola.** With black bill; greenish legs; grey body, beneath whitish; the grey plover of Ray, &c. and grey sand-piper of Pennant and Latham. Of this there is a variety, with black bill and legs; body brown, variegated with white; tail-feathers white with brown bands.

**Islandica.** With brown bill and legs; body beneath ferrugious; secondary tail-feather with a white margin: the red sand-piper of Pennant.

**Cinerea.** Cinereous; beneath white: legs obscurely green; head with black spots; neck obscurely virgated: the ask-coloured sand-piper of Pennant and Latham.

**Atra.** With black head and neck; back and wings brownish, mixed with black; break and abdomen cinereous; rump cinereous, undulated with white and black.

**Novoboracensis.** Obscure, beneath white; break spotted with brown; tail cinereous: New York sand-piper of Pennant and Latham.

**Virgata.** Obscure, beneath white; with yellowish legs; head and neck obscurely striated lengthwise with white: streaked sand-piper of Latham.

**Borealis.** With brown bill and legs; body above cinereous, beneath white; tail and tail-feathers obscure.

**Novo-terræ.** Above black, beneath ash-white; bill, fpiruous wings, tail-feathers, and tail, black; with cinereous legs: Newfoundland sand-piper of Latham.

**Vanigata.** Above variegated with brown, black, and red; front and throat pale; neck and breast streaked with whitish and black longitudinally; abdomen white; bill and legs obscure; variegated sand-piper of Latham.

**Glacialis.** With pinnated yellowish legs; apex of black bill dilated; cheeks and throat ferrugious; body above obscure, beneath white: plain phalarope of Pennant.

**Fusca.** With bill, vertex, and legs pinnated and black; body above brownish and cinereous, beneath white; throat.
cinereus, tinted with red: the cost-footed tringa of Edwards, and brown phalarope of Pennant and Latham.

CANCELLATUS. With upper feathers brown, white at the margin; lower white lined transversely obscurely; pinnated legs obscure.

EUCOPTERA. Black, beneath red, with cinereous bill, green legs, and yellow vent: the white-winged sand-piper of Latham.

MARITIMA. Above varied with grey and white; beneath white, with yellow legs; middle of the back violet: throat and tail obscure: the selsinger sand-piper of Latham.

UNDATA. Obscure, undulated with yellow and white; the rump, the tip of the secondary tail-feathers, and covert, white; tail cinereous, white at the apex: the waved sand-piper of Pennant and Latham.

UNIFORMIS. Wholly dilutely cinereous, with a short black bill: uniform sand-piper of Pennant and Latham.

AUSTRALIS. Above cinereous, spotted brown; beneath reddish; abdomen and rump whitish; tail and tail-feathers obscure; bill and legs black: southern sand-piper of Latham.

NAVIA. With obscure bill; legs greenish; body above cinereous, spotted with red and black; beneath reddish and white, spotted with obscure or bay: the freckled sand-piper of Pennant and Latham.

GRISEA. With black bill and legs; body above grey, beneath white; primary tail-feathers brown; tail grey and white at the margin; a band obscurely grey parallel to the margin: the grizzled sand-piper of Latham.

KEPUSCHICA. With cinereous body; black vertex; abdomen blackish, terminating reddish.

TRINGAN, in Geography. See Thrangano.

TRINGENSTEIN, a town of Germany, in the principality of Nafau Dillenburg: 6 miles E. of Dillenburg.

TRINGLE, in Architecture, a name common to several little square buildings, or ornaments; as reglets, lintels, and platbands.

The word is French, where it signifies the same.

TRINGLE is more particularly used for a little member fixed exactly over every triglyph, under the platband of the architrave; from whence hang down the guttae, or pendant drops.

TRINIDAD, in Geography, a town of South America, in New Granada; 20 miles N.W. of Santa Fé.

TRINIDAD, an island near the coast of South America, about thirty leagues long, and from two to ten broad. This island was discovered by Columbus in his third voyage, who landed here in 1498, and was named by him after the Holy Trinity; because, says Herrera, having been in great danger in a violent storm, he made a vow to give that name to the first land he should find; soon after which a sailor, in the main-top, saw three points of land, by which the name was in every respect suitable to his vow. The original inhabitants were a colony of Arrowsnakes; which fed. The climate is said by some to be unwholesome; the island being very often covered with thick fogs. The abbe Raynal says that it is excellent, being free from hurricanes. Heavy rains fall from the middle of May to the end of October. It is subject to flight earthquakes, and in the interior are four groups of mountains. The quality of its soil is variously reported; however, Sir Walter Raleigh, who was there some time in the year 1595, and examined the island, gives an account, that the northern part of it is high land; but that its soil is good, proper for planting of sugar-canes, tobacco, &c. The southern coast is well adapted to the culture of coffee; and on the west is a large harbour, lucrative in all seasons. Here are several forts of animals, plenty of wild hogs, fish, fowl, and fruit. It also produces maize, cattava, and other roots, and in general all that is commonly found in America. The Spaniards owned to Sir Walter, that they found gold in the rivers of this island, but nothing in comparison of what the main land produces. The natives called this island "Cairi?" but they themselves had different names, according to the different parts of the island where they dwelt. In 1707, it was taken by the British troops; and by the peace of Amiens, the island was ceded to Great Britain. The island of Tobago is separated from Trinidad by a channel called "Trinidad Channel." This island, situated at the caliburn extremity of Terra Firma, from which it is only four leagues distant, is the natural magazine and refort where the contraband traders of Cumanà, Barcelóna, Margarëta, and Guiana, make their purchases. The position of the island is singularly favourable to this commerce. The Spanish coasts, extensive, solitary, defenceless, and to leeward, offer both to the English and Spaniards the greatest facility for perfecting it. The gulf of Paria, which washes the western part of Trinidad, receives the waters of the river Guarapiche, which penetrates the province of Cumanà. By this river animals for labour and for the island are brought from Terra Firma to Trinidad; and through the same channel all the contraband articles consumed in this province can ascend with perfect convenience, or may be landed at several points without the least danger. In general, the cargoes which are defined for Barcelona proceed up this river; they are thence distributed to Caracas and other cities. The mouths of the Oronoko, which crofs the gulf of Paria from south and north, and which are compelled by Trinidad to discharge into the sea by the dragon mouths, open to this island the commerce of Guiana, whither the spurious goods by the river Apure to Barquisimeto, Truxillo, Varnas, Merida, &c Dr. Anderson has given a particular account of a remarkable phenomenon in this island, which is a bituminous lake, or rather plain, denominated Tar-lake, and by the French La Brea, from its resemblance to flint-pitch, and from its aswering a similar imitation. It lies on the leeward side of the island, on a point of land extending into the sea about two miles, and opposite to the high mountains of Paria on the north side of the gulf. The heathland, or cape, is about 50 feet above the level of the sea, and is the greatest elevation on this side of the island. From the sea it appears a mass of black vitrified rocks; but on closer examination, it is found to be a composition of bituminous ferrox, vitrified sand, and earth, cemented together: in some parts, beds of cinders only are found. In approaching this cape, there is a strong sulphurous smell, sometimes disagreeable. This smell is prevalent in many parts of the ground to the distance of eight or ten miles from it. The point of land is about two miles, and falls with a declivity to the sea, the bituminous plain being on the highest part of it, and separated from the sea by a margin of wood which surrounds it. It appears at first like a lake of water; and in hot and dry weather its surface, about an inch deep, is liquid, whence it obtained the appellation of lake. Its form is circular, about three miles in circumference. Its more common confidence and appearance are those of pit-coal, the colour being rather greyer. No appearance of sulphur is discernible, though, in passing over it, a strong sulphurous smell was experienced. Dr. Anderson apprehended that this bituminous substance is the bitumen alpahatum of Linnæus. By a gentle heat it was rendered ductile; and mixed with sawdust or common pitch, it is much used for the bottoms of ships; and he conceives it to be a preservative against the insect called the borer, to destructive
defructive to ships in that part of the world. Every part of the country, he says, to the distance of 30 miles round, has the appearance of being formed by convulsions of nature from subterraneous fires; and the whole island, he thinks, is formed of an argillaceous earth, either in its primitive state, or under its different metamorphoses. This argillaceous earth is formed, as he conceives, from the sediment of the ocean, and its formation is easily accounted for from the situation of Trinidad. The great influx of currents into the gulf of Paria, from the coasts of Brazil and Andalusia, must bring down a vast quantity of light earthy particles from the mouths of the numerous large rivers which traverse those parts of the continent; but the currents being repelled by the sides of adjacent mountains, eddies and smooth water will be produced when they meet and oppose one another; and, therefore, the earthy particles would subside, and form banks of mud, and by the accretion of fresh accumulations form dry land; and thus a tract of country as Trinidad must be formed. The cauces still operate, for the island is daily increasing on the leeward side, as is visible in the mud-beds that extend a great way into the gulf, and are there constantly augmented. But from the great influx from the ocean at the south end of the island, and its egress to the Atlantic again through the Bocas, a channel must ever exist between the continent and Trinidad. N. lat. 9° 48' to 10° 42'. W. long. 60° 6' to 61° 36'.

Trinidad, La, a town of South America, in the province of Moxes; 200 miles N. of La Plata. S. lat. 14° 40'. W. long. 65° 59'.

Trinidad, a sea-port town of the island of Cuba; situated in a bay on the south coast of the Havannah. N. lat. 51° 56'. W. long. 90° 18'.

Trinidad, La, or Sanfornates, a sea-port town of Mexico, in the province of Guatimala; 80 miles E.S.E. of Guatimala. N. lat. 14° 31'. W. long. 91° 6'.

Trinidad, La, a town of Mexico, in the province of Veragua, on a river which runs into the gulf of Mexico; 18 miles S.E. of La Concepcion.

Trinidad, La, a town of Mexico, in the province of Nicaragua, on the east coast of Nicaragua lake; 30 miles N.W. of St. Carlos.

Trinidad, a town of South America, in the province of Paraguay; 170 miles S.E. of Asfumpton.

Trinidad, a small island in the South Atlantic ocean, and one of those called "Martin Vaz's Islands," taken possession of by the Portuguefe about the year 1783, who keep a small garrison there, but, according to M. Peroune, ill-furnished. This island presents nothing to the eye but a rock, almost entirely sterile. A little verdure, and a few shrubs, are alone to be seen in the narrow pafsages between the mountains. It is in one of these valleys situated in the south-east quarter of the island, and about three hundred toftes wide, that the Portuguefe have formed their habitation. Nature certainly did not intend this rock to be inhabited: neither men nor animals being able to find a sufficiency upon it; but the Portuguefe were afraid lest some European nation should avail themselves of the vicinage, and carry on a contraband trade with the Brafsils. S. lat. 20° 31'. W. long. of the south point 26° 37'.

Trinidad Bay, a small open bay or cove on the west coast of North America. N. lat. 41° 3'. E. long. 236° 6'.

Trinitarians, a term used very variously, and arbitrarily: frequently it flands as a common name for all perfons who have sentiments on the mystery of the Trinity, different from those of the Catholic church.

Sometimes it is more immediately restrained to some one or other particular class of such perfons.

It is now applied to the orthodox themselves, in contradiflion to the others who are then called Arian or Unitarians, or who deny or impugn the doctrine of the Trinity.

Thus the Socinians and others called the Athanafrians, Trinitarians.

The Trinitarians of the present age, and especially those who, in England, have written on the subject of the Trinity, are far from being agreed in their opinions, and, therefore, ought to be called very differently from one another.

A late writer (Prieftley's Hist. Corrupt. of Chriftianity, vol. i. p. 147.) thinks that they are all reducible to two classes, viz. that of thofe who believe that there is no proper divinity in Chrift, besides that of the Father, and the class of Trinitifts, who maintain that there are three equal and difinct Gods. Dr. Waterland and the reft of the Athanafrians afert three proper difinct perfons, entirely equal to and independent upon each other, yet making up one and the fame being. Mr. Howe (Works, vol. ii. p. 566—568,) feme to fuppofe that there are three difinct eternal精神s, or difinct diftant hypofpheres; each having his own diftinct, fingular, intelligent nature, united in fuch an inexplicable manner, as that upon account of their perfect harmony, content, and affection, to which he adds their mutuell self-confcioufnefs, they may be called the one God, as properly as the different corporeal, fensitive, and intellectual natures united may be called one man. Bishop Pearson (on the Creed, p. 134, &c. 322, &c.), bishop Bull (Serm. vol. iv. p. 829.), and Dr. Owen (on the Heb. i. 5. p. 53, &c.), are of opinion, that though God the Father is the fountain of the Deity, the whole divine nature is communicated from the Father to the Son, and from both to the Spirit; yet so as that the Father and Son are not separate, or separable from the divinity, but do fill exist in it, and are most intimately united to it. Dr. Thomas Burnet (Script. Doctr. p. 173,) maintains one self-exifient and two dependent beings; but afferts, that the two latter are so united to and inhabited by the former, that by virtue of that union divine perfections may be ascribed and divine worship paid to them. In this fentence Dr. Dodridge is faid to have concurred. Dr. Wallis (Lett. on the Trin.) thought, that the diftinftion between the three perfons was only modal, which feems, fays Dr. Dodridge, to have been the opinion of archbifhop Tillotfon. (Tillotfon. Serm. vol. i. p. 492—494.) Dr. Watts (Diff. N° 7.) maintained one supreme God dwelling in the human nature of Chrift, which he fuppofed to have exifted the firit of all creatures; and speaks of the divine Logos, as the wisdom of God, and the Holy Spirit, as the divine power, or the influence and effect of it; which, he fays, is a perifhal perfon, i. e. spoken of figuratively in trinitie under perfonal characters. Dodridge's Lectures, p. 422, &c.

Trinitarians also denote an order of religious, instituted in honour of the Trinity, for the redeeming of Christian captives from the infidels; vulgarly called Mathurins, and brothers of the redemption.

They are clothed in white, and bear on the fhamach a cros, partly red and partly blue; by which three colours, white, red, and blue, is imprefled to be represented the mystery of the Trinity; but the habit of this order is different in different provinces.

The Trinitarians made it their bufinefs to go and ransom Christians held in slavery in the republics of Algiers, Tunis and Tripoli, and the states of Morocco. They have a rule peculiar to themselves; though several historians rank them among the observers of the value of St. Augufline.

The
TRI

T he order had its rise in 1198, under the pontificate of Innocent III. The founders were John de Matha and Felix de Valois; the first of Tournon in Provence; the second, not of the royal family of Valois, as some have imagined, but thus called, in all probability, as being a native of the country Valois.

Gauthier de Chartillon was the first who gave them a place in his lands to build a convent; and afterwards became the chief of the whole order: Honorius III. confirmed their rule; and Urban IV. appointed the bishop of Paris and others to reform them; they did it; and the reform was approved, in 1267, by Clement IV.

This order possessed about 250 convents, divided into thirteen provinces; of which six are in France, three in Spain, one in Italy, and one in Portugal. And formerly there was one in England, another in Scotland, and a third in Ireland.

Broughton, and some other writers, make a distinction between the order of the redemption of captives, and the fraternity of the Holy Trinity.

TRINITARIANS, Barefooted, are a reform of this order, made in Spain, in a general chapter held in 1594, where it was resolved, that each province should establish two or three houses, where the primitive rule should be observed, and where the religious should live up to a greater austerity, use coarser clothes, &c. and yet should have the liberty of returning to their ancient convent, when they thought fit.

Don Álvaro de Bazan, intending to found a monastery at Valdpegnas, and defiring to have it occupied by bare-footed religious, it was agreed to add nudity of feet to the reform, that the Trinitarians might have the benefit of that establishment. The reform afterwards grew into three provinces, and was at length introduced into Poland and Ruffia, and thence into Germany and Italy.

There are also barefooted Trinitarians in France, established by F. Jerome Hallies, who, being sent to Rome to solicit the first reform mentioned above, not content with this, carried it farther, and obtained a permission of pope Gregory, to add a coarser habit and nudity of feet thereto. He began with the convent of St. Dionysius at Rome, and those of Aix in Provence.

In 1675, there were houses enough of this reform to make a province, and, accordingly, they held their first general chapter the same year.

There are also nuns of the Trinitarian order established in Spain by St. John de Matha himslef, who built them a convent in 1201. Those who first took the habit were only oblates, and made no vows; but in 1201, the monastery was filled with real religious, under the direction of the infanta Constanza, daughter of Peter II. king of Aragon, who was the first religious, and the first superior of the order.

There are also barefooted nuns of this order, established at Madrid about the year 1612, by Frances de Romeros, daughter of Julian de Romero, a lieutenant-general in the Spanish army.

Lastly, there is a third order of Trinitarians.

TRI

The is one God, an unity in nature and essence, and a Trinity of perfons. The term Trinity implies the unity of three, the unity of three divine perfons really different, and the identity of an indivisible nature: the Trinity is a ternary of divine perfons of the same essence, nature, and subsistence.

Perfon is defined an individual, reasonable, or intellectual subsistence; or an intellectual and incommunicable subsistence.

The hypostasis, or subsistence, is what constitutes the perfon. There are then in the Holy Trinity three perfons, Father, Son, and Holy Spirit, which have all things in common, except their relations; whence that axion in theology comes to have place, in the divine perfons there is no distinction, where there is no opposition of relation.

The Father is the first perfon in the Holy Trinity, for the reason the Father alone produces the Word, by the way: underflanding; and with the Word produces the Holy Spirit, by way of will.

Here it is to be observed, that the Holy Spirit is not thus called from his spirituality, that being common and essential to all the three perfons; but from the passive spiration (as some popish schoolmen express the manner in which the personality of the Holy Spirit is derived from the Father and Son), which is peculiar to him alone.

Add, that when one perfon in the Holy Trinity is called frist, another second, and another third, it must not be understood of a priority of time, or of nature, which would imply some dependence; but of a priority of origin and emanation, which consists in this, that one perfon produces the other, in such manner, as that the perfon which produces cannot be, or be conceived, without that produced.

Those who maintain the doctrine of the Trinity allege, that the same titles, attributes, works, and worship, are ascribed by the sacred writers to the Father, Son, and Holy Spirit; nevertheless they contend, in different ways, for the proper unity of the divine nature. For the sentiments of some of the chief modern Trinitarians, see TRINITARIANS: and for the sentiments of others, who have rejected what has been usually denominated the orthodox doctrine of the Trinity, see ARIANS, MACEDONIANS, NOETIANS, SABELLIANS, SEMI-ARIANS, SOCINIANS, and UNITARIANS. See also TRINITYISM.

It is observed by Dr. Waterland and many other writers, that the term Trinity first occurs in the works of Theophilus, bishop of Antioch, about the year 180. Theoph. ad Autoly. lib. ii. c. 14. p. 148. 150. ed. Wolfi.

But at this time the words, perfons, and subsistences, were not in use; however, they were introdiced on occasion of the disputes with Praxedis, Noetus, and Sabellius, either by Clement of Alexandria, or by Tertullian.

For the punishment inflicted by the English law on those who deny the Trinity, see HERESY.

Many of the heathens are said to have had a notion of a Trinity. Steueh. Eugub. de Peren. Philof. lib. i. c. 3. observes, that there is nothing in all theology more deeply grounded, or more generally allowed by them, than the mystery of the Trinity. The Chaldeans, Phænicians, Greeks, and Romans, both in their writings, and their oracles, acknowledged that the Supreme Being had begot another Being from all eternity, which they sometimes called the Son of God, sometimes the Word, sometimes the Mind, and sometimes the Wisdom of God, and ascribed it to be the creator of all things.

Among the sayings of the Magi, the defendants of Zoroaster, this is one, Πατὴρ ἐξετάζει πόστε καίνο, μεγάλη δύναμις: the Father finished all things, and delivered them to the second Mind.
The Egyptians called their Trinity, Hemapha, and represented it by a globe, a serpent, and a wing, diptyped into one hieroglyphic symbol. Kircher, Gale, &c. suppose the Egyptians learned their doctrine of the Trinity from Joseph and the Hebrews.

The philosophers, among St. Cyril, owned three hypophyses, or perfons; they have extended their divinity to three persons, and even sometimes used the word Trias, Trinity: they wanted nothing but to admit the confubstantiality of the three hypophyses, to signify the unity of the divine nature, in exclusion of all trinity with regard to difference of nature; and not to hold it necessary to conceive any inferiority of hypophyses.

We learn from Dr. Cudworth, that, besides the inferior gods, generally received by all the Pagans, (viz. animated stars, demons, and heroes,) the more refined of them, who accounted not the world the supreme deity, acknowledged a Trinity of divine hypophyses superior to them all. This doctrine, according to Plotinus, is very ancient, and ob.

Plato, and some of his followers, speak of a Trinity in such terms, that the primitive fathers have been accused of borrowing the very doctrine from the Platonic school; but M. Mourgues, who has examined the point, affrets, that nothing can be more absurd, than to suppose the Platonic Trinity brought into the church; and to have recourse to the Platonism of the fathers to disprove their authority with regard to this dogma.

PLATO.

Plato, and some of his followers, speak of a Trinity in such terms, that the primitive fathers have been accused of borrowing the very doctrine from the Platonic school; but M. Mourgues, who has examined the point, affrets, that nothing can be more absurd, than to suppose the Platonic Trinity brought into the church; and to have recourse to the Platonism of the fathers to disprove their authority with regard to this dogma.

TRINITY, Friary or Fraternity of the Holy, is a society instituted at Rome, by St. Philip Neri, in 1548, to take care of pilgrims coming from all parts of the world to that capital, to visit the tombs of St. Peter and St. Paul.

In 1558, pope Paul IV. gave the fraternity the church of St. Benedict, to which they gave the title of the Holy Trinity. Since that time, they have built close by it a very ample hospital for pilgrims, and persons on the recovery.

The fraternity has since become very considerable, and most of the nobility of Rome, of either sex, have done it the honour to be members of it.

TRINITY, Congregation of the Holy, is a congregation of twelve priests established in the hospital of the fraternity just mentioned, to take care of pilgrims, and others entertained therein.

TRINITY, Order of the Holy, See TRINITARIANS.

TRINITY-Sunday, is the next Sunday after Whit-Sunday, thus called, because on that day was anciently held a festival (as it still continues to be in the Roman church) in honour of the Holy Trinity. The observance of this festival was first enjoined by the fifth canon of the council of Arles, in 1260; and John XXII. who distingushed himself so much by his opinion concerning the beatific vision, is said to have fixed the office for this festival in 1334.

TRINITY-Herb, in Botany. See VIOLET.

TRINITY-House, is a kind of college at Deptford, belonging to a society of seafaring persons, founded for the regulation of seamen, and security and convenience of ships and mariners on our coasts.

This society was incorporated by Henry VIII. in 1515, who confirmed to them not only all the ancient rights and privileges of the mariners of England, but also their several hospitals; which, together with various grants of queen Elizabeth and king Charles II., were confirmed by letters patent of the 11th of James II. in 1685; under the name of the master, wardens, and affilliates of the guild or fraternity of the most glorious and undivided Trinity, and of St. Clement, in the parish of Deptford Strand, in the county of Kent.

This corporation is governed by a master, four wardens, eight affilliates, and eighteen elder brethren; the inferior members of the fraternity, denominated younger brethren, and chofen among the masters and mates expert in navigation, are of an unlimited number, and serve for supplying vacancies among the thirty-one elder brethren. The master, &c. of this corporation, are invited by charter with a power to examine the mathematical children of Chrift's Hospital; to examine the masters of his majesty's ships; to appoint pilots for conducting ships in and out of the river Thames; and to amerce such as shall act as masters or pilots without their approbation in a fine of 20l.; to settle the several rates of pilottage, and erect light-houses, and other sea-marks, on the several coasts of the kingdom, for the security of navigation; to prevent aliens from serving on board English ships, without their licence, under penalty of 5l. for each offence; to punish feamen for defertion or mutiny in the merchant service; to hear and determine the complaints of officers and seamen in this service, under an appeal to the court of admiralty; and to grant licences to poor seamen (non-free men) to row on the river Thames.

To this company belongs the ballast-office, for cleaning and deepening the river Thames, by taking from it a sufficient quantity of ballast for the supply of all ships that fall out of the river; in which service sixty barges, of the burden of thirty tons, and two men each, are constantly employed; all ships taking in ballast pay to them 1s. 2d. a ton.

This corporation is empowered by charter to purchase lands, &c. to the amount of 500l. per annum, and also to receive charitable benefactions to the like amount. They have also light-houses, to which all ships pay a halfpenny per ton.

Out of the income of this corporation, about three thousand poor seamen, their widows and orphans, are annually relieved, at the expense of about 6000l.

The house in which the brethren of this corporation usually meet for the dispatch of business, is on Tower-Hill. (See LONDON.) They have three hospitals, two at Deptford, and one at Mile-End, which last is designed for decayed sea-officers, masters of vessels, pilots, and their widows.

TRINITY Term. See Term.

TRINITY, or La Trinité, in Geography, a sea-port town of the island of Martinique: the harbour is formed on the south-east fide by the point Caravelle, which is two leagues in length; and on the other fide by a very high hill, about 350 or 400 paces in length, which only joins to the main land by an illusmus not above 200 feet broad. The ead side, opposite to the bottom of this bay, is rapped up by a chain of rocks, which appear level with the water when the ebb tide is spent. The town here is a very thriving place, being the residence of several merchants, as well as of the lieutenant-governor of the Cabesterre; and much frequented by shipping, especially from Nantes; the cargoes of which are here to meet with a quick sale, the people, who
who are very numerous in the adjacent parts, choosing rather to buy what they want near at hand, than to fend far from the Buffon. Besides, during the hurricane season, ships have a safe station in this port: another advantage they have here is, that when they set out for Europe, they are to the windward of all the islands, and have about 500 leagues in their passage, which they would find by the way of St. Domingo, or Porto Rico. N. lat. 14° 53'. W. long. 61° 51'.

TRINITY Bay, a large but not a very deep bay of the South Pacific ocean, on the north-east coast of New Holland, between Cape Grafton and Cape Tribulation.—Also, a large bay on the east coast of Newfoundland. N. lat. 48°. W. long. 53° 10'.

TRINITY Harbour, a cove on the north-west end of Trinity Bay, on the east coast of Newfoundland. N. lat. 48°. W. long. 53° 10'.

TRINITY Inlet, a bay of the North Pacific ocean, on the west coast of North America; 30 miles S. of Queen Charlotte's Sound.

TRINITY Island, an island in the North Pacific ocean, discovered by Captain Cook. Captain Vancouver passed this coast in the year 1794, and says it appeared to be divided into two islands, with several others of inferior size lying to the north, between them and the land about Cape Trinity. The east point of the easternmost is, according to his observations, situated in N. lat. 56° 33'. E. long. 206° 47'.

TRINIUMGELD, or TRINIUMGELD, a compensation used among our Saxon ancestors for great crimes, which were not abated but by paying a fine thrice nine times. See GELD.

TRINK, in our Statutes, is used for a fishing-net. 2 Hen. VI. cap. 15. Blount.

TRINO, in Geography, a town of France, in the department of the Seine, lately belonging to the duchy of Montferrat, situated in a marshy foil: the country near produces great quantities of corn, rice, and cheese, by some supposed equal to those of Picenza or Parma. The fortifications are for the most part demolished. It has one collegiate and several parish churches, and religious houses; 10 miles S.S.W. of Vereille. N. lat. 45° 17'. E. long. 8° 16'.

TRINOBANTES, TRINOVANTES, or TRINOVATES, in Ancient Geography, were inhabitants of Britain, situated next to the Cantii northward, and occupied, according to Camden and Baxter, that country which now composes the counties of Essex and Middlesex, and some part of Surrey. But if Ptolemy be not mistaken, their territories were not so extensive in his time, as London did not then belong to them. The name of this British nation seems to be derived from the three following British words; Tri, Now, Hunt, which signify the inhabitants of the new city. This name was perhaps given them by their neighbours, on account of their having newly come from the continent into Britain, and having there founded a city called Tri-Now, or the New City, the most ancient name of the renowned metropolis of Britain. The Trinobantes had come so lately from Belgium, that they seem hardly to have been firmly established in Britain, at the time of the first Roman invasion. For their new city, which soon after became so famous, was then so inconsiderable, that it is not mentioned by Caesar, though he must have been within sight of the place where it was situated. They were then at war with their neighbours, the Cattivellantes, whose king, Caffibelenus, commanded the confederated Britons against the Romans; and, on this account, the Trinobantes were amongst the first of the British states who defected that confedecary and submitted to Caesar. They submitted again to the Romans, on their next invasion in the reign of Claudius, with the same facility, and almost for the same reason. For, in the interval between the invasion of Julius and that of Claudius, the Cattivellauni had reduced them under their obedience; and, in order to emancipate themselves from this subjection to their neighbours, they put themselves under the protection of the Romans. But the Trinobantes soon became weary of their obedience to their new masters. For the Roman colony at Camulodunum, which was within their territories, depriving some of them of their estates, and oppressing them several other ways, they joined in the great revolt of the Britons under Boadicea, and shared very deeply in the miseries of that revolt. From that time the Trinobantes remained in peaceable subjection to the Romans, as long as they continued in Britain. The country of the Trinobantes was greatly valued and much frequented by the Romans, on account of the excellency of its soil and climate, and the many advantages of its situation. That sagacious people soon fixed their eyes on the new town of the Trinobantes; and observing its admirable situation for health, for pleasure, and for trade, great numbers of them settled in it, and giving it the name of Londonum from its situation, and of Augella from its grandeur, it became in a little time the largest and most opulent city in this island. In the reign of Nero, as Tacitus informs us, London was become a city highly famous for the great influx of merchants, her extensive commerce, and plenty of all things. No fewer than seven of the fourteen journies of Antoninus begin or end at London; a plain proof, among many others, that this city was the capital of Britain in the Roman times, as it is at present the great and flourishing metropolis of the British empire. Camulodunum, now Malden in Essex, was the seat of the first Roman colony in Britain, and a place of great beauty and magnificence in those times; though at present few or no vestiges of its ancient grandeur remain. Cæfaromagus, from its pompous name, was probably a place of some note in the Roman times; but it is now so entirely ruined, that it is difficult to discover the ground where it once stood; some of our antiquaries placing it at Chelmsford, and others at Dunmow. The Colonia of Antoninus was probably Colcheather, and Durolitum, as some think, Leiton, but, according to others, Waltham. But though the county of Essex was certainly very much frequented by the Romans, who erected many noble works in it, yet time, cultivation, and various accidents, have made so great a change in the face of that country, that very few vestiges of these works are now remaining. The territories of the Trinobantes were included in that Roman province which was called Britannia Prima. See CAMULODUNUM.

TRINODA NECESITAS, in our Ancient Customs, a threefold necessary tax, to which all lands are liable; vis, expeditio, & reparatio pontis, & arcis; going to the wars, and repairing of bridges and of castles.

These were the three exceptions anciently inflected in the king's grants of land to the church, after the words that freed them from all secular service.

TRINODA, or TRINODA TERRA, in some Ancient Writers, denotes a quantity of land containing three perches.

TRINOMALY, or TRINOMIAL Root, in Mathematics, is a root consisting of three parts, or monomes, connected together by the signs + or —. Such
This afpect, which some call the *sfqivquadrans*, is one of the new aspects superadded to the old ones by Kepler. 

**TRIODIA**, in *Botany*, from τρίς, τρία, three, and οὐδός, a tooth, alluding to the three, nearly equal, teeth, of the outer valve of the corolla.—Brown Prodr. Nov. Holl. v. 1. 182. 

Eff. Ch. Calyx many-flowered, of two nearly equal valves. Outer valve of the corolla with three, nearly equal, teeth; the middle one large. Nectary of two scales. 

A genus of perennial, rather rigid graminaceous plants, with panicles of flowers, and the habit of a Poa or *Fusca*. Mr. Brown specifies *Fusca* decumbens of Linnæus, which is *Poa decumbens* of Sm. Fl. Brit., *Dantonia decumbens* of Decandolle, ought to be removed hither. Our learned friend also has hinted to us, that the two South American species of Humboldt and Bonpland, here subjoined to his own New Holland ones, though they answer to the generic character, are considerably different in appearance from the rest. 

1. T. *pungens*. Br. n. 1.—"Panicle rather close, erect; with alternate, mostly simple, branches. Spikelets lanceolate, of about five flowers. Outer valve of the corolla woolly at the edges and keel, in its lower half. Leaves spreading, involute, pungent; scales of the lower ones vilose."—Found by Mr. Brown, in the tropical part of New Holland. 

2. T. *procera*. Br. n. 2.—"Panicle loose; its branches undivided, spiky. Spikelets somewhat flaked, of three or four flowers. Calyx roughish. Outer valve of the corolla very smooth at the keel, and nearly so at the edges. Leaves involute, rather lax; their sheath with a silky beard."—From the same country. 

3. T. *pavufora*. Br. n. 3.—"Panicle loose, elongated; its branches undivided, spiky. Spikelets linear, of about five flowers. Outer valve of the corolla naked at the keel; rather downy at the edges. Leaves involute, rather lax. Stipula torn."—From the same country. 

4. T. *microphylla*. Br. n. 4.—"Panicle elongated, rather close; its branches undivided, spiky. Spikelets about three-flowered. Glumes rough. Outer valve of the corolla blunt, with three very short teeth; its keel and edges smooth. Leaves involute; their sheath bearded."—From the same country as the three foregoing. 

5. T. *argentea*. Br. n. 5.—"Panicle close. Spikelets lanceolate, imbricated. Outer valve of the corolla villous at the base. Leaves involute, spreading, rigid, pungent."—Native of the southern coast of New Holland. 

6. T. *ambigua*. Br. n. 6.—"Panicle lax; its branches half-whorled, undivided, spiky. Spikelets nearly sessile, linear of eight or ten flowers. Outer valve of the corolla silky at the edges; inner fringed. Leaves involute. Stipula torn."—Found in the tropical part of New Holland, by Mr. Brown, who doubts whether this be a genuine species of *Triodia*. Its aspect is perfectly that of a *Poa*. 

7. T. *pullerata*. Kunth as above, n. 1. 47.—Panicle leafy, of about three flowers. Spikelets about seven-flowered. Corolla hairy at the base; its inner valve toothed. Scyons trailing. Leaves rather long.—Native of cool dry exposed situations in Mexico, flowering in September. Root fibrous, with trailing runners, taking root as they go, and sending up stems two or three inches high, solitary or aggregate, whole simple *panicle* accompanied by many awl-shaped leaves, resembling the radical foliage. 

8. T. *avenacea*. Kunth n. 2. 48.—Panicle close. Spikelets about five-flowered. Corolla hairy in its lower half; inner valve entire. Scyons trailing. Leaves flabby.—Native of valleys in Mexico, flowering in April. This increases by runners, like the last. But the stems are twice as tall; the *panicle* leafless, rather compound, resembling a *Fusca*; the leaves flat, blunting, not unlike *Poa annua*. 

**TRIODION**, the title of an ecclesiastical book in the Greek church, which comprehends the office of a particular part of the year. This book is called Triodion, because it contains the hymns or odes of three lrophees. The hymn of two lrophees is called "Dionysion," and that of four, "Tetradion." Leo Allatius. 

**TRIOLO**, in *Geography*, a town of the Ligurian republic; 18 miles N.E. of Vintimiglia. 

**TRIOND**, a town of European Turkey, in Albania; 12 miles W.N.W. of Alexio. 

TRIONDA, a small island in the gulf of Salata, near the coast of Natolia. N. lat. 36° 36'. E. long. 36° 26'. 

TRIONES, in *Astronomy*, a sort of constellation, or assemblage of seven stars in the Ursa Major, popularly called "Charles's Wain." 

From the Septem Triones, the north pole takes the denomination Septentrion. 

**TRIONTO**, in *Geography*, a river of Naples, which runs into the gulf of Tarento; 10 miles E. of Rossano. 

Alfo, a cape of Italy, on the coast of Calabria Citera, in the gulf of Tarento, at the mouth of the Trionto. N. lat. 39° 46'. E. long. 16° 54'. 

**TRIONUM**, in *Botany*. (See *Hippopus*.) There is a *Trionum* in Thespiaus, said to be one of the Mallow tribe; like the *Hippopus* in question, whose leaves, having three lobes, are supposed to function the present application of this name. 

**TRIOPHTHALMUS**, formed of τρίς, three, and οὖν, or, a name given by authors to such pieces of agate, or other semi-polished flint, as happen to have three small circular spots, resembling eyes, upon them; these are of the nature of the common agate, &c. The spots are mere accidental varieties in the dispositions of the veins, and do not make a distinct species of stone. 

**TRIOPICUS**, in *Ancient Geography*, a country or town, or, as others say, a promontory of Caria, near the sea, and belonging to the Cnidians. On this promontory was a temple of Apollo, where the Dorians celebrated games in honour of this god. At this temple was held an assembly of the Dorians of Alba, similar to the assemblies of the European Greeks at Thermopylae. See Cape Cito. 

O.D. **TRIOP**.

Eff. Ch. Calyx in five deep segments. Petals five, roundifh, with flemier claws. Filaments combined at the base. Capsules three, fingle-fed, each with one, three, or four, membranous wings.

A twining shrub, with small white flowers. Fruit with three vertical parallel wings, each capsule being fixed in the centre of each.

7. T. buxifolia. Box-leaved Triple-wing. Willd. n. 7. (Tetrapetris buxifolia; Cavan. Diff. n. 597. t. 262. f. 3.)—Leaves elliptic-oblanceolate, blufht, smooth. Umbels foliary, terminal. Capsules with four nearly equal wings.—Native of the Antilles. The leaves are much smaller than one of the foregoing, being hardly above an inch long, and nearly fefilif.

8. T. citrifolia. Orange-leaved Triple-wing. Swartz Ind. Occ. 857. Willd. n. 8. (Tetrapetris inequaflis; Cavan. Diff. n. 594. t. 260. Acer scandens tricoccos, folia citri, flore luteo, minore; Plum. t. 9. t. 16.)—Leaves ovate, acute, smooth. Umbels axillary, flaked. Capsules with four wings; the two lowermost smallifet.—Native of woods on the mountains of Jamaica. The fhruflby stem climbs to a great height, with very long, round, flexible, smooth branches. Leaves flaked, three or four inches long, flexible, with several lateral ribs. Flowers small, yellow, in axillary and terminal flamed umbels.

Dr. Swartz very justly observes, that the Tetrapetris of Cavanilles is no difficnt genus from Triopteris. Our second fpecies, having but three wings to the whole aggregate fruit, or a fimple circumambient wing to each capsule, may be thought to anwer ill to the idea of this genus.

Triopteris, in Gardening, furnifhes a plant of the climbing woody exotic fove kind from the West Indies, of which the fpecies cultivated is the Jamaica triopteris (T. jamaicensis).

It is a tender exotic plant, which constantly requires the protection and warmth of a greenhoufe or fove in this climate.

Method of Culture.—This plant is propagated and increased by feeda, cuttings of the branches, and layers. In striking roots, the cuttings will be greatly afifted by the use of a hot-bed of tanners' bark. The plants, after they are raised, are always to be kept in pots, which are to be placed amongst thofe of the greenhoufe or fove kinds. They should have occasional waterings during hot weather.

They afford a defirable variety in collections of the above kinds of plants.

TRIORCHIS, a word used by fome to exprefs a man who has three feficles.

It is also used as the name of a buzzard; and of a plant, called ladies' traces.

TRIORS, or TRIERS, in Law, fuch as are chosen by the court to examine whether a challenge made to the panel of jurors, or any of them, be juft or not.

The triors, in cafe the firft man called be challenged, are two indifferent perffons named by the court; and if they try one man and find him indifferent, he fhall be fworm; and then he and the two triors fhall try the next; and when another is found indifferent and fworm, the two triors fhall be fuperceded, and the two fworm on the jury fhall try the ref.

Gen. Ch. Cal. Perianth superior, in five deep, spreading, lanceolate, permanent segments, the length of the corolla. Cor. of one petal, tubular; limb shorter than the tube, in five deep, crest, rounded lobes, the lower ones smallifet. Stam. Filaments five, thread-shaped, the length of the corolla, and inferted into its tube; anthers oblong. Pfif. Germin inferior, roundifh; fiyle cylindrical, the length of the flaments; stigma thickifh. Peric. Berry obovate, bluntifh triangular, of three cells. Seeds foltary, bony, bluntifh triangular, obtufe, furrowed.

Eff. Ch. Corolla of one petal, scarcely longer than the calyx, nearly regular. Calyx in five deep segments. Berry inferior, of three cells, with foliary feeda.

TRI

Pl. 250. Willd. n. 1. Ait. n. 1. Pursh n. 1. (Tri- 
toepfernum latiore folio, flore rutilo; Dill. Ethis. 394. 
t. 293.)—Leaves oblong, combined. Flowers sessile, 
whorled.—In rich rocky grounds, principally on a lime-
stone soil, from New England to Carolina, but rare. Pe-
rennial, flowering from June to August. Flowers and berries 
dark purple. Pursh. A hardy perennial, sometimes ferned 
in our more curious botanic gardens. The stem is two feet 
high, erect, round, hairy or downy, like the rest of the 
herbage, and bearing several pairs of connate, oblong, acute, 
etire leaves, three or four inches long, spreading widely, 
and crossing each other. Flowers downy, many in each 
whorl.

Sp. Pl. 250. Willd. n. 2. Ait. n. 2. Pursh n. 2. (Pe-
ricymenum herbaceum rectum virginianum; Pluk. Phyt. 
t. 104. f. 2.)—Leaves elliptic-lanceolate, slightly combined. 
Flowers axillary, solitary.—On the borders of woods, in 
a sandy soil, in Virginia and Carolina. Perennial, flowering 
in June and July. Flowers and berries yellow.

TRIPETALOIDÆ, in Botany, the 5th order among 
the Fragmenta of Linnaeus, consists of Junci, Aphyllanthes, 
Triplax, Scheuchzeria, Elegia and Rhypho in one section; 
then Flaggellaria, Calotus, Butomus, Atisnas and Sagittaria. 
Linnaeus has hinted, in a manuscript note, that the three 
fragments, or perhaps, probably to be removed to a order near 
the Palma, or a subdivision thereof. The name alludes to 
the three petals, for so we must call them, though Linnaeus, 
like the French botanists, has spoken of them, sometimes, 
as petal-like leaves of the calyx.

TRIPETALOUS FLOWERS, in Botany, such which 
consist of three leaves, which are called petals, to distingui 
h these from the leaves of plants.

TRIPETTY, in Geography, a town of Hindooftan, in 
the Carnatic, where was a celebrated pagoda, reported to 
by vast crowds of pilgrims from all parts of Hindooftan; 
49 miles S.S.W. of Nellore. N. lat. 13° 45'. E. long. 
79° 30'.

TRIPHACA, in Botany, was so named by Lourievo, 
from τρίς, three, and φακός, a lentic, or, as he takes the 
liberty of saying, a legume, in allusion to the three leguminous 
seed-vessels.—Lourievo, Cochinch. 577.—Clafs and order, 
Mamia Polyandra.

This is a large tree, found on the eastern coast of Africa. 
Mr. Brown has suggested to us that it is undoubtedly a 
Sterculia; fee that article. In species it seems to come 
neat S. Balangas and its allies. The number of the 
folios doublets varies.

TRIPHARMACUM, an ointment in the late London 
Difpenfatory, so called from its being composed of three 
ingredients: the prescription is this: Take common plaster 
four ounces; oil olive two ounces; vinegar one ounce; let 
them over a gentle fire, and firit them continually till they 
become an ointment.

TRIPHASIA, in Botany, fo named by Lourievo, 
Cochinch. 152, (omitted in his index,) from τρίς, three, 
triply-pinnate, because of the three leaves, petals, and calyx-teeth, 
proves, by his fpecimens at Sir Joseph Bank's, to be no 
other than Linnaia tripliciata of Linneus.

TRIPHOLINUS Monx, in Ancient Geography, a moun-
tain of Italy, in Campania. Pliny speaks of the vines which 
grew upon the mountain, and calls the territory which pro-
tuced them Trippholimus ager. These vines are also mentioned 

TRIPHTHONGUE, in Grammar, an affemblage, or 
concoufse, of three vowels in the fame syllable; as in quaë. 
Quintilian, lib. i. cap. 6. denies the exifence of triph-
thongues; and afferts, that there never was any syllable of 
three vowels, but that one of them was always turned into 
a consonant: Scipio afferts the contrary. However 
this may be in the Latin and Greek, which were the only 
languages Quintilian understood, it is certain there are 
several languages in Europe where triphthongues are in ufe.

TRIPHYLLA, in Ancient Geography, a country of the 
Peleponnefus, in the Elide. Strabo mentions its maritime 
town Saronic.

TRIPI, in Geography, a town of Sicily, in the valley of 
Demona; 8 miles S. of Pati. N. lat. 38° 10'. E. long. 
15° 15'.

TRIPINNA, in Botany, fo denominated from the 
triply-pinnate leaves.—Lourievo, Cochinch. 391.—Clafs and 
orde, Didynamia Angiospermas.

This appears to be a very handsome and large tree, with 
painted orange-coloured flowers, a berry of one cell, with 
feal feeds, and smooth, ovate, pointed leaves. It may be 
ferred to Juffien's order of Fites, but whether to any 
derifed genus, we want materials to determine. This
tree is a native of mountainous woods in Cochinchina.

The TRIPLARIS, from trifolium, threefold, because of the prevalence of the number 3, in all the parts of fructification.

Gen. Ch. Male, Cal. Perianth of one leaf, turbinate, in fix ovate, acute, concave segments, externally hairy. Cor. none. Stam. Filaments nine to twelve, thread-shaped, inserted into the calyx below its divisions, which they exceed in length, behind a crown of very short hairs; anthers heart-shaped, erect.

Female, Cal. Perianth of one leaf, inferior, large, permanent; tube ovate, swelling; limb erect, in three deep, lanceolate, membranous, veiny, obtuse segments. Cor. Petals three, linear, obtuse, veiny, permanent, closely pressed to the germen. Stam. Filaments about twelve, very short, awl-shaped, erect, inserted in the male, but destitute of anthers, and often altogether wanting. Pfl. Germen superior, large, triangular; stigmas three, very short; flower trigamous, awl-shaped, keeled, hairy. Peric. none, except the permanent calyx. Seed. Nut triangular, pointed, inviolate with the tube of the calyx.

Female, Calyx inferior, in three deep segments. Petals three. Styles three. Nut triangular, clothed with the calyx.

TRIPLE, Threesfold. See Ratio and Sub-triple.

Triple, in Mufic, is one of the species of measure, or time.

Triple time consists of many different species, of which there are in general four, each of which has its varieties. The common name of triple is taken hence, that the whole, or half measure, is divisible into three equal parts, and is beat accordingly.

The first species is called the simple triple, in which the measure is equal to three semi-breves, three minims, three crotchets, three quavers, or three semi-quavers, which are marked thus, †, ⅔, or 2, ⅔, ⅔; but the lat is not much used, except in church music.

In all thes the measure is divided into three equal parts, or times, called thence triple times, or the measure of three times; of which two are beat down, and the third up.

The second species is the mixt triple; its measure is equal to fix crotchets, or fix quavers, or fix semi-quavers, and accordingly it is marked ⅓, or ⅔, or ⅔; but the lat is seldom ufed.
enjoyè, arose, and treated all musicians as ignorant and absurd, who had not opposed temperance, and regarded all music as diffonance which had been composed for tempered scales. But we have heard nothing of the learned abbé since the Revolution; and there seems to be no more true believers left in Pythagoras' doctrine of the triple progression, in Europe at least, than in that of the transmigration of souls.

**TRIPEL QUARTER FEVER.** See **Fever.**

**TRIPLE Incision.** See **Engrafting.**

**TRIPlicate Ratio.** The ratio which cubes bear to each other.

This ratio is to be distinguished from triple ratio, and may be thus conceived. In the geometrical proportionals 2, 4, 8, 16, 32, as the ratio of the first term (2) to the third (8) duplicate of that of the first to the second, or of the second to the third; so the ratio of the first to the fourth is to be triplicate of the ratio of the first to the second, or of that of the second to the third, or of that of the third to the fourth, as being compounded of three equal ratios.

**TRIPlicatio, Triplication, in Civil Law,** is the fame with fur-rejoinder in common law.

**TRIPLElicity, or TRIOON, among Astrologers,** is a division of the signs, according to the number of the elements; each division consisting of three signs.

Triplicity is frequently confounded with trine aspect; though, firstly speaking, the two are very different things: triplicity is only used with regard to the signs, and trine, on the contrary, with regard to the planets.

The signs of triplicity are those which are of the fame nature, and not those which are in trine aspect. Thus Leo, Sagittario, and Aries, are signs of triplicity, because those signs are, by these writers, all supposed fiery.

**TRIPOLO Heath,** in Geography, a common of England, remarkable for being the spot where the army formed the council of agitators, and chose Oliver Cromwell for their commander, in 1643; 8 miles S. of Cambridge.

**TRIPOIDES,** a surgeon's instrument, with a three-fold blade, used in the refracting of great depreffions of the skull. Blanc.

**TRIPOD,** Tripod, in Antiquity, a famed sacred seat or stool, supported by three feet, on which the priest and fylbs were placed to render oracles.

It was on the tripod that the gods inspired the Pythians, with that divine fury and enthufiasm with which they were seized at the delivering of their predictions.

M. Spanheim obferves, that, on Roman medals, the tripod expresses some priesthood, or facerdotal dignity. A tripod, with a raven and a dolphin, is also the fymbol of the divinity, depcted for keeping of the fibiline oracles, and for confulting them on occation.

Athenæus admits only two forts of tripods, that are reduced to great and small tripods. But Banier differentiates three kinds. Under the fird he includes those used by the Pythia, when the delivered the oracles of Apollo in the temple of Delphos. The second kind comprehends whatever stood upon three feet, fuch as vases, tables, &c. of which there was a great number. Under the third class are included the votive tripods, which princes or private persons dedicated in the temples of Apollo. Herodotus (lib. ix.) speaks of a golden tripod, which the Greeks, upon their victory over the Perians, sent to Delphos. Most of the tripods found in the cabinets of the curious, are of bronz or of bronze.

**TRIPON of Aoph.** See **TRITON.**

**TRIPODIUM.** In the laws of Henry I. occurs this

*paffage—" Inquibus vero causis triplicem ladam haberet, ferat judicium tripodi, i.e. 60 solid. The meaning of which, according to Home, is, that, as for a small offence the composition was twenty shillings; so for a great offence, which was to be purged triplici lada, the composition was three times twenty shillings, and this was called *tripodi.*

**TRIPOLDA, in Geography,** a town of Naples, in Principato Ultra; 16 miles S. of Benevento.

TRIPOLI, a country of Africa, which, though tributary to the grand signior, is called a kingdom or regency; bounded on the N. by the Mediterranean; on the E. by Barca, or, considering Barca as a province of Tripoli, by Egypt; on the S. by the Atlas mountains, and on the W. by Tunis and Bledigerdir; about 600 miles from E. to W. The breadth, from N. to S., is various, from 120 to 250. It has formerly been divided into seven provinces, or with Barca, eight; but it is generally distinguished into Maritime and Inland: the inhabitants of the former generally live upon commerce and piracy; the latter for the most part on plunder and robbery. Each division hath some cities and towns, besides a number of villages, which lie scattered chiefly through the latter; most of them very poor and thinly inhabited; the country being almost every where sandy and barren: as for cities and towns, there are few of consequence, the greater part being either wholly depopulated and gone to ruins, or only inhabited by a few fishermen, lime-burners, potash-makers, and here and there some few labourers; the chief part reduced to the lowest degree of misery and wretchedness, through the cruel exactions of the government, or the frequent depredations of the Arabs. The government, religion, laws, and customs of this kingdom are in a great measure the fame with those of Algiers and Tunis. Only with respect to the sit of these articles, it will not be amifs to observe, that the beyas of Tripoli are not mere titular vaftals to the Porte, but really under subjection and tributes. This joined to the other exigencies of the regency, the avarice of the Turkish bashaws fent thither from Constantinople, and the general decay of commerce, obliges them to load the subjects with fuch heavy taxes and extortions, as hath reduced the greatest part of the kingdom to the lowest degree of indigene and misery. The revenues arise chiefly from their corfairs, which are neverthelefs but few, seldom exceeding seven or eight, and of these only one can properly be fyled a ship, the rest are small galleys, poorly manned and equipped. The next is the duty on imports and exports; the tax on the Jews, who are here very numerous; on the natives, who, though ever fo poor, must yet pay part of the produce of their ground, or manufactures; and lastly on the country Moors and Arabs, among whom the bey sends his flying camp of jauizaries to levy it; for these laft, as well as the Moors, are kept fo poor by those heavy taxes, that nothing but force, and sometimes exemplary severity, can extort it from them. The bey, by means of his protection from the Porte, makes shift to keep up a kind of despotic power, as he is besides generalissimo of all the forces. As for their commerce, it chiefly confifs in slaves, either fuch as are taken by their corfairs, or fuch as they traffic for with their neighbours: the greatest part of both they fend into 'Turkey, where they can difpofe of them to the hell advantage. The next branch is that of aches, which they buy from the Arabians, and fend to the Europeans, to make glass and soap: the rest of their traffic is not worth mentioning. One circumstance in the conduct of this regency deserves notice: they are more scrupulous observers of their treaties with other nations than any of their neighbours: which punctuality, whether it proceeds from real probity, or a conscientious of their own
own weakens, is nevertheless of no small advantage to navigation and commerce. This state, as well as the rest of Barbary, after being freed from the Roman yoke, palled successively under the Vandals, Saracens, and the kings of Morocco, Fez, and Tunis; till, weary of their slavery and oppression, they resolved to have a monarch of their own, whom they chose from among themselves; and the new monarch governed them at first with great equity and moderation; but the no sooner saw himself out of danger, than he began to play the tyrant in his turn to such a degree, that the citizens confpired against him, and he was murdered by his own brother-in-law. They chose in his room another, named Abubacer, who had been formerly an officer under him, but had since retired, and turned marabout or hermit; but he had not reigned many months, before Ferdinando, king of Capeode and Aragon, sent thither Peter, count of Navarre, with a powerful fleet and army, which laid siege to the capital. Abubacer, finding himself unequal to so powerful an enemy, surrendered on honourable terms, and was sent with his wife, two sons, and an uncle, to the emperor Charles V. then at Palermo, who soon after restored him to his former dignity, on condition that he should become his vassal and tributary. Abubacer rebuilt and re-peopled the city, which he held in the emperor's name, till the knights of Rhodes were driven out of that island, and forced to retire into Syracuse, when Charles was pleased to bellow the island of Malta upon them, and to change the city and castle of Tripoli. They first accordingly, and took possession of both, made one of their order governor, and put a garrison into it of their own troops. They were fearfully settled in this new acquisition, before Barbarossa made himself master of it, but it was soon after retaken by the emperor, and restored to them, who continued in possession of it till the reign of Solyma, who, under pretence that it had been retaken during the truce, sent thither a naval armament, consisting of about 110 royal galleys, and 30 other vessels, under the command of Sinan pasha, who had under him the famed Salha Rais, furnamed Devil-driver, and the no less famous Dragut; and notwithstanding every means of defence, it was obliged to surrender, and delivered up to the Turks, after it had continued in the possession of the Christians a little above forty years, from the time of its being taken by the count of Navarre. Sinan committed the government of it to the aga Morat, upon condition that he should hold it under the grand vassal, and reign it whenever he should appoint another governor and castle of Tripoli. It was not long however, before the famed corsair Dragut got possession of this place. He fortified both city and castle with strong walls, and two forts near the sea-fide, well supplied with artillery and ammunition; by which means it became one of the strongest cities in Africa, and the common retreat of most of the corsairs that roved under Turkish colours, from whence they infested the coasts of Italy, Sicily, Naples and Spain, and a fruitless attempt was made by the Christians to retake it. After the death of Dragut, the Porte continued sending either a fangir or basha to Tripoli, the castle being garrisoned with Turks, and the city inhabited by Moors, and the kingdom still paying tribute to the grand vassal. The piratical trade went on with success; the renegades met with the usual encouragement from the Turks, and were promoted to the command of the corsairs, and even of their own fleets, and sometimes to the basha-whip; these recommending themselves to the regency, not only by their desperate behaviour, but much more by their peculiar barbarity to the Christian prisoners, which often provoked reprisals, that were carried on both sides to such extents as can hardly be particularized without horror. In this condition the kingdom continued till the Turkish government, becoming more and more intolerable, by the avarice and tyranny of those bashaws, a certain marabout named Sid Hajah, about the close of the sixteenth century, found means to raise a general revolt both in the city and country. Unfortunately for him, he did not take care to secure a foreign assistance, before he broke out into open rebellion; so that Hafcen bishaw, the Turkish admiral, came suddenly upon him, at the head of sixty galleys, and a number of other ships and forces, which he had procured from Tunis and Algiers, and defeated him so often, that he was at length abandoned by his troops, and affianced by his own partisans. Hafcen sent the marabout's head to Constan- tinople, and had hardly settled the government on the old footing, when a new governor, sent thither from the Porte, found much more effectual way to free them from this tyranny. This man was a renegado Greek, of the ancient family of the Julianians, known by the name of Mahmet Beygh, who, by his intrigues and bribes, had obtained a banner or government from the grand vassal. He failed directly to Tripoli, and having got possession of the castle, refused to acknowledge or receive any bishaw from Con- staninople. He took the reins of government wholly upon himself; not indeed as independent, but as vassal and tributary to the Porte, to whom he obliged himself to pay a tribute and present once a year, as an acknowledgment of his subjection and dependence on his masters.

**Tripoli**, a city and sea-port of Africa, and capital of the country so called, situated on the coast of the Mediterranean. It was formerly divided into two parts, the Old and New; the former, which was the native country of the emperor Severus, is supposed to have been built by the Romans, was since conquered by the Vandals, and at last destroyed by the Mahometans, under their caliph Omar II. since which time it hath never recovered its importance, and is now almost gone to ruin; the latter, which stands at a small distance from it, though of no great extent, is populous, and in a flourishing condition. It stands on a foundation of rock, by the sea-side, surrounded with high walls and stout ramparts, flanked with pyramidal towers, but not kept in good repair. The sea washes the town on three sides; and on the fourth a sandy plain, called the Meffeia, joins it to the rest of the country. On the E. it is divided from Egypt by the dreary deserts of Barca, where the bashes refuse but occasionally the wandering Arab, but hath but two gates, one toward the inland on the S., and the other to the sea on the N., where it expands itself in a form of a crescent, near a spacious and commodious haven. On entering the harbour, the town manifests the dilapidations of time, large heaps of rubbish appearing in various parts of it. The castle, or royal palace, where the basha resides, is at the E. end of the town within the walls, with a dockyard adjoining, where the bey (the basha's eldest son) builds his cruisers. The castle is very ancient, and is inclosed by a strong wall, that appears impregnable; but within, it is totally deftute of symmetry.

New Tripoli is supposed to have been built by the natives, who gave it the name of Tarabilla, or Trebrida, whence the Latins call it Tripoli. Some authors pretend that it was once a place of vall trade, on account of its neighbourhood to Numidia and Tunis, reforted to by vessels from Malta, Venice, Sicily, Marfellies, and others; there being hardly such another commodious sea-port along this whole coast, except Alexandria; by which means it became so opulent, that it was filled with rich merchants, abounded with fine monu.png_46
TRIPOLI.

The Greek name Tripoli, denoting three cities, is derived from its having been built by three colonies, from Tyre, Sidon, and Arfus, each of which formed settlements so near each other that they were soon united into one. It is separated from the sea by a small triangular plain, half a league in breadth, at the point of which is the village where the vessels land their goods. The Franks call this village La Marine, the general name given by them to these places in the Levant. There is no harbour, but a simple road, which extends from the shore to fouths, called the Rabbit and Pigeon Islands. The bottom is rocky, and mariners are not fond of remaining here, as the cables are soon worn out, and the vessels exposed to the N.W. winds, which are frequent and violent on all this coast. In the time of the crusades, this road was defended by towers, few of which are still subsisting from the mouth of the river to the village. They are strong built, but now serve only as a place of resort for birds of prey. All the environs of Tripoli are laid out in orchards, where the nopal grows spontaneously, and the white mulberry is cultivated for the silk-worm; and the pomegranate, the orange, and the lemon-tree, for their fruit, which is of the greatest beauty. The grounds belonging to it extend as far as Mount Lebanon, and abound in vineyards. Each hill produces a different wine; but the golden wine is most admired. But these places, though delightful to the eye, are unhealthy. Every year, from July to September, epidemic fevers, like those of Alexandria and Cyprus, rage here: these are owing to the artificial inundations with which the mulberry-trees are watered, in order that they may throw out their second leaves. Besides, as the city is open only to the west, the air does not circulate, and the spirits are in a constant state of oppression, which makes health at best but a kind of convalescence. At La Marine the air is more exhilarating, its circulation being less impeded. The commerce of Tripoli consists almost wholly in indifferent coarse silks, which are made use of for laces, and is in the hands of the French alone. But they are losing their quality, which is owing to the decay of the mulberry-trees. They have a confid here, and three commercial houses. They export silks, and spunges filled up in the road; these they exchange for cloth, cochineal, sugar, and West India coffee; but this factory, both with respect to imports and exports, is inferior to Latakia; which fee.

The pachalic of Tripoli comprehends the country which stretches along the Mediterranean from Latakia to the Nahr-el-Keil, and is bounded on the W. by that torrent, and the chain of mountains which overlook the Orontes. The principal part of this government is hilly, the sea-coast alone between Tripoli and Latakia being a level country. The numerous rivulets which water it contribute greatly to its fertility; but notwithstanding this advantage, this plain is much less cultivated than the mountains, without even excepting Lebanon, with its numerous rocks and pine-trees. Its chief productions are corn, barley, and cotton. In the territory of Latakia, tobacco and olives are principally cultivated; but in Lebanon and the Refraoum, white mulberry-trees and vineyards. This pachalic contains several tribes and religions. From Lebanon to above Latakia, the mountains are peopled by the Anfarians, a particular sect of religious, which first rose in the latter end of the ninth century; Lebanon and the Refraoum are inhabited entirely by the Maronites; and the sea-coast and cities, by Christians, Greeks, and Latins, Turks, and descendants of the Arabs. The pacha of Tripoli enjoys all the privileges of his place. The military and finances are in his hands; he holds the government in quality of a farm from the Porte, on a lease of one year only, at the annual rent of 750 purses (35,000£).
In 1101, this town was taken by the Chrislians, and held by Bertrand, fon of Raymond, count of Toulouse, as a county, in which situation it remained till the year 1288, when it was taken by Melec Melior, sultan of Egypt, who ordered it to be razed to its foundation; 75 miles N.N.W. of Damasfeus. N. lat. 34° 18'. E. long. 35° 36'. Volney's Travels in Egypt, &c. vol. ii.

TRIPOLI, in Mineralogy, a mineral originally brought from Tripoli for the polishing of flones and metals, whence it derives its name. It has a dull argillaceous appearance, but is not compact; it has a fine but hard grain, and does not soften by water, or mix with it. The colours are grey, inclining to red or yellow. From analysis, it proves to be principally composed of silex. Tripoli appears to be of two formations; the one by fire, which has hardened plates or sand-flones, and converted them into this substance; the other by water, decomposing beds containing silex, clay, and iron. The tripoli from Derbyshire, called rotten-flone, may be referred to the latter formation; it occurs in the upper part of the great shale stratum which covers the mountain lime-flone of that district: it is dug near the surface, and is sold for 60s. per ton. Farey's Derbyshire, vol. i. p. 231.

The tripoli of Poligné, near Rennes, in Brittany, is fusible. It is of a red colour of different shades. Trunks of trees are found changed into tripoli in the middle of the beds, which are covered by beds of sand-flone in an inclined position.

The tripoli of Venice is the most esteemed; it comes from the island of Corfu. It is fchistose, and has a yellowish-red colour. Sauffure has remarked in this tripoli, and in the preceding, a multitude of small cylindrical pores.

Tripoli is found at Menal, near Riom, in the department of Puy-de-Dôme. It occurs in beds which appear to have been formerly ichilts changed by the action of volcanic fire. This fusible is found in the quarries of chalcedony of Volterra in Tuscany, and is said to be so situated as to appear evidently the result of the decomposition of the chalcedony. It occurs in coal stratata at Pulchappel, in Saxony. The tripoli from Billin, in Bohemia, occurs in thin beds, which pass insensibly into pitch-flone. Acids produce no effervescence with it; nor is it melted by the most violent heat; though it is somewhat hardened.

In fact, we sometimes find tripoli in volcanic mountains, or in stratata which contain beds of coal in a state of combustion; and sometimes in beds formed evidently by deposition from water. It should appear that certain stratata, composed principally of silex in a state of extreme minute division, and combined with iron and clay, are decomposed by the agency of water, and the latter materials being in a great part removed, the silex is left porous and friable, and coloured by iron; it then forms tripoli; and beds of this mineral may have been so formed, and afterwards covered by streams of lava, where they occur in volcanic mountains. Where silex is intermixed with a portion of alumine and iron, as in ichilts, the alumine by exposure to a great heat may be hardened and contract, and leave the flone in a porous or friable state. The specific gravity of tripoli is stated by Bucholz at 2.202, and its constituent parts

The sulphoric acid and water are considered as accidental.

For the method of imitating gems by means of tripoli, see Gems.

TRIPOLIS, in Ancient Geography, a country of the Peloponnesus, in Arcadia, to call all on account of its three towns, according to Pausanias.—Also, a town of Phoenicia, situated about half a league from the sea, and 18 miles from Orthoa. Diodorus and Strabo derive its name from three towns of which it originally consisted, about a stadium from one another.

Alexander the Great subdued this city, which, after his death, passed to Ptolemy Soter, whose successors retained possession of it till the reign of Antonious the Great, king of Syria, who made himself master of this town and the whole of Phoenicia, towards the year 219 B.C. After its subjugation by Pompey, it passed under the dominion of the Romans, but was allowed the privilege of being a free city, and of being governed by its own laws. Under the empire of Vespasian, Tripoli assumed the epithet of Flavian. The territory of Tripoli was watered by many rivers and streams, which descended from Libanus. About two leagues E. of Tripoli was a tomb formed in a rock, which the Syrian Christians held to be the sepulchre of Canaan, the father of the Phoenicians.

TRIPOLIS, a town or country of the Peloponnesus, in Arcadia, which afforded ample supply both of men and cattle, according to Pausanias.—Also, a country of Thebaly, where the towns of Pythium, Azorum, and Dolicha, according to Livy.—Also, a town of Asia, on the Meander, and capital of Caria.—Also, a town of Asia, on the banks of the Euxinus sea, W. of Trebifond.

TRIPOLITANA REGIO, or Tripoli, a country of Africa, bounded N. by the Mediterranean sea, E. by the river Cinyps or Cinyphus; situated in the midst of Libya Interior, and W. of the river Triton. Procopius says, that Sergius was appointed governor of this province by Justinian, at whose instigation the inhabitants embraced the Christian religion. They were called the "allies of the Romans," because they faithfully maintained peace with them. Some have confounded Pentapolis with Tripolis. See TRIPOLI, in Geography.

TRIPOLIZZA, in Geography, a town of European Turkey, in the Morea, the capital of a pacha, having about 12,000 inhabitants. In 1770, this town was besieged by the Russians and revolted Greeks, but a considerable detachment of Albanian cavalry coming up, the Greeks fled and left the Russians to the content alone, of whom hardly one escaped. The Albanians afterwards, under a pretence that the inhabitants had held a correspondence with the enemy, put three thousand of them to the sword in less than two hours, and then plundered and set fire to the town; 18 miles W. of Napoli di Romania.

TRIPONTIO, or TRIPONZO, a town of the Popedom, in the duchy of Spoletto, on the Nera; 12 miles N.W. of Norcia.

TRIPOUNTUM, in Ancient Geography, a place of Italy, in Latium, on the Appian way; which appears by the military column to be at the 39th mile; it was repaired by the emperor Trajan. The Goths constructed a tower in this place.

TRIPOUNTUM, a town of Great Britain, in the sixth Iter of Antonine, supposed to be Rugby. Drs. Gale and Stukeley place it at Dowbridge, and the last of these authors derives its name from ire, a town, and pont, a little valley, in which Dowbridge is situated. Camden and Baxter fix Tripontium at Towcester, and Camden derives its name from the British words Tair-ponti, signifying three
three bridges. But Mr. Horsey supper it to have been situated where the town of Rugby now stands.

TRIPOOR, in Geography, a town of Hindoostan, in Myfore; 25 miles N.E. of Coimbore.

TRIPPING, in Heraldry, denotes the quick motion of all sorts of deer, and of some other creatures, represented with one foot up, as it were, on a trot.

In speaking of lions, they say paffant, instead of tripping.

TRIPPING, in Sea Language, denotes the movement by which an anchor is loosed from the bottom of its cable or buoy-ropes. See ARTRIP.

Gen. Ch. corrected by Schreber. Male flowers in pairs, unilateral, alternate, mostly in the upper part of the spike.

Cal. Glume two-flowered; the outer floret male; inner neuter; each of two valves; outer valve lanceolate, flat, obtuse, awnless, cartilaginous, thinner at the edges; inner valve, which is oblong, triangular, keeled, acute, about the same length. Cor. in each floret of two nearly equal valves, membranous, very thin, awnless, smaller than the calyx; the outer valve ovate, boat-like, blunt; inner lanceolate, cleft at the end. Nectary of two minute, triangular, fleshy, convex, abrupt valves, pointed at each end, thinnest at the upper margin, notched in the middle. Stam. in the inner floret, Filaments three, capillary, longer than the calyx; anthers parallelipipedal; in the inner, Filaments three, very slender, somewhat combined; anthers none.

Female flowers in the lower part of the same spike, alternately funk in the common flak, at each side. Cal. Involucrum ovate, cartilaginous, very thick, tumid below, polished; obliquely bordered at each side externally; blunt and somewhat emarginate at the end; embracing the inner glumes with its thinner margin. Glume of two valves; the outermost oblong, tumid, taper-pointed, thickish, double; inner thinner, but rather blunt. Cor. of two valves, smaller and thinner than the calyx; the outer valve largest, tumid, bluntly three-toothed; inner rather smaller, flat at the back, emarginate. Abortive glume of one valve, oblong, folded in at each margin, furnished with two teeth, and situated at the fore-side of the fertile floret, to which it is much inferior in size. Nectary minute, of two linear, membranous, very thin scales, acutely notched at the summit. Stam. Filaments three, minute, at the base of the germin, capillary, dilated below; anthers linear, minute, imperfect. Pil. Germin superior, oblong; style one, composed, longer than the calyx; stigmas two, very long, villous, twifled. Peric. none. Seed solitary, ovate, a little compressed, pointed with the permanent style.

Obi. At the base of the involucrum, at each side, is an opening, lined internally, on one side, with bristly hairs.

Eff. Ch. Male, Calyx a glume of two flowers, the innermost neuter. Corolla of two membranous valves.

Female, Calyx a single-flowered glume, enclosed in a single-leaved involucrum, pierced at each side. Corolla of two valves. Stigmas two. Seed one.

Hort. Cliff. 438. Gramen daitylodes maximum americanum; Pluk. Phyt. t. 190. f. 2. G. daitylodes indicum efeulentum, spica articulata; Ambrosin. Phyt. 546, 547, rude, but expressive. Sefamo perenne indiano, pianta frumentacea; Zanon. Ift. 181. t. 69, not 68. — Spikes aggregate, about three together, male in the upper part, female at the base.—On the banks of rivers, and along the sea-shore, in Virginia, Carolina, and the country of the Illinois, flowering in Augufl.

Pursh. Root perennial, thick and woody, with many strong zigzag fibres. Stems numerous, erect, reedy, four or five feet high, round, smooth, as thick as a goose-quill, knotty; leafy below. Leaves long, linear, taper-pointed, an inch broad, smooth. Spike a Pan long, smooth, usually three together, often more or fewer; the male flowers very numerous.

T. montifolius, Willd. n. 2. Hort. Berolin. t. 1, found in salt meadows and ditches, from New York to Carolina, seems, as Pursh remarks, to be but a single-spired variety of the former; probably such as is represented by Miller above cited.

T. haemaphroditum. United-flowered Tripsacum. Linn. Sp. Pl. 1379. Willd. n. 4. Ait. n. 2. Linn. fil. Dec. 17. t. 9. (Cenchrus n. 2; Browne Jam. 367.)— Spike solitary, tapering, with a wavy flak, and rather dilatant spikelets.—Native of gassy pastures in Jamaica, where it is fed on by all sorts of cattle. The root is annual, fibrous. Stem from eighteen to twenty-four inches high, leafy, smooth. Leaves pointed, somewhat rough-edged. Spike tapering, pale, smooth. Sinus at each side of the involucrum delitute of internal hairs, but accompanied by a fort of blunt short spur.

TRIPTERELLA, a diminutive from τρίς, three, and πτηρός, a wing, used by Michaux to express the character of the three little narrow wings, projecting from the angles of the calyx, or rather corolla; not, as De Theis says, of the capsule.—Michaux Boreal.-Amer. v. 2. 42. Pursh 28.—Clasf and order, Triandria Monogynia, Nat. Ord. akin to Burmannia, and perhaps Hypoxis; genera whose place in Jussieu's system is not well settled.

Gen. Ch. Cal. none, unless the corolla be taken for such. Cor. of one petal, permanent, superior; tube swelling at the base, contracted in the middle, angular, with three flight wings, at the summit; limb shorter than the tube, in fix deep segments, the three intermediate ones minute. Stam. Filaments three, very short, inserted into the tube below the three smaller segments of the limb; anthers within the tube, of two widely separated lobes. Pil. Germin inferior; style the length of the flaments, triangular; stigma in three short, thickish, blunt segments. Peric. Capsule membranous, triangular, of three cells, crowned with the withered corolla. Seeds numerous, minute, oblong, cylindrical, friated.

Eff. Ch. Calyx none. Corolla superior, of one petal; its tube angular, swelling at the base; limb in fix segments, the three intermediate ones minute. Capsule of three cells, with many seeds.

TRIPUNETAIRE, in Geography, a town of Hindostan; 35 miles E.N.E. of Cochín.

TRIPURA, a city often mentioned in the mythological relations of the Hindoos, as having been destroyed, together with its wicked sovereign Tareka, by their god Siva, who is hence called Tripuranika, or the destroyer of Tripura. See SURA and TAREKA.

TRIPURANTEKA, in Mythology, a name of the Hindoo god Siva, so called from a mythological relation of his having destroyed a city and tyrant named Tripura.

TRIPYRAMIDES, derived from τριμ, three, and πυργος, a pyramid, in Natural History, the name of a genus of sars.

The bodies of this genus are sars composed of single pyramids, each of three sides, standing on no column, but affixed by their bases to some solid body.

Of this genus there are only two known species: 1. A short and thick one, found on the sides of the back of Hone Northamptonshire, and elsewhere; but this is not common, and is usually small. 2. A long one with a narrow base: this is not found in England, but is common in the German mines. Hill.

TRIQUETRA Ossa, in Anatomy, the small irregular bones of the human cranium. See CHIRURGIA.

TRIQUETRUM, among Botaniš. See LEAF.

TRIRAPHIS, in Botany, from τρις, three, and ἀράθις, a needle, or awl, because of the three straight awns,—Brown Prodr. Nov. Holl. v. 1. 185.—Cliffs and order, TRIANDRIA DIGYMINA. Nat. Ord. Graminae.

Eff. Ch. Calyx many-flowered, of two equal, awnless valves. Spikelet two-ranked; two, or more, of the lowest florets perfect, the rest male, or neuter. OUTER valve of the corolla with three terminal straight awns; inner awules. Nectary of two scales. Stigmas villous.

A genus of grasses found within the tropics, akin to the TRIODIA and PAPPOPHORUM of Mr. Brown, (see those articles); and therefore to his ETRIOFIA, and the CHLORIS of Swartz, which are said to be very little different from each other. The flowers are panicle. Two New Holland species, gathered by the learned author in the tropical part of that country, are all that occur in his Prodrorus; nor does this genus find a place in Mr. Kuntl's South American work. Probably however there may be East Indian species, unknown to us.

1. T. pungens.—"Panicle loose. Outer valve of the corolla coriaceous, minutely downy. Awns equal; the middle one simple. Leaves involute, spreading, straight—Brown.

2. T. mollis.—"Panicle close. Outer valve of the corolla bearded with spreading hairs. Middle awn furnished at each side with a bristle-like appendage—Brown.

TRIREME, or TRIREMIS, in Antiquity, a galley with three ranks of oars on a side. See ENNEAB.

TRISACRAMENTARIANS, or TRISACRAMENTARIANS, an appellation given to a sect in religion, who admit of three sacraments, and no more.

There have been several Trisacramentarians who allowed of baptism, the eucharist, and abolution for sacraments.

The English are often misrepresented by foreigners as Trisacramentarians, from an opinion that they allow ordination to be a sacrament.

TRISACTIS, in Natural History, the name of a genus of flax-flint, composed of a body and three rays, the more usual number being five.

TRISAGA, in Geography, a town of Italy, in the Ca-dorn; 14 miles N.N.E. of Cadora.

TRI-
TRISAGION, or TRISAGIUM, τρισάγιον, composed of τρις, three, and ἄγιος, ἅγιος, holy, in Church History, a hymn, in which the word holy is repeated three times.

The proper Trisagion is that word, Holy, holy, holy, Lord God of Sabaoth, which we read in Isaiah, vi. 3., and in the Apocalypse. From these words the church formed another trisagion, which is rehearsed in Latin and Greek, in the respective churches, to this effect, Holy God, Holy Mighty, Holy Immortal! have mercy upon us. Petrus Fullenius to this trisagion added, εἰς τὴν ἁμαρτίαν, Thou who was crucified for us — have mercy, &c. thus attributing the passion, not to the Son alone, but to all the three persons of the Trinity; and he pronounced anathema to all such as would not say the fame. See Theopaschite.

The use of the second trisagion (exclusive of the addition of Fullenius) began in the church of Constantinople, from whence it passed into the other churches of the East, and afterwards into those of the West: and still subsists in its primitive purity, both in Latin, Greek, Ethiopic, and Mozarabic offices.

TRISAKTI, or TRISAKTI-DEVI, in Hindoo Mythology, is a name of the goddess Parvati, consort of Siva. It means of triple energy; both god and goddess having various triform characters and potencies, and many names indicative of three-fold properties. Parvati is found to have many attributes and appellations corresponding with those of the Grecian Juno or Diana; among them several derived from their three-fold character. Triva, for instance; and by the way, the meeting or junction of roads was mysteriously facred to both. See Junction.

Tritoma, Tergemania, &c. are appellations of the Triple Hecate. See Potter's Archæol. Græc. ch. xix.

TRISANTHUS, in Botany, from τρις, three, and σαυρος, a sower, because there are three flowers in one common calyx.—Loureir. Cochin. 1753.—Clafs and order, Peniandra Dignia. Nat. Ord. Umbelliferae.

1. T. cochinchenefis. Rau má of the Cochinchinefe. The only defcribed species, frequent about hedges in Cochinchina, where, though an efculent herb, it is not cultivated. The author thought he had at one time with this plant in China, as well as other parts of the East Indies; and he gives the Ptx. cyphus of Rumphius, book g. chap. 60. t. 169, f. 1, which is no other than Hydrocygia afica of Linneaus. They may be one and the fame, as Loureirco was moft inclined to believe. He describes his Trifantbus with a long, trailing, slender, thread-shaped stem, taking root at nearly regular intervals. Leaves from the fame points as the roots, roundish, concave, rugose, smooth, crenate, divided half way down, on long, erect footstalks. Germen purple, which Loureiro takes for a perianth investing the seed, and becoming a pericarp. The flower-stalks are radical, crowded, rather long.

The whole plant is said to be vulnerary, cleansing, diuretic, and nephritic. Loureiro knew a man who, having deprived himself, at a stroke, of parts which malf people with to preferve, healed the wound readily by the applica-

TRISMEGISTUS, formed from τρις, three, and μεγας, great, &c. an epithet, or surname, given to one of the two Hermes, or Mercury, kings of Thebes, in Egypt, who was contemporary with Moses.

Mercury, or Hermes Trismegistus, is the latter of the
two Hermætes; the former having reigned about the time of the Deluge. They are both of them represented as authors of many of the arts and institutions of the Egyptians. See HERMES.

TRISMIΣ, or TRISMIS, in Ancient Geography, a town of Lower Media, near the Danube. Polit. This place is marked in Ant. Itin. on the route from Viminacium to Nicomedea, between Biroen and Arrubium.

TRISMOS, πεσμός, or πησμός, a convulsion of the muscles of the temples, causing the teeth to gnash.

TRISOLYMPIONICA, τρισολυμπιονικα, compounded of τρίς, three, ολυμπία, Olympic games, and νική, victory, among the Ancients, a person who had thrice borne away the prize at the Olympic games.

The trilemyonpica, or trilemyompiad, had great privileges and honours allowed them. Statues were erected to them, of the kind called icôneis, which were modelled to the size and form of their persons.

They were also exempted from all taxes and incumbrances, and could never be marked with infamy.

TRISPAST, TRISPASTON, compounded of τρίς, three, and σπαστός, I draw in Mechanica, a machine with three pulleys, or an assemblage of three pulleys, for raising great weights.

The trispaston is a species of polypaston.

TRISPERMUM, in Pharmacy, the name of a catalpham, or poultice, confisting of three ingredients; these are cummin and opium feed, and bay-berries.

TRISSA, in Ichthyology, a name used by some authors for the fifth more commonly known by the name of alaufa, and called in English haddock, or the mother of herrings.

TRISSACRAMENTARIANs. See TRISACRAMENTARY.

TRISSANTON BAY, in Geography. See SOUTHAMPTON.

TRISSARRI, a town of France, in the department of the Lower Pyrenees; 9 miles S.W. of St. Palais.

TRISSILD, a town of Norway, in the diocese of Aggerhus; 65 miles N. of Kongiwingen.

TRISSINO, GIANGIORGIO, in Biography, an Italian poet, was defended from a noble lineage, and born in 1478 at Vicenza. In his youthful studies he was indefatigable and ardent. Besides the Latin and Greek languages, the latter of which he acquired under Demetrius Chalcondylas, he became proficient in mathematics, phylsics, architecture, and other fine arts. He was employed in polls of truth and honour by the popes Leo X. and Clement VII., and he also received many tokens of distinction from the Venetian republic and his native city. He was twice married, and with both his wives he lived happily at Vicenza. But a law-suit, in which he engaged with the son of his first wife, obliged him to retire to Murano, near Venice, and having lost his caufe and a great part of his property, he went to Rome, where he died in 1550. Ambitious of being a poet, he cultivated an imitation of the ancients; and his tragedy of "Sofonilba," formed after the laws and manners of their drama, and the first in which verie without rhyme was employed, has been considered as the first Italian work of that class. This tragedy, framed by the author in 1515, was not printed till the year 1524. His next production was a comedy, intitled "Similini," which was well received. But his great work, in which he was engaged for twenty years, was his epic poem, intitled "Italia Liberata de' Gotth," the subject of which was the deliverance of Italy from the Goths in the reign of the emperor Justinian. His model in the composition of this work was Homer, whom he fervilely imitated, inomuch that, according to Voltaire, "he took every thing from him but his genius." The success of this poem by no means corresponded to his expectations. Of his other works, and his whimsical but ineffectual project of introducing certain Greek letters into the Italian alphabet, we need not speak here. The Bishop of TRISTAN d'Acunha, in Geography, the largest of three islands in the South Atlantic ocean, about 1500 miles from any land either to the west or north, very lofty, and about 15 miles in circumference. A part of the island, far Erasmus Gower observes, (quoting the author of the Authentic Account of the Embassy to China,) towards the north rises perpendicularly from the sea to a height apparently of 1000 feet, or more. A level then commences, forming what among seamen is termed table land, and extending towards the centre of the island; from whence a conical mountain rises, not unlike in appearance to the Peak of Teneriffe, as seen from the bay of Santa Cruz. Boats were sent to found and examine the shore for a convenient place to land and water. In consequence of their report the Lion flooded in, and came to anchor in the evening on the north side, in 30 fathoms water, one mile from the shore; the bottom black sand with slime; a small rock of the west point bearing south-west by south, just open with the western extremity of the island; a cascade or fall of water emptying itself upon the beach south by east. All the shore from the southern point to the eastern extremity appears to be clear of danger, and deep, except the west point, where there are breakers about two cables' length, or near 500 yards, from the shore. The ship, when anchored, was overshadowed by the dark masts of that portion of the island, whose sides seem to rise like a moss-grown wall immediately from the ocean. On the right the elevation was lefs rapid, and between the rising part and the sea was a flat of some extent, covered with fedge-grafs, interspersed with small shrubs, which being perfectly green, looked from the ship like a pleasant meadow, watered by a stream that fell afterwards from its banks upon the beach. The officers who went ashore reported, that the cakls might be filled with fresh water by means of a long hose, without moving them from the boats. The landing-place thereabouts was also described as being safe and superior to any other that had been examined. From the plain the land rofe gradually towards the central mountain, in ridges covered with trees with penguins, surrounded, on the north, with penguins and albatrosses; one of the latter was brought on board, his wings measured ten feet from tip to tip; but others are said to have been found much larger. The coast was covered with a broad sea-weed several fathoms long, and defervedly by naturalists termed gigantic fucus. Some good fish was caught with the hook and line. The accident of a sudden gulf, by which the anchor was in a few hours driven from its hold, and the ship forced out to sea, prevented the island from being explored as was intended. It is probable, that if the Lion had anchored in twenty instead of thirty fathoms water, the anchor would have held firmly. Some advantage was obtained, however, from coming to this place. The jetio position of those islands in respect to their longitude was ascertained, by the means of several time-pieces, to be about two degrees more easterly than generally laid down in charts. These islands are certainly worthy of a more particular enquiry; for they are not fifty leagues from the general track of vessels bound to China, and to the coast of Coromandel by the outer passage. In war-time, an excellent rendezvous might be fitted there for ships that wanted no other supply than that of water. When circumstances require particular dispatch, it is practicable to come from England to Tristan d'Acunha without stopping.
in the way, and afterwards to the end of the voyage to India or China. These islands are separated by a space of about 1500 miles from any land to the westward or northward of them. They are situated in that part of the southern hemisphere, in the neighbourhood of which a continent, to balance the quantity of land in the northern hemisphere, was once expected to be found; but where it has since been discovered that there is none. The spot where the Lion anchored was determined by good meridional observations, and by accurate time-pieces, to be in S. lat. 37°.

W. long. 157° 40'.

TRISTANIA, in Botany, from *triste*, three, and *latifolia*, or *latifolium*, to stand; in allusion, as we presume, to the ternate disposition of the flowers and their stalks; the three-forked inoffensiveness of this, doubtless very tillulent, genus, being strikingly different from all to which it is nearest allied in the parts of fructification.—Brown in Ait. Hort. Kew. v. 4. 417.

Gen. Ch. Col. Perianth superior, of one leaf, turbinate, in five deep, triangular, nearly equal segments. Cor. Petals five, roundish, inserted in the rim of the calyx between its segments. Stam. Filaments numerous, in five sets, opposite to the petals, and about the same length, mostly palmate; anthers roundish, incumbent. Pist. Germin inferior, turbinate, somewhat angular; style thread-shaped, about the length of the flaments; stigma obtuse. Peric. Capsule roundish, more or less completely coated, of three cells and three valves, the partitions from the centre of each valve. Seeds numerous, minute, angular.

This genus is selected from Melaleuca, (see that article,) whose character however may stand as it does, distinguished by the great length of its flaments. Our 4th, 5th, and 8th species belong to Tristania, with one more already published, and probably several others, known as yet to Mr. Brown alone, defined for the sequel of his Prodrumus. All the true Melaleuca have perfectly sessile, generally crowded, flowers. Having already described the above three species, we shall here merely enumerate them, with the appropriate specific characters of Mr. Brown, as far as he has given any.

1. *T. neriifolia*. Oeleander-leaved Tristania. Ait. n. 1. (Melaleuca neriifolia; Sims in Curt. Mag. t. 1559. M. echinifolia; Ait. Repof. 1814.) Leaves opposite, lanceolate. Stamens from three to five in each set.—Oberved by Mr. Brown, in New South Wales, from whence its seeds were sent to England, about the year 1804, according to Mr. Aiton, who marks it as a greenhouse shrub, flowering from July to September. The flaments are much fewer than in any other species which has come to our knowledge, and their connexion at the base is quite free. The flavour of the plant is said to be bitterish and astringent, scarcely aromatic, in which it differs from the Melaleuca.

Native of New Holland, near Endeavour river. Sir J. Banks. Not as yet introduced into our gardens.

Capule half superior.—Gathered by admiral Phillip in New South Wales, and introduced, from seed, at Kew in 1798, by Sir Joseph Banks. It is a greenhouse shrub, but has not yet flowered. *Aiton.*

4. *T. conferta*. Pittosporum-leaved Tristania. Brown MSS. Ait. n. 3.—Leaves alternate, elliptical, or somewhat lanceolate, acute; the terminal ones crowded. Segments of the calyx acute, leafy.—Found by Mr. Brown in New South Wales, and introduced at Kew in 1805. A greenhouse shrub, flowering from July to September.—We have seen no specimen of this last species, nor have we any account of the colour of its flowers, which are probably white, like those of the two immediately preceding.

TRISTE, in Geography, an island near the coast of America, on the south side of the bay of Campeachy, situated on the west of Port Royal, from which it is separated only by a narrow channel, about 18 miles in circumference. N. lat. 18° 20'.

TRISTE, a name given by the Spaniards to the gulf of Paria; which fee. This gulf, according to Deponis, is twenty-five leagues from E. to W., and fifteen from N. to S., and has anchorage in that whole extent, but its depth varies from eight to thirty fathoms. Upon the coast of Paria its foundings are much less. This gulf is, in fact, a real port, which for excellence and extent wies with the handomest in the world. It has a muddy bottom, except near the coast of Terra Firma, where are shoals and banks of sand. Its waters are as salt as those of the sea, though some have erroneously represented them as fresh. This gulf is difficult of entrance; and the wind must be from the S.E. to enter it with any prospect of safety. The tide is formidable, and has a violence inconceivable by those who are not well acquainted with the great ebbings and flowings of the sea.

TRISTEMA, in Botany, from *triste*, three, and *tristis*, a crown; "because the fruit is surmounted by a triple permanent crown;" a genus mentioned by De Theis, but without reference to any author, nor have we met with any indication of it elsewhere.

TRISTEN, in Geography, a town of Germany, in the county of Feldkirch; 11 miles S.S.W. of Feldkirch.

TRISTO, a word used by Paracelsus, to express what he calls the material fire, lodged in the matter of all the four elements, and exerting upon occasion its influence, under the form of the proper effects of each element.

TRISTONBROUGH, in Geography, a town of Stafford county, in the state of New Hampshire, containing 759 inhabitants.

TRISTRA, TRUSTRA, or TRIST, in our old Law-Books, an immunity, by which a man is exenced from attending on the lord of the foret, when he is dispoused to chase within the forest; so that he cannot be compelled to hold a dog, follow the chase, nor stand at the place appointed, which otherwise he might be, under pain of amercement.

"Sint quieti, &c. de chevagio, homedenny, buckitet, et tritis, et de omnibus misericordiis, &c." Privileg. de Semplingham.

TRISULA, in Hindoo Mythology, the name of one of the commonest attributes of the Hindoo deity Siva. In pictures of him, it is represented as a tridented implement, similar to that seen in the hands of the Neptune of the West. The feet of Hindous who are Saivas, that is, exclusive worshipers of Siva as the deity, maintain that the Trisula is symbolic of S.E. of his trident of powers; meaning that he comprehends those of creation, preservation, and destruction. Others explain...
explain the Trisula as allusive to Siva's supremacy over the
three worlds: or earth, heaven, and hell: a mysterious triad,
forever indicated by the compound trisyllable Bhur-
bhuvanashca, of which see under the article Om

The word Trisula means, in the Sanscrit tongue, three-
pointed. In the west of India, it is sometimes called tri-
phala; and hence, connected with other coincidences, Mr.
Wilford (Af. Ref. vol. iii.) considers "the Jupiter Tri-
physius of the Panchman islands to be no other than Siva holding a
triphalal, he being also represented with three eyes, to de-
note a triple energy; as Vishnu and Prithvi are severally ty-
pified by an equilateral triangle, and conjointly, when their
powers are supposed to be combined, by two such triangles
interflecting each other." The mysterious properties of the
triangle, or cone, with its apex upward or downward, and of
the two intersecting triangles, are noticed in our articles LINGA,
Om; Parvati, Pavaka, Siva, Vishnu, and others thence
referred to. The intersected equilateral triangles, mentioned
by Mr. Wilford as typical of Vishnu and Prithvi, have an
allusion in natural philosophy to the influence of humidity
on the earth; Vishnu representing the aqueous principle of
nature, and Prithvi the material, or the earth. (See Prithvi
and Vishnu.) Of the resemblance of Jupiter Triphysius, or Triphala, with the three-eyed Siva,
see under his name of Thulokan, which means with three
eyes. Trintra also has a similar meaning.

TRISULLI, a name of the Hindoo deity Siva. He is so
called from bearing the symbol Trisula, or trident. See 
TRISULA.

TRISYLLABLE, TRISYLLABIC, in Grammar, a word
consisting of three syllables.

TRITHEIA, in Ancient Geography, a town of Achaea, in
the southern part, on the river Melas; said to be founded
by Menalippus, son of Trittia, a priest of Minerva, in
consequence of her amours with the god Mars. The prin-
cipal temple of this city was that of the greater gods, who
were annually honoured by feasts similar to those of Bac-
chus. The statue of Minerva, which was reckoned beau-
tiful, was transported from hence to Rome. This town
was one of those which Augustus put into a state of de-
pendence upon Patras.

TRITEOPHYES, a word used by the medical writers of
the ancients, to express a kind of fever, much of the na-
ture of the tertian, and taking its rise from a five-day
interval. .

TRITANY, in Geography, a town of Hindoostan, in
the Carnatic: 18 miles S. of Bonrauzepollam.

TRITCHINGODE, a town of Hindoostan, in My-
fore; 6 miles S. of Sankeriduram.

TRITCHINOPOLY, a town of Hindoostan, in the
Carnatic. It is surrounded with two walls, flanked with
towers, and encompased with a ditch. It was taken by the
British under major-general Lawrence and captain (after-
wards lord) Clive, in 1751, and since that time it has been
made the capital of Madura: 67 miles W. of Tranquebar.
N. lat. 10° 48'. E. long. 76° 45'.

TRITE, τρίτη, in Music, the third musical chord in the
fyllem of the ancients.

There are three strings under this denomination in the an-
cient diagramma, viz. the trite hyperboleon, trite diezeugmenon, and
trite sýnemmenon.

This chord of the ancient tetrachord was so named
from its being the third from the note; and hence we
might call it the anti-penultimate. It was otherwise, in
some tetrachords, called parypate. See Diagram and
INTERVAL.

TRITE Diezeugmenon, in the Greek Music, was the anti-
penultimate note of the diezeugmenon tetrachord, and an-
swers to Guido's b, f, e, ut.

TRITE Hyperboleon, was the anti-penultimate note of
the hyperboleon tetrachord, and answers to Guido's f, e, ut.

TRITE Syvnetemenon, was the anti-penultimate note of
the sýnemmenon tetrachord, and answers to Guido's b, f, ut.

TRITHEISM, or TRITHEISTS, in Ancient Geography, a town of
Afia, in the Troade.

TRITHEISM, the opinion of the Trithistic, or the heresy of
believing three Gods.

Trithemius confins in admitting not only of three per-sons
in the Godhead; but of three subsistances, three effences or
hypostases, and indeed three Gods.

Several people, out of fear of giving into Trithemius, have
become Sabellians; and several others, to avoid Sabel-
lianism, have commenced Triteists; so delicate and subtile is
the diifinction.

In the famous controversy between Dr. South and Dr.
Sherlock, the firit is judged to have run into Sabellianism,
by a too rigorous assertion of the unity of a Godhead; and
the latter into Trithemius, by a too absolute maintaining
of the Trinity.

John the Grammarians, furnamed Philoopus, lover of
labour, is held the author of the fect of the Triteists, under
the emperor Phocas; at least it appears that he was a zeal-
ous advocate of it.

The chief of this sect, according to Moffheim, Eccl.
Hist. vol. i. was John Afcufnate, a Syrian philosopher,
and a Monophyfite. He imagined in the Deity three na-
tures or subsistances, absolutely equal in all respects, and
joined together by no common effence.

TRITHEIT,E, TRITHEISTS, in Church Hiflory, a name
given to fuch hereticks, as admit not only of three persons,
but of three distinct subsistances and natures, in the Holy
Trinity. See TRINITY and TRITHEISM.

TRITHEMISUS, John, Abbot, in Biography, was born
in the year 1442, at the village of Trittenheim, near Treves,
whence he took his name. Having finifhed his course of
education in the universities of Treves and Heidelberg,
he was chosen abbot of the Benediftine monastery of Spanheim
in 1483, which he superintended for twenty-two years, and
when he withdrew from it, in consequence of a faction of the
monks, he was placed by the bishop of Wurtzburg at the
head of a monastery in that city, where he died in 1518, at
the age of seventy-six. "Trithemius," says one of his
biographers, "was a perfon of vaft erudition, a philo-
pher, mathematician, chymift, poet, historian, and divine,
and conuenient in the Hebrew, Greek, and Latin lan-
guages." His works, written in Latin, are numerous,
but thofe in biography and hifory are held in the highest ef-
fimation. His writings on piety and morality chiefly relate to
the monafic and facerdotal life, miracles of faints, and fuch
topics. His philofophy bore the myflic character of the
age in which he lived. His "Steganography, or the Art of
writing in Cyphers," containing fome inquifitive characters
ignorantly taken for tallfman, subjected him very unjuftly
to the charge of magic. Upon the whole, " he appears to
have been a perfon whose great learning was confiderably
tinctured with credulity, and whose industry was superior

TRITHING. See TRITHIN.

TRITICUM, in Latin, and Old Latin name, very sat-
isfactorily derived, by Varro himself, from tritum, ground or
rubbed, because of the manner in which its grain is prepared
for the food of mankind. Wheat, or Wheat-gras.—Linn.
Gen.
TRITICUM.

Gen. Ch. Cal. Common receptacle zigzag, toothed, elongated into a spike. Glume tranverse, containing about three or more flowers, and consisting of two ovate, bluntish, concave valves. Cor. of two nearly equal valves, the rafe of the calyx; the outermost tumid, obtuse with a point, or awn; the inner flat. Nectary of two acute scales, gibbous at the base. Stam. Filaments three, capillary; anthers pendulous, oblong, cloven at each end. Pîen. Germen superior, turbinata; styles two, capillary, reflexed; stigmas feathery. Peric. none, the corolla embracing the seed till it is full-grown and ripe, then letting it go. Seed solitary, ovate-oblong, blunt at each end, convex at the outer side, marked with a longitudinal furrow on the inner.

Eff. Ch. Calyx of two valves, solitary, tranverse, manyflowered, on a zigzag, toothed receptacle.

We have already adverted to the difficulty of distinguishing this genus from Secale; see that article. They both agree in the tranverse, or lateral, position of their bivalve calyx, by which position the rafe of each spikelet is parallel to the common receptacle, not, as in Lolium, contrary. The greater number of flowers in Triticum, which are only two in Secale, is the only technical distinction. The outer valve of the corolla of the present genus is often terminated by a long awn; but this appendage varies, even in the same species.

Section 1. Root annual.
1. T. aestivum. Summer Wheat. Linn. Sp. Pl. 126. Willd. n. 1. Ait. n. 1. Bauh. Pin. 21. ("T. arilatum; Blackw. Herb. t. 40. f. 4. 5.:—T. loculcis quadrifloris, haii sub floribus, glumis exterioribus floribus arilatis; Hall. in Com. Nov. Goett. v. 5. t. 1. f. 1")—Calyx fourflowered, tumid, smooth, imbricated, awned.—Supposed to be a native of Siberia. It is found in the spring, and produces a speedy but uncertain crop. We have never seen an authentic specimen, nor are we at all certain that what has generally been taken for this species is any thing more than a variety of the following:

2. T. hybernum. Winter, or Lemmas, Wheat. Common Cultivated Wheat. Linn. Sp. Pl. 126. Willd. n. 2. Ait. n. 2. Ehrh. Pl. Off. n. 151. Gaertn. f. 1. (T. vulgare; Hoff Grum. Aufr. v. 3. 18. t. 26. T. hybernum, arilis carens; Tourn. Infl. 512. t. 292. T. spicis muticæ; Ger. Em. 65. Siligo spicis muticæ; Lob. Ic. 25.)—Calyx four-flowered, tumid, even, imbricated, abrupt, with a short compressed point.—Native country unknown. Cultivated in various parts of the world; being found in autumn, it flowers the winter, and ripens seed in the following summer, so that it may be reckoned biennial. The root consists of downy fibres. Stem one or more, erect, straight, from three to five feet high, round, jointed, smooth, leafy. Leaves linear, pointed, flat, many-rubbed, rough, entire, rather glaucous. Sipula jagged, bearded. Spike solitary, or two or three inches long, dense, two-ranked, smooth, joints of the common axis bearded. Glumes fringed. Calyx in the upper part of the spike with a more elongated point. Corolla of the upper spikelets frequently more or less awned.

Under this most important and familiar species are comprehended a great number of varieties, the knowledge and history of which are more peculiarly the province of the agriculturist, and will be treated of under the article Wheat. By the botanist they have not been sufficiently investigated, either as varieties or species. Some of them appear entitled to the latter denomination; particularly the White Wheat, T. album, Gaertn. f. 2, whose leaves obtuse calyx, and the long awns of its corolla, seem to indicate a specific difference. This last character indeed occurs in many of them; see Tourn. t. 293. Some of the reputed species of Linnaeus are less decisively marked. The determination of these points, with the respective qualities of each species or variety, might very advantageously occupy the attention of some accurate rufic botanist, continually on the spot, by whose labours the question might be set for ever at rest, and probably a most important service rendered to scientific agriculture. Not to embroil the subject, we shall not, with insufficient materials, enter upon it.

3. T. compositum. Many-spikeled Wheat. Linn. Suppl. 115. Willd. n. 3. (T. spicis multiplici; Bauh. Pin. 21. Ger. Em. 66. Morif. fect. 8. t. 1. f. 7.)—Spike compound; spikelets crowded. Corolla awned.—Native of Egypt; cultivated at Naples. The glumes are smooth. Awns three or four inches long. This is probably a variety of the last, rather than, as Linnaeus says, of T. aestivum.

5. T. polonicum. Polith Wheat. Linn. Sp. Pl. 127. Willd. n. 5. Ait. n. 4. Hoff Grum. Aufr. v. 3. 21. t. 31. Pluk. Phyt. t. 231. f. 6. Morif. fect. 8. t. 1. f. 8.—Calyx three or four-flowered, pointed, naked, lanceolate like the corolla, which is compressed, with a long awn.—The native country of this like-wise is unknown. It was cultivated here in the latter part of the seventeenth century, for curiosity at least, and is still seen in botanic gardens, though not much regarded by the farmer, being easily laied by rain. That this is a distinct species there can be no doubt. The strength of the whole plant, its large ears, and long, narrow, feebly tumid glumes, readily distinguish it at first sight. Linnaeus defines the Triticum of T. hybernum having a two-flowered calyx, the character of Secale; but Haller affirms the preence of one, if not two, imperfect florets.

6. T. Spelta. Spelt Wheat. Linn. Sp. Pl. 127. Willd. n. 6. Ait. n. 5. Ehrh. Pl. Off. 432. Hoff Grum. Aufr. v. 3. 21. t. 30. (Zeä dicoccos five major; Bauh. Theatr. 412. t. 413. Z. spicis muticæ dicoccos, vel major; Morif. fect. 8. t. 6. f. 1.)—Calyx imperfectly four-flowered, elliptical, obliquely pointed, shorter than the long-awned corolla.—The origin of this species is likewise unknown, nor is its specific character satisfactory. The glumes are very glaucous. It is chiefly cultivated in the south of Europe, and is given to horses in Spain, when barley is scarce. The bread it makes is of a dry quality, but no kind of flour is better for pastry.

This appears to us a mere variety of the last, with downy glumes, and longer awns to the florets. Looping's specimens are of humbler growth than those of the preceding that have in general fallen under our inspection, but there is no specific difference between them.

12. T. maritimum. Sea Wheat-grass. Linn. Sp. Pl. 128. Willd. n. 14. Vahl Symb. v. 2. 26. (Gramen loliaceum paniculatum maritimum; Bauh. Theatr. 130. Schenckz. Agrost. 274. t. 6. f. 5.)—Spikes panicked. Spikelets many-flowered, compressed. Florets linear-lanceolate, ribbed, pointed, awnless. Stem branched.—Native of the sea-coasts of the south of France, Greece, and Egypt. Root annual, of many woolly fibres. Stems branched from the base, leafy, a foot high, more or less bent at the joints, and partly decumbent; often purplish, as well as the sheaths of the leaves, and branches of the panicle. Glumes long and tapering, narrow, flat, articulated. Spikelets broader than the leaves, but much shorter. Spikelets many-flowered, compressed. Florets about three inches long, forked, with many spreading, spikeled, triangular, smooth branches. Spikelets alternate, slightly flaked, half an inch long, smooth, of about eight crowded florets, each strongly keeled, and acutely pointed, smooth, with a strong marginal rib at each side. Calyx-valves furrowed, nearly equal. Some synonyms referred to this, belong to the following. That of Boccone, t. 95, is at least doubtful.

13. T. loliaceum. Dwarf Sea Wheat-grass. Fl. Brit. n. 4. Engl. Bot. t. 221. Willd. n. 17. Knappe t. 114. Gramen pumilum, loliaceum simile; Raul Spreng. 295. G. loliaceum exile durium; Sm. Rel. Rudb. 13. G. exile durifolium maritimum, siliquis circumvolutis, veluti junceus, brevibus; Pluck. Phyt. t. 32. f. 8. G. parvum marimum, spica loliaceae; Morif. f. 32. t. 2. f. 8.)—Spikes mostly simple, unilateral. Spikelets many-flowered, compressed. Florets elliptical, obtuse, awnless, with marginal ribs. Stems branched.—Native of the sandy sea-beach, on the east and south coasts of England, as well as in Italy. We have it from a Piedmontese botanist, under the name of T. unilaterale. Root annual. Stems rigid, spreading, smooth, from three to five inches high. Leaves tapering; involute when dry. Spike erect, mostly simple, linear, rigid, of from nine to twelve alternate, slightly flaked, two-ranked spikelets, turned most to one side; in very luxuriant, or cultivated, specimens the lower part of the spike is branched. This plant is very nearly allied to Poa rigida, nor is the position of their spikelets difsimilar. It serves however to connect our last species of Triticum with the following one.

17. T. repens. Creeping Wheat-grafs. Couch-grafs. Linn. Sp. Pl. 128. Wildl. n. 13. Fl. Brit. n. 2. Engl. Bot. t. 909. Leers 45. t. 12. 3. Knapp t. 111. Mart. Rulst. t. 124. Fl. Dan. t. 748. Schreb. Gram. part 2. 24. t. 26. (Gramen caninum vulgaris; Morif. feet 8. t. i. f. 8.)—Calyx awl-shaped, many-rubbed, five-flowered. Florets pointed. Leaves flat. Root creeping.—But too common throughout Europe, in all kinds of cultivated ground, flowering in summer and autumn. The long and deeply creeping roots are of all things most difficult to extirpate. Yet when collected in sufficient quantity, they afford wholesome nourishment for cattle, and in some countries have been made into bread in times of scarcity. The flims are two feet high, flender. Herbage green, except in a maritime variety, the γ of Fl. Brit., T. junceum of Relhan, T. intermediate of Hoft Gram. Ausfr. v. 2. 23, which is glaucous, with pungent leaves, and posibly desirous to rank as a separete species. The leaves of our common kind spread horizontally, often all one to a fide, by which this species becomes conspicuous among bushes or hedges in autumn. Spikes two or three inches long, much smaller in every part than those of T. junceum. Florets from five to eight, either simply pointed, or furnished with awns, which vary in length, but are scarcey ever equal to the glumes.

21. T. fcabrum. Rough New-Holland Wheat-grafs. Brown n. 1. (Feltuca scabra; Labill. Nov. Holl. v. i. 22. t. 26.)—Spikes elongated, lax. Calyx lanceolate, ribbed, pointed, many-rubbed, half the length of the corolla. Florets rough, taper-pointed, shorter than their awns. Leaves flat, rough, with smooth fheaths.—Native of New South Wales, and the Cape of Van Diemen. Root apparently perennial, with thick downy fibres, not creeping. Stems flender, erect, eighteen inches high, smooth. Leaves narrow, hairy. Florets from five to ten, in fefile, alternate, rather diftant, upright, oblong spikelets, from an inch to an inch and half in length.

22. T. peclinatum. Peclinate New-Holland Wheat-grafs. Brown n. 2. (Feltuca peclinata; Labill. Nov. Holl. v. i. 21. t. 25.)—Spikelets two-ranked, horizontally divaricated. Calyx awl-shaped, pointed, about six-flowered. Awns shorter than the florets. Leaves flat, ciliated.—Found by Labillardiere, in the illand of Van Diemen. The root is fibrous, prehumin to be perennial. Stems numerous, tufted, erect, hairy, a foot or more in height; leafy below; downy upwards. Leaves narrow, spreading, hairy and fringed, acutely pointed. Spikes solitary, erect, ovate-oblong, flat, two-ranked, two or three inches in length, of a dozen or more alternate, rather crowded, feftile spikelets, each near an inch long, in which the flowering fefion spread horizontally, but infubsequently become refted. The calyx-valves are flender, fomewhat unequal, pointed, but not awned, rather shorter than the florets, which are rough, ribbed, and furnished with ftraight awns, whose length, however, is les than that of each correponding glume. The inner valve of the corolla is elliptic-lanceolate, fringed with fairs. TRITNU, or TRIYETNU, in Hindoo Mythology, a name of Surya, the Hindoo regent of the Sun. The word means three-bodied. See SURYA AND TRIMUHT.

TRITOMA, in Botany, so named by Mr. Ker, late Gawler, from tri, three, and tom, to cut, whence comes the adjective trimus, cut, or fit for cutting; in allusion to the three fharp angles of the leaves. — Ker in Curt. Mag. Q q 744.
TRI

Gen. Ch. Cal. none. Cor. of one petal, inferior, cylindrical, even, with five hollow, regular, marginal teeth. Stam. Filaments fix, inserted into the receptacle, thread-shaped, simple, straight, projecting beyond the corolla, three alternate ones longer than the rest; anthers roundish, two-lobed. *Pisg*. German superior, roundish; style of the shape and length of the longer flowers; stigmas acute, somewhat downy. *Peric*. Capsule ovate, bluntly triangular, of three rather rigid valves, and three cells. Seeds numerous, smooth, crowded, in two rows, angular.

Eff. Ch. Corolla tubular, of one petal, with five marginal teeth. Stamens prominent, straight, inserted into the receptacle; three intermediate ones longest. Capsule ovate, of three cells, with many angular smooth seeds.

The present genus is well distinguished from *Aletris*, as well as from the *Veltheimia* of some botanists; being, as its author observes, nearer in character to *Aloe*; from which, however, it differs greatly in its leaf succulent habit, and more absolutely monopetalous *corolla*; but especially in the long, prominent, unequal, straight, not ascending, *flamens*, and more firm, or harder, *capsul*. The insertion of the *flamens* into the receptacle, not into any part of the *corolla*, to lay nothing of other characters, or of the different habit, essentially distinguishes this from the two other above-mentioned genera. (See all in their proper places.)

When habit functions such a division of genera, we must, especially in a very natural order of plants, like the present, be content with technical characters which might otherwise seem too flight. *Blandfordia*, Sm. Exot. Bot. v. 1. 5. t. 4. is distinguished from all the above by its brilly *feeds*, fructified upwards, in a prismatic *capsul*.

2. T. *media*. Leffer Orange-flowered *Tritoma*. Curt. Mag. t. 744. Ait. n. 2. Redout. Liliac. t. 161. (Aletris *farmentos*a; Andr. Repol. t. 54.)—Leaves smooth at the edges and keel. *Corolla* cylindrical-club-shaped.—Native of the Cape of Good Hope, from whence it is said to have been introduced in 1789, by Mr. Williams, nursery-man, of Turnham Green. As hardly as the last, but flowering either in winter or the early spring, so that a frame, or greenhouse, is requisite to the plant in perfection. It is smaller than the preceding, with a glaucous tinge on the *leaves*, whole edges and keel are perfectly smooth. *Stems* a foot and half or two feet high. *Flowers* sometimes elegantly tipped with green.

3. T. *pumila*. Late Orange-flowered *Tritoma*. Ait. n. 3. Curt. Mag. t. 764. (Veltheimia pumila; Willd. Sp. Pl. v. 2. 182.)—Leaves two-ranked, roughish at the edges and keel. *Corolla* cylindrical at the base; bell-shaped above.—Native of the Cape, from whence it was sent by Mr. Maffon to Kew, in 1774. It flowers late in autumn, and forms as hardy as the others, but is smaller than the last. The *flowers* are of an uniform orange, and distinguished by their bell-shaped, or globose, limb. *Leaves* not at all glaucous.

*Tritoma*, in Entomology, a genus of the Coleoptera order of insects; the characters of which are, that the * antennae* are clavated or club-shaped, the club being perforate, and the anterior palpi or feelers hatchet-formed. It has seven species, as follow.

Glarrum. Smooth, black, with pitchy antennae and feet. Found in Sweden.

Morgo. Black, silky, with antennae and feet of the same colour.

Sericum. Blackish, silky, with feet teelaceous. Found in Germany.

Collake. Black, with the fides of the thorax and abdomen red. Found in New Holland.

*Triton*, in Ancient Geography, a marsh of Africa Propria, in which is the source of a river of the same name; furnished by Pliny Pallantius. This lake was 20 leagues in length from E. to W., and about fix leagues wide; and it contained several islets. The mouth of the river was in the Mediterranean, in the gulf of the Leffer Syrtis. Herodotus mentions this river.—Allo, a river of the isle of Crete. Near its source was a temple, dedicated to Minerva Tritoniana.—Allo, a town of Africa, in Libya.—Allo, a town of Greece, in Bocotia.

*Triton*, in Mythology, a sea demi-god, held by the ancients to be an officer, or trumpeter, of Neptune, attending on him, and carrying his officers and commands from sea to sea.

The poets and painters represent him as half man, half fish, terminating in a dolphin's tail, and bearing in one hand a sea-shell, which served him as a trumpet.

Some of the ancients make him the son of Neptune, and the nymph Salacia; Hesiod, of Neptune and Amphitrite: Numenius, in his book De Piscationibus, makes him the son of Oceanus and Tethys; and Lycophron, the son of Nereus.

But though Hefiod and the mythologists only speak of one Triton, the poets have imagined several; giving some of them for trumpeters to all the sea-gods, particularly to Neptune and Venus; accordingly they were frequently introduced on the ancient theatre, and in the nauchamia.

In effect, the Tritons not only officiated as trumpeters in Neptune's retinue, but were also supposed to draw his chariot, i.e. the sea-shell in which he rode over the waters: as we find in Virgil, *Aeneid*, x. 209; Ovid, Metam. l. 10. 333; and on a medal of Claudius.

The fable of the Tritons, no doubt, took its rise from what are called the sea-men, or mermen; for that there are such things as sea-men has been believed in many ages. See Mermaid and Sea-Cow.

The poets ordinarily attribute to Triton the office of calming the waves, and of making tempests cease. Thus, in the first of the Metamorphoses, we read that Neptune, defining
to recall the waters of the deluge, commanded Triton to find his trumpet, at the noise of which the waters all retired.

Thus Ovid:

"Cœrœulum Tritona vocat, conchaque fonanti
Inspirare jubet, flœtœque flumina signo
Jam revocare dato, &c."

And Virgil:

"Huc venit immannis Triton, et cœrœula concha
Exterrens freta: cui laterum tenus hîpîda nanti
Frons hominem praefert, in Prittin definit alvus."

Of Triton, as connected with the Argonautic expedition, Herodotus gives the following account. Speaking of the river Triton, which discharged itself into the lake Tritonis, where was an island called Phila, he says it was believed that the island must have been inhabited by the Lacedemonians; and he adds, it was reported by tradition, that when Jafon had built at the foot of Mount Pelion the ship which was called Argo (see Argonautic), and had flowed in it a blood, and a tripod of brahs, he undertook the voyage to Delphi by the tour of Peloponnesus; and that, taking his route by the promontory of Malea, the north wind drove him upon Libya, where he found his ship run aground in the lake Tritonis; and while he was endeavouring to extricate himself, a Triton appeared to him, and told him, that if he would give him the tripod he had in his ship, he would show him how to get clear of this danger; upon which Jafon, agreeing to the proposal, gave him the tripod, which the Triton laid up in his temple, and foretold Jafon and his crew, that when one of their defendants should carry off that tripod, it was fixed by fate that there should be one hundred Greek towns built upon the lake Tritonis; in fine, that the Libyans being informed of this oracle, kept the tripod carefully concealed. The explication given of this fable is, that the Triton who appeared to the voyager under a human form was a prince who reigned in that place, whom Pindar and his scholiast name Eurypilus. He gave good instructions to the heroes to avoid the sand-banks which lie in and about the Syrtes. This, says Banier, is the whole mystery; the prediction which they put in his mouth having only been invented after the event; that is, after the Greeks were settled in that part of Africa, and had built cities there. Our heroes, in gratitude for the signal service done them by Eurypilus, made him a prefent of the above-mentioned tripod. Diodorus, who also speaks of it, says there was upon the tripod an inscription in very ancient characters, and adds, that it was preferred to the latest times, among the people called Hesperitans, in Cyrenaicum.

Triton, in the Linnaean System of Natural History, a genus of the Mollufca order of worms; the characters of which are, that the body is oblong, the tongue spiral, the tentacula twelve in number, and bipartite, fix on each side, and the three hinder ones cheliferous. There is one species, viz. T. littoroc, which is found in the clefts of submarine rocks.

Triton Avis, in Ornithology, a name under which Nie- remborg has described a bird of the West Indies, famous for its fine fingering, and found in Hispaniola: it is said to have three different notes, and to be able to give breath to sounds of all three kinds at the same time: it is also said to be a very beautiful bird. Ray.

TRITONEA, or Trigionia, in Mythology, a name given to Minerva, derived from the river Triton, near which she was born, and where she had been seen for the first time.

Gen. Ch. Cal. Spatha inferior, shorter than the corolla, of two oblong, membranous, pointed or toothed valves. Cor. of one petal, superior; tubular at the base; swelling in the throat; limb divided to its very bottom into fix, nearly regular and equal, segments, each of which, in the lower part, is more or less contracted into a claw. Stam. Filaments three, inserted into the tube, unconnected with the throat, variously directed, curved, shorter than the limb; anthers oblong, curved. Pijl. German roundifh; fyle thread-shaped, erect; fligma three, linear, recurved, spreading. Petir. Capuile roundifh-ovate, membranous, tuftid, of three cells and three valves. Seeds numerous, globofe, fimple, neither winged nor pulpy, rather small.

The characters of this genus are confefcil very difficult to define; yet its intelligent author confiders the species to be easily discernible by their common habit. The corolla in fome is quite regular, in others more or less irregular, yet never in a very frong or evident degree. "The bulb is solid, ovate and defpreeid, or roundifh with a point; its coats reticulated; the outermost spotted. Leaves graffy, broadifh; very rarely cripped at the edges. Flowers feveral, various in the different species; in fome their limb is large, bell-shaped, regular, reverfed, the segments broad, the tube fhort, with an inflated fpreading throat; in others the corolla is of a smaller fize, with a longer tube, a turbinatfe throat, the segments oblong, little dilated, defpofed fo as lightly to imitate a two-lipped flower, one of them broader than the reft; in others again the segments are linear-oblong, fpreading in a wheel-shaped manner, equal, the throat but fightly dilated, and the tube very long. The flammes of the two-lipped fpecies are afceding, of the regular reverfed ones ereft; anthers in the wheel-shaped flowers contiguous, incumbent."

2. T. viridis. Green-flowered Tritonia. Ait. n. 2. Curt. Mag. t. 1275. (Gladiolus viridis; Ait. ed. 1. v. 3. 481. Vahl Enum. v. 2. 96. Ker Ann. of Bot. v. 1. 231.)—Stalk triangular, with membranous angles. Segments of the corolla lanceolate, shorter than the tube; five of them afceding; one deflexed.—Found at the Cape by Mr. Malloin, who fent it to Kew garden, in 1788, where it blooms in July. The leaves are linear-lanceolate, with a frong mid-rib. Spike zigzag. Flowers not numerous, pale green, with a purplish tinge, especially in the tube, and
TRITONIA.

at the back of the limb. We should suppose these flowers, by their colour, to be fragrant at night.

4. T. renata. Trumpet-flowered Tritonia. Ait. n. 3. (T. capensis; Curt. Mag. t. 618. and t. 1531. Gladiolus roccus; Jacq. IC. Rar. t. 261. Willd. Sp. Pl. v. 1. 217. Vahl Enum. v. 2. 110.)—Sheath taper-pointed. Upper segment of the corolla broadest; throat funnel-shaped; tube twice the length of the limb.—Native of the Cape. Sent to Kew by Mr. Maffon in 1793, where it flowers in June and July. The stem is leafy. Leaves green, many-rribered, taper-pointed. Flowers spied, three or four inches long, flesh-coloured, or buff with purplish veins; the third lower segments tipped with crimson at the base. The corolla however varies in size as well as colour; see the figures cited.

5. T. longiflora. Long-flowered Tritonia. Ait. n. 4. (Ixia longiflora; Willd. Sp. Pl. v. 1. 203. Redout. Liliac. t. 34. Curt. Mag. t. 256. and t. 1503, Tritonia. Gladiolus longiflorus; Linn. Suppl. 95.)—Segments of the corolla regular, linear-oblong, obtuse; tube thread-shaped, angular and slightly dilated at the top; four times as long as the limb, and fix times as long as the nearly equal valves of the spathe.—Native of the Cape. Introduced by Mr. Maffon in 1774, and now a general favourite in our greenhouses, flowering in the spring. The very long and slender, regular, buff-coloured flowers, often tinged with a rose-colour, sufficiently disinterminate this elegant species. The stem is ever tall and slender, naked except at the lower part.

6. T. Rockenbos. Bending-flowered Tritonia. Ker in Curt. Mag. t. 1503. Ait. Epit. 375. (Ixia paniculata; De la Roche Diff. 26. t. 1, according to Mr. Ker. Gladiolus longiflorus; Thunb. Diff. n. 22.)—Segments of the corolla regular, elliptical, concave, scarcely as long as the flender, deflexed tube. Stamens and style prominent.—Imported from the Cape in 1829, by Meirs. Lee and Kennedy. Nearly akin to the last, to which we should, but for Mr. Ker’s authority, have referred the branched variety, figured by De la Roche.

7. T. lineata. Pencilled Tritonia. Ker Ann. of Bot. v. 1. 228. Ait. n. 5. (Gladiolus lineatus; Salis. Prod. 45. Curt. Mag. t. 487. Redout. Liliac. t. 55. Ixia flagalida &; Willd. Sp. Pl. v. 1. 206.)—Limbo of the corolla thrice the length of the curled tube, bell-shaped; its upper segment largest; outer ones abrupt.—Native of the Cape. Sent to Kew by Mr. Maffon in 1774, but more recently introducted into our greenhouses by way of Holland, flowering in May. The stem is two feet high. Leaves green, with a solitary mid-rib. Spike drooping before the flowers open, which are large, of a straw-colour, tinged with orange, and marked with fine, dark, parallel and branching, veins. Each of the three lower segments has a yellow internal spot near the base. The tube, about half an inch long, fearfully equals the length of the spathe.

8. T. secernens. Dwarf Copper-coloured Tritonia. Ker Ann. of Bot. v. 1. 228. Ait. n. 6. (Gladiolus secernens; Willd. Sp. Pl. v. 1. 219. Vahl Enum. v. 2. 109. Curt. Mag. t. 383. Montbretia secernens; Redout. Liliac. t. 53.)—Limbo of the corolla twice the length of the tube; its upper segment largest; each of the three lower bearing at its base an erect, compressed prominence. Outer valve of the spathe blunt, with three teeth.—Found at the Cape by Mr. Maffon, who sent it to Kew in 1774. It flowers freely in May and June, and increases by offsets. The stem is but a span high. Leaves two-ranked. Flowers tawny; the three lower segments yellow at the base, with a deeper hue of red about the middle.

9. T. flavus. Yellow Tritonia. Ker Ann. of Bot. v. 1. 228. Ait. n. 7. (Gladiolus flavus; Willd. Sp. Pl. v. 1. 218. Vahl Enum. v. 2. 110.)—Limbo of the corolla twice the length of the tube; each of the three lower segments bearing at its base an erect, compressed prominence. Outer valve of the spathe pointed.—Found at the Cape by colonel William Paterfon, who sent it to the famous Countess of Strathmore in 1780. The somewhat broader leaves, pointed spathe, and uniform deep yellow of the corolla, are said in the first edition of Hort. Kew. to differ from this the last.

10. T. refracta. Bent-spiked Tritonia. Ker Ann. of Bot. v. 1. 228. (Gladiolus refractus; Jacq. IC. Rar. t. 241. Willd. Sp. Pl. v. 1. 215. Vahl Enum. v. 2. 109.)—Spikes bent backwards. Flowers erect, recurved. Limbo of the corolla thrice the length of the tube, bell-shaped, two-lipped; its three lower segments small.—Native of the Cape. We have not heard of it in any English garden. The stem is branched, singularly bent, feecily rising above the long, erect, two-ranked leaves. Spikes horizontal, of several flowers, whose three upper segments are purplish, lower yellow or orange.

11. T. flagalida. Sweet-scented Pink Tritonia. Ker in Curt. Mag. t. 581. Ait. n. 8. (Ixia flagalida &; Willd. Sp. Pl. v. 1. 206. Vahl Enum. v. 2. 73. L. hyalina; Redout. Liliac. t. 87.)—Limbo of the corolla bell-shaped, regular; its segments rounded, transparent in the margin below, clove together; one of them gibbous at the base.—Native of the Cape. Sent to Kew by Mr. Maffon, in 1774. The flower is naked, ascending, much taller than the leaves, which are many-rribered, equitant; the outer ones bluntish. Spike reclining, of about half a dozen large, very sweet-scented flowers, whose tube is fearfully half the length of their limb, and whose colours are a mixture of dull pink, with a dirty pellucid white, like wet paper. The claw of each segment is red, with a distinctly defined white membranous border, that of the three innermost segments lying over the others. Style longer than the thermometer, in the two following. The deprecatting name of flagalida is surely not suitable to this elegant species.

12. T. fenzlifera. Open-flowered Orange Tritonia. Ker in Curt. Mag. t. 704. Ait. n. 9. (Ixia fenzlifera; Jacq. IC. Rar. t. 289.)—Limbo of the corolla funnel-shaped, regular; its segments obovate, dentate, transparent in the margin below. Stamens and style reclining.—Native of the Cape; said to have been imported in 1801, by Mr. W. Salibury, of the Sloane-street Botanic Garden. It blossoms in the spring, and differs from the last in having scented flowers, of a deep rich orange-colour; the membranous edges of their segments pink. The corolla is also differently shaped, as in our specific character expresses. The tube is short, fearfully exceeding the spathe. Stem often branched.

in their lower half.—Native of the Cape, and one of the first of its tribe cultivated in the gardens of Europe, where it has always been a great favourite, flowering in spring. The brilliant orange-colour of its corolla, contrasted with the membranous transparence of the lower half of its segments, all close together, has a very striking appearance. We have some doubts whether Miller's t. 239. f. 2. be not rather taken from the foregoing species, which, in the shape and disposition of its segments that figure most resembles.

14. T. deutila. Tall Copper-coloured Tritonia. Ker in Curt. Mag. t. 622. Alt. n. 11. (Isia deutila; Wild. Sp. Pl. v. t. 205. Vahl Enum. v. t. 74. L. crocata, nigro maculata; Andr. Repof. t. 134. l. miniate, nigro maculata; Redout. Lil. t. 89.)—Limb of the corolla regular, widely spreading; its segments imbricated, obovate, solid throughout; the three outermost gibbous underneath. Tube rather shorter than the spatha.—Found at the Cape of Good Hope, by Mr. Maffon, who sent it to Kew in 1774. Allied to the two last, but taller, with still deeper orange-coloured flowers, whose segments have no marginal transparence. The three outermost have a fort of hollow, or depressions, just above the base, marked with a very dark spot, and prominent beneath. Jacquin's Isia miniate is taken by Vahl for a variety of the pretent, deficient of spots; but the figure more resembles our fengrota, n. 12, in the shape and position of the segments of the corolla, though wanting their membranous margin. See the following.

15. T. miniate. Tall Late-flowering Tritonia. Ker in Curt. Mag. t. 609. Alt. n. 12. (Isia miniate; Jacq. Hort. Schoenbr. v. t. 10. t. 24.)—Limb of the corolla funnel-shaped, somewhat two-lipped, reversed; its segments obovate, close, solid throughout. Tube the length of the spatha. Found at the Cape of Good Hope, by Mr. Maffon, who sent it to Kew garden in 1795. It flowers in August, and is the tallest and strongest of this genus, having a branched stem, eighteen inches or more in height. The flowers are scentless, of a rather dull orange-colour; their three lower segments, (turned uppermost by the reversed posture of the flower,) marked at the base with an oblong yellow spot, indicating a degree of irregularity in the corolla. This circumspection does not appear in Jacquin's figure, above quoted, where all the segments have a similar mark. How far such characters are variable in this difficult tribe, requires a longer experience, and more intimate practical acquaintance with it, than we can boast, to decide with certainty. More has been done by Mr. Ker than any other person, to clear up the subject; but a wider range of practical observations and experiments is still wanted, in order to a correct understanding of what makes a permanent species. In the perception of natural genera, this botanist seems to us to display great abilities, whether their technical limitations be, as yet, perfected or not. With respect to colour, and even proportion of parts, in the flowers of this family, Jacquin's reputed varieties of Isia maculata, in the 1st vol. of his Hortus Schoenbrunnensis, are sufficient to drive any botanist to despair.

TRITONUS, in Muffe, a diffusant interval, composed of three tones, two major and one minor; and which is, in practice, called the sharp 4th. This interval on keyed instruments is equal in nominal semitones to the flat 5th: the numerical ratios, however, are not equal; that of the tritonus being only 32 to 45; which is occasioned by the tritonus having only one tone major instead of two semitones major, which the flat 5th contains. See FIFTH.

But the most considerable difference between the flat 5th and the sharp 4th is, that the latter is a major discord, and that the parts are resolved by separation; and whereas the other is a minor discord, and resolved by approximation of the two parts.

The chord of the sharp 4th is only an inversion of the chord of the 4 to the sharp 7th of the key, by giving the discord to the base.

TRITOPATORIA, τριτοπάτης, in Antiquity, a solemnity in which it was usual to pray for children to the Dios τριτοπάτης, or gods of generation, who were sometimes called τριτόποντες.

TRITORIUM, in Chemisty, a vessel generally made of glass, used for the separation of liquors of different densities, as oil and water. Its largest diameter is in the middle, and it terminates with an aperture at each of the two extremities. The lower extremity, the aperture of which is very narrow, is dipped into the mixed liquor, and when it is sufficiently filled, the upper orifice is to be stopped close, by pressing the thumb upon it, by which means the liquor contained will not run out at the lower aperture, when the vessel is raised from the mixed liquor. When the fluids of which this liquor consists have perfectly separated according to their respective densities, by removing the thumb, the heavier fluid will run out at the lower extremity, and the separation will be thus effected. Macquer's Dist. Chem.

TRITTAAU, in Geography, a town of the duchy of Holstein; 20 miles E. of Hamburgh.

TRITTARCHI, τριτταρχοι, among the Athenians, were magistrates who had the command or government of the third part of a tribe. See PHYLARCHUS.

TRITUM PROMONTORIUM, Sebb-a-Rous, in Ancient Geography, a promontory of Africa, at the west entrance of the gulf of Numidia; called by Pomponius Mela Metagonium.

TRITURATION, Tritura, or Tritus, formed from triturare, to thrash; of terra, I swear, rub, or grind, in Pharmacy; grinding; the act of reducing a solid body into a subtile powder, called also fìguratio, pulverisation, &c.

The trituration of woods, barks, minerals, and other hard and dry bodies, is performed by the rotary motion of a pestle in metallic, glafs, agate, or Wedgwood-ware mortars; and in mills, by means of large rollers of hard stone.

The same term is also applied to the comminuting, bruising, and dividing of humid matters into little parts. The trituration of moist bodies is performed in marble or flint mortars, with pestles of wood, glafs, ivory, &c. The word trituration is generally applied to denote the division that is made of several bodies together, to unite them with each other; as, e.g., the extinction of mercury in the operation of Ethiops mineral, and others similar.

Trituration, Boerhaave observes, has a wonderful force to dissolve some bodies, and will render them as fluid as if they were fluxed by the fire. Thus if you grind the powder of myrrh and salt of tartar together, they will dissolve each other. By rubbing new and bright filings of iron in a mortar, with double their weight of clean sulphur, the iron will be dissolved, so as by diluting it with water to afford the vitriolum Martis.

Gold long ground in a mortar with salt of tartar, will yield a kind of tincture; and rubbed with mercury in a mortar of glafs, it entirely dissolves into a purple liquor, and becomes a most powerful medicine.

Dr. Langelotte has written a curious treatise of the great effects of trituration in chemistry, and describes a peculiar way
T R I

way he employed to grind gold, by which, he says, he could render it as fluid as the fire does, and make an aurum potabile by the bare motion of a mill.

This author, in the Philosophical Transactions, mentions his way of grinding gold, and describes two engines, or philosophical mills, for the purpose; with one of which, in the space of fourteen natural days, he reduced a leaf of gold to a dusty powder, and, putting it into a shallow retort, placed in a rapid current of air, he thence obtained, by gradually increasing the fire, and giving it a strong one at last, a very few red drops, which, digested, per se, or with tartarized spirit of wine, afforded a pure and genuine aurum potabile.

The success of this operation the doctor attributes, in a great measure, to the falt of the air, which, in grinding, plentifully mixes and unites itself with the gold.

It has been observed, that there appears to be an error in reducing vegetable matter to the state of impalpable powder; as in this state, both during the processes of grinding and afterwards, the air and light act powerfully upon them, and produce changes, which, although they be not well understood, yet appear to alter the medicinal virtues of the substances.

Trurbation is also used, in Medicine, for the action of the stomach on the food, by which it is fitted for nutriment. See Digestion.

TRIVADI, in Geography, a town of Hindoostan, in the Carnatic. The pagoda forms a citadel; 23 miles S.W. of Pondicherry. N. lat. 11° 42'. E. long. 79° 45'.

TRIVANDOR, a town of Hindoostan, in Madura; 16 miles N. of Nattam.

TRIVATOOR, a town of Hindoostan, in Maravar; 20 miles N. of Trumian.

TRIVATORE, a town of Hindoostan, in the Carnatic; 6 miles S.E. of Arcot.

TRIVELAWARY, a town of Hindoostan, in the Carnatic; 12 miles N. of Trichinopoly.

TRIVEMBAR, a town of Hindoostan, in Maravar; 27 miles N. of Ramanadporem.

TRIVENALORE, a town of Hindoostan, in the Carnatic; 13 miles N. of Tiagar.

TRIVENI, a term in the Sanscrit tongue, said to mean a triad of rivers; a junction of three of the most important streams of Hindoostan being pre-eminently distinguished by this appellation. These are the Yamuna or Jumna, the Ganga or Ganges, and the Saraswati; being, in the mythological mysticisms of the Hindoos, personifications or symbols of their three great goddesses, Lakshmi, Parvati, and Saraswati.

The Hindoo poets, as indeed all their writing priests or philosophers, and even mathematicians, seem to be, call the Triveni the three platted locks; and elegantly breathe this idea into many pleasing allegories. See Radha.

The spot of junction of the three river-goddesses in question, near Ilahabad in Bengal, is extensively esteemed very sacred; and pilgrims resort thither from distant regions to bathe in the purifying trine stream. Of this we have taken sufficient notice under our article JUNCTIONS; and under that of Suicide, an account is given of meritorious self-destruction at this revered spot. See also Sati.

The Triveni has been noticed as a fruitful source of poetical allusion.

We cannot refrain from briefly alluding, in this place, to some supposed coincidences in Irish and Indian mythology, of which see something under our articles Soma and Surya. And we allude to them here in view to the opportunity of faying that poetical traditions existied, and perhaps still exist, in Ireland of a mythological origin and junction of three rivers, reminding us strongly of the Indian Triveni. The Irish rivers appertain to the county of Kilkenny; and our own Spenser has described them so exactly in the style of Eastern hyperbole, that we must invite the reader to turn to our article Kilkenny, where he will find an extract from Spenser descriptive of the mythological origin and junction of the Irish Triveni, that may be almost suspected as of Oriental origin.

TRIVENTO, in Geography, a town of Naples, in the country of Molise, the seat of a bishop, immediately under the pope; 11 miles N. of Molise.

TRIVERAL DIES, in the Roman Calendar, denoted judicial days, or such as were allowed to the prætor for hearing of causes.

They were otherwise called dies fojni, in quibus licet praetori fari tria verba, do, dico, addico.

Of these court-days, the Romans had only twenty-eight in the whole year; whereas with us, one-fourth of the year is term-time, in which three courts constantly fit for the dispatch of business; besides the close attendance of the court of chancery for determining suits in equity, and the numerous courts of alizate and nisi prius that sit in vacation for the trial of matters of fact.

TRIVESPER, in Mythology, one of the epithets of Hercules.

TRIVETICH, in Biography, an English historian of the thirteenth century, was the descendant of a respectable family in Norfolk. Having entered among the Dominicans in London, he studied at Oxford and at Paris; and at the latter place collected from books on the history of the Normans and Franks such passages as related to the English nation, and supplied their defects from the best accounts which he could procure in his own country. In this way he composed his "Annals of the Six Kings of England sprung from the Counts of Anjou," introducing a detail of the most remarkable events that occurred under the Roman pontiffs, the emperors, the kings of France, and other contemporary princes, together with an account of learned men, particularly of his own order, and intending that his work should be a continuation of that of William of Malmsbury. He also wrote various other works, partly containing illustrations of ancient authors, but none of them were printed, except his commentary on St. Augustine's book "De Civitate Dei." Soon after his return from France he became prior of a monastery in London, where he died in 1328, at the age of nearly 70 years. His historical work has passed through several editions under different titles, for which we refer to Aikin's Gen. Brigg.

TRIVAL NAMES, Nomina Trivialia, in Botany, were first used by Linnaeus in his dissertation entitled Pans Sueus, published at Upsal in 1749. The plants there enumerated, with a view to their economical qualities as the food of domestic cattle, are each designated by its generic and specific name. The same measure was adopted in the first edition of the Species Plantarum, published four years after, and was extended subsequently to every department of natural history. Linnaeus originally intended his specific definitions to be used as names; but however comprehensively such might be constructed, they were soon found totally unmanageable for that purpose. He therefore adopted the method of Rivinus, of mentioning each plant by a sort of appellative, in addition to its generic name; not intending, like Rivinus, that such appellative should comprehend the specific definition of the plant, which Linnaeus knew to be impossible. That no such expectation might be formed of these names, and that students might not too much rely on them, as any thing like definitions, he termed them nomina trivalia, as serving for common
TRI
common everyday use. They are now however usually called specific names, in contradistinction to generic ones; the original specific names of Linnaeus being at present more properly termed specific definitions, or differences. Trivial names may convey the essential characters of the several species, as Sagina procumbens and atasola, in which case they are but a repetition, or an anticipation, of the specific differences.

They more usually serve to express some concomitant circumstance, tolerably certain as a distinctive mark of each species, though not in the specific character, such as annua, perennis, or alba, lutea, rubra, &c. Former apppellations of each species, such as Hydropteris and Persicaria, especially if the plants be remarkable for their medical or economical uses, as Cinnamomum, Rhabarbarum and Abshinthium, Nopus, Rapa, &c. are very commodious, though injudiciously laid aside by some reformers. These must always begin with a capital letter, being proper names, not required to agree in gender with the generic name. In zoology, such apppellations of species as we have last mentioned are peculiarly useful, and generally preferred by Linnaeus to all others.

TRIVICARY, in Geography, a town of Hindoostan, in the Carnatic; 20 miles S.E. of Gingee.

TRIVICUM, TRIVICO, in Ancient Geography, a small town of Italy, on the frontiers of the Hirpines and of Apulia. It lay on the Trajan way, at a distance E. of Benevento.

TRIVIDHA, in Mythology, a name of the Hindoo goddes Parvati. The word is said to mean three-fold, the Hindoo goddes correspnding in many points with the triple Hecate of the Greeks.

TRIVIER, in Geography, a town of Italy, in the Trevisan; 7 miles W.N.W. of Trevigio.

TRIVIKERA, or TRIVIKRAMA, in Mythology, a name of the Hindoo god Vishnu. It means the three-deemer, alluding to his having in one of his avatars, or incarnations, deceived a powerful sovereign into a promise of giving him all he could cover in three steps.

TRIVIUM, a term invented in the times of barbarism to express the three sciences that were first learned in the schools, viz. grammar, rhetoric, and logic; and the schools in which these sciences were taught were called triviales.

The quadrivium, to which the scholar next proceeded in his way to the summit of literary fame, comprehended the four mathematical sciences, viz. arithmetic, music, geometry, and astronmony.

TRIUMFETTA, in Botany, named by Plumier, serves to commemorate John Baptitl Triumfetti, of Bologna, doctor in medicine and philosophy, and lecturer at the botanic garden of Rome, which was under his direction. He published there, in 1685, a thin quarto volume entitled Observationes de ortu ac vegetazione plantarum, including descriptions and engravings of several new species. This is an able work, though more frequently quoted for its figures than its philosophy; a very common sale. The author published in 1703 a refutation of some criticisms that had appeared against his book. He died in 1707. His brother, Leolin Triumfetti, likewise professor of botany at Rome, is said to have been well skilful in the knowledge of plants, though he does not appear as an author.—Linn. Gen. 239. Schreb. 321. 832. Willd. Sp. Pl. v. 2. 873. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 3. 145. Plum. Gen. 40. t. 8. Juff. 290. Lamarck Illifr. t. 400. Gertn. t. 111. (Bartramia; Linn. Gen. cd. 5. 184. Lamarck Illifr. t. 400. Gertn. t. 111. —Clas and order, Dodendandria Monogynia. Nat. Ord. Columnariæ, Linn. Tiliaeae, Juff.
Gen. Ch. Cal. Perianth inferior, of five lanceolate, deciduous leaves, with a shortly point just below the summit. Cor. Petals five, linear, obtuse, erect, concave, bent backward just above the base. Stam. Filaments fifteen, equal, afending, awl-shaped, straight, the length of the corolla; anthers simple, roundish, of two cells. Pist. German superior, roundish; style the length of the stamens; stigma in two acute divisions. Peric. Capsule globose, covered all over with hooked prickles, separating into four cells. Seeds one or two in each cell, erect, convex at the outside, angular at the inner.

Eff. Ch. Calyx of five leaves, deciduous. Petals five. Capulce prickly, separating into four parts.

Obf. The supposed want of a calyx in the original Triumfetta is a manifest error, subsequently corrected by Linnaeus; as is likewise, if we mistake not, the dorval point attributed to each petal. Yet Gertner uses the former character to strengthen the difference between Triumfetta and the original Bartramia, though purely of principle of character and habit proclaim their identity. Bartramia therefore, is now retained as the name of a very distinct and elegant genus of Moffs. See Muscr.

1. T. Lappula. Bar Triumfetta. Linn. Sp. Pl. 259. Wildl. n. 1. Ait. n. 1. (T. fructu echino racemoso; Plum. 1c. 253. t. 255. Lappula bermudensis althoizoides (picata, fructu orbiculari majo; Pluk. Phyt. t. 245. f. 7.)—Leaves heart-shaped at the base. Calyx four deciduous. Flowers in densely whorled aggregate spikes.—Native of the West Indies and South America. A shrub four or five feet high, flowering about July and August in our haves, where it was cultivated in Miller's time, but is seldom much noticed, the yellow flowers being small and inoffensive. The leaves are stalked, alternate, several inches broad, roundish, toothed, downy, with three or five shallow acute lobes. Capsule the size of a pea, armed with prominent hooked prickles, which stick to the coats of animals, and are widely dispersed, each capsule splitting when ripe into four parts, lodging solitary seeds. The spikes are terminal, several together alternate.

2. T. glandulosa. Glandular Triumfetta. Forst. Cat. Fl. Arab. Fel. 112. n. 297. Vahl. Symb. v. 3. 62. Willd. n. 2.—Leaves ovato-lanceolate; downy and hoary beneath; their lower ferratures more or less glandular. Flowers axillary, from the upper leaves.—Gathered by Forskall in the middle region of the hills of Arabia Felix. Branches woody, round, villos. Leaves on short stalks, numerous, three inches long; gradually smaller upward, clothed on both sides with soft flary hairs, but greenish on the upper; entire at the base, but otherwise ferrated. Stipulas awl-shaped.

3. T. Bartramia. Currant-leaved Triumfetta. Linn. Sp. Pl. 638. Wildl. n. 3. Ait. n. 2. (Lappago ambova; Rumph. Amboin. v. 6. book 10. 59. t. 255. f. 2.) Lappula bengalensis tetrafermos, ribetii folio, echinis orbicularibus ad foliorum exortis plurimis fimal feffilibus; Pluk. Phyt. t. 41. f. 5.—Leaves acutely lobed and toothed; entire at the base; roughish on both sides. Flowers racemo-me, partly aggregate; the lower ones axillary.—Native of the East Indies. The leaves are roughish to the touch, not downy. We are not certain of having seen authentic specimens, Linnaeus having been very superficially acquainted with the species of this genus. Our's has but four seeds in each capsule.

lobed, pointed; softly downy on both sides. Stem erect.

—Native of the island of Mauritius. We have a specimen from thence, given by Thouin to the younger Linnaeus, which we conceive must be Vahl's plant, though, being in feed, the inflorescence has a racemose appearance, the floral leaves having perhaps fallen off. The stem is round, downy. 

Leaves alternate, flaked, two or three inches long, more or less evidently five-ribbed, unequally ferrated, clothed with soft flaky hairs on both sides, but much of the moll copiously on the under; the base is undivided, not heart-shaped. 

Stipules lanceolate, tapering, fringed, of a rufy hue. Flowers from the bifoms of the upper leaves, according to Vahl. In our specimen, which answers in other respects to his description, the capsule is smaller than a pea, form compound, terminal, interrupted clufers; their partial flarks aggregate, deflexed, from a quarter to half an inch long. The prickles of each capsule are copiously barred with minute, reflexed, pale hairs.

Prodr. 35. Wildl. n. 5. — Leaves round-fifh-headed, obtufes, flightly three-lobed; very downy beneath. Stem procumbent. —Native of the Society ifles. Our specimen is from Otakeite, gathered by the younger Forrer. The stem is woody, round, downy and hoary; the younger branches leafy. Leaves about the size and fhape of thofe of a gooseberry, bluntly ferrated, usually three-lobed, on long downy flalks; their upper fide green, nearly even, clothed with ferrated, fimple, deciduous hairs; the under paler, covered with soft foky hairs, and reticulated with prominent veines. Of the flowers or fruit nothing is mentioned, nor does the specimen before us fhow traces of either.

Symb. v. 3. 63. Wildl. n. 6. — Leaves three-lobed, acute; smooth above. Panicle terminal, compound, hairy. — Found by Von Rohr, in the Weft Indian ifland of St. Martha. Stem shrubby. Leaves three or four inches in length and breadth, uneven-ribbed, unequally ferrated; three or five of the lowermofl ferratures glandular; the base rather heart-shaped; the extremity divided into three ovate, dilating, pointed lobes: the under side is clothed with very minute flary pubefcence, and its ribs with long flattered hairs. 

Paniclfs moll fhy when young. Panicle diffufe, with alternate, twice or three forked, branches, molt hairy in the lower part. Flowers small, flaked, solitary at the forks of the panicle, but otherwife aggregate. Calyx hoary. Vahl.

7. T. fenniriloba. Mallow-leaved Triunfetta. Linn. 

Mant. 73. Wildl. n. 7. Ait. n. 3. Jacq. Amer. 147. 

Hort. Vind. v. 3. 41. t. 76. (T. n. 2; Browne Jan. 

233.) — Leaves divided half way down into three lobes. Panicle terminal, compound, downy. —Native of the Weft Indies.Introduced at Kew in 1773, by John earl of Bute. It flowers in the ifowe in July. The stem is shrubby, fuffy. Leaves clothed on both fides with fine, foft, fily hairs. 

Flowers yellow, not many together, in more or less compound terminal panicles. Browne fays, the leaves, ftepped for fome time in water, give out a copious clear mucilage; and that the fibres of the bark ferve, in the inland parts of Jamaica, to make ropes, &c. We do not by any means understand Linnaeus's comparifon of this ifpecies to T. Lappula. He had no authentic specimen of either.

8. T. grandiflora. Large-flowered Triumfetta. "Vahl 

Eclog. v. 2. 34." Wildl. n. 8. — "Leaves ovate, undivided, somewhat heart-shaped, ferrated, rather hairy; the floral ones lanceolate. Branches hairy." — Native of the island of Montferrat. Carolla twice or thrice as large as in any other ifpecies with which Vahl was acquainted.

9. T. macrophylla. Large-leaved Triumfetta. "Vahl 

Eclog. v. 2. 34." Wildl. n. 9. "Leaves ovate-heart-shaped, undivided, unequally ferrated, pointed, downy; glandular at the base." —Native of South America. Like T. Lappula, but having a calyx, Vahl judged it to be a different ifpecies. We have already expressed our difoifbelief of the want of a calyx in any ifpecies of this genus. Plumer diffirinctly reprefents one in his generic figures, taken from T. Lappula itself. The macrophylla is laid to differ from what we shall now defcribe, in the fhape, as well as downy,

T. rhombifolia. Rhomb-leaved Triumfetta. Swartz 

Ind. Occ. 863. Wildl. n. 10, misfeple. (T. rhomboidea; Jacq. Amer. 147. t. 90.) — Leaves rhomboid, flightly hairy; the uppermoft ovato-lanceolate, nearly fefille. 

Flowers in axillary tufts. —Native of dry, watery, bushy places in Jamaica, and other parts of the Weft Indies. The stem is shrubby, two or three feet high, crefet, branched, downy. Leaves contracted and entire at the base; the lower ones rhomboid, and somewhat hexagonal, an inch and half long, on fidesfalks nearly of their own length; all rugofe and more or less hairy. 

Flowers pale, in axillary tufts, accompanying most of the upper smaller leaves, each tuft of about three or three-fhelf flower-flarks. 

Petals with hairy claws, and five nectariferous glands at their base. 

Cafpule of three ifingle-fedee’d cells. Swartz.
the limits of the empire, and slain at least five thousand of his enemies in battle, without any considerable loss on his own part: to this purpose an express law was established, and he was obliged to make oath before the quafiers, that the account delivered to the senate was true. But this law became obsolete, and intrigues and faction procured a triumph in favour of generals whose merit was not very considerable.

The general who vanquished his enemies in a naval engagement, had also the honour of a naval triumph. These were first granted to C. Duillus, in the year 449, after the defeat of the Carthaginians.

The triumph was of two kinds, the left and the greater. The left triumph was granted upon a victory over some unequal and unworthy enemy, as over pirates, slaves, &c. This they called ovatio, because the only sacrifices offered in it were sheep.

The greater triumph, called also curule, and simply the triumph, was decreed by the senate to a general upon the conquering of a province, or gaining a single battle. The order and economy of the triumph were thus: the general having dispatched couriers with tidings of his success, the senate met in Bellona's temple to read the letters; this done, they fend him the title Imperator, with orders for him to return, and bring his victorious troops along with him.

When he was arrived near the city, the general and principal officers took oath of the truth of the victory; and the day of triumph was appointed.

The day being arrived, the senate went to meet the conqueror without the gate called Capens, or Triumphals, and marched in order before him to the Capitol. He was richly clad in a purple robe, embroidered with figures of gold, setting forth his glorious achievements; his buffins were beft with pearl, and he wore a crown, which at first was only laurel, but afterwards was gold; in one hand he bore a laurel branch, and in the other a truncheon. He was drawn in a car, or chariot, adorned with ivory and plates of gold, drawn usually by two white horses; though sometimes by other animals, as that of Pompey, when he triumphed over Africa, by elephants; that of Mark Antony, by lions; that of Heliogabalus, by tigers; that of Aurelian, by deer; and that of Nero, by hermaphrodite mares, &c.

At his feet were his children, or sometimes on the chariot-horses. It is added, that the public executioner was behind him, to remind him, from time to time, that these honours were transitory, and would not screen him from the severity of the laws, if he should ever be found delinquent.

The cavalcade was led up by the musicians, who had crowned on their heads; after them came several chariots, in which were plans of the cities and countries subdued, done in relief: they were followed by the spoils taken from the enemy, their horses, arms, gold, silver, machines, tents, &c. After these came the kings, princes, or generals subdued, loaded with chains, and followed by mimics and buffoons, who infulted over their misfortunes. Next came the officers of the conquering troops, with crowns on their heads.

After these appeared the triumphal chariot, before which, as it passed, they all along threw flowers, and the music played in praise of the conqueror amidst the loud acclama
tions of the people, crying Io triumpli!

The chariot was followed by the senate, clad in white robes; and the senate by such citizens as had been set at liberty or ransomed.

The procession was closed by the priests, and their officers and utensils, with a white ox led along for the chief victim.

In this order they proceeded through the triumphal gate, along the Via Sacra, to the Capitol, where the victims were slain.

In the mean time all the temples were open, and all the altars loaded with offerings and incense; games and combats were celebrated in the public places, and rejoicings appeared everywhere.

What was horrible amid all this mirth was, that the captives, when arrived at the forum, were led back to prison and strangled; it being a point of religion with them, not to touch the victims till they had taken full revenge of their enemies. The rites and sacrifices being concluded, the triumphant treated the people in the Capitol, under the porticoes, and sometimes in Hercules's temple.

The most considerable triumphs were those of Caesar after the taking of Utica, and of Augustus after the victory of Actium. Caesar had four triumphs, which lasted four days, and were conducted with the most extraordinary splendour and magnificence. The first was the triumph of the Gauls, on which occasion there were presented to the view of the Romans the names of three hundred nations and eight hundred cities subdued by the death of a million of enemies, which Caesar had defeated in several battles. The second triumph was that of Egypt: the third represented the defeat of Pharasin; and the fourth exhibited pictures of Scipio, Petreius, and Cato.

The triumph of Augustus lasted three successive days, and was not less magnificent than the former.

After Augustus, the honour of a triumph became an appendage of sovereignty.

TRIUMPHAL Arch, Car, and Column. See the articles.

This is said to have been taken from Apollo's crowning his head with a laurel, after killing the Delphian serpent.

TRIUMPHAL Gown, toga triumphalis. See Toga.

TRIUMPHANT CHURCH. See Church.

TRIUMPHO de la Cruz, in Geography, a cape on the coast of Honduras. N. lat. 15° 50'. W. long. 88° 25'.

TRIUMVIR, one of three persons who govern absolutely, and with equal authority, in a state.

The word is little used but in the Roman History. Caesar, Caius, and Pompey, were the first triumvirs, i.e. the first who divided the government of the republic among them.

There were also other officers, called triumviri, triumviri; as the triumviri, or tresviri capitales, created in the year of Rome 403, to take care of prisoners, and superintend the execution of criminals.

Triumviri monetales, who were magistrates created at the same time to superintend the coinage of the money: whence that mark till extant on many ancient coins, IIIVIRI. They seem to have been created about the time of the first coinage of silver in Rome, or 266 years B.C. Pomponius ascribes their first creation to the year of Rome 452, or 289 B.C. These officers were very considerable, and were chosen out of the senatorial rank, till Augustus appointed them from the equestrian, and the alteration seems to have continued. However this be, the title triumviri remained still after Caracalla, as appears from inscriptions given us by Gruter, and by Butenroth. But under Aurelian it is probable there was but one master of the Roman mint, called the "Rationalis," which change is supposed to have taken place under Gallienus. The "Rationalis" was succeeded by the "Procurator monetae." The triumviri made a part of the centumviri. The title they bear on medals, which is common on the coins of Augustus and Tiberius, is IIIVIR.

A.A.E.F.F., triumviri aureo, argento, argo, flando, ferrando, R T which
which signifies, that they had the direction of calling and striking of gold, silver, and brass. Julius made quatuor
viri, who continued for 15 years, till the battle of Actium, when Augustus reformed the triumviri.

There were also triumviri aditus reficendi, officers appointed to look at the repairation of temples; triumviri
volui coloni deducendi, for the conducting and setting of colonies; triumviri, for the raising of troops; nautical
triumviri, to prevent or extinguish fires; triumviri, to review the forces, &c.

In the Acilian family we read of one M. Acilius IIII VIR VALETU; that is, triumvir of health, or a
magistrate of health. M. Scaenius takes him to have been a magistrate established to perform sacrifices to the gods of
health, to dedicate their temples, &c.

Onuphius and Vaillant read triumvirus velutinus; Patin,
triumvirus velutoidarius; but M. Scaenius, with much more
reason, reads triumvirus velutudo; in like manner, as on a
medal of the Acilian family, we read IIII VIR VIRTVUS;
signifying that one M. Aciilus had been made triumvir to
repair the temple of Virtue, and Acilius that of Health.

TRIUMVIRA TE, TRIUMVIRATE, an absolute go-

government administered by three persons, with an equal
authority.

There are two famous triumvirates at Rome; Pompey,
Caesar, and Crassus, established the first; and Augustus,
Mark Antony, and Lepidus, the second.

This latter triumvirate gave the last blow to the liberty of
the republic. Augustus having vanquished Lepidus and
Antony, the triumvirate sunk into a monarchy.

TRIUNE, Trei in Uno, three in one; a term sometimes
applied to God, to express the unity of the Godhead, in
a triinity of persons.

TRIXIS, in Botany, from τρίκλα, three-fold, because the
florets of the circumference have three deep dilate petals.
The name is borrowed by Swartz from Browne, who originally
applied it to what is now Pericisium radiale of
Linnaeus and other writers.—Swartz Prodr. 115. Ind.
v. 3. 2337. Mart. Mill. Dict. v. 4. (Baillera; Ablut.
Guian. 804. Juss. 188. Lamarck Illus. t. 712.)—Claf
Compositae opposite-folia, Linn. Cymobifera, Juss.

Gen. Ch. Common Calyx imbricated, ovate, of eight or
ten ovate-oblong, pointed, convex, nearly equal scales; the
outermost slightly keeled, membranous at the tip. Cor.
compound. Perfect florets, in the disk, numerous, funnel-
shaped, with a very short tube, and upright five-cleft limb.
Female ones, in the radius, fewer, shorter, funnel-shaped,
with a compressed tube, and a three-cleft limb, whose hinder
segment is larger than the two in front. Stam. in the florets of
the disk, Filaments five, the length of the tube; anthers
united into a five-toothed cylinder, rising above the limb.
Pil. in the florets of the disk, German linear, downy; fyle
thread-shaped, the length of the filaments, divied at the top;
filigras reflexed; in the female florets, German oblong;
fyle thread-shaped, divided at the top; fligmas reflexed.
Peric. none, except the cloeled unalter ed calyx. Seed of
the florets of the disk, often abortive: of the female ones ovate,
slightly compressed, bordered, convex behind, obtuse, hairy,
and somewhat triangular, at the summit. Down none.
Recept. chaffy, with oblong, acute, concave, membranous
scales.

hairy in their upper part. Florets of the radius three-cleft.
Calyx imbricated.

Willd. n. 2. (T. Canbra; Swartz Ind. Occ. 1378. Baill.
a pera; Aulb. Guian. 804. t. 317.)—Branches silky,
with close-preferred hairs. Leaves ovate, serrated, pointed;
harsh above; rough with defteft hairs beneath.

—Native of Guiana, Cayenne, and the West Indies. As
tall as the fift, but of a more tender habit. Branches
smooth to the touch, being covered with close hairs, point-
ing upwards, not with rigid prominent bristles, as in
the foregoing. Leaves not half so large, rough like a fine file,
on the upper surface, when fully grown; pale beneath,
with flattened, not prominent, brilty hairs. Flowers larger, but
fewer, in looser panicles. We cannot, on an examination
of the stems, doubt this being Aublet's plant, and therefore
we retain the original specific name. His B. syphugis
appears to be, as Willdenow makes it, a mere variety,
though his apera only is used for intoxicating fish.

Ind. Occ. 1375. Willd. n. 3.—Branches brily. Leaves
broadly-ovate, with deep irregular notches and serratures;
roughish on both sides; pale beneath.—Native of various
parts of the West Indies. This is the fize of the first
species, but its leaves are more deltoid, deeply jagged,
and less hairy, though roughish with minute scattered bristles.
Flowers white, much like the first, but fewer and rather
larger, on hairy stalks. The calyx-scales, in every one of
our stems, are much broader and rounder than
Swartz's figure represents. Aublet gives five teeth to all
his florets.

TROADENSE MARMOR, in Natural History, a name
given by the ancients to a species of white marble, dug in
Mount Ida, and greatly used in building.

TROARN, or Trouard, in Geography, a town of
France, in the department of the Calvados, on the Dive;
6 miles E. of Caen.

TROAS, in Ancient Geography, a country of
Asia Minor, commencing at the promontory Leuctum,
and extending as far as the Propontis. It took its name
from the famous city of Troy, its capital. It extended
a little towards the south. If indeed under the appellation
of Troade we comprehend the whole extent of the country
which was subject to the Trojans, that is, almost the whole
kingdom of Priam, we must comprehend almost the whole ex-
tent of the two Myia and Lesser Phrygia. But the Troade,
properly speaking, comprised merely the country which lay
between the Dardanis on the north-east, and the country
of the Leleges, to the south-east, the Hellespont and the
Aegean sea. Tolemy includes the Troade in Lesser Phrygia.
Its principal rivers were the Simois, the Scamander or
Xantippus, and the Andrus. Its principal towns were
Troja or Ilium Sigem, Sminthine, &c.

TROAS-ALEXANDRIA. See Alexandria.
TROAT; among Sportsmen, the cry of a buck in rutting time.

TROCADIE, in Geography, a small island in the gulf of St. Lawrence, near the north coast of St. John's island.

TROCAR, or Trochar, an instrument commonly used in Surgery, for tapping the abdomen, in cervices of uterine and oral dropsy; the tunica vaginalis, in cases of hydrocele; the joints, in bad cases of hydrops articuli, &c. Trocars are also employed for tapping the bladder, when there is no other mode of evacuating the urine, and the symptoms which the patient suffers are so urgent, that no time remains for the trial of milder plans of relief. Abcesses have likewise been opened in some instances with a trocar; though it must be allowed that, in these cases, the lancet is generally a better instrument.

A trocar consists of two pieces, viz. a perforator or fillette, and a silver cannula. The latter is so constructed and adapted to the first part of the instrument, that when the puncture is made, they both enter the wound together with perfect ease; after which, the fillette being withdrawn, the cannula remains in the wound, and affords a convenient channel for the escape of the fluid outward.

Such are the uses of a trocar, and the principles upon which the instrument ought to be made. It has been proposed to make the perforator with a flat lancet-point, in order that it may enter the flesh with greater facility; but time and experience seem still to give the preference to the fillette, which is of a triangular shape. It is true, that it cannot so readily make the necessary puncture; yet if sharp, and in good condition, no great fault can be found with it, in regard to the difficulty of making it enter the flesh; and it is certain, that its cannula is better calculated than the tube of a flat trocar to afford an outlet to fluids, which are at all thick and gelatinous.

The trocar is an instrument which should never be used for the discharge of fluids, except when the practitioner knows with certainty, not only that such fluids are present, but also that their quantity is considerable, so that no injury will be done to the parts beyond them by the sudden introduction of the instrument. In all other cases, cautiously making a small puncture with a lancet, is the most prudent practice. Whenever a trocar is used, surgeons likewise avoid introducing the instrument to a dangerous depth.

The instill the perforator has passed through such parts as intervene between the fluid and the surface of the body, it has performed all that it ought to do: the attentive operator feels a sudden cessation of resistance to the instrument, and he immediately holds back the fillette, whilst he only pushes forward the cannula. See Paracentesis.

TROCHAIC, Trochaic, in the Latin Poetry, a kind of verse consisting of troches, or in which that foot predominates; as the tambus does in the iambic.

The 8th ode of the 2d book of Horace's Odes consists of troches of two verses, the first of which is trochaic dimeter catalectic, i.e. trochaic, composed of three troches, and a syllable at the end, or wanting a syllable in the first foot; which some call the Europidon trochan:

--- Nōn fēlōr | nēgau | au rēum
Lurgia | fluido.

Long verses of fifteen half feet, which are more particularly distinguished by the name of trochee, are nothing more than tetrameter iambics, or of eight feet, the first of which wants a syllable; as there are others where it is wanting at the end. Thus,

--- Pusc | piccia | tō anē | nō sēm | ēm sūp | pul | ērūt | pātri. "Ter.

TROCHANTER, Major and Minor, in Anatomy, two considerable processes of the thigh-bone. See Extremities.

TROCHAR, in Surgery. See Trocar.

TROCHE, Trochicus, in Pharmacy, a form of medicine, made into a cake or tablet, to be held in the mouth to diffuse gradually.

The troche is properly a dry composition; the chief ingredients of which, after having been brought into a very fine powder, and mixed with sugar, are incorporated with some proper liquor, as distilled waters, wine, vinegar, or mucilages, and reduced into a mafs, which is moulded into little cakes, or balls of any form, at pleasure, and dried in the air, far from the fire. As remedies they are of little importance; and the preparation of them properly belongs to the confectioners; and they should be altogether rejected from the Pharmacopoeia, as the London and Dublin colleges have done.

There have been and still are troches of various kinds, and for various intentions; as purgatives, alteratives, aperitives, corrosivatives, &c. troches.

Latin authors call them paffili, rotule, placntule, orbes, and orbiculi; and the English, frequently, lozenges.

The following troches are described in the Edinburgh Pharmacopoeia; viz.

Troches of Carbonate of Lime, prepared by rubbing to powder four ounces of prepared carbonate of lime, an ounce of gum arabic, one drachm of nutmegs, and fix ounces of refined sugar, and forming them by means of water into a mafs fit for making troches. These are intended as antacids; but in the state of the stomach which requires them, the efficacy of the carbonate of lime is counteracted by the sugar.

Troches of Liquorice are formed by dissolving in hot water extract of liquorice and gum arabic, of each one part, and two parts of refined sugar, and then straining; and afterwards evaporating the tolution into a proper state for troches. These troches are demulcent, and serve to allay the tickling irritation which occasions coughing; but the simple extract of liquorice, refined by straining and insufflation, found in the shops under the name of refined liquorice, will answer the same purpose.

Troches of Liquorice with Opium are obtained by well rubbing two drachms of opium, with half an ounce of the tincture of balsam of Tolu; adding gradually eight ounces of simple syrup, and five ounces of extract of liquorice, softened by hot water, and afterwards sprinkling in five ounces of powdered gum arabic; then drying the mafs, and forming it into troches, each weighing ten grains. These troches are rendered more efficacious than the former for the same purpose, by the opium; six troches containing one grain of opium, and from fix to ten may be taken in twenty-four hours.

Trocha, Gum, are prepared by rubbing four parts of gum arabic, one part of flax-hemp, and twelve parts of refined sugar to powder, and forming it into a mafs with rose-water fit for forming troches. These are simple demulcients, and serve to allay a tickling cough.

Troches of Nitrate of Potassium are obtained by beating to powder one part of nitrate of potassa, and three parts of refined sugar, and forming them into a mafs fit for troches, by means of mestilage of gun tragacanth. Thus nitre may be agreeably taken in the dry state, and these troches may serve to cool the mouth in salinations, and to stop the progress of inflammatory fore-throat, when taken at its commencement. They may also be used as a general refrigerant in fevers, diluting largely during the use of them. The
dofe is one or two taken every second or third hour. Thomson's Lond. Dift.

TROCHEE. Trocērus, formed of τριχήν, I run, because it moves quickly, in Greek and Latin Poetry, a kind of foot consisting of two syllables, the first long, the latter short: such as the words νιόεῖ and μουτρία.

The trochee is the reverse of the iambus, and has just a contrary effect; the latter being light and springy, and the former weak and languid, as all those measures are which move from a long to a short syllable.

Some called the trochee, choroet, because it is proper for songs and dances. Thee give the denomination trocheus to the tribachus. Quint. lib. x. cap. 4.

TROCHERA, in Botany. See Ehrharta.

TROCHILUS, in Architecture, a hollow member, more usually called, by modern architects, the female; and, by our English workmen, the bafement.

Trocilus, the Humming-bird, or Honey-sucker, in Ornithology, a genus of birds of the order Picæ; the characters of which are, that the bill is longer than the head, subulate-filiform, or cylindrical, slender, with slightly-thickened tip; the upper mandible sheathing the lower; the tongue filiform, consisting of two conjoined lips forming a tube, and extenfible; the legs slender and rather short, and feet formed for walking; the tail composed of ten feathers.

The humming-birds constitute a lively brilliant race, distinguished by their beautiful colours and diminutive size, peculiar natives of the American continent and adjacent islands, and, with few exceptions, confined to the hotter regions. The genus is extensive, and it has therefore been found convenient to divide them into two sections, viz. the curve-billed and the straight-billed.

* Curve-billed.

PARADISEUS. Red; head crested; blue wings, and two of the tail-feathers very long. This is the Paradise humming-bird of Latham. Native of New Spain.

PELLA. Red (purple-red, Shaw), with brown (black, Shaw) head; golden (topazine, Shaw) throat; green rump, and two very long middle tail-feathers. This is the Cibil topaze of Buffon, the long-tailed red humming-bird of Edwards, and the topaz humming-bird of Latham. It is the most brilliant of this section, and has a decided superiority to all the rest by its magnitude as well as colours. The female is far inferior to the male with respect to brilliancy of colour. This bird is a native of several parts of South America, but is principally found in Surinam and Guiana, frequenting the banks of rivers and brooks. During flight, they skim the surface of the water like swallows.

SUPERCIUS. Gilded or shining brown; elongated middle tail-feathers (white at the tips, Shaw), grey beneath, with long bill and white eye-brows. Shaw. The supercilious humming-bird of Latham, distinguished from all others by the great length of its bill, and its strongly cuneated tail. The female differs by being of a pale rufous-grey beneath, by having a shorter bill, the lower mandible whitish, and the tail lightly cone-shaped and tipped with white. Found in Cayenne.

POLYANTHUS. Glossy-green, with black crown and tail; violet-brown wings, and two very long outer tail-feathers. This is the long-tailed black-cap humming-bird of Edwards, and black-capped humming-bird of Latham. An elegant species, of considerable size. A native of South America, and found also in Jamaica. The female is greenish above and white below; the sides of the neck varied with white and green, and the tail deftuite of the two long plumes so conspicuous in that of the male.

FORICATUS. Gold-green, with blue crown, and gold-blue forked tail, and two outer feathers very long. The long-tailed green humming-bird of Edwards, and fork-tailed humming-bird of Latham. An elegant but rare species; found in Jamaica.

LEUCERUS. Coppery-green, with brown quill-feathers; a reddish crescent in front of the neck, and white even tail. The white-tailed humming-bird of Edwards and Latham. Native of Surinam.

JUGULARIS. Gold-green, with a tinge of dusky-blue; with blood-red throat and breast, blackish abdomen, and even tail. Red-breasted humming-bird of Edwards and Latham. The garnet-throated humming-bird of Latham is of the same species. Found in Surinam.

THAUMANTHIS. Gold-green, with blackish quill-feathers, and tail-feathers edged with white; the exterior one entirely white on the outside. The admirable humming-bird of Latham, first described by Marcgrave. A native of Brazil and several other regions of South America.

DOMINICUS, or PECTORALIS. Gold-green, with velvet-black breast; white belly, and purplish steel-blue tail. The black-breasted and St. Domingo humming-bird of Latham. The female is said to be distinguished from the male by having the green on the fore-part of the neck divided by two white streaks, and the breast of a paler black than that of the male. A native of the West India islands.

MANGO. Copper-green, with black defied throat-fripe and abdomen; violet-brown wings, and ferruginous tail edged with black. The Mango humming-bird of Latham. The female is said to differ in having the two middle tail-feathers gold-green, like the back. A native of South America, particularly of Brazil, but found in St. Domingo, Jamaica, and other West India islands. Dr. Latham mentions a variety of this species, in which the throat, on each side of the black fripe, was white. Gmelin makes the "melivora avis maxima" of Ray and Sloane a variety of this.

HOLOSERICEUS. Gilded-green, with brown wings; black tail and abdomen, and blue pectoral bar. The black-bellied humming-bird of Edwards and Latham. Native of Mexico and Guiana.

GALERUS. Green-gold, with brown quill-feathers, and purple crest. Found in Chili.

EXILIS. Brownish-green, with a gloss of red; glossy-green crest with gilt tip, and black wings and tail. The little humming-bird of Latham, and humming-bird of a black colour of Bancroft. The smallest of the curve-billed section. Native of Guiana.

CYANUS. Velvet-crimson, with blue back, and black wings. The crimson-headed blue humming-bird of Latham. A native of Mexico.

FURCATUS. Glossy violet-blue, with gold-green crown and throat, and black wings, abdomen, and forked tail. The lesser fork-tailed humming-bird of Latham. A native of several parts of South America, and of some of the larger West India islands.

MACROURUS, or FORICIPATUS. Gold-green, with violet head and neck; abdomen marked by a white spot, and forked tail. Cayenne fork-tailed humming-bird of Latham.

PURPUREUS. Green, with crown, wings, and bifurcated tail purple, and wreath blue. The purple-crowned humming-bird of Latham.

AURATUS. See JUGULARIS. Of this Gmelin gives a variety, viz. with cheeks, nape and throat golden-red; head and body black, with shining-green.

GRAMINEUS. See DOMINICUS or PECTORALIS.
TROCHILUS.

VIOLEACEUS. Dark purple-violet, glisting on the fore- parts, with green and gold wings and tail, the latter tinged with black. The violet humming-bird of Latham. Native of Cayenne.

MACULATUS. See Gutturalis.

PUNCTATUS. Gold-green, with blackish wings; shoulders and back spotted with white, and brown tail with white tip. The spotted humming-bird of Latham. Native of Mexico, where it is called "Haitizitil." See Gutturalis, of which it is a variety.

AURANTICUS. Brown, with orange head; yellow throat and breast, purple wings, and ferruginous tail. The orange-headed humming-bird of Latham. Native of South Africa.

FLAVIFRONS. Green, with yellow front, and black wings and tail. The yellow-fronted humming-bird of Latham, and yellow-fronted honey-fucker of Pennant.

VENUSTISSIMUS. See Cyaneus.

MARGARITACEUS. Bright-green, pearl-grey beneath, with the tail fleck-blue at the base, purple-brown in the middle, and white at the tip. The grey-necked humming-bird of Latham. Conjectured by Dr. Shaw to be female?

HIRSUTUS. See Brasiliensis.

MULTICOLOR. See Histrio.

ICERUS. Green, with blackish wings, and rounded fleck-blue tail with white tips. The ash-bellied humming-bird of Latham.

GULARIS. Gold-green; white beneath, with blackish wings and tail, and deep-blue throat and vent. Probably a native of South America.

FULVUS. Yellow, with the tail-feathers and covers thick; underneath brownish. A native of South America.

VARUS. Green; beneath whitish-brown, with a double pectoral band green-blue and blood-red. Found in South America.

CYANUS. Green; cinereous beneath, with the throat, breast, and two very long middle tail-feathers blue. The blue-tailed humming-bird of Latham. Native of New Spain.

FURCIFER. Green, with brown wings; white throat, and glossy blue-green breast and forked tail. Native of Paraguay.

MAXIMUS. Green, with white throat, ferruginous vent, and blue crown, quill and tail-feathers. Eekelberg's humming-bird of Latham.

CAPENSIS. Green, with long middle tail-feathers, and blue wing-coverts. Eekelberg's humming-bird of Latham.

CHRYSOBROCHOS. Gold-green, with very bright throat and breast; subferruginous wings, and white-edged tail. Native of Guiana.

SPARANUS. Gold-green, with emerald throat, and black forked tail, with a gold-crimson bar across the feathers. The barred-tailed humming-bird. A very beautiful species, said to be a native of Peru.

PORPHYRUS. Brown, with velvety-black throat, and purple neck-stripes and tail. A variety of the mango, according to Latham. Native of South America and the West India islands.

GUTTURALIS. Green, with emerald throat; whitish- rufous on each side; black breast, and black abdominal stripe. The T. gularis of Latham; and maculatus of Gmelin. The green-throated humming-bird of Latham.

NITIDUS. Violet-tailed humming-bird of Latham, and T. albus of Gmelin's Linnaeus. Supposed by Shaw to be a variety of the preceding.

BRASILIENSIS. Gold-green; rufescent beneath, with violet-brown wings and tail; the latter tipped with white, and white-feathered legs. The rufous-bellied humming-bird of Latham. The T. hirifutus of Gmelin's Linnaeus. An elegant species. Native of Brazil.

FASCICATUS. Green-gold, with rufous undulations; blackish-rufous head; and a black band edged with white along each side of the body. Banded humming-bird. Native of Paraguay.

PUNCTATUS. Gold-green; beneath brownish undulated with white; with subvilaceous wings, and tail white at the base and tip. Scallop-humming-bird, strongly allied to the Mango, and it is not impossible, says Dr. Shaw, that it may be the young, in its first year's plumage.

AUREO-VIRIDIS. Gold-green, with blackish wings; and fleck-blue tail with white tip. Native of the West India islands.

AUREOLUS. Dark gold-green, with brighter throat and shoulders; black breast, brown abdomen, and subvilaceous tail. A native of the island of Porto-Rico.

TRIMACULATUS. Gold-green; black beneath, with three white spots on each side; brown quill-feathers, and fleck-blue tail. Native of South America. Dr. Shaw conjectures that this may be only a variety of T. mango, holosericeus, or pectoralis.

ELEGANS. Gold-green, with black breast; violet-black wings; and greenish-black forked tail. Native of St. Domingo.

HISTRIO. Brown, with gold-green crown, throat, breast, and shoulders; red belly, and blue cheeks. The harlequin humming-bird of Latham and Shaw, and the multicolor of Latham and others. A highly elegant species, and remarkable for its variety of colours. Native country uncertain.

CHRISTELLUS. Green, with shining gold-green crest; and black wings and tail. Gilt-crested humming-bird of Latham. A small and elegant species, much allied to the T. exilis.

* * * With straight Bill.

PLATIRUS. Gold-green, with brown belly, quill-feathers, and tail; the middle tail-feathers naked with webbed tips. The racket-tailed humming-bird of Latham. This is a rare species, and a native of South America.

LATIPENNIS, OF CAMPOLOCTERUS OF LINN. LINN. Gold-green; grey beneath, with brown wings and tail; and the edges of the greater quill-feathers dilated and incurved. The broad-tailed humming-bird of Latham. One of the larger humming-birds, a native of Cayenne, and a very rare species.

AURITUS. Gold-green; white beneath, with slightly elongated violaceous ear-feathers, black wings, and lateral tail-feathers. The violet-crested humming-bird of Latham; an elegant species. Native of Cayenne. Gmelin mentions a variety with a purple band below the eyes, a large area near the ears, below which is a green-blue spot.

MELLIVORUS. Gold-green, with blue head, neck, and breast, and white mouchal bar, abdomen and tail. White-bellied humming-bird of Edwards and Latham. Native of South America, and not uncommon in Cayenne. The T. simbriscus, or spotted-necked humming-bird of Latham and Gmelin. Linnaeus is supposed to be a species. There are also other varieties mentioned by Vieillot.

OURSIA. Gold-green, with blue back, breast, and belly; brown quill-feathers, and golden-brown tail. The green and blue humming-bird of Edwards and Latham. Native of Surinam. N.B. The American word "Oursia," signifying a fun-beam, is applied by some of the earlier writers to certain species of humming-birds, on account of the
the splendour of their colours. Gmelin mentions a variety, viz. T. green; beneath blue, with orange spot on the chin; quill-feathers and tail obscure.

SUPERBUS. Gold-green, with blue crown; double black-and-white cheek-stripe, and crimson throat and breast. Stripe-checked humming-bird of Shaw. This superb humming-bird is a most beautiful species, and one of the finest of this brilliant race. Native, probably, of South America.

SAPPHRINUS. Bright fapphire-coloured, with slightly-gilded back; brown wings; black abdomen, and blue-blue tail. The fapphire humming-bird of Latham. Native of South America. Gmelin mentions a variety, viz. T. with fapphire breast, white belly, and tail blue-black.

SMARAGDO-SAPPHRINUS. With bright fapphire-blue head and throat; gold-green body; brown wings, and reed-blue tail. The fapphire and emerald humming-bird of Latham. Native of South America and the West Indies. Shaw suggests that the two last mentioned humming-birds really constitute one species. He mentions a variety of the last from Viellot, viz. the blue-gorge humming-bird.

LUCIDUS. Bright gold-green, with deep-blue throat, black belly, and tail; and a white spot behind each eye: supponed by Azara and Sonnini to be the same with the fapphire and emerald humming-bird. Native of Paraguay.

AMETHYSTINUS. Gold-green, varied beneath with grey and brown, with amethystine throat, and forked tail. The amethystine humming-bird of Latham. Native of Cayenne.

MOSCHITUS. Purple-brown; blackish beneath, with ruby-gold crown, topazine throat, and black-tipped tail. The ruby-necked humming-bird of Latham. To this species Dr. Shaw refers the T. elatus of Gmelin's Linneas, or ruby-crested humming-bird of Edwards and Latham. This is one of the most beautiful of the straight-billed humming-birds. Native of South America, and particularly of Brasil, Guiana, and Surinam. The ruby-crested humming-bird is a variety.

PEGASUS. Gold-green; grey beneath, with brown wings, and blackish-purple tail with greenish hue. Grey-bellied humming-bird and gold-throated humming-bird of Latham. Dr. Shaw suggests that this may be a young female of T. moschitus.

HIPPOPHUS. Gilded-brown; whitish beneath, with brown crown, and gold-green stripe down the middle of the throat. The brown-crowned humming-bird of Latham, conjectured by M. Viellot to be no other than an advancing young of T. moschitus.

CARBUNCULUS. Glossy-black, with dark-red crown and nape, fiery-red throat and breast, and gilded-rufous tail. The carbuncle humming-bird of Latham is fuguected to be a variety of T. moschitus; rare in Cayenne.

CHRYSEUS. Gold-green, with cinnamon throat, brown quill-feathers, and topazine tail. Native of Paraguay.

COLORUS. Gold-green; about three inches in length; beneath white, with gold-red throat, and purple-brown wings and tail. The red-throated humming-bird of Edwards and Latham, red-throated honey-flicker of Pennant, guianumbi of Maregrave. A beautiful species. A native of America, breeding in Carolina, Florida, and, as some say, in Canada; and also a native of Jamaica and some other West India islands. The female differs in having the whole under side white, without any redness on the throat, and all the tail-feathers, exclusive of the two middle ones, tipped with white. The general history of this beautiful bird is detailed by Mr. Pennant in his Arctic Zoology. Its flight is rapid, so that it is transient as lightning, and resembling this meteor in the glare of its colours: it feeds only upon the wing, suspended over the flower from which it extracts nourishment. The most violent passions sometimes agitate the little bodies of these birds. Their contests in disputing possession of the same flower are very violent; tilting against one another with such fury, as if they intended to transfuse their antagonists with their long bills. They are fearful of mankind, coming into apartments of houses, the windows of which are left open, but when approached, darting away with admirable velocity. Their nests, made in branches of trees amidst the thick foliage, are found with difficulty: they are of elegant structure, formed on the outside with moss, and within lined with down or goat's hair collected from the great mullein, but sometimes constructed of flax, hemp, hair, and other soft materials. The female is said to be the builder, and the male supplies her with materials: both are in the labour of incubation, which lasts twelve days: they lay only two eggs, which are white, and as small as peas. It is fuguected that the patch-necked humming-bird of Latham's first supplement is no other than a young male of this species. The tominuo of Gmelin is a variety.

RUBINEUS. Green-gold, with gold-red throat, purplish-brown wings, and rufous tail. The ruby-throated humming-bird of Latham. Native of South America, and particularly of Brasil, and is considered as one of the rarer kinds of humming-birds.

MELEAGRUS. Gold-green, with gloriously blue-green throat, violet-black wings, and feathered legs. The emerald-throated humming-bird of Shaw, the all-green humming-bird of Edwards, and the Cayenne humming-bird of Latham. This is one of Maregrave's guianumbis.

COLLARIS. Rufous, paler beneath, with gold-green crown, and gold-red throat, with the feathers elongated on each side. The rufus-necked humming-bird of Latham. This species is numerous in Nootta Sound.

ALBROSTRIS. Blackish, with gold-green throat; each feather edged with grey, and white bill, thighs, and vent. The white-billed humming-bird of Shaw. Native of Cayenne.

VIELLOTI. Blackish-olive, with golden gloss; beneath whitish, with violet-brown quill-feathers. Viellot's humming-bird, and black humming-bird of Latham. This small species is common in the island of St. Domingo, supponed by Viellot to be the T. niger of Linneas.

LEUCOCRATOPHUS. Gold-green; beneath grey, with white belly; a whitish stripe behind the eyes, and blue-black quill and tail-feathers. The most common species in Paraguay.

MAUGEAHUS. Gold-green; beneath glossed with violet-blue, with violaceous-black wings and tail, the latter slightly forked. Maugean humming-bird, or Tabago humming-bird of Latham. Native of the island of Porto-Rico, whence it was brought by M. Mauge.

RUBER. Sub-ferruginous; slightly spotted with brown, with the side-feathers of the tail violet-brown. The little brown humming-bird of Latham. Brought from Surinam.

CRISTATUS. Gold-green, cinereous beneath; with golden-blue pointed crest, and violet quill-feathers and tail. The crested green humming-bird of Edwards and Latham. The female differs in wanting the crest, and in being ash-coloured beneath. Native of South America, and some of the West India islands.

PILEATUS. Brown, with gloriously blue pointed crest. The T. puni-
TROCHITAE, or TROCHITES, in Natural History, a kind of figured fossil flakes, resembling parts of plants; vulgarly called St. Cathbert's beads.

They are usually of an opaque, brownish colour: they break like spar, glossy and shining, and are easily dissolved in vinegar. Their figure is generally cylindrical, sometimes a little tapering, the circumference smooth, and both the lat fides covered with fine radii drawn from a certain hole in the middle to the circumference.

Two or three, or more, of the simple trochites, joined together, constitute what the naturalists call an entrochus.

In thefe the trochite, or single joints, are so set together, that the rays of the one enter into furrows in the other, as in the futures of the flull. They are found in great plenty in the bodies of the rocks at Braughton and Stock, two villages in Craven, at all depths under ground; also in Mendip-hills, &c. sometimes only sprinkled here and there, and sometimes in large strata, or beds, of all magnitudes, from the size of the smallest pin, to two inches about.

They are often found ramosus or branchy, several rudiments of large branches arising from the fl emblem, or cylinder, and sometimes flill smaller from thefe. The branches being deeply incerfed into the flem, the tearing them off leaves great holes in them. See Entrochus Rumpfus.

Dr. Lister has discovered a f ort of little fragment among them, which he takes to have been the apices of them; and another fort, which he imagines to have been the roots: for he supposes them to be a fort of rock-plants.

M. Beaumont, in the Philosophical Transafsions, affures us that he has found, that all the cliffs in fome mines are made up of fome entrochi, fome of which have been converted into a reddish matter: while others, becoming white fpar, compofe bodies of that fubfance: and confidering that all the cliffs, for a very large circumference in fome places, confift almost wholly of thofe ftones, it has been thought by fome, who suppofe them plants, that there have been, and ftil are, whole fields or forefts of thefe under ground, as there are of coral in the Red fea. In the courses between the cliffs are found of thofe foffils, at all fages and degrees of maturity, growing up in the gritty clay, and rooted in the rake-mold ftones, many of them of the form and dimensions of a tobacco-pipe, with the evident beginnings of circles and futures; and others full-grown, formed of perfect fpar, and at their point of maturity.

The central matter, in many, continues fill white and folt, as the whole fubfance is, by fome, thought to have been at firft; and is continually refhened by the mineral freams and moifure, which have free access to it through the mafs of clay usually lying under the plain roots.

From the curiosity of their make, and from this accidental refemblance of plants, many have thought them to be fuch; and affirm, that they may vie with most of the vegetable kingdom, and are shaped and formed like them; having flem, branches, roots, an inward pith, as likewise joints and runnings in their grit, and fometimes cells to fupply the place of veins and fibres.

Others have thought it highly probable, thefe rock-plants are lapides fui generis, and not parts of animals or plants petrifed, as many authors have imagined. If the figured roots, on which they fometimes grow, give any fufpicion they might have belonged to an animal, particularly a fpecies of the illa arborefens, the trunks feem to them to excite the contrary: nor are they reducible to any known fpecies of vegetables. M. Beaumont tells us, that he had by him above twenty diferent fpecies of trochiotes, all of them wonderfulliy regular, and not to be paralleled by any vegetable he knows of in nature; and it is inconcievable how fo many fpecies, diffused through many parts of the earth, should come to be loft. They are certainly, indeed, not vegetable remains, but are truly parts of the illa arborefens petrifed. See farther, Keppells Effai de Entroche, and the articles Entrochus, Star-flills, and Star-flone.

TROCHITIFER GLANS. See GLANS Trochitifa.
TROCHLEA, \( \tau \rho \rho \chi \lambda \varepsilon \), one of the mechanical powers, usually called a pulley; which see.

TROCHELA, in *Anatomy*, a name given to some articular emanations of bones, which resemble in form the grooves of a pulley: viz. that of the humerus, adapted to the ulna.

TROCHELEARIS, a muscle of the eye. See EYE.

TROCHMI, in *Ancient Geography*, the name of one of the three Gaulish nations, which, according to Strabo, established themselves in that part of Galatia which respects the Enxine sea, and that which touches on Cappadocia.

TROCHOCARPA, in *Botany*, from \( \tau \rho \chi \omega \sigma \), a wheel, and \( \kappa \alpha \tau \rho \omega \tau \), fruit, serving to express the orbicular depresed form of the nut, like a little toothed wheel.—Brook Prodr. Nov. Holl. v. 1. t. 54.—Cliffs and order, Pendantria Memegynia. Nat. Ord. Epipisperidae, Brown. Gen. Ch. Cal. Persiant inferior, of five equal, ereth, oval leaves, with two smaller ones, of the same shape, at the base, permanent. Cor. of one petal, funnel-shaped; tube cylindrical, pervious, longer than the calyx; limb in five deep, oval, spreading segments, bearded on the upper side. Nectary cup-shaped, five-lobed, surrounding the base of the germen. Stam. Filaments five, thread-shaped, the length of the tube, inserted into its lower part; anthers oblong, incumbent, included within the tube. P. Figs. Germen superior, ovate; style very short; stigma filiform. Peric. Drupa globoso, depressed, juicy. Seed. Nut orbicular, with ten lobes, finally separating into as many distinct cells, with a kernel in each.

1. *T. laurina*. Laurel-leaved Trochocarpa. Br. n. 1. (Cyathodes laurina; Ridge Tr. of Linn. Soc. v. 8. 293. t. 9.)—Found near Port Jackson, New South Wales. A small tree, smooth in every part, with very hard wood. Leaves feathery, on short falks, elliptico-lanceolate, acute, entire, many-ribbed, with somewhat of the aspect of a *Rafan*, each near two inches long. Spikes rather lax, terminal and axillary, shorter than the leaves. Flowers white, small. Fruit less than a pea.

TROCHOID, Trochoi, or Trochoidea, formed from \( \tau \rho \chi \omega \sigma \), wheel, and \( \omega \), form, in *Geometry*, a curve, whose genesis may be thus conceived: if a wheel or circle be moved with a two-fold motion at the same time, the one in the right line, and the other circularly about its centre, and these two motions be equal, i.e. describe two equal lines in the same time: and if in the radius, which at the beginning of the motion reaches from the centre of the wheel, or the first point of the line which describes the circumference: if I say, in this radius, a point be taken any where, except in the centre, this point will describe a curve, one part of which will be below the line described by the centre, and the other above it. This line, thus described by the point taken in the radius, is called the trochoid.

The right line which joins the two extremities of the trochoid, and which is either the path the wheel makes, or a line parallel to that path, is called the base of the trochoid.

The axis of the trochoid is the diameter of the wheel, perpendicular to the base in the middle of the motion; or that part of the radius between the trochoid and its base. The point, in which the axis is cut into two parts by the line described by the centre of the wheel, is called the centre of the trochoid; the uppermost point of the axis the vertex of the trochoid; and the plane comprehended between the trochoid and its base, the trochoidal space.

The trochoid is the name with which we otherwise call the cycloid; for the properties, &c. of which, see CYCLOID.

TROCHOIDES LACUS, or Trochoide Lake, in *Ancient Geography*, a lake in the isle of Delos. It was on the borders of this lake, that, according to the mythologists, Latona was brought to bed of Apollo and Diana; and here the first of these deities had a temple.

TROCHTELINGEN, in *Geography*, a town of Wurttemberg, lately imperial; 16 miles N.W. of Buchau. N. lat. 48° 16'. E. long. 9° 18'.—All, a town of Germany, in the county of Osteningen, on the Eger; 4 miles S.W. of Nordlingen.

TROCHUS, in *Antiquity*, denotes the exercise or game of the hoop. The hoop was of iron, five or six feet in diameter, set on the infield with a number of iron rings. The boys and young men used to whirl this along, as our children do their hoops, directing it with a rod of iron, having a wooden handle: which rod the Grecians called *oikop*, and the Romans *radius*. The clattering of the ring served partly to the diversion, and partly as a notice for persons to keep out of the way. Horace de Art. Poet. ranks this exercise among other manly sports:

“Ludere qui nefcit, campelfribus ablinet armis, Indoculis, pilae, dierce, trochive quiet.”

TROCHUS, in *Natural History*, the name given by authors to a genus of shells; some of the species of which resemble the figure of the trochus, or top, which boys play with. As there are many species of this shell, however, which are flattened and have nothing of this form, the whole series of them are much better named, by a denomination taken from the shape of the mouth, which is of an oval figure, and is alike in all these species, and different from all other shells. They are therefore aptly characterized by a late French writer under the name of cochlea ore deprego.

The trochi, or tops, form the fifteenth family of shells in Da Costa's arrangement; and he designates them to be shells of a conic or pyramidal shape, the top being broad and flat, and gradually tapering thence to a very sharp point; the aperture or mouth is most generally angular, low, and narrow. This is a numerous family, and abounds with curious and fine shells, See Trochus, under COXCHOLY.

There is a fossile species of trochus, not yet discovered recent. It is a large kind, flat, and like a coelacha helix, generally about two inches in diameter, much wrinkled, with sharp prominent edges like plates, which are spiked at regular distances, running across the sires; and the whole shell is likewise fricated. This trochus is found in the limestone of Coalbrook-dale in Shropshire, and Dudley in Staffordshire.

TROCKENBERG, in *Geography*, a town of the duchy of Storia; 4 miles N.W. of Rein.

TROCTOU, a small island in the East Indian sea, near the coast of Qu بدا. N. lat. 6° 30'. E. long. 99° 33'.

TROCTUS, in *Ichthyology*, a name given by Aristotle, *Athens*, and others of the Greek writers, to the fish called *ama* by Pliny, and most other of the later, as well as ancient Latin writers; but by some, *lechia* and *glauce*. It is properly a species of the *scambar*; which see.

TROČZENIECZ, in *Geography*, a town of Poland, in the patalinate of Bracław; 20 miles S. of Bracław.

TRODEN, a town of Germany, in the principality of Querfurt; 8 miles S.E. of Juterbock.

TRODENA,
TROGEN, a town of the county of Tyrol; 16 miles S.S.E. of Bolzano.

TROGEN, or TROZEN, Damali, in Ancient Geography, a town situated towards the S.S.E. extremity of the peninsula of the Argolid, at a small distance from the sea, and at the junction of the two rivers, the Chryforrhoeus and the Hylycus. This town took its name from a hero, the son of Pelops, and the brother of Pitheus. The last reigned there, and was admired for his virtues and the mildness of his government. The veneration which his conduct had excited, remained to the time of Pananias.

Trozen abounded with a variety of monuments; among which we may reckon the tomb of Pitheus, a temple dedicated in honour of Diana Convenatrix by Theseus, after his return from Crete, as an acknowledgment of his having escaped the fury of the Minotaur; a portico ornamented with the statues of women and children; a chapel consecrated to the Muses, and a great number of temples. The inhabitants of Halicarnassus, in Caria, regarded Trozen as their capital. A great part of the territory of Trozen was an ilithmus extending into the sea, and as far as Hermione to the W. The port lay N. of the town, and was called "Pogonis portus."
